This is one of a series of books, by different authors, on wireless apparatus published by Messrs. Hachmeister and Thal, Leipzig. The book under review may be said to deal with the design and construction of loud speakers of various types. The work is divided into four chapters, the first of which deals with the electrical characteristics of loud speaker design. This chapter contains a useful sectional diagram, with appropriate reference numbers, of a cone type loud speaker. Chapter two deals with loud speakers of various types, both ancient and modern. This is useful, since it enables comparisons to be made between various types, and it shows the progress which has been made. Loud speakers for open air use are also described and illustrated in this chapter. The third chapter is, perhaps, the most valuable one in the book, since it deals with the electro-technics of loud speaker design. Several illustrations of the distribution of flux, and graphs showing magneto-motive force plotted against flux density, are given, in addition to calculations and worked examples. Some of the most important calculations deal with the impedance at various frequencies; the calculations are not too mathematical. The last chapter occupies but two and a half pages, but it is valuable from the fact that it deals with a typical circuit diagram of a four valve receiver, and two diagrams of a loud speaker circuit connected in different ways to the receiving circuit by means of change-over switches. To those interested in the design and construction of loud speakers the work is to be commended. C. S. R.

SAG CHART FOR COPPER CONDUCTORS.

Sag Values in Terms of Variable Span Length.

By W. T. TAYLOR, M.Inst.C.E., M.I.E.E.

ON the opposite page is reproduced a series of curves giving sag values for copper conductors (⅜ in. ice loading) in terms of variable span length.

To find the stringing tension in still air first find the sag from the chart for the given temperature in deg. F., then calculate stringing tension from formula: $T = wL^2/s$ 0.66 lb. Where, T = tension in lb., L = span length in ft., w = weight of bare conductor in lb./ft. of length, s = sag in inches.

Where it is desired to find the sag for maximum loading conditions (8.0 lb. wind and ⅜ in. ice loading) calculate from formula: $s' = WL^2/T'8$ ft. Where: T' = allowable tension or safe load in lb., L = span length in ft., W = weight of ice covered conductor in lb./ft. of length, s' = sag of conductor in ft. The allowable value of w and T' are given in B.S. Specification No. 125.

The following results of examples are given for the purpose of showing readers how to use the chart. The values of sag are more closely calculated than the average lineman will often be able to hold to, because of changing physical conditions, such as temperature and constants, in the material, etc.:—

Examples:—	Sq. in.	Span (L)	Temp. (t)	Sag (s)
	0.20	300 ft.	40° F.	24 inches
	0.15	350 ,,	40 ,,	35 ,,
	0.10	300 ,,	20 ,,	24 ,,
	0.075	300 ,,	40 ,,	36 ,,
	0.050	250 ,,	20 ,,	24 ,,

It should be noted that A, B, etc. for conductors, correspond with the respective A, B, etc. of spans shown on the left of the chart.

THE YALLOURN ELECTRICITY SCHEME.

Details of Generating Transmission and Distribution Arrangements—Use of Local Brown Coal Deposits—Remote Control of Hydro-Electric Stations.

By JAMES CASSIDY.

THE name " Yallourn " is derived from two native words, " Yalleen " and " Lourn," meaning " brown " and " coal " respectively. The town lies five miles from Morwell, and it is 87 miles from Melbourne by train, 90 miles by road, and 110 miles via the Electricity Commission's high tension transmission line.

Yallourn is a model town, and an interesting example of applied town-planning ideals. A large number of shade and ornamental trees are planted in streets and reserves. These trees are produced at the Commission's own nursery at Yallourn.

An " Electrical " Town.

Apart from bank and public officials, the population of Yallourn is composed entirely of officers and employees of the Commission. That of the town itself numbers approximately 1 500. The population is housed in dwellings designed, erected and owned by the Commission. The number of dwellings erected and in occupation at Yallourn is 305. It will soon be 370.

The town is perfectly self-contained. It has a fine State school, a fire brigade, the usual postal and banking facilities, and a large general store owned by the Commission. An up-to-date hospital is about to be erected, together with a higher elementary school and technical school. There are football, soccer, cricket, tennis and golf clubs, which, with a Glee Society, horticultural society and various church societies, contribute to the amenities of life.

The town obtains its water supply from the Latrobe River, which lies about two miles to the north of Yallourn. The water is pumped into a reservoir at the top of a hill overlooking the town.

The brown coal fields at Yallourn under the control of the Electricity Commission, cover an area of about thirty square miles, containing 6 000 000 000 tons of brown coal, of an average thickness of 200 ft. lying beneath an average depth of 50 ft. of overburden (the name given to the soil covering the coal deposits).

The coal, being at such a shallow depth, is won by the open-cut method, the overburden being stripped off, exposing the coal, which is then excavated by an electrically-operated power shovel, which takes six tons at a " bite." It is intended to supplement this method by the use of a coal-dredger, which will enable the present output of 4 000 tons a day to be increased to 10 000 a day of two eight-hour shifts.

The present open cut lies about one mile from the township, and is adjacent to the power station. In the area of the one square mile set apart for the initial workings, there are 150 000 000 tons of coal of an average thickness of 180 ft., covered by 30 ft. of overburden.

The open cut is 2 400 ft. long and 1 000 ft. wide. Here a face of 70 ft. of coal is being operated on. There is sufficient fuel in this cut to develop 200 000 H.P. of energy daily for fifty years. In the whole field there is enough coal to generate one million H.P. of energy daily for 400 years.

The present output of coal is 4 000 tons per day. Of this, 1 700 tons provide a daily output of 400 tons of briquettes, the remainder being used to generate electricity.

In addition to the " new " open-cut workings, coal is obtained from the old open cut, which was taken over by the Electricity Commission from the Mines Department. The old open cut is located on the northern bank of the Latrobe River, and serves to supplement the supply of coal to the power station.

The power station is situated adjacent to the weir on the Latrobe River. This weir was constructed in order to raise the level of the water, and also to provide a storage of cold water which can be drawn upon at times of the day when the condensing water is required at a greater rate than the flow of the river.

The power station has an installed generating capacity of 62 500 kW. Its normal operating capacity is 50 000 kW, but during the year it has, on occasion, operated at over 59 000 kW.

The Yallourn power station buildings are mainly steel-framed structures. The boiler house contains twelve boilers, which successfully burn coal containing 65% of moisture, by means of step grates, fitted with pre-drying devices.

The generating plant comprised five main turbo-generators, each rated at 12 500 kW, generating three-phase 50 cycle alternating current energy at 11 000 V. A sixth turbo-generator of similar type is on order, and is expected to arrive about March of next year. It will be ready for next year's winter load.

The main transmission line from Yallourn to Melbourne is 110¼ miles in length. It comprises 591 steel towers, and operates at a pressure of 132 000 V. It commences at the Yallourn switchyard and terminates at the Yarraville terminal station.

The Yarraville terminal station receives and regulates the energy transmitted from the Yallourn and Newport " B " power stations. It provides a link with the 25 cycle distribution system of the Victorian Railways Department, and distributes energy to the various sub-stations in the metropolitan area and surrounding districts.

The Newport " B " station came into operation early in 1924, and is of 15 000 kW operating capacity. It acts as an auxiliary station, functioning at " peak " load periods only.

The transmission systems are made up of three sections, viz.: (1) Main 132 000 V transmission line, carrying power from Yallourn to Melbourne; (2) metropolitan supply system; (3) country district service.

The Commission has approximately 1 300 route miles of overhead and underground h.t. transmission lines now in operation. These lines radiate in all directions, passing through fifty shires en route, and carrying energy for distances up to 300 miles from the source of supply at Yallourn.

The metropolitan supply system covers the supply of energy to thirty-four centres in the metropolitan and outer metropolitan areas, including such centres as Bayswater, Dandenong, Ferntree Gully, Tremont, Sherbrooke, Ferny Creek, Olinda, Sassafras, Mulgrave, Ringwood and Lilydale. It also supplies electricity in bulk to ten metropolitan municipal councils, as well as to the Melbourne Electric Supply Co., Ltd., which will be absorbed by the Commission in 1930.

The country supply system is divided into three areas: Western District, Gippsland, and North-Eastern District.

The first named does not take its energy from the Commission's generating plants, but is supplied in bulk from the Melbourne Electric Supply Co.'s generating plant at Geelong. Gippsland takes power direct from Yallourn.

The North-Eastern District is at present supplied through the transmission line from Melbourne to Sugarloaf. This transmission line will later be used to supply portion of the Melbourne load through a terminal station at Thomastown, from the Sugarloaf-Rubicon hydro-electric undertaking.

In all, about 100 centres and towns throughout the State receive their energy from the Electricity Commission.

Sugarloaf-Rubicon Hydro-electric Scheme.

The rapidly growing demand for electrical energy from the States scheme has necessitated the provision of additional generating plant, and for this reason the construction of the Sugarloaf-Rubicon hydro-electric scheme has been undertaken.

The general location of the scheme is about eighty-five miles from Melbourne. It provides for the harnessing of the mountain streams of the Rubicon and the utilisation of the irrigation water, discharged by the Eildon weir at Sugarloaf, of the State rivers and Water Supply Commission.

The scheme involves the construction of power stations situated at the following points: Sugarloaf, Rubicon, Lower Rubicon, Royston and Rubicon Falls.

The Rubicon Falls power station is already installed. It supplies power for the construction work as well as for the requirements of Alexandra.

The generating voltage will be 6 600 at all stations.

All the power stations will be unattended, being controlled from a centrally-located sub-station, to be known as Rubicon " A."

At present there are about 400 men engaged on the work. Communication is maintained between the main camp and the rail-head at Alexandra, fifteen miles distant by road and by steam-tramway operated by saw-milling companies.

Digitized by Google

As indicated above, the North-Eastern District will take its electrical energy from this scheme, and any surplus available will be utilised in meeting the growing demands on the metropolitan system.

The labour of approximately 10 000 men has been employed in the building up of Victoria's scheme of electricity supply. At present it gives employment to about 3 000 electricians, tradesmen and labourers. The work of dovetailing a multiplicity of major and minor operations into one harmonious whole was completed in May, 1924, when a pressure of 132 000 V was put on to the Yallourn-Yarraville transmission line, which has operated without one serious interruption ever since.

The scheme has been in actual operation on a revenue-earning basis for little more than three years. At the present moment it represents a capital expenditure of £11 500 000. Interest was charged against the scheme during the period of construction; losses accumulated during the developmental period; and interest on these accumulations of interest and deficits has had to be charged. During the quarter ended September last all these accumulated burdens were overtaken, and adequate provision was earned for depreciation. In other words, the scheme has begun to pay its way.

The demand for electricity seems insatiable, and each succeeding year has witnessed a tremendous growth.

In five years the consumption of energy in the metropolis, excluding the railways, increased from 190 million units to 350 million units, and it would indeed be hard to fix the future limits of progress, because the people of the State are just awakening to a realisation of the wonderful value of electricity in the home.

There has also been vigorous development in the rural areas, as is evidenced by the extraordinary increase in demand in most of the important centres, and the fact that the State scheme has been the means of giving electric service to no less than fifty-six centres which previously had no supply.

The problem of turning to economic use Victoria's vast resources of very low grade brown coal has been completely solved, and the Commission is now conducting researches into the problem of making even greater commercial use of this fuel than is represented by the generation of electricity and the manufacture of briquettes.

SCIENTIFIC DEVELOPMENTS IN STEAM-DRIVEN POWER STATION PRACTICE.*

Pulverised Fuel Firing—High Pressure Boilers—Substitutes for Water in Boilers—Low Temperature Carbonisation—The Sulphur Problem.

By DAVID BROWNLIE, B.Sc.

DURING the past ten years we have witnessed a revolution in the design, equipment and operation of the standard electrical power station, that is, coal-fired and driven by condensing steam turbines.

In the firing of boilers, however, we have had the most remarkable changes of all. The first power station in the world operated entirely with pulverised fuel was Lakeside, of the Milwaukee Electric Railway and Power Co., started up by John Anderson in December, 1920, which altered the whole situation. Now many of the largest and most famous stations in the world are operating with pulverised fuel, and in consequence boilers of 350 000-800 000 lb. evaporation per hour can be used, and 92-94% steam generation efficiency is being obtained on short test and 88-90% in continuous running, an amazing advance as compared with the general conditions of ten years ago.

For example, in the United States there are now operating 64 large electricity stations for public supply, with aggregate plant of 3 275 000 kW, burning about 10 750 000 tons of coal per annum in the pulverised condition. This corresponds to 26% of the total coal burnt in American power stations and represents nearly 20% more coal than in all the stations of Great Britain put together.

As a result of this formidable competition the mechanical stoker has also made giant strides, especially in the last five years. Multiple retort stokers are operating boilers of 300 000 lb. evaporation per hour, and at the present time there are under construction in Great Britain the largest travelling grate stokers in the world, over 30 ft. wide, for boilers of 200 000 lb. evaporation per hour. This is made possible by the introduction of the suspended arch, which has rendered obsolete the sprung arch, limited to only about 6-8 ft. in width, while the combustion chamber generally has been reorganised out of all resemblance to the standard designs of 1919. The air heater, a very old invention, has arrived as a practical proposition and is superseding the feed-water economiser, while as regards turbo-generators 50 000-65 000 kW is standard practice, 100 000 kW units are at work, and 200 000 kW sets are under construction. Very important also is the fact that the overall thermal efficiency is now 20-28% instead of 14-18%.

Further Developments.

Following these general lines of evolution we may expect still further striking developments in the immediate future. For example, the 1 000 000 lb. per hour evaporation boiler will probably be constructed in the United States, and many more forged drum boilers up to 1 800 lb. pressure installed for operation with existing power station equipment, that is, with small, very high-speed, super-pressure turbines exhausting to the mains at any desired pressure, say, 150-350 lb. per sq. in., so as to improve the overall thermal efficiency from 14-17% to over 20%.

But the design of steam generators may be altered entirely, as shown by the work during the past few years of Benson, Blomquist and Löffler, for example. It will be remembered the Benson generator operates under the actual "critical" conditions of about 3 200 lb. per sq. in. pressure and 706 deg. F. temperature when water is converted into steam at the same volume without any heat being rendered latent. Consequently, a simple narrow tube generator can be employed, since the problem of ebullition no longer exists, and the steam superheated to, say, 900 deg. F., and reduced to any desired pressure below 2 000 lb. per sq. in. if necessary.

Word of Mark Benson.

It is even yet not generally realised that this work of Mark Benson, from the scientific point of view, whatever the commercial results may be, represents the greatest advance in the science of steam since the invention of the high-pressure "Cornish" boiler in 1797 by Richard Trevithick.

The basic principle used by Löffler, of Vienna, and other workers on the Continent, partly developed from the work of Schmidt in Germany, is to generate steam by blowing highly superheated steam into cold water so that a steel coil only can be used for the heat transmission from the furnace. This simplifies considerably the construction of generators for, say, 1 500-2 000 lb. per sq. in. pressure, while another outstanding development is the "Wood" boiler in Great Britain for pulverised fuel firing on "turbulent" principles. In fact, as regards the firing of steam boilers, as well as overall thermal efficiency of steam generation, we are rapidly approaching a "dead end," and in connection with the operation of modern steam boilers it would be interesting to know how many other operations in the world are running at 88-94% efficiency.

Also with pressures of 2 000 lb. per sq. in. and over, and possibly with superheated steam temperatures of, say, 1 000 deg. F., combined with high-speed turbines of 25 000 r.p.m., perhaps operating in series with ordinary low-speed turbines, we may reach 35% continuous overall thermal efficiency with condensing steam practice.

In spite of all the advances of the past ten years, and those one may expect on the same general lines in the immediate future, there are still a number of serious problems in connection with the coal-fired, condensing, steam-driven super-power station even of the latest type, some of which may be insoluble, as follows: (1) The use of water as the liquid in the boiler; (2) over 50% of the total heat of the coal lost in the condenser; (3) low peak load, probably averaging only about 33% in Great Britain; (4) consumption of raw coal without recovery of by-products; (5) sulphur in the chimney gases.

* Extracts from a paper read before the Glasgow and West of Scotland Branch of the Institution of Mechanical Engineers.

Digitized by Google

All of these offer fascinating opportunities for detailed consideration and incidentally material for many papers. For example, mercury, or stable high boiling point organic compounds, such as diphenyloxide, are already being investigated in the United States for use, on the " binary " principle, in a boiler instead of water, with an auxiliary combined condenser and boiler containing water to make steam, and two turbines in series, and obviously in any scientifically organised community a power station would sell low-pressure steam and hot water as well as electricity to industrial and domestic establishments, instead of wasting in a fantastic manner more than half the coal in warming up a river, such as the Clyde.

Sulphurous Flue Emissions.

Also it is not exactly an efficient principle for this, or any other country, to have millions of horse-power of machinery which is only used for eight or nine hours per twenty-four hours. However, there will only be discussed the subject of the consumption of raw coal in power stations as mere fuel without any attempt to recover the by-products, which is closely associated with a new problem in the power station world that has suddenly arisen only a few months ago—the serious effects of sulphurous and sulphuric acid in chimney gases. The enormous increase in the size of the modern super-power station has resulted in the two last items being forced prominently upon the attention, not only of the power station world, but also of the whole community.

Not so very long ago, say, in 1919, the largest power stations only consumed about 100-300 tons of coal per twenty-four hours, but to-day 1 000 tons of coal per twenty-four hours is a common figure for a single station, and stations are under construction which will have eventually a consumption of 5 000 tons per day, that is, over 1 250 000 tons of coal per annum. Even in the case of stations taking 1 000 tons of coal per day it is impossible, at any rate in Great Britain, to go on squandering all the valuable by-products that could be extracted from this coal, concentrated in one spot and already having to be stored, handled, crushed and delivered to storage bunkers for the combustion chamber.

As showing the possibilities, we can take the case of Glasgow, consuming a total of about 275 000 tons of coal in electricity stations (including tramways). If low-temperature carbonisation combined with combustion was adopted for the generation of electricity, Glasgow would consume about 340 000 tons of raw coal, and produce every year 510 000 gallons of purified petrol and 76 500 barrels of Diesel oil, as well as large amounts of other products, such as solvents, fuel oil and pitch. For example, the city could run motor buses auxiliary to the trams with her own petrol from Scottish coal, and instal Diesel engines at the power stations to take the peak loads, as well as run Diesel engine motor wagons, quite apart from the installation of low-temperature carbonisation plants to supply solid smokeless fuel, as already considered in connection with the " Maclaurin " process.

Highly important also is that the sulphur problem in chimney gas would be more or less eliminated. Arising out of the litigation in which the Manchester Corporation has been involved concerning the Barton power station, and the uproar against the new Battersea power station, most large coal-using installations will have to take measures to eliminate or mitigate to a considerable extent the trouble from sulphur.

Raw coal varies greatly in sulphur content, generally between about 0·75-2·50%, but anything within the extreme range of 0·25%, or even less, and as high as 8·00%. However, we can take as a fair figure an average of total sulphur for British coal as 1·5%, of which probably 90% is converted during combustion into sulphurous and sulphuric acid, and discharged from the chimney. This corresponds to 1·35% " effective " sulphur, and a station burning 1 000 tons of coal per twenty-four hours will therefore discharge in this time the equivalent of 13·5 tons of sulphur or 41·3 tons calculated as sulphuric acid (H_2SO_4).

At Battersea, for example, on the figure of 2 000 tons of coal per day mentioned, this will correspond to 27 tons of sulphur, or 82·6 tons of sulphuric acid, per twenty-four hours, equal to that from about 120 000 private houses, concentrated in one spot in the heart of London.

With low-temperature carbonisation, however, a large proportion of the total sulphur, probably in average cases well over 50%, is driven off in the gases and vapours, and is easily removed from the gases, after the condensation of the tar, by washing. Under these circumstances, most of the sulphur in the gases is in the simple form of su'phuretted hydrogen (H_2S), and can be removed by water sprays, quite different from the many complicated and difficult sulphur compounds in the gas from high-temperature carbonisation of coal (town's gas and metallurgical coke ovens), necessitating laborious chemical methods of extraction. If, therefore, coal of normal quality is used in the washed condition to reduce the pyrites content, submitted to low-temperature carbonisation, and the gas washed, probably in average cases about 65-75% of the sulphur would be removed.

This new problem also emphasises the many claims for the principle of submitting the raw coal in an adjoining setting to combined low-temperature carbonisation and total gasification in a vertical continuous setting, condensing the tar, scrubbing for light oils, and removing the whole of the sulphur from the gas, which could then be burnt under the boilers in place of solid fuel. In this way sulphur in the chimney gas would be eliminated, and with, of course, also absence of smoke, grit, and dust, all the troublesome ash and clinker being removed from the generator and not the boiler combustion chamber. Alternatively the coal could be submitted to combined low-temperature carbonisation and partial gasification only, with the gas and the solid fuel burnt under the boilers, and the sulphur reduced as before by, say, 65-75%.

Still another scheme also would be to sell all the smokeless fuel for domestic use and instal a plant large enough to give sufficient purified gas to fire the boilers without solid fuel, thus also completely preventing sulphur troubles, recovering all the by-products, and reducing the black smoke of the city by using a smokeless fuel instead of coal.

There are, of course, almost endless methods of combining low-temperature carbonisation, gasification, and combustion for large power stations. For example, any low-temperature carbonisation plant could be erected next to a power station, and the gas and solid fuel merely taken across to the boiler combustion chambers. From this point of view the choice of processes is somewhat bewildering. For example, I have the details of about 600 processes that have been tried, more or less on the commercial or semi-commercial scale, during the past century and a quarter for the low-temperature carbonisation of coal, lignite, shale, cannel, torbanite, general canneloid material, tar sands and bituminous rocks, peat, wood, sewage cake, and general vegetable matter. Certainly about 300 of these processes were regarded as suitable for coal, and at the present time there are nearly 150 low-temperature carbonisation processes in the world of more or less importance under active consideration.

What is now termed the " Babcock " process is of great importance, because a commercial plant of 3 boilers, fitted with retorts having a throughput of 100 tons of coal per twenty-four hours has been operating since 1925 at the Dunstan station of the Newcastle-on-Tyne Electric Supply Co., Ltd. This process was originated by Messrs. Merz & M'Lellan, whose many patents on the subject date from 1917, while they operated experimental retorts at the Neptune bank power station, and later the Dunstan station, before the present commercial installation. In 1928, however, the process was taken over by Messrs. Babcock and Wilcox, Ltd., and it is understood the present plant at Dunstan is to be enlarged.

Financial Results.

It is stated, based on the extensive experience of the burning of 27 300 tons of coal, the total operating and maintenance charges of the plant are 4s. 8d. per ton, and the net profit obtained is 2s. 11·6d. per ton of coal carbonised, taking the smokeless fuel and the gas equal in value to the corresponding amount of raw coal on the heat content basis. In this particular installation the respective figures taken are 12s. per ton for the coal; motor spirit, 1s. 2d. per gallon; white spirit (second grade), 1s. 1d. per gallon; paraffin oil, 3¾d. per gallon; creosote, 8¼d. per gallon; pitch, 5·38d. per gallon; and crude cresylic acid, 1s. 8d. per gallon.

So far as can be ascertained, the " Pintsch " process originated about 1918, and the Julius Pintsch A.G., of Berlin, have developed on scientific lines the principle of combined low-temperature carbonisation in conjunction with water tube boilers and combustion on mechanical stokers, representing the most extensive experience of any firm in this particular field. The first Pintsch plant was erected in 1919 at the old Lichtenberg station, Berlin, and about nine other Pintsch plants are in operation in Germany, Norway, and the Prinzengrube and Trauscholdsegen colliery district of Upper Silesia.

(To be concluded.)

MARINE ELECTRICITY.

Present Position Eminently Satisfactory—The Weight Question in Large Passenger Liners—Two Years' Operation of a Diesel-electric Ship in the Arctic.

By A. C. HARDY, B.Sc., A.M.I.Mar.E. (Author of "Merchant Ship Types," etc.)

A brief summarisation of marine electrical news of the last four weeks or so must necessarily include the completion of a large train ferry with electric propulsion for service in the Great Lakes of North America, the completion of reconstruction of a British cargo liner with a novel form of auxiliary electric propulsion, the proposal to build a small ferry boat with battery electric propulsion, and the attention of a large section of the marine community directed towards marine propulsion problems by a paper read by a representative of the General Electric Co. of Schenectady, N.Y., before the Institute of Marine Engineers. As a matter of fact, the problems associated with the electric propulsion of the largest of passenger liners are still continuing to excite a great deal of interest, and this interest is not of a purely academic type but rather of a definitely practical kind because it is gradually being realised that for large high speed passenger liners and for certain of the smaller liners there is a demand for electric propulsion. The "Virginia" and "California" in America and the "Viceroy of India" in this country are good advertisements for electric propulsion of this latter type of ship and although no one would attempt to justify electricity for this purpose on grounds of fuel economy alone (and this is the main point made, for example, for Diesel engine propulsion) its all round economy has been excellent.

The Question of Electric Mammoths.

While for the largest of passenger liner mammoths the question of electric propulsion seems to have for its justification Lord Kylsant's announcement that, when built, the new White Star mammoth would be an all-electric ship and for its confusion the fact that the highly successful record breaker "Bremen" is a steamer, there is very little doubt that electricity must receive very serious consideration in any large ship proposition which comes forward in the near future. But even those engineers who agree with this point are still undecided as to the relative merits of turbo-generators and Diesel-generators. The consensus of opinion would appear to be against Diesel-generators on the grounds of multiplicity of units and the unknown dangers of vibrations, coupled with a somewhat vague and unfounded fear of unreliability. Examined purely from a naval architectural and from a ship arrangement standpoint, there is much to recommend Diesel-electric propulsion, partly on grounds of weight but particularly on grounds of fuel weight saved. This, in a large ship, is an important business. One has stressed in a previous article the possibly superior flexibility which a Diesel-electric power plant gives. Unfortunately, everything of high power in Diesel-electric ships is theoretical, while much that is of high power in turbo-electric propulsion is practical.

Two of the largest electric ships at present afloat are the U.S. Aircraft Carriers "Lexington" and "Saratoga" which are designed for about 180 000 shaft horsepower, and this is important in view of the fact that these ships were designed about 12 years ago. In Italy an electric liner is under consideration with turbo-electric propulsion of 200 000 shaft horsepower. This ship is proposed to have four shafts, each turning at 250 revolutions and having water tube boilers generating steam at 500 lb. per sq. in. pressure and 750 deg. Fahr. superheat. The "Lexington" and her sister ship have a steam pressure of only 265 lb. per sq. in. and 50 deg. F. superheat, which incidentally serves to indicate the strides made in marine steam generation in the last ten years or so, and may well justify the thought now often expressed that in electricity steam will find a new channel and outlet in its battle for superiority with the marine Diesel engine.

Turning again to theoretical considerations we may note that there is also a proposed Diesel-electric proposition in Italy for about 150 000 shaft horsepower with 20 Diesel generator sets delivering power for propulsion to four shafts on each of which five motors are arranged, working in tandem. In Germany, the M.A.N. company, well-known as makers of Diesel engines, have a 180 000 shaft horsepower electric propulsion proposition with 16 generator sets arranged in novel fashion with the generators in groups in watertight compartments, while in Great Britain Messrs. Doxford have a 100 000 shaft horsepower arrangement, referred to already in these notes, in which there are 16 generator sets, each propelled by a two-cycle airless injection opposed piston engine. These proposals are not wildly theoretical and appear to indicate that when a shipowner wants high speed and high powered Diesel-electric propulsion, there it is ready for them. Meanwhile, it is interesting to remark that there are strong rumours of the P. and O. Company being in the market for two new electric liners of moderate size—of turbo-electric type. Turbo-electricity, one feels, will have a big future in ships of this size and class, but in the final analysis it boils down partly to a question of weight. Analysis shows, furthermore, that electric propulsion, when due consideration is taken of all the factors involved, is not as heavy as some of its detractors would have us believe. Not only is the weight of fuel oil required for electric ships less than that for full-powered steamers, but the weight per horsepower of the plant, including fuel for a round trip, is considerably less. In a recent paper read before the Institution of Naval Architects in Italy, a prominent Italian naval architect, General E. de Vito, well bears out this statement.

Considering a 100 000 shaft horsepower 26-knot ship of passenger liner type running between Naples and New York, he finds that a geared turbine ship with oil-fired water-tube boilers has a total machinery and fuel weight of 18 130 tons, a turbo-electric ship has a similar weight of only 16 880 tons, while a Diesel-electric layout weighs only 14 315 tons—a very considerable reduction due to the fact that only 8 515 tons of fuel have to be carried compared with 11 960 tons for both the direct steam-driven and the turbo-generator sets. As far as actual weights are concerned, the direct steam turbine drive weighs 6 250 tons, while the turbo-electric layout weighs only 5 000 tons. The Diesel-electric power plant is 800 tons heavier than the turbo-electric set, but what it gains in weight it loses in fuel consumption, which in the fast transatlantic liner, with a minimum time in port at each end, is very important indeed. It may be directly traced to the fact that both the direct steam and the turbo-electric ship burn 0·7 lb. of fuel per shaft horsepower per hour for all purposes, whereas the Diesel-electric ship uses only 0·5 lb. of fuel per shaft horsepower per hour. Even if Diesel oil is more expensive than fuel oil in some ports it is obvious that a shipowner has got to consider a Diesel-electric proposition very seriously.

Theory and Practice.

But he has so much theory to go on and very little practical information. One of the most useful contributions to contemporary marine electrical literature, therefore, from this latter point of view, was the paper which Mr. Eskil Berg prepared to be read before the Institute of Marine Engineers recently, and while it was far too optimistic and far too biased in favour of turbo-electricity to the entire exclusion of Diesel-electricity, it did justify its *raison d'être* if not its title "Electric Propulsion as Applied to Large Passenger Liners" by a detailed discussion of the operation of the first large American electric passenger liners, now operating on the New York-San Francisco service. Interested people will do well to study the paper in detail on this account only. Further practical operating data, this time of an American electric coastguard cutter operating in Arctic ice is also available, thanks to our American contemporary "Motorship," and because of the arduous service on which the ship (a Diesel-electric ship) is engaged it may be taken as a testimonial of the suitability of electric propulsion for unfailing operation under the most adverse of circumstances. The ship in question is the "Northland" (illustrated in the marine number of THE ELECTRICIAN, July 29th, 1927) a little ship of only 2 050 tons displacement and a waterline length of 200 ft., a beam of 39 ft., and a depth of 24 ft. 9 in. Everything on board (except cooking) is electrically operated, and the power source consists of two 600 H.P. four-cycle single-acting trunk piston Diesel engines, each coupled to a 410 kW generator set. The main propelling motor is a double armature 1 000 shaft horse-power unit and the vessel has a cruising radius of about 11 000 miles at 11 knots, and of 17 000 miles at 7½ knots. The vessel has now been in service about two years and when we examine her operating record and consider that but a few years ago electric propulsion was, comparatively speaking, non-existent, while to-day there are some 60 all-electric ships, we can form some appreciation of the possibilities in front of marine electricity.

ELECTRICAL COMMUNICATIONS.

Inaugural Address of I.E.E. President Reproduced Simultaneously before Local Centres by Conference Communication Service—Col. Purves Reviews Developments in Long-distance Telephony.

WHENEVER a President of the Institution of Electrical Engineers delivers an Inaugural Address the lecture theatre of the Institution building holds a large audience. Last Thursday, however, the President's audience was not restricted to that building, but included crowded gatherings at the local centres of the Institution at Manchester, Liverpool, Birmingham, Glasgow, Leeds, Newcastle, Cardiff, Southampton and Portsmouth. Transmitters and loud speakers were fitted at each place, so that speech from any point was reproduced at all other points. The occasion furnished a demonstration of an interesting innovation in the British trunk telephone service known as " conference communication." This facility, which is now available to the public, enables conferences and discussions to be carried on by joint participants assembled at several different places. In the course of Thursday's proceedings speakers at all the centres took part, and their speeches were clearly heard at all the other centres.

Colonel Purves's Address dealt with the subject of " Electrical Communications," and especially with the scientific developments which have made possible the recent remarkable extensions in the range of long-distance and international telephony.

Referring to the wonderful expansion of the range of telephony which has taken place since the last reference was made to the subject in Mr. Gill's Inaugural Address in 1922,* Col. Purves recalled that at that time the only places abroad with which a British telephone user could communicate were Paris and Brussels. To-day one could speak from any telephone in this country to nearly 90% of the telephone stations of the world.

At the present day the installation of full automatic telephoning systems was being pushed forward all over the world. The system specially evolved for the service of London was realising in practice the hopes that had been founded upon it. Twenty-one large exchanges with an aggregate capacity for about 132 000 lines had already been brought into service in London, in addition to the main junction switching-centre known as the " Mechanical Tandem " Exchange. The provision of 26 further exchanges, with capacity for about 125 000 lines, was now in hand and it was expected that equipment for about 50 000 lines would be added annually to the London automatic system until the conversion of the area, which at present had a total of about 650 000 working telephone stations, was completed and all the manual exchanges were removed.

In order to effect plant economies it was proposed to provide auxiliary automatic tandem switching-centres, and an automatic switching-centre for " Toll " circuits was also contemplated. It was anticipated that in seven years' time the number of automatic exchanges in the central London business area would have reached 100, leaving only five manual exchanges for subsequent conversion.

Exchange Developments.

In this country as a whole we now had 163 automatic exchanges in operation in urban areas, with an aggregate capacity of about 300 000 lines (say 500 000 stations), and the planning and construction of 126 further exchanges was at present in hand. The manual system remained in use at the present moment at 487 exchanges having a capacity exceeding 300 lines, and at 3 790 smaller exchanges, serving, in all, about 1½ million stations; and exchange equipment of the automatic type capable of serving about 100 000 lines was being installed annually. At the present rate of development, one new public exchange and about 1 000 new telephones were installed for each working day throughout the year.

Rural exchanges had, until quite recently, been entirely manual, but automatic equipment for exchanges serving small communities had now been designed on a basis which promised favourable economic results, and a start had been made in its installation. Up to the present, 60 such village automatic exchanges had been brought into operation, and about 110 more were in hand.

The telephone engineer had to steer the best possible course between over-provision of plant for the future on the one hand and under-provision on the other. For every 100 new stations joined up he found, on the average, that about 30 had gone out of service and that partially useless lines were thrown back upon his hands. Conditions affecting development were not particularly troublesome in the early days when exchanges were small and the lines consisted of open wires strung upon poles or overhouse fixtures, which could be supplemented or rearranged at small cost, but modern conditions had sadly reduced the element of flexibility. Exchanges were now immovably established in large special buildings, and the many thousands of lines radiating from them were embedded in cables carried beneath streets and roadways that could only be opened at great expense and inconvenience. The exercise of the utmost possible foresight in determining the primary quantities and lay-out of plant in a telephone area and all subsequent additions had thus become a *sine qua non*.

Value of Economic Studies.

If the annual increase in the number of telephone users in a section of the area, and the probable trend of the prices of money and materials, were known with approximate accuracy, one could calculate the " economic periods " for which ducts and cables should be provided, *i.e.*, the quantities which should be laid at one time in order that the " ultimate " development of the area would be provided for by the minimum aggregate expenditure. The ultimate period was taken as 30 years ahead in the case of exchange plant, and 20 years ahead in the case of underground plant, and the calculations were made on the basis of the " present value " of the annual charges for interest, depreciation and maintenance, that would apply to the plant if constructed in quantities designed to meet the requirements of various intermediate periods. The object aimed at was, of course, the substitution of scientific calculation for intelligent guesswork, and there was no question that the cost of elaborate development study was richly repaid to such telephone administrations as the Post Office, which sank new capital to the amount of about £10 000 000 annually in the provision of plant to meet its growing requirements, and which would expend very large sums ineffectively if rule-of-thumb methods were depended on.

The number of telephones in use in Great Britain was far smaller than it ought to be in a great commercial nation, and the same remark applied to the amount of use made of the telephones actually in service.

The position of this country among telephone users would not be improved merely by pouring more capital into the system. The additional interest and other annual charges thrown upon the accounts would soon convert the business into a losing one unless the public market for telephones and telephone service were at the same time correspondingly stimulated. It was only upon the estimated results of new salesmanship expedients that increased expenditure of capital could be judiciously regulated and the additional plant required be made available neither too soon nor too late. The system already carried and maintained the margin of spare plant required to meet continued development at the present rate of about 8½% cumulatively, per annum. This rate of increase was in itself a healthy one and compared well with progress in other countries, but it was not sufficient to enable Great Britain to retrieve its arrears of telephone development in a reasonable time.

A feature of communications engineering worthy of remark was the manner in which electrical considerations affecting the transmission line had advanced into prominence. Not very many years ago the indoor apparatus associated with telegraph and telephone systems was regarded as the complex subject, and as the main field for study and invention. The situation to-day was very different. Notwithstanding the wonderful development and performance of the apparatus of modern communication systems, it was overshadowed by the results of the attack which was now being made by research upon the properties with which the line, the transmitting medium and its adjuncts, might be endowed. All the weapons of the most advanced electrical and mathematical technique were being employed, and it might fairly be said that the contributions which the study of telephony had made to alternating current transmission theory were of first-class importance to

* " Journal I.E.E.," 1923, vol. 61, p. 1.

Digitized by Google

electrical science and practice in general. It was to the study of the ideal wave-transmission line, and to the efforts made to realise its qualities in practice, that we owed nation-wide telephony and the striking progress which had recently been made towards telephony of world-wide range.

Prof. Pupin was the first to show how the harvest of Heaviside's theorems might be reaped by the practical engineer; and the great advance in the telephone art represented by the addition of inductive loading to long-line circuits would always be associated with his name, as well as with the names of Campbell and others who followed him.

Effective Loading Requirements.

Effective loading called for a high degree of stability in the leakance of the line, and this factor necessarily varied considerably in the case of a wire carried on open insulators, especially if the climate was damp and variable. For this reason, and also for the reason that the policy of placing long trunk telephone circuits in underground cables was adopted in this country as soon as loading methods matured, the loading of open-wire routes had never been resorted to here, and it was now being generally abandoned elsewhere.

So far as underground cables were concerned, the introduction of loading immediately increased the practicable range of telephone communication to three or four times its former limits. Its application was, however, both costly and troublesome. At intervals of about 2 000 yd. an underground manhole chamber had to be substituted for a simple straight-through buried joint, in order to accommodate the sealed cast-iron pots in which the loading coils were fitted, and into and out of which the cables had to be led. Many hundreds of loading-coils had frequently to be accommodated in a single chamber.

One would rejoice to find it possible to supersede inductive loading by some less formidable means of reducing the attenuation and the various forms of distortion appearing in unloaded underground cables.

Methods by which this might eventually be accomplished by compensating devices at the ends of the cables, were appearing and coming into use, in the search for further improvements in the transmission line. Phase distortion due to the unequal speed of propagation of the various component frequencies making up the complex speech wave, which would be eliminated by perfect loading, could also be corrected by the introduction, at the terminals of the circuit, of artificial line networks in which inductance and capacity were so disposed that the propagation characteristics natural to the cable were reversed. The lower-frequency components which would arrive too soon, after passing over a cable in which the ratio of inductance to capacity was too small, might thus be retarded and stepped back into their original phase relationship with the higher frequencies which had travelled more slowly along the line.

Similarly the disproportionate attenuation to which the higher frequencies had been subjected in the cable might be corrected by linked terminal networks, so designed that the lower frequencies were over-attenuated and brought down approximately to their original proportions in the complex wave.

There remained the difficulty of compensating for attenuation as a whole, since the omission of loading-coils and the introduction of such devices as those already mentioned—all of which frittered away the energy of the speech wave—would have increased the attenuation factor of the circuit to 8 or 10 times that of the loaded cable line.

It might be thought that the energy loss could readily be made good by the almost unlimited possibilities of amplification now at our disposal; but in practice the amount of amplification that could be applied at any point in a telephone circuit was severely limited by the necessity for avoiding crosstalk between one circuit and another. It was necessary to pack hundreds of pairs of conductors closely together within the lead sheath of a single cable, and the problem of avoiding crosstalk, even at the ordinary energy levels of telephony, by maintaining symmetry of position and uniformity of electrical characteristics of all conductors throughout the length of a cable between repeater stations, was one which called for the greatest care and accuracy in manufacture.

It had been necessary also to devise an elaborate system of testing the resistances and various cross-capacities of all the pairs in each cable length after the cable was drawn into ducts, in order that pairs having high and low characteristics in each length, and successive groups of lengths, might be selected and matched together in such a way that variations in the manufacturing lengths could be made to cancel each other out as far as possible in the completed cable.

All that could be done at the successive amplifying points in a long line was to restore the energy to a level not much exceeding the energy output of the subscriber's telephone.

The answer to the frequent question whether amplifying and distortion-correcting devices had sounded the death-knell of inductive loading was decidedly in the negative, and it was clear that the art of cable manufacture would need to achieve another order of freedom from crosstalk, before an answer in the opposite sense could be given. This did not imply that telephone-cable design and manufacture were in any sense non-progressive. On the contrary, steady improvement was being made in the mechanical symmetry and electrical uniformity of the circuits and in the means of providing circuits for special purposes, as well as in the economics of production.

Apart from conductors and cables, as such, the study of the transmission line must be credited with a wonderful range of inventions designed solely from the standpoint of improving it as a transducer, and included strictly within the limits of the line quadruple.

A phenomenon which gave a good deal of trouble in connection with the first attempts to provide very long telephone cable circuits was the occurrence of electrical echoes. If the time of transit of the speech waves from the transmitting to the receiving end and back again by reflection exceeded about $\frac{1}{6}$ sec., the effect in the ear of the speaker was very confusing and might be rather disastrous to the intelligibility of the conversation. The effect was equally marked in the case of 4-wire circuits, although on such circuits the possibilities of lighter loading, with consequent increase in the speed of wave propagation, extended the distance that could be covered before the return of the reflected waves was retarded beyond the permissible time. It was at one time thought that such echoes would set a practical limit of about 1 000 miles to the length of cable circuit that could be used for telephony.

The difficulty was overcome by the invention of voice-operated echo suppressors applicable to the 4-wire circuit. These devices utilised a small derived portion of the speech current, passing on the active half of the double line, to energise delicate devices which temporarily blocked the inactive half against the return of reflected current.

In the suppressors first devised by the Post Office the blockage was effected by over-priming the grids of the repeater valves in the inactive line to an extent which put them temporarily out of action. In another type of suppressor, sensitive relays actuated by amplified speech currents were employed to produce an actual disconnection, or a short-circuit, of the inactive line. Both types were in practical use.

Use of the Repeater.

The use of the repeater on long circuits had now become universal throughout the telephone world. Among many refinements which have been developed in association with their use mention was made of devices for ensuring the constant energy-level of the amplified speech, independently of the level of speech incoming to the amplifier. In one such device the amplification was regulated by varying the impedance of a three-electrode valve, the requisite smoothness of control being obtained from a condenser and resistance combination. Thus low levels due to weak voices, or to faulty lines, could automatically be made good at the amplifiers, and unduly high levels toned down.

After paying tribute to the remarkably stimulating effect which Mr. Frank Gill's 1923 address exerted upon the development of European international telephony, and outlining the assistance rendered by the various co-operating nations and by the American Telephone and Telegraph Co., Col. Purves said it would be recollected that Mr. Gill strongly favoured the entrusting of international telephony in Europe to a single company, or in default of that, to a single organisation set up by the existing administrations to carry on the business as a separate entity. No doubt either of these plans would, from the standpoint of efficient working, have been superior to the present system since, even with the best will in the world, co-operation was but a poor substitute for unified control. The co-ordination of the international telephone system by a committee on which all the administrations were represented, on a basis of equality, was Mr. Gill's third alternative, and no doubt the one he loved the least, but it had proved to be the only one realisable in practice, and it could not be said to have been barren of results.

(To be concluded.)

The Farce "Light's Golden Jubilee."

[To the Editor.]

Sir,—The curtain came down on the above comedy on October 21st. After a long-drawn-out piece culminating in the biggest wireless "hook-up" (simultaneous broadcast) in history, the world has been well and truly impressed with the fact that the inventor of the electric lamp was an American.

We may regret that Sir Joseph Swan has not received general recognition, but I think that we, in this country, should be heartily ashamed of the manner in which this specious American boost has percolated to and influenced our own people. Of course the electrical industry has been aware of the real facts in this issue, and the technical Press has repeatedly dealt with the imposture. The I.E.E. made a dignified protest, but it was obviously far too mild and ineffective. Can the electrical people of this country be happy over this business? I do not think so.

There is another aspect—perhaps more serious. So far as I was aware, no steps were being taken to make our lay Press cognisant of the true facts of the October 21st ceremonies. Periodically the inspired news from the United States has been published without corrective comment. Here on Tyneside (the scene of Swan's labours) I therefore prepared a very brief account setting forth the authentic historical facts.

I sent these facts to five great British newspapers. *Not one of them accepted the facts.* The Jubilee reports from America came and were published without (so far as I know) any qualification.

This enlightening experiment (or lesson) cost me about one shilling—or rather, a quarter-dollar.—I am, etc.,

Experto Crede.

"Where *Is* That Battery?"

[To the Editor.]

Sir,—In your issue of August 30th I put forward the suggestion that a large prize would produce a valuable stimulus in the research for the much needed improvement in traction battery construction. This suggestion appears to have been completely ignored, and the discussion has apparently developed into an advocacy of various existing batteries and suggestions for improvements in vehicles. In regard to the first point, no one realises better than I the advantages of a well-made nickel-iron battery for traction work, yet, in spite of superb construction, this form of battery has its own peculiar disadvantages in regard to low energy efficiency, and high first cost, which make it sometimes a debatable point in the minds of unprejudiced engineers as to whether it possesses overwhelming advantages in commercial vehicle application.

Concerning Capt. Durtnall's attack on the apparently slothful attitude of vehicle manufacturers towards improved electrical gear and regeneration, I would like to point out that some ten years ago I was able to fit electrical vehicles with motors of considerably lower weight and greater efficiency than those even now commonly adopted. The machines had a motor weight of 360 lb., and propelled a gross load of 12 tons up any usual gradient, and gave an average speed on good roads of about 10 m.p.h. An electrical efficiency of 88% was established over a wide range of load and over-load. These machines were produced to the designs of Mr. L. Murphy for use on vehicles manufactured by Electricars, Ltd.

It was, however, found in point of fact, that the increased performance value, as against the usual motors having approximately double the weight, and about 4% less efficient, was only a matter of 2 or 3% useful ton miles per charge, and it is not surprising to find that although the original motors did their work well (and the majority of them are still in service), the commercial value of the improved performance was not sufficient to justify the production of special machines of this kind; and I believe I am right in stating that the type has since been discontinued in favour of heavier and slightly less efficient machines, which also cost considerably less to make.

In regard to regeneration, some very careful tests made on a specific vehicle show that on a practically flat road such as the Bath Road, in the early morning, with light wind and no traffic obstruction, a performance of 90 watt-hours per ton mile was possible. The same vehicle running on undulating roads, and with a fair amount of traffic obstruction; would consistently register 100 watt-hours per ton mile. While, therefore, not disputing the advantages to be obtained from regenerative braking, I would point out to Capt. Durtnall that all he can possibly save is a fraction of 10%, and if the scheme includes considerable increase in complication, weight, and possible loss of electrical efficiency in general operation it is quite probable that the effective gain will be nil.

Again reverting to the challenge that no progress has been made in this direction, I am at liberty to say that during the past five or six years I have been privileged to see the development of a system of regeneration which requires only one electrical unit for driving or regeneration and no complication of control, and this gives back to the battery a charge of approximately 70% of the total retardation energy at all useful speeds. It should, however, be clearly pointed out that the object of this regenerative braking system is not so much to save energy as to get a perfect system of control, together with economy in the wear of brake friction linings.

The ultimate ideal to aim for is that all internal city transport shall be conducted by "pure electric" vehicles, i.e., propelled solely by the stored energy of electric accumulators. This must, however, await the advent of an enormously improved type of cell in which specific output (capacity), durability, and cost are all better than we now know.

Meanwhile, in accord with evolutionary principles, it seems to me to be entirely logical to give careful attention to the possibilities of an intermediate type of automobile between the pure electric and the pure internal-combustion types.

If work now being done in this field proves that such a vehicle possesses the merits and commercial advantage anticipated, the type will survive and take us a few steps further. If not, the new type of vehicle will justly be forgotten.

But whatever the outcome of such experiments the question still remains: "Where *is* that battery?" Echo answers "where?"—I am, etc.,

Raymond J. Mitchell.

"Advertising for Electrical Contractors."

[To the Editor.]

Sir,—I hope you will allow me space to reply to the letter from Col. Vignoles in your issue of October 25th, in which he makes reference to a booklet produced by my company.

Col. Vignoles takes exception to the statement that electricity "may be either a treacherous or a trustworthy servant," but omits to add that the sentence goes on, "it all depends upon the way in which it is installed."

I take it that Col. Vignoles and his Council consider that electricity should always be represented as a trustworthy servant, never as treacherous. This, it seems to me, is a difficult line of argument to maintain in face of the great damage which is beyond doubt caused every year by inferior electrical installations. Moreover, if Col. Vignoles's view is the correct one, then there can be no possible logic in the existence of the National Register of Electrical Installation Contractors—an institution which is pledged to accept for members only those contractors who are beyond reproach in the matter of conscientious workmanship, and who can be counted upon to leave no dangerous installations behind them.

In particular, it is a matter of very much regret to me that Col. Vignoles should not have taken steps to see the booklet as a whole before condemning a part of it. The second page of this booklet is given up to the following:—

Versatility.

"Electricity is no longer merely a medium for the provision of light. If properly handled it can be adapted to almost any business or domestic service. Moreover, the idea that the liberal use of electricity is costly is a tradition passed down from the days of electrical pioneering. Figures disprove this myth to-day."

From this it will be seen that my company has deliberately made a present to the electrical industry as a whole of one valuable page containing no individual advertisement, and that in an eight-page booklet. If the E.D.A. could count upon one-eighth of every trade booklet being devoted to their interests, they would have cause to congratulate themselves.—I am, etc.,

for Thorpe and Bosco, Ltd.

"OUR HOUSE IN ORDER."

A Symposium of Electrical Installation Contractors' Views on Compulsory Registration, Wiring Rules and Inspection of Installations.

WE have received from contractors in various parts many interesting expressions of opinion on the points raised by Mr. T. C. Gilbert in his article "Our House in Order," published in THE ELECTRICIAN of October 18th. Some of these views were printed in our last issue, and a further selection from the many letters received is given below.

[TO THE EDITOR.]

SIR,—Mr. T. C. Gilbert's article in your issue of October 18th, under the heading "Our House in Order" is both amusing and interesting, and I hope will also prove valuable. I strongly agree with him that the problem of diminishing the quantity of dangerous and ignorant installation work requires more careful study throughout all branches of the industry than it is apparently receiving, and if such articles will lead to such study, please let us have more of them.

Mr. Gilbert, however, weaves a maze around himself and the issue, and then in effect says, "Look what a tangle we are in."

This is the amusing part, and I should not join in the discussion if it were not that my name and opinions are quoted frequently in his article; and more particularly that part of a 1928 report of the Executive Committee of the National Register is taken from its context and used by Mr. Gilbert to enmesh himself (and possibly others) more than ever; whereas, properly understood, it would have the opposite effect.

The point under consideration on the Report was the setting up or adoption *by the Register of compulsory wiring regulations for Registered Contractors* and Mr. Gilbert quotes the wording correctly that the "Executive Committee are still of the opinion that the time has not yet arrived for making compulsory a set of such regulations." Mr. Gilbert construes these words in a report of a Committee to the National Registration Board into an official pronouncement that the Register is opposed to the *setting up by legislation of a compulsory code of wiring rules for all installation contractors, registered or otherwise.*

So far from this being the fact, I can say that no such statement has been made; and although I have no authority to speak officially for the National Register, I will venture to prophesy that a very large percentage of those conducting its work would support, with every means in their power, the establishment by law of a compulsory wiring code.

Mr. Gilbert's subsequent reference to the "Crime Sheet" set up under the 1929 report of the National Register should alone be sufficient to show that he is entirely misleading himself in his deduction from the words quoted from the 1928 report.

Divergence Practically Non-existent.

Into the intricacies evolved from the (apparent) divergence of view of Mr. Munro, Mr. Shaw, the E.C.A., the N.R.E.I.C. and myself, I do not propose to follow Mr. Gilbert, beyond saying that the divergence is practically non-existent; we all want the same thing and with very minor differences which can very easily be disposed of, it will be found on discussion that we are all agreed on the means of attaining them.

If Mr. Gilbert is determined to be convinced, and to convince others, that we are all mutually opposed and pulling in opposite directions, he will do nothing to help the industry. But if, as I feel sure, he is only endeavouring to make all those concerned *think* on a subject urgently needing their study and consideration, then I can only offer him my congratulations on his amusing tangle of deductions, and my thanks for his timely assistance.—I am, etc.,

H. J. CASH.

London, S.W.1.
October 23rd.

[TO THE EDITOR.]

SIR,—Mr. T. C. Gilbert's article in your October 18th issue is most opportune, and an excellent contribution to the campaign for compulsory registration for which I have been fighting during the past two years or so.

Mr. Gilbert says "My own conclusions are that registration is imperative, without regulations if possible, if not, then with regulations."

In a letter to the "Electrical Contractor," for October, I said, "It appears to me that the supporters of compulsory registration and the other supporters of a compulsory code have the same ultimate object in view."

Whilst I am a firm believer in the abolute necessity for compulsory registration, I don't care which way it comes, whether with or without a compulsory code of rules or wiring regulations.

The general issue now appears to have spread over a much wider field, hence we have not only compulsory rules looming large on the horizon, but the "bogey"—to some people—of inspection. Is it not a fact that we have both compulsory rules and inspection at the present time? Isn't every reasonable sized job carried out to-day to compulsory rules laid down in the specification, and haven't we got inspection before the job is passed?

Inspection of Installations.

Are not many municipalities enforcing certain wiring rules set up, either by themselves or in conjunction with a committee of representative contractors, and don't these supply authorities inspect the installations before connecting up to the supply, and refuse to connect under certain conditions, which are justifiable in the public interest?

I am prepared to say that a standard code of wiring rules, acknowledged and agreed to by all supply authorities, would be better than the chaotic conditions prevailing at present, where every authority appears to have different rules, and contractors are working to different regulations on installations only a few yards apart, where the boundaries of authorities meet.

Some authorities say the fuseboards must only be single pole, with a common busbar on the installations connected to their mains, whilst others say all fuseboards must be double pole. Some authorities insist on a d.p. switch and fuses to control the supply at point of entry, whilst others say a switch and single pole fuse on the live side is sufficient. Some authorities want nothing but stranded wires, whereas single wires are quite permissible in other cases, and, of course, are allowed by the I.E.E. Rules. Others say that nothing less than 7/044 shall be used for a heating or radiator plug circuit, whereas a 7/029 will safely carry 18 A according to I.E.E. Rules, and, of course, is plenty large enough for a 3 kW radiator.

These local "compulsory" rules are worked to by the contractors in their respective areas, but a national code, agreed upon by the I.M.E.A. and accepted by all supply authorities, would be preferable.

But whether we still flounder on with "local compulsory" rules or have a national code, inspection will be necessary; otherwise the "shoddy" man will still carry on his nefarious and dangerous work.

Inspection to-day, on ordinary jobs, appears to be of two classes, that is, the inspection of installations which have been obtained and carried out by contractors, as distinct from those let to a contractor to a definite specification. In some cases the supply authority takes a test between poles, and between each pole and earth, and if "clear" puts the fuses in and leaves the job, whilst another authority will go to the trouble of seeing every wired point in the building, to see if shockproof holders and switches are fitted in "earthed" rooms such as cellars, etc., and bathrooms. They will also check the size of the fuseboards with the number of points wired, and in the case of a metal sheathed system of wiring, will test for "earth" continuity from the furthest point wired in the building. They will also test every switch on the installation to see that it is correctly wired up on the "live" side, examine the main earth connection, etc.

Is this kind of inspection objected to by reputable firms, and is it such a "nightmare" to those objectors to inspection that they don't approve of it? Personally, I have no objection to it, and have found that this kind of inspection is beneficial to the good class contractor, and very objectionable and detrimental to the "jerry" man. Further, how else can it be assured that jobs which are supposed to be carried out to a definite specification have been so done? There are innumerable instances where materials other than, and inferior to those specified, have been installed on contracts by firms who have got the jobs at cut prices, and then adopted such measures as mentioned, in an endeavour to make a profit. If there was no inspection these things would not be found out, and the result would be that there would be more price-cutting, more inferior jobs and less chance of the honest contractor getting work.

Digitized by Google

Mr. Gilbert gives opinions of many leading contractors, especially past-presidents of the E.C.A., and now, in the current issue of the "Electrical Review" we have the opinion of Mr. Willoughby Ellis, our present president, who says, "The whole electrical industry, from top to bottom, must set its face resolutely against shoddy installations and shoddy equipment." This is exactly what I have been preaching for some time, and is directly in support of Mr. Gilbert, only that Mr. Ellis thinks that the object will be achieved by the adoption of compulsory rules, without an army of inspectors, which also appears to be the opinion of Mr. Cash.

A Compulsory Rule Weakness.

Mr. Ellis unwittingly gives away the weakness of a compulsory code of wiring rules when he says "All the compulsory rules in Christendom will not prevent the shoddy worker executing his shoddy work, but such compulsory rules, representing the electrical law of the land, would bring the fake installation man within the grip of the law," etc. Exactly, but isn't this putting the cart before the horse? Compulsory registration *would prevent* the shoddy worker from doing any shoddy work, because he would be breaking the law by attempting it, if compulsory registration were the law of the land.

The voluntary National Register has done much to raise the status of the contracting industry, compulsory registration would be a thousand times better, and one wonders if, again in the words of the present president of the E.C.A., "Some such legal control of installation work must be instituted in this country in the near future," it cannot best be attained in the shortest possible time by all parties who are interested getting together and working for the compulsory registration of electrical contractors, with the compulsory code of wiring rules to be adhered to.

It is evident there are many and varied opinions on these matters at the moment, but what an interesting subject for discussion at I.E.E. meetings and E.C.A. meetings all over the country, and how enlightening it would be to have a national ballot of all members of the I.E.E., the E.C.A., the R.I.B.A. and I.M.E.A. on the following points, with definite answers to each question, either "Yes" or "No."

(1) Are you in favour of the compulsory registration of electrical contractors?

(2) Are you in favour of a national code of wiring rules to be adopted by all supply authorities?

(3) Do you consider a system of inspection is necessary and essential in connection with installations, for the protection of the public?

(4) Do you think compulsory registration is more important than wiring rules or inspection?

Although many of us think differently and have varied ideas, it is also evident that what we are all aiming for is vastly improved conditions in the contracting industry; not only conditions that will materially benefit the legitimate contractor in carrying on his business and protect him from the incompetent and shoddy wiring competitor, but conditions that will also help the whole industry in this age of rapid electrical development, and will effectively and safely harness this great power which is now being placed at the disposal of millions of the population, who must of necessity rely on the skill and judgment of those intermediaries, the electrical contractors, to see that this great agency shall be a willing, ever-ready convenient ally, instead of a dangerous destroying enemy, spreading fire, disaster and death in its trail.

"Our House in Order." Yes, it is very desirable, but the electrical contracting house will never be put in order under the present conditions. The longer the delay the more deeply the rot will have set in, but compulsory registration would be a powerful antidote and germ killer, preserving that which is now good but destroying that which is causing pain and decay in what should be a healthy body.—I am, etc.,

HARRY MOSS.

Bradford.
October 21st.

[TO THE EDITOR.]

SIR,—It was with the greatest pleasure and interest that I read Mr. Gilbert's article "Our House in Order" in THE ELECTRICIAN dated October 18th.

We certainly do hear a good deal to-day about bringing electricity into all country places, villages, farms and cottages, but what is the use of an elaborate grid system when so many country people are afraid to use electricity? They have their newspapers and have read of seventeen fires at large country houses having occurred already this year. One of these, which occurred in my own county, is still fresh in their minds. These may not have been caused by defective electrical installations, but we all know how ready the lay Press is, where the cause of a fire is unknown, to jump to the conclusion that the outbreak was caused by "the fusing of an electric wire." It is high time the minds of these prospective consumers were set at rest by the assurance that electricity, properly installed by responsible contractors, is the safest form of lighting and heating, and that only responsible contractors would be allowed to do the work.

Instead of this, immediately the cables appear in a district the village blacksmith, plumber and garage proprietor get busy canvassing for wiring contracts; work which they know very little or nothing about. Take the case of the miner or the factory worker. Whilst at work he is protected by a thoughtful Government against injury from inefficient electrical wiring and apparatus, but upon his return home he is too often exposed to the death traps left by the cheap, inefficient or unscrupulous electrical contractor, or the handy man who has done the work in his spare time. Mr. H. Moss has done excellent work in exposing the dangers of shoddy work. How much longer is this state of affairs going to be tolerated by Government? Mr. Gilbert does not exaggerate the situation when he says "the installation side of our industry is shot through with inefficiency and incompetency."

What is the remedy for all this? As pointed out by Mr. Gilbert, there are really two suggestions, viz., compulsory wiring regulations, with or without inspection; and registration; both of which have their own following. After the ground has been so ably covered by Mr. Gilbert there is little left for me to say beyond offering him my feeble support.

Suppose the compulsory regulations idea was an accomplished fact, how would it work? How would the regulations be made *compulsory*? Would every firm of reputable contractors, as well as the cheap jerry contractor, the plumtrician, the smithtrician, the garagetrician, the curbstoner, and the sparetimer, all be put on their honour to adhere to the regulations? If they could not be trusted, and I venture to suggest there may be a few here and there who could *not* be, then it would seem that their work *must* be inspected to compel them to observe the regulations. To avoid invidious distinctions being made, this would mean that all work would have to be inspected. Is it not also possible that some of the people towards the end of my category would be in blissful ignorance of the existence of any regulations, just as to-day they have never heard of the I.E.E. wiring rules?

If it is proved that inspection would be necessary, what form would it take, and who would be responsible for it? Corporations may make a superficial inspection, even going so far as to pay a visit whilst the work is in progress, but can we reasonably expect other supply authorities who have to pay a dividend to their shareholders to make more than the usual insulation test? But, surely, such inspection would not satisfy anyone that any code of rules has been observed unless such rules are so simple as to be useless.

Cost of Inspection.

As I have said elsewhere, a man who is out to do cheap shoddy work will take good care to hide it before the inspector comes. Inspection, to be thorough, and it must be thorough to ensure that regulations are complied with, would require an inspector at the elbow of every wireman all the time to see that the ends of all tubes are rhymered, that all threads are of sufficient length, that no cables are kinked or insulation damaged whilst drawing in, etc. This is, of course, ridiculous, for who is to pay this great army of inspectors?

Again, suppose a contractor were found evading the regulations on a job, what happens? The worst is that he would have to pull out part or even the whole of the work on that particular job and do it again properly. But is it not worth while for the jerry worker to risk detection? The chances are a hundred to one he will get away with it. So much for the contractor's work which is to be connected to the mains. But what about private plant work? Is the country house wired for 110 V immune from danger? If not, who will see that the regulations are observed? Take the case of work done by supply authorities. Who is to inspect their work? Are they to do it themselves? Would they always be above suspicion when in competition with contractors?

At home I am accused of being "obstinate." Perhaps I am. (I notice that the same trait when appearing in the fair sex is called "strong will.") This perhaps accounts for my blindness in failing to see the "illogical" position of

Digitized by Google

Mr. Gilbert and myself, and the blessings which compulsory regulations would bestow all round. I am very sorry I cannot agree in this matter with some of our leaders, for whom I have the greatest respect.

Let us now consider the registration side of the question. There appear to be two camps of opinion again here. Some are in favour of the voluntary register system, which we now have, and others, like Mr. Gilbert and myself, are pressing for the compulsory registration of all contractors before they are allowed to touch any cable over 16 V.

The present voluntary Register is useful as forming the nucleus of a compulsory register and to show the powers that be that there are already a goodly number of competent electrical contractors in the country to allow fair competition and to safeguard the public from a few monopolists. I look upon the voluntary Register, not as an end to which we are aiming, but as one of the means to achieve that end. It is very nice for those contractors who are in the habit of getting Corporation work in the towns and cities where the engineer is in favour of registration, but what about all the other private work and the other corporations and public bodies who are not interested in the Register?

My own town, for instance, disregards the Register, and the Corporation gives its work to members of E.C.A. What guarantee of a really good sound job has the man in the street who does give his work to a voluntary registered contractor?

Mr. Gilbert refers to the power possessed by the N.R.E.I.C. to remove a contractor's name from the Register and also to the list of nine "Thou shalt not's" (known by my staff as "the Electrician's Commandments") to which might be added a tenth, "Thou shalt not be found out," the commission of either or any of which will be sufficient to hurl the miserable offender into outer darkness.

During this month I was called into a place which was wired by a registered contractor within the last four or five years. A gas pipe had melted and the gas ignited. An inspection revealed that the place had been wired with v.i.r., some of which was C.M.A. Non-Association grade and the remainder, with no name on the braid, suggested doubtful origin and poor quality. C.j. tube had been used with screw grip fittings, but the enamel had been left on the ends of the tubes and the grip screws left loose. The ends of the tubes were sharp and there were no bushes, which suggested the cables were probably damaged whilst being drawn in.

At all events, two cables were burnt through and the insulation on another was burnt off for a distance of about five inches when I was called in. In several cases the tubes were lying on the gas pipes and the leaking electricity, for want of a better earth than the tubing of its own system, which from the foregoing remarks will be seen to have had no continuity to earth, "went for" its deadly rival, the gas pipe. Had this occurred during the night one shudders to think of the consequences, but fortunately it was daytime and a smell of burning was instantly detected and smoke was seen rising from the floorboards.

"Who Cares?"

Deplorable as this is, will the offending firm be cast into outer darkness? I think not. Even if their name were struck off the voluntary Register would it do them much harm? It might be rather serious for them if they were in the habit of receiving lucrative work from one of the Corporations who only employ registered contractors, but if not, why should they worry? Who cares besides the few Corporations I have referred to? Perhaps a few consulting engineers and a still smaller number of architects, and no one else. How many architects are interested in the N.R.E.I.C.? Perhaps they have had a circular or two about it which, for lack of interest, have been consigned to the waste paper basket, and the very existence of the Register forgotten.

The great general public, the householder, the shop keeper, house and estate agent, churches and chapels, brewery companies (with their numerous public houses), know nothing of a voluntary Register, much less whether a contractor's name has been struck off, or if it has ever been on.

These are the people that give out the bulk of the work and who are likely in their innocence to accept the lowest tender for electrical work. These are the people that Government should protect from damage to themselves and their property. Whilst the present state of things exists how can a contractor in any but the favoured towns be expected to fall over himself in his anxiety to be registered? What has he to gain? May I suggest to Mr. Gilbert that it appears to me that it is putting the cart before the horse seriously to expect 75% of the reputable contractors to subscribe to this voluntary Register, until they are forced into it by public opinion and legislation.

The Only Cure.

Finally, what about compulsory registration. In the face of what has been said to the contrary, I still maintain that the only cure for the evil is for every electrical contractor to be compulsorily registered in the same way as doctors, dispensing chemists, etc., and I fail to see that it is putting the cart before the horse to consider this without first having a compulsory wiring code. I have yet to learn that a doctor has to write his prescriptions or perform operations according to rule. Before he can practice he must satisfy the British Medical Association that he has the training, and that he is in the possession of the knowledge, judgment and discretion necessary for his life's work.

So should the would-be electrical contractor be compelled to satisfy a registration body that he too has had the training. If we had such a compulsory Register, every contractor would be compelled to apply for registration within a given time, and those who could not satisfy the registration authorities would automatically drop out of the business.

There are, as pointed out by Mr. Gilbert, frequently cases where any hard and fast code of rules would not only be undesirable but impracticable, not only in our calling, but also in that of the doctors. As Mr. Gilbert says, we want brains rather than rules. It would then be up to the contractors to use their knowledge, discretion and brains to ensure that their clients were not exposed to the dangers of shock or burns, loss of life or property.

In the event of this, he, like a doctor who offends, would be hauled before his registration authority to show cause why his name should not be struck off the Register and himself driven out of business. I still maintain that herein lies the way out of our difficulties, and thus, and thus only, can the industry be raised to a proper standard.—I am, etc.,

EDGAR R. MORRIS.

Chesterfield,
October 22nd.

[TO THE EDITOR.]

SIR,—Mr. Gilbert says, "The incompetent and half-trained contractor will, of course, always carry on his nefarious trade until he is forcibly prevented from doing so," and it appears to me the sooner he is put out of action the better for the industry. All I said during my presidency of the E.C.A. was with a view to getting a better standard of work all through.

Mr. Gilbert says "The only standard demanded for registration should be knowledge." I agree there should be knowledge first, and that knowledge should be put into practice and religiously carried out. I have always advocated a national code of rules and standard for materials to be used, so that all contractors would be put on one footing when tendering for work where there is no specification.

We all know that at the present time one contractor may be tendering for good quality English cable and English-made fittings and accessories, and be in competition with another contractor who is tendering for the cheapest foreign wire and cable and cheap continental fittings. Surely a standard is required so that the purchaser may know what he is getting.

Mr. Gilbert makes a great point of inspection. All supply authorities do, or should, inspect work before this is coupled to their mains. They do not and cannot be expected to accept responsibility for this, but I do very strongly suggest that floor boards should always be left so that an inspector can see that the wiring under the floors is what it should be. This would not be a difficult matter in an ordinary sized house. I also suggest that it should be compulsory that floor boards over the wire should be screwed down and not nailed.

Should a national code of rules be adopted—I.E.E. or some other—the engineers in various supply authorities would no doubt interpret some of the rules differently, and this might lead to a little confusion unless means were found to deal with it. This could be got over by small local committees such as we have at present for other purposes.

With respect to the National Register, we must remember that Rome was not built in a day. The National Register is only young and feeling its way, but those who are behind the scenes know that the National Register is doing a great service.—I am, etc.,

W. A. SHAW.

NEWS IN BRIEF.

Camouflaged Telephone Wires—Scottish Farmers want Cheaper Telephones—Irish Workhouse Lighting—The Projected New Transatlantic Telephone Cable.

HIRED cookers connected by Manchester electricity department during August numbered 56, making the total on circuit 5 524.

On October 23rd Lt.-Col. W. A. Vignoles, director of the British Electrical Development Association, addressed members of the Advertising Club of Ulster on "Electrical Development."

The next meeting of the Physical Society will be held at 5 p.m. on November 8th, at the Imperial College of Science, Imperial Institute Road, South Kensington, London, S.W.7, when a lecture will be delivered by Prof. Sir C. V. Raman, F.R.S., on "Diamagnetism and Molecular Structure."

A sub-station is being built for Bradford electricity department, at a cost of £2 672.

Armagh Electricity Committee has recommended that steps be taken to have the workhouse premises wired and supplied by electricity.

"Pictures by wireless and television" was the subject of a lecture by Mr. L. A. Sayce, at Armstrong College, Newcastle, on October 23rd.

Cardiff Electricity Committee has decided to arrange for the floodlighting of the Welsh National War Memorial in Cathays Park and of the City Hall on the night of Armistice Day and on other special occasions.

The Standing Committee appointed under the Merchandise Marks Act, 1926, will, at some date, hold an inquiry as to whether lattice reinforcements and stirrups of iron and steel for concrete construction, should bear an indication of origin.

A meeting of the Institute of Wireless Technology will take place at the Engineers' Club, London, on November 11th, at 7 p.m., when Mr. Noel D. Cumming will deliver a lecture entitled "The Maintenance of a Modern Broadcast Station."

The Postmaster-General has authorised the use of bright green insulating covering on the overhead telephone wires in the New Forest area, so that they will harmonise with the surrounding scenery. It is not usual, however, for telephone wires to be insulated, and the uninsulated wires are not to be coloured.

A deputation from the National Farmers' Union of Scotland urged upon the Postmaster-General (Mr. Lees-Smith) last week that there should be one flat rate for telephone service within a radius of three miles. They also thought the revenue should be mainly or entirely from calls, and that the extension of the telephone was retarded by its cost in annual rent.

Mr. E. C. Lennox, of the Newcastle-upon-Tyne Electric Supply Co., lectured to the students of the Domestic Science College in the company's lecture theatre, Carliol House, Newcastle, on October 22nd on the history and development of electricity. This was the first of a course of lectures arranged by Miss Bright, principal of the College, under the auspices of the E.D.A.

Applications are invited for the following appointments: Electrical engineer, for the Public Works Department of the Government of Nigeria. Applications to Crown Agents for the Colonies (Ref. M./1 252); Assistant mains engineer in Bexley electricity department; Full-time lecturer in electrical engineering section of engineering department at Halifax Municipal Technical College; Mains assistant in York Corporation electricity department.

With the installing of a new electric grab, the West Sleekburn pit is now one of the best electrically equipped pits in the North.

Derry Board of Guardians received five tenders for an electric light installation in the workhouse. The prices ranged from £309 to £468, and the lowest, that of a Derry firm, was accepted.

The ocean bed off the coast of Mayo is being tested by engineers of the American Telephone and Telegraph Co., in preparation for the new Atlantic telephone cable. The chief aim of the tests is to disclose deposits of iron ore which, if they exist in any considerable quantity, would seriously interfere with the working of the cable. Several lengths of test cable have been laid experimentally.

Belfast T.C. has placed a contract for the erection of a sub-station at Lisburn Road, at a cost of £1 350.

The contract for the building of the north regional broadcasting station at Moorside Edge, near Huddersfield, was signed by the B.B.C. last week.

A meeting of the Mersey and North Wales (Liverpool) Centre of the I.E.E. will be held on November 4th, at 7 p.m., at the Liverpool University, when a paper by Messrs. Johnstone Wright and C. W Marshall, entitled "The Construction of the Grid Transmission System in Great Britain" will be read.

A Japanese contemporary refers to a method adopted by the Japanese Railway Department for abating smoke in long tunnels. An electric fan with a diameter of 12 ft. is provided in the entrance of the Kobotoke tunnel, and this causes the smoke to pass between the train roof and the top of the arch.

Opening a wireless exhibition in Dublin last week, Mr. M. R. Heffernan, Parliamentary Secretary to the Irish Free State Department of Posts and Telegraphs, said the Department thought the most suitable method of extension of the broadcasting service was a high power station which would give the major portion of the country crystal reception. They had to satisfy the powers that be that the increased revenue would defray the capital charges.

Mr. A. D. Phillips, manager of the Derbyshire and Notts Electric Power Co., in opening an electrical exhibition at the Worksop Town Hall on Monday, referred to the allegation that electricity is out to spoil the beauty of the countryside. Overhead lines, he said, could be made to look quite well. The opposition was delaying development, and increasing the cost, which must be reflected in the charges to the consumer. The exhibition was organised by the Electrical Development Association Local Circle in conjunction with the electricity department of Worksop U.D.C.

The National Federated Electrical Association calls attention to the fact that a 5% increase in wages was granted to men engaged in the electrical industry on May 1st, 1929, for a period of six months; that this period of six months terminated with the last pay day in October, for the period covered by that day pay, and that the Declaration of Wages recently circulated indicated that the present rate of pay would terminate on such date. The Association now announces that it has been agreed to continue the increase, pending further negotiations, and the present rate, therefore (1s. 10½d.) will remain in operation until further notice.

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN, *dated November 1st, 1879, recorded that:*

Prof. Loomis, of West Virginia, claimed to have demonstrated "that at certain elevations there is a natural electric current, by taking advantage of which telegraphic signals may be sent without the use of wires."

* * *

TWENTY-FIVE years ago, according to THE ELECTRICIAN *dated November 4th, 1904:*

The Indian Government made unsuccessful attempts to establish wireless telegraphic communication between Diamond Island and Amherst, a distance of 212 miles.

Plant at the new power station at Stoke-on-Trent included two Willans three-crank engines direct-coupled to Dick-Kerr multipolar dynamos, with an aggregate capacity of 300 kW.

* * *

FIFTEEN years ago it was reported in THE ELECTRICIAN, *dated October 30th, 1914, that:*

Electric battery 'buses were coming into use, following favourable reports from Mr. Birkett on the operation of these vehicles.

A Glasgow builder proposed to erect a number of all-electric houses without chimneys or fireplaces.

* * *

TEN years ago THE ELECTRICIAN, *of October 31st, 1919, stated that:*

Mr. Andrew Rae Duncan had been appointed Controller of Coal Mines.

The Anglo-Belgian telephone service was inaugurated.

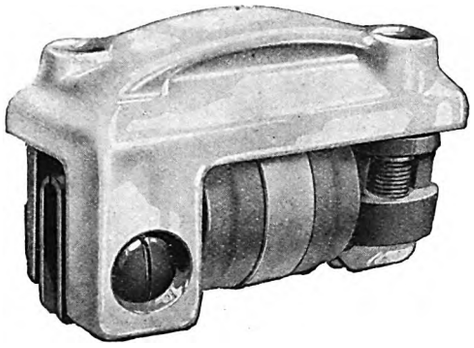
A NEW FUSE.

A NEW cartridge fuse has recently been put on the market by Messrs. W. T. Henley's Telegraph Works, Ltd., which provides a satisfactory protective device against the effects of short-circuits and heavy overloads on distribution systems. These fuses operate at 2·6 times the working current within 30 minutes, whilst they are so designed that they will not blow with twice the working current. One advantage of these new fuses is that, being interchangeable with the standard link fittings in " Henley " underground disconnecting boxes, they can be inserted, if desired, in existing installations, where these boxes were used. Their construction is interesting, both mechanically and electrically. The fuse consists of a barrel-shaped cartridge with U-shaped brass spring contacts projecting at each end. The unit is held in a specially designed carrier by screws passing through the U-shaped contacts, which also secure the wedge clamping device. It is a simple matter to fit a spare cartridge fuse to the porcelain carrier when a fuse has operated, there being no need to discard the porcelain carrier (see illustration). In order to tighten the spring contacts the wedge-shaped pieces are screwed down, using an insulated screwdriver which has been specially designed for this purpose. The range of sizes includes fuses for working currents from 60 to 300 A and for use in disconnecting boxes taking up to 0·15 sq. in. and 0·30 sq. in. conductor cables.



The new "Henley" cartridge fuse.

Tests carried out by Henley's Research Laboratories with fuses for working currents of from 60 A to 300 A showed that at full working current the maximum air temperature inside the box does not exceed 40 deg. C, while as a short-circuit test three 200 A fuses were subjected to a 500 V short-circuit test, and in all cases the fuses cleared the circuit satisfactorily. The circuit resistance was adjusted for a maximum current of 5 000 A, but the actual currents recorded on an oscillograph were 3 260, 3 080 and 3 120 A. Three 200 A and two 300 A fuses were tested connected to an accumulator of 3 000 A capacity, the pressure being 554 V. The resistance of the circuit was adjusted to limit the current to 5 000 A. Each fuse cleared the circuit satisfactorily.

A number of 100 A fuses were tested singly by the Manchester Corporation Testing Laboratories at 500 V d.c. and the estimated maximum short-circuit current available was 4 500 A the circuit being cleared quietly in each case. Other specimens tested by the Westminster Electric Supply Corporation gave a satisfactory performance under most severe testing conditions. A circuit was taken from the l.t. d.c. bars through a circuit-breaker set to break at 1 800 A with a 15 sec. time lag. The current was switched on by first closing the circuit-breaker and then dead shorting the circuit by means of a non-automatic switch. The fuses were mounted in a 4-core 0·15 sq. in. disconnecting box, the case of which was earthed. On closing the circuit the fuses operated satisfactorily and the circuit-breaker remained unopened. A further interesting short-circuit test, carried out by the Kensington and Knightsbridge Electric Lighting Co., consisted of connecting a specimen 300 A size fuse direct to a 210-240 V 6-700 Ah battery without resistance in the circuit. The fuse cleared this heavy short circuit load satisfactorily without leaving any visible evidence of the test to which it had been subjected.

At a meeting held in the Grand Central Hotel, Belfast, on October 22nd, it was decided to form an area committee of the Electrical Development Association for Northern Ireland. Mr. Charles V. Hill presided, and an address was given by Lieut.-Colonel W. A. Vignoles. A lengthy discussion followed, after which it was decided, on the motion of Mr. F. H. Whysall, seconded by Mr. E. Fawthorpe, to form such a committee, and also that Mr. Whysall should be its chairman.

PERSONAL.

MESSRS. J. Neale and C. L. Clutterbuck have resigned from the board of Radiovisor (Parent), Ltd.

Mr. C. L. Faunthorpe, for 26 years mains assistant in Blackburn Corporation Electricity Department, has retired.

Mr. W. G. Davies, sales director of Graham Amplion, Ltd., has been appointed joint managing director of the company.

Mr. H. W. Laing, of Lytham St. Annes Tramways Department, has tendered his resignation after 23 years as general manager.

The Roosevelt Medal for Distinguished Service has been awarded, on his 55th birthday, to Mr. Owen D. Young, chairman of the General Electric Co., of America.

Capt. H. de A. Donisthorpe, of the General Electric Co., Ltd., broadcast a talk on " The Evolution of the Wireless Valve, " from the Dublin station on Wednesday.

One of the employees of the Automatic Telephone Co., Ltd., Mr. Arthur Hankey, has been raised to the aldermanic bench of Bootle T.C. He is already a Justice of the Peace.

The marriage of Mr. H. A. C. Ridsdale, who is on the electrical staff of the Synthetic Ammonia and Nitrates, Ltd., and Miss M. G. Wyman was solemnised at Gloucester last month.

Estate of the gross value of £53 043, with net personalty £45 345, was left by the late Sir Somerset Richard French, at one time manager of the Rhodesian Telegraph Service and of the African Trans-Continental Telegraph Co., who died aged 80 years.

Mr. J. Herbert Edwards, managing director of the Western Electricity Supply Co., Ltd., and associated companies, who is retiring from active management in favour of other appointments, has been presented by the staff with a telescope and an illuminated address.

Miss Freda Nayler, daughter of Mr. G. F. Nayler, chief engineer of the Nelson Corporation Electricity Department, winner of the silver rose bowl at Blackpool Musical Festival, is one of the principals in a production by the Burnley Amateur Operatic Society.

Estate of the gross value of £4 881, with personalty nil, was left by the late Mr. Henry John Sutherland Mackay, managing director of the Stirling Boiler Co., Ltd., and a vice-president of the Batti Wallahs' Society, who died on June 19th last, aged 57 years.

Mr. Alfred H. Morton, commercial manager of R. C. A. Communications, Inc., has been appointed European manager of the Radio Corporation of America and is expected to sail for Europe this month. Mr. Morton was formerly with the General Electric Co., of America.

Mr. Kunihiko Iwatare, chairman of the Nippon Electric Co., has made a donation to the Japanese Institute of Electrical Engineers of a sum amounting to half a million yen. The interest accruing from the principal is to be used for " the purpose of international exchange of knowledge of electrical science and art."

Fifty-three Glasgow Municipal Tramway employees were honoured by the Tramways Committee at a function in the Govan tramways depôt on October 14th. Among those recognised was Mr. Lachlan MacKinnon, the general manager, who is the oldest tramway employee in the city, having completed 43 years service. He was the first boy employed by the old tramways company which preceded the municipal department.

Mr. S. H. Fowles, engineer and manager of the Ilkley Electricity Department, has been recommended, out of 117 applicants, for the post of borough electrical engineer and manager at Loughborough, in succession to Mr. G. J. Hollyer, who has been appointed to Torquay. Mr. Fowles was on the short list two years ago when Mr. Hollyer was appointed to Loughborough.

Many of our readers will be glad to know that Mr. P. P. Wheelwright, until recently engineer and manager of the Blackburn Corporation Electricity Department, who has been ill and confined to bed, is now reasonably well, and about again. Since leaving Blackburn Mr. Wheelwright, in addition to receiving some personal gifts from members of his staff, has been the recipient of a handsome gold cigarette case from the members of the staff and workmen of the Blackburn Corporation Electricity Department as a token of their esteem.

Obituary.

MR. ALFRED BAKER, on October 25th. He was for 24 years general manager of the Birmingham Tramways Department and retired last year.

Digitized by Google

LEGAL INTELLIGENCE.

Huddersfield Corporation Electricity Dept. and the Factory Acts.

THE Huddersfield Corporation was fined £10 by the local magistrates on October 16th, under the Factory Acts. The summons arose out of an accident at the works on August 19th, when a man named John Sykes was severely burned while he was cleaning a switchboard.

Mr. G. B. Saywell (for the Director of Public Prosecutions) said Sykes was quite clear that he was not told that the cubicles were "alive" when he was put on the job, and he was certain that his instructions included an instruction to clean the front part of the switchboard, which he did with the aid of a ladder and a handbrush. Sykes was working under the orders of the shift engineer, a man of experience, and he was entitled to assume that he would not be placed in danger.

Mr. W. Brown, a divisional inspector of factories, said that he thought that Sykes' brush must have established contact with one of the links of the cubicles.

In answer to Mr. E. D. Spencer (for the Corporation) the witness said that the regulations laid it down that the switchboard must be "dead" before even the top or back could be cleaned.

Mr. Spencer said that would mean leaving a section of the town without current for a time.

Mr. Saywell said that commercial practicability did not matter.

For the defence, Mr. Spencer said that Sykes undertook work that he was not asked to perform. He was told to clean at the back of the switchboard. The cleaning at the front was done weekly by the trained man who had charge of the board. He contended that the top and back of the switchboard, which were insulated and could not possibly be dangerous, were not part of the board.

Mr. J. W. Turner, borough electrical engineer, said that the cubicles on the switchboard were cleaned out once a year. The job was a serious one, as it meant that a section of the town was cut off for a time. The weekly cleaning of the switchboard was performed by a trained man without the board being made "dead."

The Bench found that an offence had been committed, and convicted on the first of two summonses.

Alleged Valve Infringement.

The case of the Mullard Radio Valve Co., Ltd., against the London Radio Company (Leeds) was before Mr. Justice Eve in the Chancery Division on October 18th. Counsel said it was a motion for an injunction to restrain the defendant company from infringing the plaintiffs' patent by selling valves in breach of the licence. The defendants appeared and consented to the injunction and to treat the motion as the trial of the action. They would pay ten guineas agreed damages and the costs of the action. Counsel added that the notice of motion asked that defendants might be restrained from infringing plaintiffs' patent by selling valves made in breach of the licence. It would be better to amend that by saying "below the price fixed by the licence."

Counsel for the defendants assented, and his lordship granted an order in the terms arranged.

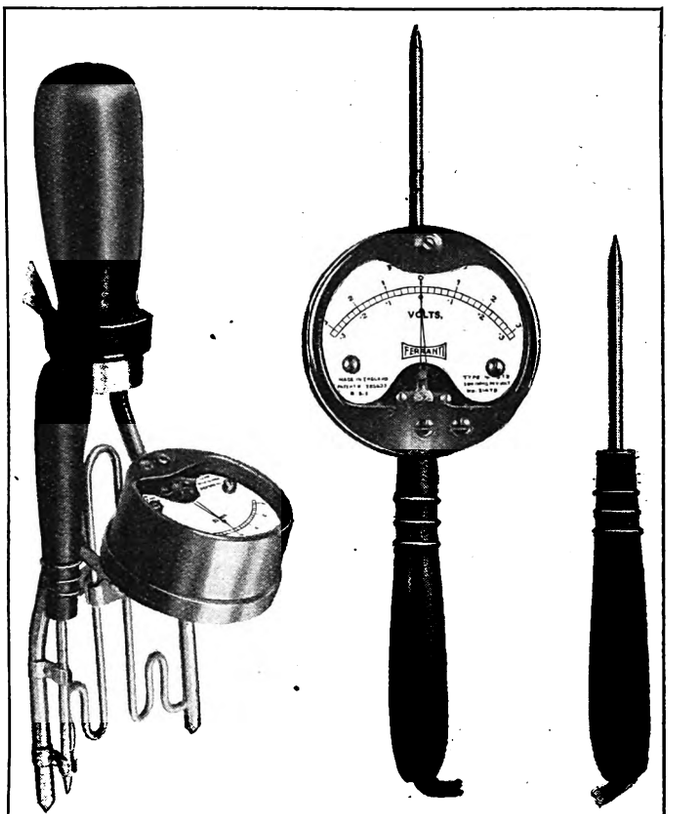
SMOKE ABATEMENT.

Special E.D.A. Exhibit at Manchester in Support of Electric Homes Campaign.

THE Manchester "Daily Dispatch" Smoke Abatement Exhibition will be opened on November 5th at the City Hall, Manchester, by Mr. Arthur Greenwood, M.P., the Minister of Health. One of the most interesting sections of the exhibition will be the display of the Electrical Development Association, and a committee representative of the Association and all branches of the industry, under the chairmanship of Mr. L. Romero, Salford city electrical engineer, and Mr. R. C. Hawkins, of the Association, is in charge of the detail work. The "electric homes (outlet) campaign" will be supported in the exhibition, electrical devices for heating, cooking and ventilation will be shown, and a complete electrical service for the house will be demonstrated as an indication of what a "wired home" should be. A number of shop windows will be featured also, adding to the brightness of the combined exhibit. On the industrial side the E.D.A. will stress the virtues of electricity as a means of supplying hot water in bulk, and for works' canteen equipment. The use of electricity in commercial baking is also to be demonstrated.

TESTING VOLTMETERS.

TWO further developments of the open-circuit cell testing voltmeter are just about to be placed on the market by Ferranti, Ltd., Hollinwood, Lancs, each embodying one of the well-known "Ferranti" 2½ in. dial 2½ in. scale moving coil



Two new open-circuit voltmeters introduced by Ferranti Ltd.

voltmeters. The type CT2 is a two-range instrument reading 3-0-3 and 0·3-0-0·3, the range desired being selected by means of a small switch mounted on the top of the instrument. It is particularly suitable for good cadmium test readings as the same length of scale is available for cadmium-to-positive, cadmium-to-negative and open circuit voltage readings. A cadmium stick adapted for fitting to the instrument can be supplied. As an indication of the robustness of the instrument it is interesting to note that if the 0·3 V scale is used in error instead of the 3 V scale, the voltmeter withstands the overload without injury. The type CTL is a "loaded" cell tester designed to permit of the rapid testing of cells under heavy discharge conditions and is primarily intended for car-battery work. With the "wander-spike" in position in the clips provided, the two prongs are placed across the cell to be tested, and the shunt, which is permanently connected across the two prongs, puts a heavy load on the cell. In this manner it is possible to obtain rapidly an indication of any variation in terminal voltage under heavy discharge conditions. A novel feature is the introduction of a slider which short-circuits a varying length of the shunt, thus giving a different value of discharge current for each position of the slider. An approximate scale is engraved on the back of one of the prongs of the tester, standard settings being 100, 150 and 250 A. It is very important to maintain clean contact surfaces between the slider and the shunt and to screw up the slider as tightly as possible. By removing the "wander-spike" from its clips, open-circuit tests can be made by applying this spike to one terminal of a cell and either of the prongs of the tester to the other.

We have received from the MIDLAND ELECTRIC MANUFACTURING CO., LTD., M.E.M. Works, Barford Street, Birmingham, a new complete illustrated catalogue giving full particulars of the most recent productions and latest improvements, together with latest prices, which are much reduced. The new list claims to be something more than a mere price list, and the publishers have tried to make it something of a book of reference on the design and installation of electrical switch and fuse gear. The new prices came into force on October 14th.

NEW EQUIPMENT.

Apparatus of Interest to Power and Marine Engineers.

SUPPLY companies and contractors may be interested to hear that a new type of prepayment meter is being marketed by the A.E.G. ELECTRIC CO., LTD., of 131, Victoria Street, London, S.W.1. This meter is intended for use as a slot sub-meter for rooms in hotels, etc. The meter can be supplied for either 6d. or 1s. insertion, and the design is such that the meter switch can be opened by means of a key after the room has been vacated, leaving any prepaid but unconsumed energy as a profit to the hotel proprietor. The latter collects the cash from the sub-meter in each room, but pays for the energy actually consumed, which is recorded by his ordinary master meter. It is stated that on the average a profit of 2d. on each 1s. inserted in the 1s. type of meter may be assumed. The meters can be supplied for continuous or alternating current or for any voltage.

The A.E.G. phase sequence indicator.

An extremely small synchronous self-starting motor for driving clocks has also been put on the market by the A.E.G. The rotor is only about a centimetre in diameter and runs at 3 000 r.p.m. This speed is geared down in an oil chamber to one revolution in 24 hours. This "clock" is thus energised from a.c. mains, and its timekeeping depends only on the frequency of the supply being maintained constant. The ordinary frequency indicator is not, of course, sufficient for the purpose, and the A.E.G. has put on the market also a master frequency control clock, which is installed in the generating station and is claimed to permit perfectly constant frequency to be maintained, thus enabling synchronous clocks to be utilised over the whole area covered by the supply. The master clock consists of a precision "grandfather" clock of the ordinary type, upon whose dial is superimposed a second pointer driven by one of the standard synchronous clock motors connected to the supply circuit. It is the function of the operator to regulate the speed of the alternator so that the two pointers run together. It is stated that by this means every synchronous clock or time switch connected to the supply can be kept as completely accurate as the precision master clock, which has a regulation factor of 15 seconds per month.

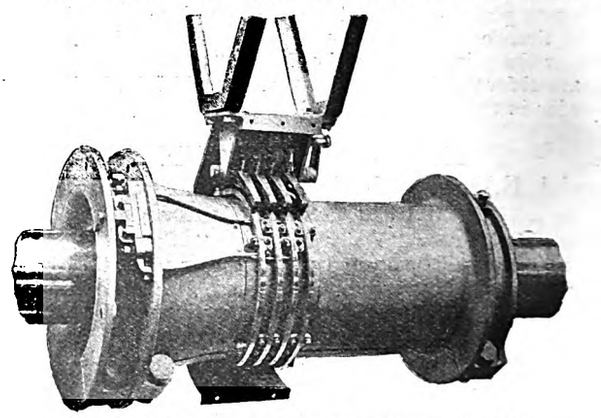
The A.E.G. has also produced recently a phase sequence indicator in portable form, for ascertaining the sequence of a 3-phase supply—that is, the direction of the rotating field—when making meter connections or installing power factor indicators, reverse current relays, etc. In this indicator, two ohmic resistances and one condenser are used, causing the star-point to vary with the phase-sequences. A small lamp is connected in series with each of the two resistances, arranged so that with correct sequence the right-hand lamp is lighted, and with the wrong sequence the left-hand lamp. A press-button switch is used for completing the test: two such switches are provided, one for 100-200 V, and the other for 200-400 V. The indicator measures 80 by 80 by 40 mm.

The POWER CENTRE CO., LTD., 15, Park Lane, Liverpool, is adding to its range of "Turret" systems a means of carrying electric cables for power or lighting, which is claimed to be cheaper and more accessible than methods hitherto available, wherever anything larger than 1½ in. conduit would ordinarily be required. It is known as the "Turret" Patent Trunk Conduit System, and the trunking consists essentially of a heavy-gauge sheet steel trough, fitted with a detachable cover-plate on its front side. The upper side of the trough is so shaped with a continuously projecting lip as to throw off any drip or moisture which may collect on the top, and the cover-plate fits well inside this projection. The cover also has a continuous projecting lip on its lower edge; this again serves to carry away any drip, and the troughing is made of one continuous sheet forming the base, side and top, so should be practically damp-proof. The cover-plate is secured at intervals to steel strips, which can be easily removed to enable the cables to be pushed into place and secured. It is stated that cables cannot be damaged in any way during installation; no draw-in boxes are required, even with very heavy cables. Any type of cable can be used with the "Turret" trunking, which is supplied in 8 ft. lengths in various sizes, and may be fitted with welded block ends or detachable block ends at an extra charge. Special lengths shorter than standard can also be obtained. Each trunk is fitted with one butt strap—a joint piece which is riveted into position and drilled to enable it to be bolted to the next section; the small bolts and nuts necessary are supplied with the trunking. For vertical runs a trunk with a simple overlapping cover is supplied; this type is also useful for laying in floors, where it may be necessary to put in the cable from the upper side. A universal angle box, which can function as an inspection or connecting box, is supplied as standard.

A patent adjustable meter panel is available for use with turret trunking and consists of a channel-section back-plate of sheet steel, with two impregnated teak battens attached to its upper end. One batten can be adjusted either vertically or horizontally so that any type of meter can be attached.

Those interested in radio and other electrical equipment for ships may be glad to be reminded that SIEMENS BROTHERS AND CO., LTD. (of Woolwich, S.E.18), provide a complete radio-telegraph service on various sets of terms and conditions. The ¼ kW spark station is now the standard transmitter of its type, owing to the new regulations which come into force on January 1st, 1930, prohibiting the installation of spark transmitters of greater power than 300 W. The ¼ kW station is of the self-contained cabinet type, with a folding flap which when open forms a writing table, and when closed protects all vital parts from dirt. A 300 W motor alternator supplies power to the quenched spark transmitter, and the other apparatus comprises an emergency battery, a two-valve receiver and the necessary receiver batteries and charging panels. Under the heading of valve transmitters the firm is offering two sizes of station. The 200/300 i.c.w. equipment is tuned to 600, 705 and 800 metres and employs 2 valves. It is supplied complete with motor alternator, control, main switchboard and two-valve receiver. With the 400/500 i.c.w. station two transmitting valves are used to produce interrupted continuous waves on the band 600/800 metres, and there is a large increase in the range as compared with the 200/300 size. By the addition of a two-valve rectifier for supplying a d.c. potential to the plates of the transmitting valves, c.w. is produced on the commercial wave-band of 1 875-2 500 metres.

Other marine equipment now being produced by Siemens Brothers includes ships' telegraphs (electric), navigational and inter-communication telephones, electric helm indicators, navigation lights and "look out" indicators, torsionmeters, distance thermometers and thermo-electric pyrometers. The Siemens helm indicator is operated directly by the movements of the rudder and therefore indicates the actual angle of the helm and not merely the movements of the telemotor or other control gear. Two types of torsionmeter are available.



The "Ford" torsionmeter of Siemens Brothers and Co., Ltd.

The "Hopkinson-Thring" is of the optical type; it provides a simple means of measuring the H.P. of turbine driven shafts, but is not applicable to shafts driven by reciprocating engines. The "Ford" torsionmeter is of the electrical type. Being designed to indicate mean torque it can be used with shafts driven by any kind of engine. For investigation purposes it can also be arranged to indicate the instantaneous value of the torque at any point in a revolution, so enabling a curve of cyclic fluctuations to be plotted.

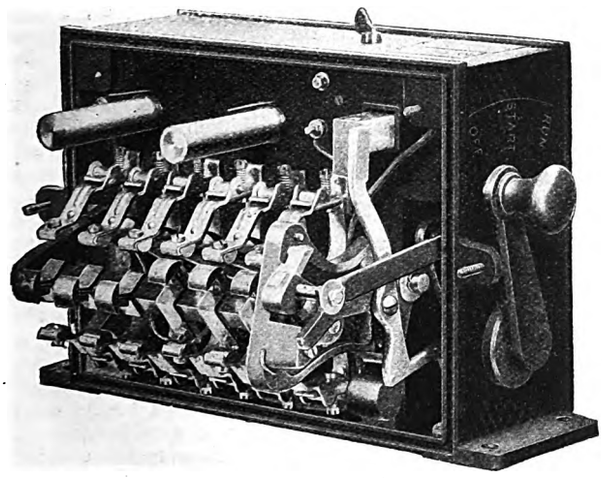
Digitized by Google

An electric slicing machine, known as the "Scout," is being produced by FRANK V. MAGRINI, LTD., of Phœnix House, 19-23, Oxford Street, London, W.1. It is stated to be equally suitable for slicing hot and cold meats, bacon (up to 11 in. wide), large-size hams, and bread. As a bread slicer it excels—according to the claims made by the firm—owing to the high speed of the knife, which is approximately 940 r.p.m. Enclosed double sharpeners keep the knife edge in condition. The knife itself is made in one piece, of chrome nickel steel. The gauge plate moves parallel to the cutting plane of the knife, and the regulation is universal—that is, any number of different thicknesses between a half-inch and $\frac{1}{100}$ inch can be obtained. The motor is specially constructed, with a consumption of 293 W.

It is normally of the counter type, but can be supplied on a pedestal for ship board or similar purposes. A special feature of the slicer is its ability to handle tomatoes, apples, etc. All parts that come in contact with foodstuffs are of porcelain enamel.

Another useful product of FRANK V. MAGRINI, LTD., is the "Thermotainer," which consists of an electrically-heated food container. The Thermotainer can be adapted to serve as a kitchen unit to replace the old-fashioned steam table; as a hot food conveyor, for marine passenger and similar service; for cafetaria service counters; or for roll, pastry and pie warmers—to keep bakery foods hot and fresh. The various tray-like insets can be changed in size and arrangement according to individual requirements; they can be made in any specified material, standard substances being chinaware, monel metal and aluminium. For hospitals large Thermotainers, sufficient for serving 80-100 patients, can be had; the dimensions of the standard Model H, which has a consumption of 1 200 W are 56 in. long, 28¾ in. wide, and 53½ in. high. Electrically-heated air chambers, under thermostatic control, surround the food compartments and no circulating air comes into contact with the food.

Amongst the industrial equipment of the WALSALL ELECTRICAL CO., LTD., of 61, Bridge Street, Walsall, is a series of oil immersed star delta startors for low and medium pressure a.c. circuits. These units are of the totally-enclosed type arranged for fixing either to panels or upright supports. When arranged as startors they are suitable for currents up to 40 A., and when used as circuit breakers they can be used up to 80 A. The no-volt release coils can be wound to suit any supply up to 600 V, and any frequency from 25 to 60 cycles, while the case and tank consist of heavy cast iron. The tripping mechanism is oil immersed, and is thus suitable for use in damp or tropical situations. The stationary contacts are of the self-aligning type, with renewable hard drawn copper tips

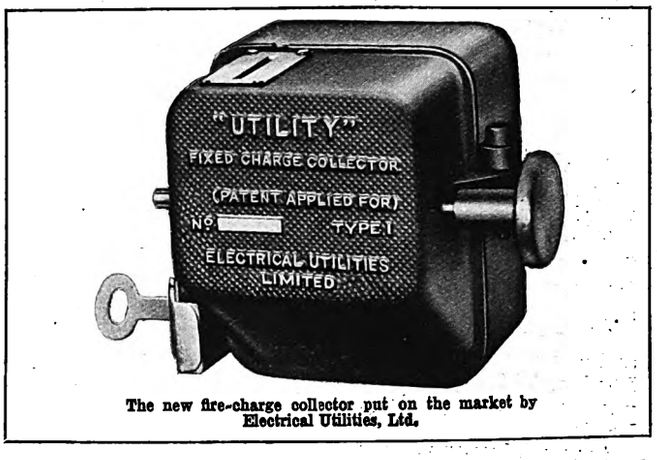


The internal arrangement of the startor equipment of the Walsall Electrical Co., Ltd.

pressing against the moving contacts by adjustable springs, and the drum contacts are clamped on an insulated square steel shaft and also arranged with renewable hard drawn copper tips. The switch is of the free-handle type to prevent its being held in the "running" position against overloads. A sequence device is fitted, so that it is impossible to switch into the "running" position without having passed through the start position. A catch is provided on the front of the case for tripping the startor. The terminals are of ample size and easily accessible when the lid is removed, claw grip washers being used on all terminals.

FIRE-CHARGE COLLECTOR.

A SIMPLE and robust instrument has just been put on the market by ELECTRICAL UTILITIES, LTD., Tudor Works, Park Royal, London, N.W.10, to take the place of the prepayment meter, which is normally placed in hotel bedrooms to



The new fire-charge collector put on the market by Electrical Utilities, Ltd.

collect the charge for current, where electric fires are provided. In most hotels it is the practice to charge 1s. per night for fires, and when electric fires have been introduced, a separate shilling in the slot prepayment meter has usually been installed.

The instrument which is now being offered has the advantages of being robust, easily re-set and low in price.

In the case of the standard instrument, a 15 A tumbler switch is contained in a cast iron case, with a glass window at the base, which is not visible in the illustration. When the user places the coin in the slot, and pulls the handle over, the coin forces the switch in the "on" position, where it remains until the following morning, when the instrument is unlocked by some authorised person, the coin taken out, and the tumbler switch re-set. This enables the consumer to use an electric fire for a precisely similar charge to that which is normally made for coal fires in hotel bedrooms, and assures the hotel proprietor that his revenue from fires will be at least the same as that which he has received in the past. A complete hotel bedroom fire equipment of this type has been installed in a South of England hotel for £3, a 1½ kW fire being used.

Larger patterns of collector for controlling bigger fires, and for taking coins, such as sixpences or florins, can be supplied.

ELECTRICITY IN CANADA.

THE Dominion Bureau of Statistics at Ottawa in its final report for 1927 on Central Electric Stations in Canada, records an increase of 20% during the year in the output by these plants. The total output in 1927 was 14 549 099 thousand kWh, as compared with 12 093 445 thousand kWh in 1926. The 1927 output was produced to the extent of 9 944 330 thousand kWh in commercial stations, the output of municipal stations during the year aggregating 4 604 769 thousand kWh. The number of central stations operating in Canada in 1927 was 629, capitalised at $866 825 285, having a total primary power equipment of 4 173 349 H.P. and a secondary power equipment aggregating 3 385 227 kVA. Of the 629 stations operating, 302 were hydraulic and 327 fuel-power stations. Commercial plants numbered 432 and municipal plants 197. Although the number of fuel-power plants was in excess of those producing current with water wheels, the primary power equipment of the hydro-electric plants totalled 3 975 012 H.P., as against only 33 788 H.P., represented by steam reciprocating engines; 144 683 H.P. by steam turbines; and 19 866 H.P. by internal combustion engines.

TECHNICAL PAMPHLETS FOR WORKMEN.

The latest addition to the useful series of Technical Pamphlets for Workmen, issued by the Post Office Engineering Department, is one dealing with wireless transmission and reception. The contents cover general principles, systems of generation and transmission, methods of reception, direction finding and directive reception, and the inspection of wireless stations. The pamphlet, obtainable from H.M. Stationery Office, price 6d., also includes details of wave-traps and other methods of improving the selective properties of receivers.

BUSINESS ITEMS.

MR. H. LITTLEWOOD has commenced business as an electrician at 18, Scholes Road, Birkby, Huddersfield.

HARRY JONES AND CO. advise us that they have removed to new premises at 32, Goodge Street, London, W.1.

S. W. WALKER AND SON, radio engineers, of 47, Jewry Street, Winchester, have opened additional premises at 21B, Southgate Street.

STEATITE AND PORCELAIN PRODUCTS, LTD., announce that all inquiries and correspondence should now be addressed to Bewdley Road, Stourport, Worcs.

Messrs. C. GILBERT AND SON, electrical and radio engineers, of 3, Shouldham Street, Marylebone, W.1, announce that their late manager, Mr. W. Moody, is no longer in their employ.

The HENDON LAMP AND ACCESSORIES CO., LTD., 104, Southampton Row, London, W.C.1, request lists from manufacturers of electric heating and cooking apparatus and accessories.

The new address of Mr. E. KILBURN SCOTT, chartered, civil, and electrical engineer, is Conway Hall, 25, Red Lion Square, London, W.C.1 (rear entrance, 49, Theobald's Road). Telephone: Chancery 8473. Telegrams: Beadlebob, Holb, London.

ALLOY WELDING PROCESSES, LTD., have removed their premises from 14-16, Church Street, Islington, London, N.1, to Ferry Lane Works, Forest Road, Walthamstow, London, E.17. Telephone: Walthamstow 2366-7-8; telegrams: Alweprol Waltstreet, London.

Trolley Bus Literature.

A syndicate in Brazil, having in view the establishment of a service of electric trolley buses over a distance of 100 kilometres, desires to receive literature from British manufacturers. Details can be obtained from the Department of Overseas Trade. (Reference A.X. 8 616.)

The whole of the 10 000 line "Flaxman" automatic telephone exchange equipment was manufactured and installed by the Telephone Works of the General Electric Co., Ltd., Coventry, Warwickshire, the exchange being opened in the London area on September 14th.

The GENERAL ELECTRIC CO., LTD., has opened a new branch at Magnet House, 3, Campbell Street, Leicester, and Mr. W. J. Hodgkins, of the Birmingham branch, has been appointed manager. The telephone number is Central 58778, and the telegraphic address "Electricity."

The UNDERFEED STOKER CO., LTD., Africa House, Kingsway, London, W.C.2, announce that they have secured the sole manufacturing rights for Vibro conveyors under the Schenck-Heymann system, the conveyors being manufactured entirely at the company's works at Derby.

BELLING AND CO., of Enfield, Middlesex, have appointed NUTTER, SON AND EDGE, LTD., of Cromford House, Cromford Court, Manchester, as main agents for the sale of their electric fires and cookers in the Lancashire, Cheshire, and North Wales area and stocks are being carried at the Victoria Bridge stores. Mr. P. Nutter, managing director of Nutter, Son and Edge, Ltd., is giving special attention to the requirements of supply authorities, corporations, and wholesalers, and will call on the supply authorities with regard to the new range of cookers which have recently been brought out.

A Reception Problem.

Some interesting experiments were made by Captain P. P. Eckersley at Jack Straw's Castle, Hampstead Heath, last week, when he sought to demonstrate that even within six miles of the Brookman's Park station, it is easily possible to receive 5 GB without interference, and to bring in several foreign programmes, and this with a reasonably priced set. His contention was proved very convincingly—first on an all-mains "Marconiphone 4" (model 47); later in the evening one of those present challenged Captain Eckersley to produce clear reception of 5GB on a three-valve set, and a model 39 receiver was substituted—with satisfactory results. A 30 ft. aerial, similar to that generally used by the public, was employed in each case.

Madrid is now placed for the first time in direct wireless telegraph communication with both North and South America and, by means of the "Marconi" short wave beam installation which is included in the equipment of the Aranjuez station, a regular commercial telephone service between Spain and the Argentine Republic will be available in addition to high-speed beam telegraph services. For use in these circuits special receivers have been constructed by MARCONI'S WIRELESS TELEGRAPH CO., LTD., on behalf of Transradio Espanola, the Spanish company to which these stations belong. The supply of this apparatus to Transradio Espanola is the second big order for British wireless equipment recently received from Spain, the Marconi Co. having also supplied a short wave station to the Spanish Government to establish a direct wireless service between Madrid and the Spanish colony at Fernando Po, in Africa.

"His Master's Voice," having begun to manufacture radio sets, realise that this, plus the electrical reproducers, makes a fresh demand upon the technical knowledge of dealers and their assistants. In order that all those who handle "H.M.V." products may be able to give the fullest services to the public, the Gramophone Company has started, at the London Polytechnic, a special course of lectures in elementary radio-gramophone production. Capt. P. P. Eckersley has supervised the course of lectures and gave the opening address last month. The evening lectures are delivered by Mr. S. T. Short, and the sixteen discourses and demonstrations will cover the entire field for dealers, salesmen, service staff and others engaged in the radio-gramophone industry. Similar courses of instruction are to be given in such centres as Manchester, Liverpool, Birmingham, Southampton, Hull, Bristol, Cardiff, Glasgow, Edinburgh, Newcastle, Leeds, Bradford, Sheffield, Nottingham, Leicester, Norwich and Brighton, by arrangement with the local technical schools. In each case one pound is charged for the complete course. For those who are unable to attend the evening lectures a correspondence course will be available, and on this matter letters should be addressed to the Technical Education Department, the Gramophone Company, Ltd., whose address is 363, Oxford Street, London, W.1.

Electrical Exhibition.

The claims of electric lighting, heating, and labour-saving appliances in the modern home were prominently featured at the Empire Exhibition, recently held at Tunbridge Wells. The exhibition was formally opened by Sir Derrick Watson, and its object was to demonstrate that goods manufactured and produced within the Empire are superior to those imported from abroad. A high standard of display was noteworthy on all the electrical stands, and the following are some brief notes on the electrical contractors' stands, and others featuring electrical goods. An attractive display of electric fittings and shades was made by the ADVANCE ELECTRICAL CO., Monson Road Tunbridge Wells, while the centre of interest was the "Kelvinator" refrigerator. An added attraction was a demonstration of the "Hoover—" vacuum cleaner. Visitors to the stand of E. POWELL, LTD., 39, High Street, Tunbridge Wells, were introduced to the advantages of "Ericsson's" telephones for domestic uses. "Goblin" vacuum cleaners were featured among a wide range of electric heating and labour-saving apparatus. STRANGE AND SONS ELECTRICAL ENGINEERING CO., LTD., Tunbridge Wells, focussed attention on their installation service, which covers a wide area, and showed the "Marco" refrigerator, "Magicoal" fires, and a variety of clothes washers, driers, water boilers, etc., in addition to a good display of "Marconi," "Pye" and "Symphony" portables, all-mains units, and the new "Mullard" and "Burndept" speakers. Mr. H. FEATHERSTONE, 22, London Road, Tunbridge Wells, occupied two stands with "Manning Bowman" table apparatus, the "Vac-Tric" suction cleaner, "Belling," "Creda," "Heatrea," and "Magnet" fires, a wide range of fittings and shades, and electric toasters, irons, and kettles. Wireless was strongly featured, "Kolster-Brandes" full range and many of the new "Burndept" receivers being shown. Mr. Featherstone handled the amplification in the hall. The "Electro-Vapour" radiator was a centre of interest on the stand of H. A. STONHAM AND CO., LTD., Mount Ephraim, Tunbridge Wells. The full range of the new Kolster-Brandes sets was also shown, the new four-valve portable and the three-valve set for mains operation being featured. The TUNBRIDGE WELLS CORPORATION ELECTRICITY DEPARTMENT gave many demonstrations of cooking by electricity, and displayed cookers, boilers, etc., for hire. In addition to the examples of "Magicoal" electric fires shown on traders' stands, they were also shown in great variety by BERRY'S ELECTRIC (1928), LTD., of 85/6, Newman Street, London, W.1. CALLENDER'S CABLE AND CONSTRUCTION CO., LTD., had a stand specially devoted to their system of electric wiring, including in the exhibits a complete list of the names of local contractors from whom their products are obtainable.

TEXTILE MACHINERY.

Some of the Electrical Equipment Exhibited at Leicester.

FROM an electrical standpoint the main interest in the Textile Machinery Exhibition, which opened at Leicester on October 16th and closed on October 26th, was in the advance which is being made in the driving of hosiery machinery by means of electricity. As practically all the working exhibits were electrically driven, the manufacturer visiting the exhibition was able to get an excellent idea of the advantages of the electrical drive over other methods. The power for the exhibition was supplied by a rotary convertor taking 500 V d.c. and giving 400 V a.c.

The MIDLAND DYNAMO CO., LTD., Leicester, supplied most of the motors in the exhibition, and perhaps their most interesting drive was that for sewing machine benches. This is a small motor, which fits under the middle section of the bench, and drives by a silent chain running in an oil bath. Most of these fractional horse-power machines are for driving sewing machines, linking machines and small knitting machines. A special group for driving a number of knitting machines were mostly from $\frac{2}{3}$ H.P. The firm also supplied reduction gears with automatic features which give a ratio of 45 to 1.

Mr. R. H. DONALD, the British agent for E. Blaschke of Berlin-Tegel, showed several electrical features in connection with rayon (artificial silk) spinning.

The A.E.G. ELECTRIC CO., LTD., also showed spinning equipment, and the latest spinning motor is considerably cheaper than previous models, said to be due to the mass production methods adopted. A new spinning motor known as the "Tornado," which is very light and enclosed entirely in bakelite, was also shown. The patent "Kuma" brake switch, which is also made of bakelite, was another new feature.

This year the UNIVERSAL WINDING CO., LTD., Manchester, had a special stand devoted to machinery for winding electrical coils. The No. 96 coil winder is for winding field or meter coils of the self-supporting spool-wind type. This will wind rectangular coils up to $3\frac{1}{2}$ in. long and 4 in. diameter with wires ranging in size from No. 18 to No. 44. It is fitted with a special device which stops the winding spindle immediately breaks or other interruptions occur. It has also the usual wire compensating device. The No. 97 winder is for producing self-supporting coils of the spool-wound type.

W. AND T. AVERY, LTD., had a full range of the latest industrial visible weighers.

"HELP YOURSELF."

Many Electrical Prizes Included in Seventh Annual Gift Distribution.

OVER 2 000 prizes, ranging from a 20 H.P. Austin saloon car to a stick, a ball of string, a bent pin, a glass jar, and a tiddler are to be distributed this year to members of the Stock Exchange "Help Yourself" Society.

A number of electrical and radio firms are providing gifts, as will be seen from the list given below :—

CELESTION, LTD.—Two C.24 mahogany model radiophones, three C.14 model mahogany radiophones, five C.14 oak model radiophones, five C.12 radiophones in oak, three C.12 radiophones in mahogany, and six C.10 radiophones.

A. DEAN AND CO.—A two-pint nickel-plated electric kettle, nickel-plated electric iron and a japanese lacquer table lamp with shade, complete with flex and lampholder.

MESSRS. JUPP AND RYAN.—Two electric irons, any voltage.

MESSRS. ORMOND ENGINEERING CO.—Three "Ormond" five-valve suit-case portable wireless sets, 158 cone loud speaker units.

E. K. COLE.—An Ekco-Lectric straight three receiver.

BAIRD TELEVISION DEVELOPMENT CO.—A Baird televisor.

J. J EASTICK AND SONS.—Ten "Eelex" safety wireless aerial earth switches and a box of assorted "Eelex" treble duty wireless plugs and terminals.

GENERAL ELECTRIC CO.—Two "Magnet" electric cleaners complete with all attachments, two breakfast table sets, two "Magnet" Minor-de-luxe model electric table cookers, and six "Magnet" universal voltage electric travelling irons.

MARSHALL, STEWART AND CO.—Working scale model of a locomotive driven by electricity.

SHERIDAN SIGNS, LTD.—Electric day and night box sign.

ELECTROLUX, LTD.—Model XI Electrolux cleaning equipment.

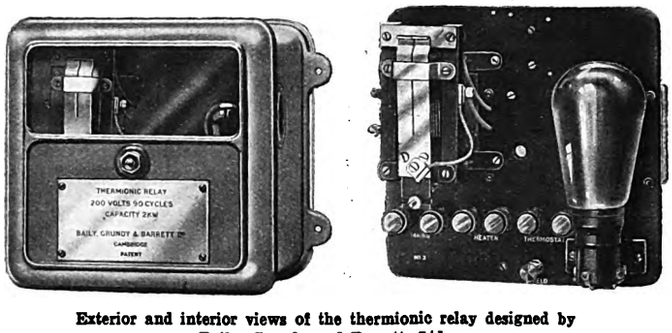
MULLARD WIRELESS SERVICE CO., LTD.—Six Mullard loud speakers, Model "C."

J. DYSON AND CO., LTD.—"Goodwinex" high-tension eliminator for wireless set.

DUBILIER CONDENSER CO. (1925), LTD.—Dubilier h.t. battery (66 V), and Dubilier h.t. battery (108 V).

TEMPERATURE CONTROL.

AN interesting device for the automatic control of temperatures in experimental chambers, is a thermionic relay by BAILY, GRUNDY AND BARRETT, LTD., of 2, St. Mary's Passage, Cambridge. The apparatus is for operation from an a.c. supply, and consists of a thermionic valve, supplied



Exterior and interior views of the thermionic relay designed by Baily, Grundy and Barrett, Ltd.

by a small transformer with filament, anode, and grid potentials, which operates the main contactor switch by means of the anode current; the thermostat, connected in the grid circuit, effecting control by application or non-application of a suitable potential to the grid. By the use of this relay, the following advantages over the usual low voltage magnetic type are claimed: (*a*) Elimination of batteries, and direct operation from alternating current supply; (*b*) reduction of current in the thermostat to a negligible quantity, approximately 10 mA; (*c*) the reduction of moving parts and small contacts to a minimum; and (*d*) a thermostat with a fine mercury column can be used, giving very sensitive control, the surface of the mercury remaining clean after prolonged use; and (*e*) the relay can be operated through an external resistance of from 1 to 2 megohms, enabling a semi-conducting fluid to be employed in the thermostat if required. The device is made for operation from mains of 200-250 V, 40-100 cycles, with a control capacity of 200-250 V, 10 A. The current consumption with the contact open is 0·35 kWh in 24 hours, and with the contact closed, 0·6 kWh in the same period. The thermostat current is 10 mA, and the valve life one to two years. The range of fluctuation in supply voltage allowable is + or −10% of stated voltage.

An adjustable contact thermostat with mercury column is recommended for use with the relay, the temperature regulation being within 1/100 deg. C. This thermostat is similar in construction to a glass mercury thermometer, but in addition contains two contacts, one of which makes permanent contact with the column of mercury, and the other is connected to a small spiral of platinum wire. A small glass capsule, containing a short piece of iron, is located at the top of the thermostat tube, to which is attached a length of platinum wire, passing through and making contact with the platinum spiral. The capsule can be moved up and down in the tube by means of a permanent magnet applied externally, and hence the thermostat can be arranged to make contact at any temperature desired.

N.Z. TELEGRAPHS AND TELEPHONES.

General Increase in Traffic Since Last Year—Automatic Telephone System Extending.

THE report of the New Zealand Postmaster-General for the year ended March 31st, 1929, states that the number of cable messages, excluding press, sent during that period from New Zealand to international offices was 217 033, against 210 662 in previous year, through the Pacific Cable Board's system, and 109 308, against 108 167, by Eastern Co. Press messages, numbering 5 102, were sent *via* Pacific, and 2 381 *via* Eastern, against 4 925 and 2 920 respectively in 1927-8. The total number of international cable messages, excluding press, sent by cable from New Zealand was 179 399, against 170 818, and the number sent to Australia was 146 942, against 148 011. The numbers received were: international 156 115, against 147 325, and Australian 140 597, against 140 899.

The number of telephone stations supplied by the Post Office system grew from 144 552 to 152 541 during the year, in each case including about 5 000 non-exchange stations. Out of this total 42% are on the automatic system.

INDUSTRIAL HEATING.

Some Exhibits at the Bradford Engineering Society's Exhibition.

WE are advised by the Electrical Development Association that it has been possible to arrange within the last few days a special electric heating section of the Bradford Engineering Society's Engineering Exhibition, which will be held at the Olympia Hall, Bradford, from November 6th to 16th. At the time of going to press the complete catalogue of the section was not available but the scope of the exhibits will be appreciated from the following brief descriptions.

The BASTIAN METER CO., LTD., Farmham Road, Trading Estate, Slough, will show on Stand No. 42, "Mascarini" electro-steam boilers, hot water electrode calorifiers, 10 gal., "Bastian" 500 W., 230 V water heaters fitted with thermostats, 6 electric radiators, fires, samples of tabernacle heaters and samples of electric elements. The BRITISH RESISTOR CO., LTD., Clare Road, Halifax, will exhibit on Stand No. 57, furnace type "Globar" non-metallic heating elements in operation, suitable for working temperatures up to 1 350 deg. C. Another item will be a small "Globar" electric furnace, shown in operation at a temperature of 1 350 deg. C.; electric paint burners, "Globar" electric grills for industrial requirements and photographs of large furnaces will complete the exhibit. BROWNS' DRYERS, LTD., 17, Victoria Buildings, Deansgate, Manchester, will be found on Stand No. 41, but details of their exhibit are not yet available. FERRANTI, LTD., Hollinwood, Lancs, on Stand No. 59 will feature fires, showing details of construction, water heating equipment gear, thermostats, relays, etc. THE GENERAL ELECTRIC CO., LTD., of 11A, Wellington Street, Leeds, will occupy two stands and these will be devoted to displays of double deck bread baking ovens, double deck pastry ovens for fancy pastries, and various industrial heating appliances. The stands are Nos. 58 and 69.

The JACKSON ELECTRIC STOVE CO., LTD., 143, Sloane Street, S.W.1, on Stand Nos. 57 and 70, will feature 2 deck pastry ovens, 4 ft. hot cupboard 10 D. vertical oven ranges, 24 D. cooker wash boilers, which will be dissembled for examination, electric cooking cabinets and fires complete, cooker and fire elements assembled and dismantled, and typical wiring connections for cookers and switchboard showing arrangement for obtaining series-parallel control. JESSOP AND BOYDELL, 21, Northgate, Bradford, will occupy Stands Nos. 71 and 72 and will show various types of low temperature air warmers with automatic temperature control. LANG BRIDGE, LTD., of Accrington, will feature on Stand No. 20 patent electrically-heated drying cylinders. "Lecfur" electric furnaces for annealing hardening and tempering, normalising, carburizing for temperatures up to 1 050 deg. C., and up to 1 350 deg. C., for melting non-ferrous metals; for vitreous enamelling, firing glazes and colours; for the wire trade, patenting, pot annealing, hardening and tempering (continuous process), annealing bright non-ferrous wires (continuous process), etc., are to be shown by the LEEDS ELECTRIC CONSTRUCTION CO., of Leeds, on Stand No. 36.

Welding transformers and regulating choke coils for alternating current of all periodicities; "Premier" electrodes for welding mild steel; examples of "Belfinish" welds and electrodes. "Flexin" welding tool and welding electrodes and the "Premag" copper welding process will form the exhibits of the PREMIER ELECTRIC WELDING CO., LTD., Abbey Wood, S.E.2, whose stand will be No. 19. YOUNG, OSMOND AND YOUNG, LTD., Welwyn Garden City, Herts, will also show in the heating section of the exhibition and on Stand No. 40 will be featured "Unity" electric heating systems, gas-tight heaters for heating cellulose paint shops, explosive factories, etc.; low-temperature heaters for heating of tar, crude oil, etc., and heaters for traction and other high voltage work, up to 1 500 V.

GLASGOW AND THE COMMISSIONERS.

Glasgow Electricity Committee has been informed that the Electricity Commissioners do not approve of the depreciation method carried out by the Corporation, and that the Commissioners insist on all repayments of capital being confined to the sinking fund method. The Commissioners desire that formal application should be made to them to regularise the sums met out of revenue by way of depreciation during the past two years.—The Electricity Committee recommends that a request by the Education Authority that the experimental heating of schools be continued for a further period of one year, be acceded to.

SAVOY THEATRE.

New Lighting Arrangements of Outstanding Design.

THE decorative lighting scheme at the Savoy Theatre, London, seen by the public for the first time last week, was designed by Mr. Ionides in conjunction with Mr. Arthur T. Earnshaw, of the Strand Electric and Engineering Co., Ltd. The stage lighting equipment supplied and installed by the same firm consists of "Sunray" magazine battens and footlights, the first batten being of the combination type with six 1 000 W spotting lanterns and a number of 12 in. floodlights, each unit being under separate control, both for switching and dimming. A special batten has been installed at the extreme back of the stage for use with transparencies, while a battery of "Strand Electric" panorama horizon lanterns has been fitted on a movable lighting bridge over the proscenium arch. Perch arcs have been dispensed with and replaced with "Boomerangs" (an Americanism for false return perches) on either side of the stage, each fitted with three 1 000 W spotting lanterns. A "special effect" circuit has been fitted at the side of the stage of 100 A capacity for accommodating any special apparatus which may be required. Four 30 A arc dips have been provided for optical effect lanterns, etc., and six incandescent four-colour dips have been installed with stage traps flush with the stage level (3 on either side), each single plug on individual dips being controlled by a separate switch on the stage switchboard. The stage and auditorium decorative switchboard is installed in a special chamber on the side of the stage, and consists of the Strand Electric Co.'s latest design, fitted with 50 "Sunset" pattern metallic dimmers on all circuits with the exception of the dips, which, having a variable load, are supplied with liquid dimmers. The dimmers are mounted in banks for the red, white, blue and amber stage lighting circuits, two further shafts being provided for the spot lighting of the "Boomerangs" and No. 1 batten. Each chamber is capable of master control, which may be obtained through a worm-drive for slow motion or by a handwheel for quick operation. Special four-way multiple switches have been provided for the fly plugs and all the spotting lanterns, so that they may be controlled by any colour master. The scene control switching panel consists of "all-insulate" tumbler switches, operating remote control master clapper switches. These latter are housed in a special sound-proof chamber. Behind each dimmer regulator handle a pilot light has been fitted in order that the operator may be aware of the progress of his dimming. In close proximity to the stage switchboard the front-of-house decorative control board is installed of the same construction as the stage lighting board, but fitted with ten "Sunset" dimmers. A complete set of "cue" lights is installed in the stage manager's corner.

The whole of the battens are suspended on the counterweight system, in order that they may be easily raised or lowered for cleaning and maintenance purposes. Separate circuits are provided in the batten lighting for working lights on the stage independent of the ordinary stage lighting, while a large chamber has been built in the ceiling of the auditorium to accommodate the F.O.H. spotting lanterns. Special signs to the design of Messrs. Easton and Robinson, the architects for the exterior of the building, have been manufactured and installed by Strand and Interchangeable Signs, Ltd., a subsidiary company of the Strand Electric and Engineering Co., Ltd., who have been responsible for the complete installation.

We have received from the WESTINGHOUSE ELECTRIC AND MANUFACTURING CO., South Philadelphia Works, Philadelphia, Pa., leaflet 3 907 D, dealing with 5 to 750 B.H.P. turbines; 20 392 describing cog belt drives for industrial services; D.M.F. 5 154, multiple retort underfeed stokers; 20 342 B, 1½ and 3 kW turbo-generator units, 20 312 A, synchronous motors for centrifugal pump drive; 20 391, type C.S. squirrel cage motors; 20 405, unbreakable terminal blocks; 1 034 D, type S.K. motors; 1 611 B, magnetic starters; 20 403, reversing line startors; 20 386, line start squirrel cage motors; 1 653, speed regulating and starting rheostats; 20 132 B (superseding 20 132 A and 20 133 A), distribution transformers; D.M.F. 5 179, assembled switchboards of steel; 21, winding material for traction armatures; 22, gear cases for mining and industrial locomotives; 23, armature shifts for mining and industrial locomotives; 24, sleeve type armature and axle bearings for similar locomotives; D.M.F. 5 134, multiple unit and articulated car applications; 20 402, railway signal transformers; D.M.F. 5 155, trunk line electrification; and 20 190, 55 ton, 300 H.P. oil-electric locomotives for switching service (sheet 31), and 43·5 ton oil-electric motive power units for similar service (sheet 30A).

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

WARRINGTON GUARDIANS, November 2nd.—Two electrically driven hospital lifts, for Whitecross Institution buildings. Particulars, until November 2nd, from Mr. A. Bottomley, Union Offices, Warrington, or Messrs. W. and S. Owen, Palmyra Square Chambers, Warrington; deposit £5 5s.

BO'NESS CORPORATION, November 4th.—Electric lighting work in connection with erection of 24 houses at Philpingstone Road, Bo'ness. Intending offerers should apply to the Director of Housing by November 4th.

DERBYSHIRE COUNTY COUNCIL, November 4th.—Electric light installation in new block at Bretby Hall Orthopædic Hospital, near Burton-on-Trent. Particulars from Messrs. Martin and Martin and W. H. Ward, 106, Colmore Row, Birmingham; deposit, £1 1s.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, November 7th.—Installation work in connection with Council's assisted wiring scheme. Specification, etc., from Mr. R. Willis, 37, High Street, Cheadle, Cheshire.

BRADFORD CORPORATION, November 9th.—Twelve months' supply of stores to the tramways department, including electrical fittings for tramcars, insulating material, insulated bolts, copper controller contacts, etc. Schedules, etc., from Mr. R. H. Wilkinson, general manager, 11, Forster Square, Bradford.

CENTRAL ELECTRICITY BOARD, November 9th.—Supply and erection of overhead 33 000 V transmission lines in South Lincolnshire, in connection with Mid-East England scheme. Specification (No. M.E.E.—S.L.1) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

MANCHESTER CORPORATION, November 12th.—Supply and erection of 5-ton electrically driven overhead travelling crane. Specifications, etc., from the General Manager, Corporation Tramways, 55, Piccadilly, Manchester.

SWALLOWNEST HOSPITAL, November 13th.—Electric light installation, for South Rotherham and Kiveton Park District Isolation Hospital Committee. Specifications, etc., from the clerk, Mr. A. H. Styring, 6, North Church Street, Sheffield; deposit £1 1s.

WAREHAM CORPORATION, November 16th.—Four centrifugal pumps and electric motors, with automatic control, etc. Specifications from Mr. W. E. Blizard (Messrs. Lemon and Blizard), Castle Lane, Southampton; deposit £2 2s.

MID-GLAMORGAN WATER BOARD, November 18th.—Electric lighting work, supply of transformers, switchboards, meters, etc., in connection with construction of pumping station, etc., at Schwyll, Ewenny, near Bridgend, and installation of electrical depth transmitters on various reservoirs, with cables, etc. Specifications, etc., from the Board's Offices, Bridgend, or from Messrs. Thomas and Morgan and Partners, civil engineers, Pontypridd; deposit £2 2s.

EAST RETFORD CORPORATION, November 19th.—Electrically driven centrifugal borehole pump (60 000 gall. per hour). Specification from Mr. S. O. Pacey, Gas and Water Electricity Offices, East Retford; deposit £2 2s.

WALLINGFORD RURAL DISTRICT COUNCIL, November 19th.—Electric light wiring of 34 houses at Cholsey, Berks. Specification, etc., from the Clerk, 7, St. Martin's Street, Wallingford.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

AUCKLAND ELECTRIC POWER BOARD, November 4th.—Distribution pillar shells and link units and cable sealing ends. (Reference B.X. 5 682.)

AUCKLAND ELECTRIC POWER BOARD, November 4th.—Low tension porcelain insulators, etc. (Reference B.X. 5 648.)

EGYPTIAN DEPARTMENT OF PUBLIC HEALTH, November 5th.—Supply of 31 electric refrigerators. (Reference A.X. 8 632.)

TORONTO MUNICIPALITY, November 5th.—One 10 000 000 gallon centrifugal pump, and electric motor, with bedplate, switchboard, etc. (Reference A.X. 8 703.)

INDIAN STORES DEPARTMENT, November 12th.—Battery charging motor generators, transformer and oil switch, for Simla wireless station (order No. N. 10 159). (Reference B.X. 5 774.)

NEW ZEALAND POSTS AND TELEGRAPHS, November 12th.—Four-conductor telephone operators' cords. (Reference B.X. 5 685.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, November 12th.—Supply of 15 kW generating set for installation on the "Maui Pomare" (tender No. 369). (Reference B.X. 5 683.)

Telephone Material for Australia.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 12th.—Transmitters and associated parts (schedule C. 477). (Reference B.X. 5 653.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 12th.—Receivers and associated parts (schedule C. 477). (Reference B.X. 5 656.)

CHILEAN STATE SUPPLY DEPARTMENT, November 14th.—Telegraph material. (Reference B.X. 5 746.)

INDIAN STORES DEPARTMENT, November 14th.—Supply and erection of crude oil engine-driven d.c. generating set motor generator set and switchgear, for Military Engineering Services, Razmak (order Nos. N. 9 886 and 10 075). (Reference B.X. 5 744.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, November 14th.—Supply of 400 000 lb. of hard drawn copper wire, 2 000 lb. of soft drawn copper wire and 2 000 lb. of soft drawn tinned copper wire (tender No. 173). (Reference A.X. 8 510.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, November 14th.—Telephone cable, terminal strips and paper sleeves (tender No. 1 565). (Reference B.X. 5 813.)

BOMBAY, BARODA AND CENTRAL INDIA RAILWAY CO., November 15th.—(1) Primary battery supplies; and supply of (2) gasfilled and vacuum lamps, (3) overhead contact wire and stranded catenary cable. Specification (10s.) from the secretary, Mr. S. G. S. Young, The White Mansion, 91, Petty France, Westminster, S.W.1.

SOUTH AFRICAN RAILWAYS AND HARBOURS, November 15th.—Supply of 42 000 lb. of galvanised signal wire and 31 500 lb. of galvanised point wire (tender No. P.S. 2 025). (Reference A.X. 8 712.)

INDIAN STORES DEPARTMENT, November 17th.—Supply of electric cables for 12 months (order No. 9 920). (Reference B.X. 5 808.)

GREAT NORTHERN RAILWAY (IRELAND), November 18th.—Six or 12 months supply of stores, including electric fittings, lamps, cable and wire (form 11), and signalling materials (form 26). Tender forms (1s. each), from the Secretary, Amiens Street Station, Dublin.

INDIAN STORES DEPARTMENT, November 18th.—Supply and erection of two 20 kW oil engine driven d.c. generators, etc. (order No. N. 10 253). (Reference B.X. 5 757.)

NEW ZEALAND POSTS AND TELEGRAPHS, November 18th. Resistance spools (P. and T. 151/1832). (Reference B.X. 5 716.)

EGYPTIAN MINISTRY OF THE INTERIOR, November 19th. Supply of 160 H.P. Diesel-electric generating set for Manfalout power station (Assiut Province). (Reference B.X. 5 720.)

NEW ZEALAND POSTS AND TELEGRAPHS, November 19th.—Telephone transformers (P. and T. No. 151/1807). (Reference B.X. 5 718.)

NEW ZEALAND POSTS AND TELEGRAPHS, November 19th.—Automatic wall and table telephones (P. and T. No. 151/1825). (Reference B.X. 5 717.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 19th.—Supply of telephone generators and motor generators (schedule No. C. 479). (Reference B.X. 5 662.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 19th.—Motor generators (schedule C. 486). (Reference B.X. 5 694.)

VICTORIAN ELECTRICITY COMMISSION, November 25th.—Watt-hour meters, recording instruments and remote metering equipment, for Metropolitan terminal stations and sub-stations (specification No. 29/92.) (Reference B.X. 5 614.)

Digitized by Google

Victorian Electricity Commission, November 25th.—Switchgear, for Yallourn power station (specification No. 29/103). (Reference B.X. 5 636.)

Postmaster-General's Department, Melbourne, November 26th.—Vitreous resistances, each consisting of wire element wound in vitreous spool, for telegraph battery feeds (schedule C. 489). (Reference B.X. 5 696.)

Melbourne City Council, November 27th.—Totally-enclosed, metal clad, 6 000 V, three-phase switchgear (specification No. 1 000). (Reference B.X. 5 708.)

Melbourne City Council, November 27th.—Supply of 600 V d.c. switchgear (specification No. 1 001). (Reference B.X. 5 734.)

Victorian Railway Commission, November 27th.—Indication transformers for railway signalling (contract No. 43 412). (Reference B.X. 5 737.)

Victorian Railway Commission, November 27th.—Supply of automatic oil switches (contract No. 34 411). (Reference B.X. 5 735.)

Western Australia Government, November 29th.—Supply and erection at Perth of (*a*) boiler house equipment, and (*b*) 12 500 kW turbo-generator and condensing plant. Specifications (£1 1s. for each; not returnable) from the Agent-General for Western Australia, Savoy House, Strand, London, W.C.2.

Egyptian Ministry of the Interior, November 30th.—Diesel engine driven electric lighting installation at Abou-Tig. (Reference B.X. 5 791.)

Bloemfontein Municipality, December 2nd.—Supply of two electrically driven low lift pumping units and two electrically driven high lift pumping units, with cables, starters, valves, etc. (contract No. 18, 29/30).

Indian Stores Department, December 3rd.—Ceiling and table fans. (Reference B.X. 5 672.)

Victorian Electricity Commission, December 9th.—Supply of 3 000 kVA transformers and spares (specification No. 29/119.) (Reference B.X. 5 775.)

Postmaster-General's Department, Melbourne, December 10th.—Switchboard keys and parts (schedule No. C. 496). (Reference B.X. 5 776.)

Postmaster-General's Department, Melbourne, December 10th.—Electric lamps, lamp caps and sockets for telephone purposes (schedule C. 497). (Reference B.X. 5 783.)

Victorian Electricity Commission, December 16th.—Oscillographic equipment (specification No. 29/115). (Reference B.X. 5 692.)

Postmaster-General's Department, Melbourne, December 17th.—Secondary batteries (schedule C. 505). (Reference B.X. 5 777.)

Postmaster-General's Department, Melbourne, December 17th.—Telephone fuses, heat coils and protectors (schedule C. 498). (Reference B.X. 5 784.)

Postmaster-General's Department, Melbourne, December 17th.—Loading coil pots (schedule C. 499). (Reference B.X. 5 785.)

Egyptian Ministry of Public Works, December 28th.—Supply and erection at site of Mankabad Barracks of three Diesel engine driven electric generators, and sinking of two wells. Specifications (£1 0s. 6d., not returnable) from Chief Inspecting Engineer, 41, Tothill Street, Westminster, S.W.1.

Egyptian Ministry of Public Works, January 4th.—Supply and erection at site of Meadi Barracks, Cairo, of two Diesel engines to drive existing generators. Specifications (£1 0s. 6d. not returnable) from Chief Inspecting Engineer, 41, Tothill Street, Westminster, S.W.1.

Postmaster-General's Department, Melbourne, January 7th.—Supply of testing instruments (schedule C. 504). (Reference B.X. 5 786.)

Equipment Required for Australasia.

Postmaster-General's Department, Melbourne, January 7th.—Supply of timing clocks (schedule No. C. 507). (Reference B.X. 5 762.)

Victorian Electricity Commission, February 3rd.—Electrically-driven mobile coal-trimming machine, for Yallourn power station. (Reference A.X. 8 681).

New Zealand Public Works Department, March 11th.—Switchgear and controlling equipment, for Timaru, Waitaki power scheme, section 75. (Reference B.X. 5 798.)

New Zealand Public Works Department, March 11th.—Supply of 110 kV switchgear, for interconnecting auto-transformers, for Waitaki power scheme, section 76. (Reference B.X. 5 797.)

New Zealand Public Works Department, March 11th. Supply of 66 kV switchgear and protective system for Lyttelton, Lake Coleridge power scheme, section 217. (Reference B.X. 5 796.)

Victorian Railway Commission, March 30th.—Supply of d.c. neutral relays for power signalling purposes (contract No. 43 457). (Reference B.X. 5 793.)

Tenders Accepted.

Brighton Corporation.—Siemens Bros. and Co., Ltd., supply of tube heaters, £190.

Carlisle Corporation.—British Thomson-Houston Co., Ltd., e.h.t. switchgear, £7 961 15s.

Ilford Corporation.—Foster Engineering Co., Ltd., supply of spare transformer, £128 10s.

Portsmouth Corporation.—Johnson and Phillips, Ltd., cable in connection with extensions to Sarisbury.

Taunton Corporation.—Electricars, Ltd., one 2-ton, electric, low loading, refuse collection vehicle, £828.

Fulham (London) Borough Council.—H. Estall, wiring consumers' premises under rental wiring schemes. (Recommended.)

East Ham Corporation.—British Brown-Boveri, Ltd., supply of 500 kW mercury arc rectifier, £2 395. (Recommended.)

Poplar (London) Borough Council.—Standard Telephones and Cables, Ltd., supply of cable, £404 17s. 6d. (Recommended.)

Worcestershire Education Committee.—J. Freeman, electric light installation at headmaster's house, Halesowen Grammar School, £42 10s.

Heston and Isleworth Urban District Council.—Electricars, Ltd., four 2-ton, low loading, electric vehicles, £519 each. (Recommended.)

Liverpool Corporation.—British Thomson-Houston Co., Ltd., supply and erection of main auxiliary switchgear section at Clarence Dock power station, £72 651.

General Post Office.—Cable manufacture, supply, drawing in and jointing: Anglo-Belgian 1930 (land and submarine), Siemens Bros. and Co., Ltd.; Bradford-Huddersfield, W. T. Henley's Telegraph Works Co., Ltd. Telephone exchange equipment: Regent Automatic Telephone Manufacturing Co., Ltd.

London County Council.—Metropolitan-Vickers Electrical Co., Ltd., provision of rotary convertor, with supervisory control, £5 568; British Thomson-Houston Co., Ltd., supply of six rotary convertors, £16 853; Metropolitan-Vickers Electrical Co., Ltd., two rotary convertors, £6 949 2s. 6d.

Birkenhead Corporation.—Supply of transformers: four 100 kVA, £333, and two 100 kVA, £161, English Electric Co., Ltd.; and three 200 kVA, £360, Brush Electrical Engineering Co., Ltd. Supply of cable: W. T. Glover and Co., Ltd., £3 575; Hackbridge Cable Co., Ltd., £1 189, and Liverpool Electric Cable Co., Ltd., £568 14s.

Stoke Newington (London) Borough Council.—The tender of Andstro (A.A.) Electric, for installation work in private premises, under the assisted wiring scheme, at 18s. per point, which we reported in our last issue as recommended for acceptance, has been referred back to the Electricity Committee for further consideration.

St. Pancras (London) Borough Council.—Standard Telephones and Cables, Ltd., supply of l.t. cable required for ordinary extension works, services, etc., and main e.h.t. lead from new 15 000 kW turbo-generator to switchboard, £1 723. (Recommended.) Other tenders: British Insulated Cables Ltd., £1 749; Pirelli-General Cable Works, Ltd., £1 751; Siemens Bros. and Co., Ltd., £1 770; Hackbridge Cable Co., Ltd., £1 806. Holden and Brooke, pump for grit-extracting plant, £65. (Recommended.)

Metropolitan Asylums Board.—Fuller Accumulator Co. (1926), Ltd., installation of storage battery on training ship "Exmouth," £293. (Recommended.) Also tendered: Alton Battery Co., Ltd., £293; Accumulators of Woking (1928), Ltd., £295; Edison Swan Electric Co., Ltd., £346; alternative £330; Tungstone Accumulator Co., Ltd., £369; Hart Accumulator Co., Ltd., £398; Tudor Accumulator Co., Ltd., £409; Chloride Electrical Storage Co., Ltd., £409; D.P. Battery Co., Ltd., £415; Pritchett and Gold and E.P.S. Co., Ltd., £415; Premier Accumulator Co. (1921), Ltd., £418; Shimwell, Alexander and Co., £430; Phillips and Sons (Chiswick), Ltd., £612; Batteries, Ltd., £678.

WORK IN PROSPECT.

ANSDELL.—Church to cost £5 000, for the Unitarian trustees. Particulars from the architect, Mr. S. Thomas, Fairhaven, Lytham.

AUDENSHAW.—Houses (20), Manchester Road, for Hadfield and Revell.

AYR.—Library extensions, to cost £3 050, for the Town Council. Particulars from Burgh Surveyor.

BEXHILL-ON-SEA.—Church. Particulars from contractors, Pool and Sons, Hartley Wintney, Hants.

BRADFORD.—44 houses on White Abbey site. Particulars from R. J. Packett, Queensbury, contractor.

CHAPELTOWN.—Alterations and additions to picture palace in Station Road. Particulars from Mr. E. Bryan Dean, architect, Mansfield.

COSHAM.—Children's homes at Peaked Field, to cost £30 503. Particulars from Bevis, Ltd., Portsmouth.

HOLBEACH.—Additional 20 houses for Urban District Council. Particulars from Surveyor.

HOUNSLOW.—Houses (126), for Urban District Council. Particulars from contractors, Blackwell and Meyer, Bexley Heath.

LINCOLN.—Additional 34 houses, for Town Council. Particulars from City Surveyor.

MORETON.—School, to cost £6 123. Particulars from contractors, Humphreys, Ltd.

PURFLEET.—Housing scheme (80), for Urban District Council. Particulars from Surveyor.

READING.—Erection of a school in Wardle Avenue. Particulars from Messrs. Ruffle Bros.

READING.—30 houses in Morecambe Road. Particulars from Messrs. Sheppard, Ryder and Taylor.

READING.—2 000 houses, 20 shops, etc., at Whitley Park Estate, for T.C. Particulars from Housing Architect.

SANDERSTEAD.—Telephone exchange, for H.M. Office of Works, King Charles Street, London, S.W.

SEVENOAKS.—Housing scheme (26), for Rural District Council. Particulars from surveyor, Mr. J. N. Prior.

SHANKLIN.—Housing scheme, for Urban District Council. Particulars from architect, Mr. E. C. Cooper.

STAINFORTH.—Alterations and additions to the New Inn, for W. M. Darley, Ltd. Particulars from Messrs. Garside and Pennington, architects, Pontefract.

STOCKPORT.—Telephone exchange, Great Moor, for H.M. Office of Works, King Charles Street, London, S.W.

SWINTON AND PENDLEBURY.—Houses (102), for Urban District Council. Particulars from Surveyor.

THORNE.—New Cinema at Moorends. Particulars from Mr. T. H. Johnson, architect, Doncaster.

TISBURY.—Housing schemes, Fonthill, Gifford, and Tisbury, for Rural District Council. Particulars from the Surveyor.

TWICKENHAM.—Fire station extensions, for Town Council. Particulars from borough engineer, Mr. G. R. King

WAKEFIELD.—Additions to works of Messrs. A. Talbot and Son, manufacturing chemists. Particulars from architect, Mr. F. Simpson, Wakefield.

WEST PELTON.—Sunday schools for Wesleyan Trustees. Particulars from architects, Cowe and Lawson, Chester-le-Street.

WESTON-SUPER-MARE.—Secondary school, for Somerset Education Committee. Particulars from Director of Education, Weston.

WHITEHAVEN.—Additional housing scheme (82), for Town Council. Particulars from the Borough Surveyor.

WHITTLESEY.—Housing scheme (24), for Urban District Council. Particulars from surveyor, Mr. H. W. Hawkins, Old Fletton.

WINCHESTER.—Parish hall. Particulars, Messrs. Carter and Joyce.

WINCHESTER.—New offices for Hants C.C. County Architect, with Sir Herbert Baker collaborating.

WOOLWICH.—Municipal offices and extensions to Public Hall. Particulars from Borough Surveyor.

WOOLWICH.—Offices for Equitable Building Society, 35, George Street. Particulars from Secretary.

WORTHING.—Manual instruction and science rooms, Sussex Road schools. Particulars from Clerk.

WORTHING.—Reconstruction of baths. Particulars from Borough Surveyor.

YEOVIL.—Additional housing schemes (76), for Rural District Council. Particulars from surveyor.

YORK.—Flats, for City Council. Particulars from contractors, Messrs. Flowitt and Gilbert, Doncaster.

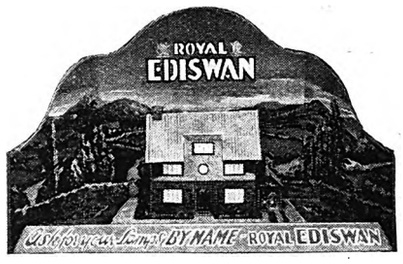
TRADE PUBLICATIONS.

THE "TYPERLITE" Co., 86, Cannon Street, London, E.C.4, has sent us a new supplementary price list of "Typerlite" fittings.

The current price list of the HENDERSON WIRELESS AND ELECTRICAL SERVICE, 54, Queen's Road, Brighton, has been received.

The 1929/30 pocket price list of the WANDSWORTH ELECTRICAL MANUFACTURING Co., LTD., Kenyon Street, Birmingham, is now available.

An illustrated envelope enclosure folder, No. 4150/7, giving details of the company's iron de luxe, has been issued by METRO-VICK SUPPLIES, Trafford Park, Manchester.



A CUT-OUT display model by the Edison Swan Electric Co., Ltd, which is now available for distribution. The design is approximately 38 in. wide and 24 in. high and is printed in colours. The house is lit throughout, and the light is reflected through the headlights of a motor car emerging from the garage. The words "Royal Ediswan" are illuminated and continually change colour. No "flashers" are employed. The display is extremely simple to erect and instructions are printed on the back.

The EDISON SWAN ELECTRIC Co., LTD., of 123, Queen Victoria Street, London, E.C.4, has published three new folders relative to "Tungar" 6 and 12 A battery chargers.

SUPERLAMP, LTD., 92/94, Paul Street, London, E.C.2, has published Edition XXXII of the illustrated list of electrical material, motors, telephones, and domestic appliances.

A number of well produced leaflets dealing with staff signalling systems have been received from the SLIPTON AUTOMATIC TELEPHONE SYSTEM (E. Slipton and Co., Ltd.) of Caxton House, Tothill Street, London, S.W.1.

The METROPOLITAN-VICKERS ELECTRICAL Co., LTD., Trafford Park, Manchester, has published two new descriptive leaflets, 40/1-1 and 40/2-1, dealing with large induction motors and high speed induction motors, respectively.

PHILIPS LAMPS, LTD., 145, Charing Cross Road, London, W.C.2, point out that publication No. 214L, giving particulars of daylight-blue head lamps and "Duplo" anti-dazzle lamps, is now available to the trade upon request.

Publication No. H.118, dealing with multiple telephone cables, P.250, replacing P.206, and dealing with meters, and P.F. 59, relative to aerial cable unions, have been issued by BRITISH INSULATED CABLES LTD., Prescot, Lancs.

ERSKINE, HEAP AND Co., LTD., Lancashire Switchgear Works, Caroline Street, Broughton, Manchester, have issued two pamphlets, O.S. 24 and I. 23 relative to heavy duty oil circuit breakers, and long scale moving iron instruments.

Amongst the latest publications of J. G. STATTER AND Co., Queen Anne's Chambers, Westminster, London, S.W.1, is leaflet No. 203X, dealing with air circuit breakers; another leaflet entitled "Maintenance Instructions for Air Circuit Breakers" has also been published.

The MORSE CHAIN Co., LTD., Letchworth, Herts, has sent us a copy of the new handbook ML 929, dealing with standardised and individually suitable "Morse" chain drives in a range from 1 H.P. up to 60 H.P., as well as further useful information relating to installation, maintenance, chain cases, lubrication, etc.

Amongst the latest publications of J. M. DOUGHTY AND SONS, LTD., of 214, St. John Street, Clerkenwell, London, E.C.1, are two new catalogues dealing with lighting fittings. A somewhat personal touch is added to one of these catalogues by including pictures of the various workshops and a group of the works' staff.

The IGRANIC ELECTRIC Co., LTD., 149, Queen Victoria Street, London, E.C., has published list No. 6 610 dealing with "Springmore" wander-plugs, No. 6 616 concerning the company's l.t. supply unit, No. 6 618 describing the "Igranic" battery charger, No. 6 642 illustrating the type L.T. 92 input transformer for metal rectifiers, and No. 6 482 dealing with short wave h.f. chokes covering 10-80 metres.

ELECTRICITY SUPPLY.

Birkenhead Contracts for Cables—Underground Mains in Maidstone Rural District—Colchester Loans for Wiring and Apparatus—New Plant at St. Pancras—Acquisition of Irish Undertakings—Electricity Supplied to Large Area from Shannon System.

SWANSEA Electricity Committee has decided to obtain an option of a site at Tir John for a generating station.

Burton-on-Trent Electricity Committee seeks sanction to borrow £85 000 for mains, services and transformers.

Spalding U.D.C. is introducing a scheme of assisted wiring for private houses where no extension of cable is necessary.

Driffield U.D.C. has decided to withdraw opposition to the scheme of the Holderness Trust, Ltd., to supply current to the district.

Lincoln Corporation has decided that electrical installations shall be put in 14 houses which are being erected on the St. Giles Estate.

Malling R.D.C. has given consent to the application of Maidstone T.C. for a Fringe Order to supply current to Leybourne Grange.

Birkenhead Electricity Committee has authorised the Electrical Engineer to invite tenders with a view to placing twelve months' contracts for mains and service cable.

Barnstaple R.D.C. has now given its consent to the application of the Bideford Electricity Supply Co. for a Special Order to supply current to certain parishes in the Council's area.

Maidstone Corporation has decided to accede to the R.D.C.'s request to transmit current to the villages of Teston and Wateringbury, by underground cables, instead of by overhead lines.

Colchester Corporation has received sanction to a loan of £7 500 for domestic electrical apparatus for hire, and a like sum for consumers' wiring installations with prepayment meters.

Gillingham T.C. has come to an arrangement with local contractors for electric wiring and fitting, the work to be carried out in rotation, and the borough electrical engineer to take his turn in the work.

St. Pancras (London) Finance Committee recommends the B.C. to seek sanction to borrow £17 340 for electric mains and services and also to apply for an advance by London County Council of £30 000, on account of £42 760, for a 15 000 kW turbo-alternator.

Plans have been drafted for the erection of a power station at Svinov, near Ostrava, in Moravia, which will be capable of supplying energy to the whole of North and Central Moravia as well as Northern Slovakia. The initial capacity of the station will be 42 000 kW and the ultimate capacity 140 000 kW.

The revenue of Wellington (N.Z.) electricity department during the year ended March 31st, 1929, was £326 344, against £340 018 in the preceding year, and, after providing for working expenses, capital and special charges, and placing £20 000 (against nil) to district fund, the net credit balance was £33 868, against £51 607.

The rapidity of hydro-electric development of Canada is shown in recently published statistics. Present developments under way will, when completed, amount to over 2 000 000 H.P., bringing the total Dominion development up to 7 349 232 H.P., representing a 650% increase in 20 years. The total capital investment is estimated at $1 172 600 000.

Stoke-on-Trent Electricity Committee has approved a proposal to lay a main, at a cost of £250, to give a supply to Messrs. Johnson Bros. (Hanley), Ltd., for an electric kiln with a maximum demand of 60 kW. New distribution mains are to be laid in Queen Street and Swan Square, to supersede old mains laid in wooden troughing. The cost will be £1 700.

The Irish Free State Electricity Supply Board and the Provincial Electricity Suppliers' Association have agreed to the formation of an arbitration board to deal with any cases in which the Electricity Board wishes to acquire a permitted undertaking and the permitted undertaker may be unable to agree with the Board as to the price to be paid by the latter for the acquisition of the undertaking.

The Auckland (N.Z.) Electric Power Board's accounts for the year ended March 31st, 1929, show revenue £605 788, against £574 179 in the previous year, and gross profit £300 553, against £303 729. After provision for interest, redemption and sinking funds, depreciation, superannuation, writing off expenditure on preliminary expenses, capitalised interest, etc., balance carried down was £49 458, against £60 999.

Wimbledon Electricity Committee appeared before the Assessment Committee and successfully sustained the Council's objection to the increased assessment of the electricity undertaking in Maldens and Coombe from £3 500 to £4 000.—Sanction is to be sought to borrow £30 000 for mains and services.

Stalybridge, Hyde, Mossley and Dukinfield Electricity Board is applying for power to borrow £54 091, including excess expenditure on building work, railway sidings and crane (Hartshead), £16 418; excess expenditure on plant and plant foundations (Hartshead), £2 673; prospective expenditure on mains, £25 000; and on transformers and switchgear on consumers' premises, £10 000.

A main is to be laid by Stoke-on-Trent electricity department to the proposed sub-station at Greengate Pottery, Tunstall, at a cost of £6 000.—It has also been decided to spend £1 000 upon a main to Stuart Avenue and Longton Road, Ash Green, Trentham.—Another extension of mains, from Etruria sub-station along Garner Street to a new sub-station, at a cost of £3 200, has also been approved.

On October 21st electricity generated under the Shannon scheme was supplied for the first time to virtually all centres of population in the Irish Free State south of a line drawn from Galway to Dublin. It is expected that the area north of Dublin will be linked with the Shannon system within the next five or six weeks. Dublin, which will be the largest consumer of Shannon current, will be the last centre to be supplied. The charges at which Dublin consumers will be supplied have not yet been announced.

Hastings Electricity Committee has obtained sanction to borrow £15 000 for mains and £10 000 for wiring installations.—The Committee recommends the carrying out of certain work, including an overhead line from Northiam via Ewhurst and Staplecross to Cripps Corner, £3 445; overhead lines in these districts and services, £2 990; and two 30 kVA and one 50 kVA transformer, three transformer switches and outdoor sub-station, £755.—The Committee has arranged terms for a supply of electricity for decorative lighting at the pier.

Glasgow Electricity Committee has received from the Glasgow and West of Scotland Retail Drapers' Association a copy of a resolution protesting against the new scale of charges for electricity adopted by the Corporation for commercial lighting, and asking that the rates applicable to shops be reconsidered with a view to a reduction being made. The Committee agreed that the representations be taken into consideration.—The Housing Committee has agreed to receive a deputation from the Hawthorn and Hillend Tenants' Association requesting that the houses at Hillend be supplied with electricity in lieu of the gas supply installed when the houses were built by the County Authorities.

Omagh U.D.C. recently received an offer by Mr. George Harvey in connection with the proposed electricity supply scheme for the town. Mr. Harvey stated that sufficient power for the scheme could be obtained from a waterfall, his property, about three miles from the town. He would let the water power and a mill at the place to the Council at a yearly rent of £300 for the first five years, and assuming that the supply of electricity increased, then an additional £50 per annum until a maximum of £500 was reached. A report was received from Mr. P. A. Spalding, stating that a water-power scheme would be more costly and not as satisfactory as the Council's original scheme to instal engines and generators. The matter was referred to the Electric Lighting Committee for consideration.

Hull Corporation has received sanction from the Electricity Commissioners to the borrowing of £100 000 for mains and services and £50 000 for sub-stations and equipment. The Commissioners have approved in principle the proposal for increasing the cooling tower capacity.—The Electricity Department is to instal, for experimental purposes, cookers and washboilers in 12 houses in each of the Corporation's two estates, Derringham Farm and Hall Road.—Sanction has been given to the supply of areas in the urban district of Corringham, the boroughs of Heverley and Hedon, and the rural districts of Beverley, Skirlaugh, Sculcoates and Partington. The Engineer reports that the total area covered by this section is 120 square miles, and that preliminaries are already in hand for the construction of the necessary trunk lines.

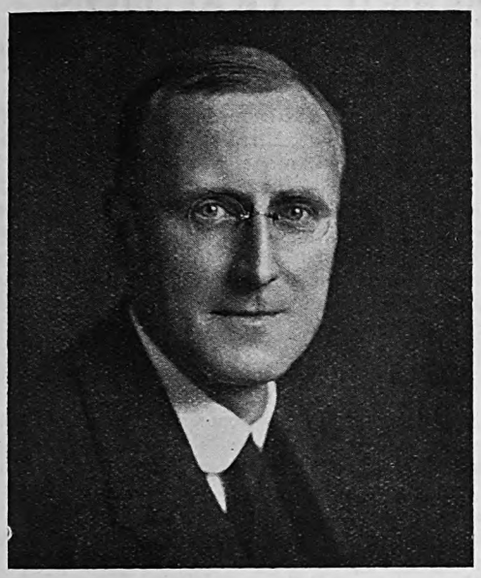
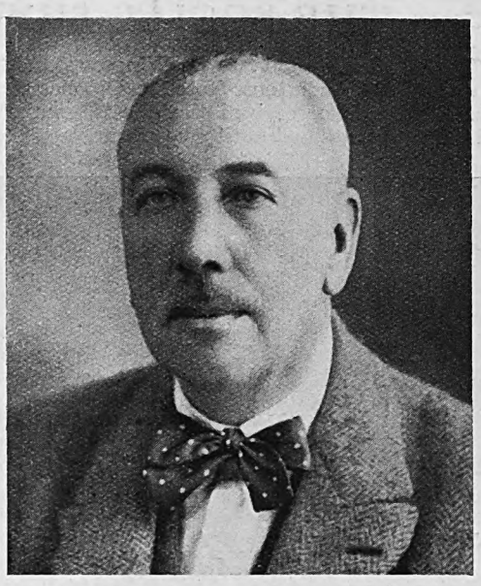
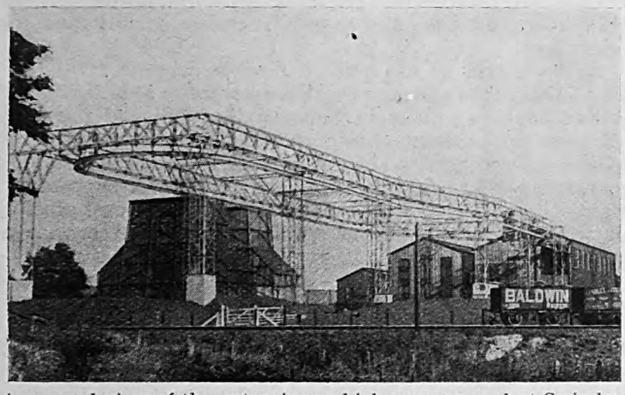
ELECTRICAL NEWS IN PICTURES.



Right. Mr. T. Herbert, the new chairman of the North Western Centre of the Institution of Electrical Engineers, and assistant superintending engineer of the South Lancs. district, P.O. Engineering Department.

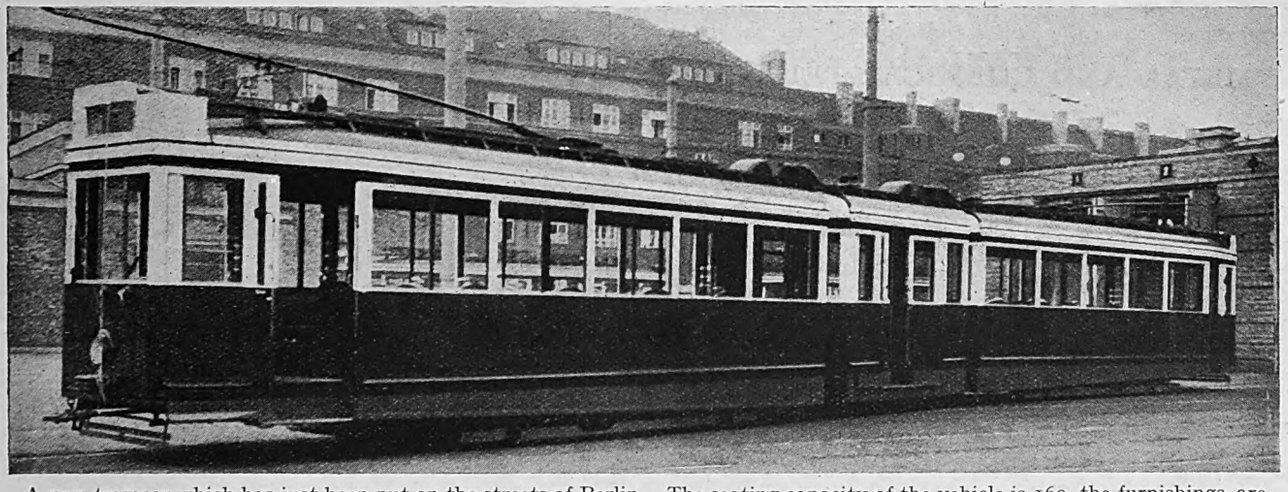
Left. Mr. E. H. E. Woodward, of the Newcastle-upon-Tyne Electric Supply Co., Ltd., who, as announced last week, has been appointed technical assistant to the general manager.





A general view of the extensions which were opened at Swindon on October 26th. The initial plant comprises two 3 750 kW Ljungström turbo-alternators and two of 1 875 kW, but preparations for additional plant are already being made.

Good progress has been made with the construction of the R 100 at Howden, and like the R 101, this vessel is fitted with an all-electric kitchen. One of the cookers is here seen being used in preparing meals for the stand-by crew.



A new tramcar which has just been put on the streets of Berlin. The seating capacity of the vehicle is 169, the furnishings are said to be luxurious, while the lighting arrangements are claimed to be better than those of any other tramcar in the country. Another tramcar which claims to be of unique design is that of the Liverpool Corporation, an illustration and description of which appear on page 548.

Bolton Electricity Committee has obtained sanction to borrow £75 000 for mains and £25 000 for sub-stations and equipment.

Fulham (London) Electricity Committee has acquired a site in Avonmore Road for a sub-station, which will be equipped with two 200 kW transformers, the total cost being £1 390.

Kensington (London) Works Committee has decided that a higher standard of illumination of the streets of the borough generally is desirable, and has authorised the Borough Engineer to submit proposals for improvements.

East Ham Electricity Committee has obtained sanction to loans of £7 290 for distributor mains and £1 748 for feeder mains.

Eastbourne Electricity Committee seeks sanction to borrow £16 000 for a 2 500 kW turbo-alternator, £16 000 for a new boiler and £6 000 for a switch house.

Leigh (Lancs.) Electricity Committee has adopted a scheme for laying conduit lines and cables and providing a sub-station and transformer equipment for electricity supplies in West Leigh and in Pennington. The estimated cost is £6 929.

THE SOCIAL SIDE.

THE London staff dance of Wingrove and Rogers, Ltd., was held at Anderton's Hotel, on October 18th. Major and Mrs. G. D. Ozanne received the guests, numbering about 90, and dancing continued until a late hour.

A scene from the farce "The Whole Town's Talking" as performed by the M-V. Dramatic and Operatic Society.

Herbert Terry and Sons, Ltd., of Redditch, on October 22nd commemorated the 21st anniversary of the establishment of their London office by a dinner at the Holborn Restaurant. Mr. Albert Ball gave an account of the beginnings of the firm which has become recognised as the "Spring Specialists,"

The Royal Naval Divisional Engineers are holding their annual dinner at the London Tavern, Fenchurch Street, E.C., on November 15th, at 6.30 p.m. for 7 p.m., morning dress. Tickets, price 5s. 6d., from Mr. F. W. Davey, 14, Victoria Street, S.W.1; Mr. Eric Wettern, St. Stephens House, Westminster, S.W.1; or at the restaurant.

An amusing debate took place at Magnet House on October 17th under the auspices of the G.E.C. Debating Society, the subject being "Should Bachelors be Taxed?" The mover of the motion put forward the plea that most married men experienced untold hardships in paying income tax, school fees for children and other outgoings. He taunted the bachelors with shirking their national responsibilities and with evading their proper share of the national burden. The bachelors furiously repudiated the slur on their character and termed it an iniquitous and abominable interference with their liberties. One speaker said he rejoiced in the fact that his tobacco bill was twice that of any married man. He poured such scorn on the motion that it was irretrievably lost.

Sodium Bichromate—Per lb. 3⅛d.
Rubber—Para fine, 9⅛d.; plantation, 1st latex, 9d.

*** The metal prices are supplied by British Insulated Cables Ltd.,

THE LEAD MARKET.

The market opened last week with a weak tone in sympathy with other metals, and, according to James Forster and Co., prices fell 5s. per ton, later in the week dropping a further 5s. per ton lower, forward lead selling at £22 16s. 3d. The American market has an easier tone; price unchanged 6·90 cts.

Closing prices on Oct. 25th were £23 12s. 6d. for Oct. £23 8s. 9d. for Nov., Dec. and Jan. 5s. to 1s. 3d.up on the week.

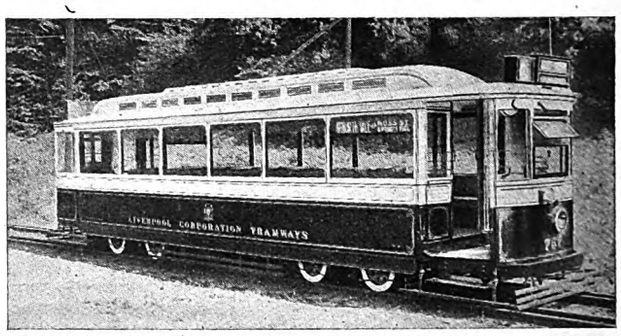
ELECTRIC TRACTION.

Special New Car for Liverpool Corporation Tramways.

A NEW type of tramcar has been designed and developed by Mr. P. Priestly, general manager of the Liverpool Corporation Tramways Department, in conjunction with the English Electric Co., Ltd., of Preston, and has been manufactured wholly by the latter company. A driving equipment consisting of two D.K. 120 motors, each of 60 H.P. at 500 V, is employed, thus giving an exceptionally high power. All four axles are driving axles, so that the whole of the car weight is available for adhesion and the maximum possible acceleration can be obtained. The actual arrangement of motor and truck is that they have been developed as one unit, so that in its completed state the motor forms an integral part of the truck. The motor, which is mounted longitudinally, has a pinion at each end, driving on to a spiral bevel gear wheel which is mounted on a quill surrounding each axle. The quill is mounted on large roller bearings secured in a cast steel casing to the main frame of the motor, so that the gears are always correctly in mesh. Similarly, in order to retain this correct meshing, the armature of the motor is also mounted on roller bearings, and, therefore, as no wear takes place in the bearings, the correct pitch line will be maintained between the pinion and gear, and generally ensure smooth and silent operation.

At each end of the quill, a flexible drive is arranged for transmitting the power to the driving wheels. This flexible drive allows relative movement between the quill and the axle in all directions without setting up additional strains in any part of the driving gear. The truck, which really consists of the motor, together with the two end casings, is supported on eight coil springs, and the whole is mounted on cast steel caps in which are enclosed the special anti-friction bronze axle bearings.

The arrangement for lubrication is also very simple, as each casing at the end of the motor forms an oil bath, from which all the axle and motor bearings, flexible drive and gears, are lubricated. The control equipment is arranged for operation with coupled cars. The controllers are of the English Electric drum type, and have been arranged so that it is possible to drive the two-car unit from either end of the unit, or, alternatively, to drive each car separately from either end. The only extra switchgear necessary is the change-over switch on



The new tramcar of the Liverpool Corporation Tramways Department, details of which are given above.

each car, together with a three-way coupler. The line contactors have been incorporated so that when shutting off from power the whole of the current braking is taken on these contactors. The feature of electric braking has been retained, though in order to keep the control as simple as possible, it has been arranged that the electric brake, which is used in Liverpool essentially as an emergency brake, is operative on the driving car only. For the same reason of simplification, the reverse position on each controller only operates the motors on the driving car. The other items in the electrical equipment are standard units as used in the more normal tramcar equipment, and consist of D from A circuit breakers, F.R. type resistances, all manufactured by the English Electric Co., and the trolley made to the special design of the Liverpool Tramways Department. The body which has been fitted to this car is of the super luxury type, having a seating capacity of 44. Special attention has been paid to the lighting, and inside the saloon 13 lights have been fitted, four down each side, and five down the centre under the Monitor roof. The fittings consist of large base holders with "Super-lux" white glass shades and "Silvalux" opal gasfilled lamps.

COMPANY NEWS.

Effect of American Collapse on British Electrical Price—Chloride Electrical Storage Co.'s Increased Distribution—Amalgamated Wireless Improved Dividend.

THE speculative collapse in New York has naturally not been without its effect on this side, and prices of most of the leading electrical shares are lower than a week ago, and by the time these lines are read will probably have further receded. At the time of writing, General Electrics at 45s are 2s. 6d. down; Callenders at 75s. show a decline of 5s. and British Insulateds at 80s. of 2s. 6d. Henley's at 127s. 6d., are 1s. 3d. down and Brush stock at 126½ is 4 points down. Cables and Wireless A and B stocks at 80 and 45⅛ respectively, show a decline of about four points, and Marconi Marine shares have dropped 5s., to 42s. 6d.

SIMMS MOTOR UNITS, LTD.—Intm. div. on ord. shs. of 5% (actual), less tax (same as last year), is payable to-day (Nov. 1).

ADELAIDE ELECTRIC SUPPLY CO., LTD.—Usual fin. div. on ord. shs. of 6% actual, again makg. 12%, tax free, will be payable on Dec. 2.

UNITED RIVER PLATE TELEPHONE CO., LTD.—Intm. ord. div. of 3%, tax free (same as last year) on acct. of year endg. Dec. 31 next, is recommended.

CHLORIDE ELECTRICAL STORAGE CO., LTD.—Intm. div. of 10% actual, tax free (compared with 5% last year) has been declared for the "A" and "B" shs.

ANGLO-PORTUGUESE TELEPHONE CO., LTD.—Transfer books relatg. to ord. shs. are closed from Nov. 1 to 14, inclusive. Intm. div. 3%, less tax, will be paid on Nov. 15.

FOUNDATION CO.—Net pft. for year ended June 30, 1929, after makg. reserves for depreciatn., £22 655, agst. £21 282. It is proposed to carry to contracts res. £5 000. Div. on pref. shs. at rate of 8% p.a., less tax; fwd. £26 168, agst. £18 112.

WESTERN UNION TELEGRAPH CO.—Gross revs. for nine months to Sept. 30, 1929, $111 120 485, agst. $102 582 646. Deductg. total exes. left blce. $14 226 724 ($13 937 224), and deductg. int. on bonded debt, $2 707 349, agst. $2 705 858, left net income $11 519 175, agst. $11 231 366.

AMALGAMATED WIRELESS (AUSTRALASIA), LTD.—Company has published blce. sheets for past two years. Pft. for past year was £80 000, increase £31 000, and div. 8%, increase 2%. The cost of the beam service is £304 000. Subscribed cap. is £744 000, of which Commonwealth subscribed £300 000.

EVER-READY CO. (GREAT BRITAIN), LTD.—Directors have declared intm. divs. for half year ended Sept. 30, 1929, at rate of 10% p.a. on pref. shs., and 10% actual on ord. shs. (same on increased cap.), both payable on Nov. 30, 1929.

OFFICIAL QUOTATIONS.—The Stock Exchange Council has granted official quotations to $3 155 000 cap. stk. of the American Telephone and Telegraph Co.; £103 082 income deb. stk. (6% participatg.) of Aron Electricity Meter, Ltd., and 12 482 £1, fully paid, ord. shs. of Underground Electric Railways Co. of London, Ltd.

AMERICAN WIRELESS MERGER.—It was announced on Oct. 26 that a merger had been effected between the Radio Corporation of America, the General Electric, Westinghouse Electric, and the Victor Talking Machine Co., for the production and sale of wireless equipmt. The combine will come into operation on Jan. 1 next.

Company Meeting.

DRAKE AND GORHAM, LTD.—Mr. B. M. Drake, presiding at the meeting on Tuesday, said it was satisfactory that they had been able to maintain the same rate of dividend as for the previous three years and to continue placing a substantial sum to general reserve, thereby increasing the book value of the proprietors' shareholdings. The spread of supply main's was opening up new fields for their activities. The chairman then mentioned a number of important contracts which had been entrusted to the company, including those at the Bank of England, Lloyd's Bank head offices, Harrods, Ltd., Concrete Aggregates, Ltd., Lord Lonsdale's estate and stud farm, Brookman's Park broadcasting station and the Ninth Church of Christ Scientist. The electric sign department, he said, continued to expand, and the value of an agency which they held for the north-western district appeared to be increasing.

New Companies.

BULL (W. J.), LTD.—Cap., £1 000. General merchants, electricians, etc. Reg. Office: 57, Farringdon Road, London, E.C.1.

CONVECTED HEAT CO., LTD.—Cap., £500. Electric light engineers, etc. Solicitor: R. Harradine, Moorgate Station Chambers, London, E.C.2.

ROBINSON AND REILY, LTD.—Cap., £4 000. Electrical engineers, manufacturers of machinery, etc. Reg. Office: The Garage, Trundle Street, Hull.

BRITISH CONTROLLED FINANCE CORPORATION, LTD.—Cap., £2 750. Capitalists, financiers and concessionaires, electrical engineers and contractors, etc. Reg. Office: 90, Fenchurch Street, London, E.C.3.

DIRECT FURNISHERS, LTD.—Cap., £50. Electricians, etc. Reg. Office: 75, Portland Street, Leeds.

HUDSON RADIO, LTD.—Cap., £100. Engineers, advisers, experts and consultants in connection with wireless, etc. Secretary: M. Marks, 65/6, Basinghall Street, London, E.C.

BRIDGES-BOWER, LTD.—Cap., £500. Wireless, radio and electrical engineers, manufacturers of and dealers in electrical apparatus, etc. Reg. Office: 77, New Oxford Street, London, W.C.1.

BRITISH ALARMEX CORPORATION, LTD.—Cap., £3 000. Manufacturers of or agents for fire alarms, fire extinguishing appliances and equipment, etc. Reg. Office: Oswaldestre House, Norfolk Street, London, W.C.2.

WILLIAM EDWARDS (BIRMINGHAM), LTD.—Cap., £2 000. To acquire business of electrical turnery and general woodworker now carried on by J. M. Boydell as "William Edwards," at 248, Bell Barn Road, Birmingham.

RADIO REPAIRS, LTD.—Cap., £700 in £1 shares. Objects: To carry on the business of consulting wireless experts, designers and manufacturers of, agents for, and dealers in radio, wireless, electrical and telephone appliances, etc. Reg. Office: 5, Carshalton Grove, Sutton, Surrey.

ROE AND WILDERS, LTD.—Cap., £3 000. To acquire business of manufacturer of railway carriage, tramcar, and other metal fittings, including metal fittings for telephones, chandeliers, etc., now carried on by F. Clews as "Roe and Wilders" at 89, Leopold Street, Birmingham.

L. COLE AND SONS, LTD.—Cap., £500. Engineers, advisers, experts, consultants, contractors, etc., in connection with wireless telephony or telegraphy, etc. Subscribers: R. H. Currell, 79, Scott's Road, Leyton, London, E.10; C. H. Blazier, 11, Downhurst Avenue, Mill Hill, N.W.

HOME-TALKIE SETS, LTD.—Cap., £100. Manufacturers of, agents for and dealers in instruments for producing or reproducing sound, apparatus and installations for synchronisation of sound with motion picture photoplays, etc. Reg. Office: Kent House, 87, Regent Street, London, W.1.

MUNICIPAL FINANCE.

Points from the Past Year's Accounts of Electricity Undertakings.

THE total revenue for the year 1928–9 of the 146 undertakings included in the following table and in the tables which appeared in our issues of August 9th and September 13th, was £24 156 796. The gross profit on the year's working of the undertakings was £11 650 468, and the aggregate sales of electricity amounted to 4 126 515 884 kWh, while 61 undertakings out of the total number have contributed out of the year's profits or from reserve an aggregate of £426 398 to the relief of rates. In many cases the costs include items of a capital nature, and net profits have been reduced as the result of reduction of charges for current. As it is desired to make these tables as complete as possible, the Editor will be pleased to receive similar particulars of other municipal electricity undertakings.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

APPLEBY'S RADIO ELECTRIC, 119, Nursery Road, Birmingham, wireless dealers. £11 2s. 1d. September 11th.

ARMSTRONG, Mr. F. N., 22, Park Street, Shirley, wireless dealer, £15 18s. 8d. September 4th.

EVANS, Edward, 6, Vine Street, and Sandy Road, Seaforth, electrical contractor. £32 1s. 8d. September 16th.

GARTER ELECTRICAL MANUFACTURING CO., LTD., Church Street, Staines. £15 5s. 11d. September 19th.

HAYES ENGINEERING CO., High Street, Hayes, wireless dealers. £22 8s. 6d. September 4th.

LANGHAM RADIO, 96, Regent Street, W., radio manufacturers. £19 0s. 4d. September 12th.

OATES, J. AND J., 53, Haymarket, S.W., electrical contractors. £19 0s. 1d. September 11th.

PARCELL, Mr. E., Eastcheap, Letchworth, wireless dealer, £31 15s. September 4th.

RADIO HOUSE, 510, Stockport Road, Longsight, wireless dealers. £13 11s. 2d. September 4th.

SHILVOCK (G.) AND SON, 197, Station Road, Rugby, electrical engineers. £12 19s. 1d. August 31st.

STOURBRIDGE BATTERY AND ELECTRIC CO., Court Street, Stourbridge, electrical engineers. £17 18s. September 11th.

TERRACE RADIO AND SPORTS SUPPLIES, 4, Terrace Road Upton Manor, radio engineers. £13 18s. 7d. September 4th.

WARDLEWORTH, L. AND V., 335, Bury Old Road, Heaton Park, wireless dealers. £13 5s. September 4th.

WOOD'S RADIO DEPOT, 142, High Road, Leyton, wireless dealers. £17 3s. 6d. September 4th.

Deed of Arrangement.

ABBOTT, James William, trading as ELECTRICAL ENGINEERING AND SUPPLY CO., 26, The Bank, Barnard Castle, electrical engineer. Dated October 26th, filed October 28th Trustee, H. Wood, Newgate, Barnard Castle, C.A. Secured creditors £217; liabilities unsecured, £556; assets, less secured claims, £328

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure: Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

HANSON, Harold, and JACKSON, Alfred Vincent, trading as THE AVON ELECTRIC CO., Chesnut Street, Liverpool. A meeting of creditors of the above was held recently at the offices of John Airey and Co., accountants, Liverpool, when a statement of affairs was submitted which showed liabilities of £454, of which £428 was due to unsecured creditors. In addition, there were fully secured creditors for £23, holding security valued at a similar amount, and partly secured creditors' claims amounted to £35, the security being valued at £9, leaving £26 to rank as unsecured. The assets comprised cash, £2; stock in trade, £22, valued at £15; trading fittings, etc., £1 15s.; work in progress, £10; balance due from purchasers of Aigburth Road business, £239; Marconi royalty, £5; and book debts, £12; making a total of £284, from which preferential claims of £64 had to be deducted, leaving net assets of £220, or a deficiency of £234. One creditor at the meeting, however, intimated a further account of about £20, which would increase the deficiency to £254.

It appeared that the debtors commenced business in 1920 with £30 capital. In December, 1927, they estimated that they had a surplus of assets over liabilities of about £100. They then opened a branch in Aigburth Road for the sale of wireless accessories, but they found that this involved them heavily, and as a consequence they became short of capital. Eventually they sold that branch for £350. A full set of books had not been kept, but it was stated that at one time the drawings were about £3 per week each, but they later dropped to about £2, and more recently 30s. each per week. About six months ago they opened a branch at Cherry Lane for the purpose of charging batteries, but this had not been successful and had only contributed to their present position. No definite offer was forthcoming, and it was suggested that the purchase money of the Aigburth Road branch might be paid to a trustee and the debtors allowed to carry on business. They proposed to increase the amount spread over a period of 18 months, and pay in all a composition of 15s. in the £. After some discussion, the creditors resolved to adjourn the meeting to enable the accountant acting in the matter to investigate the position further.

REPRODUCTION LTD., 5, 6 and 7, Dysart Street, Wilson Street, E.C.2, electrical wireless and gramophone dealers. In pursuance of the provisions of the Companies (Consolidation) Act, 1908, a meeting of the creditors in this matter was held on October 28th at the Institute of Chartered Accountants, Moorgate Place, E.C., when the chair was occupied by Mr. H. B. Keeping, 18, Ironmonger Lane, E.C., the liquidator of the company. A statement of affairs was submitted which disclosed liabilities of £6 173, all due to unsecured creditors. In addition, there were six per cent. debentures issued for cash amounting to £500 and interest at five per cent., totalled £5 18s. 4d. The assets consisted of cash in hand, £28; cash at the bank, £25; book debts, £460, estimated to realise £224; stock, loose tools, fixtures and fittings, £2 308, expected to realise £580, making total assets of £858, from which had to be deducted the debentures amounting to £506, and preferential creditors totalling £19, leaving net assets of £333. Dealing with the heavy depreciation of the stock the liquidator said that it had been written down by such a large amount because it would be difficult to dispose of having regard to the high price of the machines, which, for the "Rhapsody Twin" was £130 and the buyers and dealers required guarantees to be given. As the company was now in liquidation that would be impossible, and any parts of the machines would not be able to be replaced. The liquidator mentioned that he would endeavour to dispose of the stock to advantage if he were continued in his appointment, but it would not be advisable to prolong the liquidation indefinitely, with regard to the debenture, that was created in July of this year. After discussing the position, several of the creditors considered that the liquidation should not be confirmed but the liquidator declared that his appointment as liquidator was confirmed on the proxies received in his favour.

London Gazette, etc.

Bankruptcy Information.

COLES, Allan James, 424, Pinner Road, Harrow, electrical engineer and contractor. First meeting, November 5th, 2.30 p.m., 29, Russell Square, London, W.C.1 Public examination, November 27th, 10.30 a.m., Court House, St. Albans.

JAMES, John Price, lately 2A, Neath Road, Hafod, Swansea, wireless engineer. Receiving order, October 21st. Debtor's petition. First meeting, November 5th, 11 a.m., Official Receiver's Offices, Government Buildings, St. Mary's Street, Swansea. Public examination, November 22nd, 11 a.m., Town Hall, Swansea.

NEWMAN, Edmund Harold, and BAYNES, Maudslay, lately 96, Regent Street, London, W.1, trading as LANGHAM RADIO, wireless manufacturers. Receiving order, October 23rd. Creditor's petition.

Notice of Dividend.

BLOOD, Ralph, 44 and 46, Station Road, Padiham, Lancashire, wireless dealer and electrician. First and final dividend, 1s. 11½d. per £, payable, November 4th, Official Receiver's office, District Bank Chambers, Blackburn.

Notice of Intended Dividend.

PAGE, Edgar George Matthews, Bohemia Road, St. Leonards-on-Sea, dealer in wireless sets and accessories. Last day for receiving proofs, November 12th. Trustee, R. W. Cave, 12a, Marlborough Place, Brighton, official receiver.

Partnership Dissolved.

WEBB AND RODGERS (Albert Wallace RODGERS and Leonard Charles WEBB), electricial engineers and contractors, 34, King Street, Bristol, by mutual consent, as from October 22nd, 1929. Debts received and paid by A. W. Rodgers, who will continue the business.

Bankruptcy Proceedings.

MARSH, Basil, 17, Victoria Road, Brighton, lately 6, Victoria Road, Brighton, Sussex, electrician. The adjourned public examination herein was held recently at the Court House, Church Street, Brighton. It was stated by the debtor that between August and September, 1928, he had been pressed by creditors, and before Christmas had paid out an execution after the bailiffs had been in one day. Early in January he was pressed by creditors and he formed a company, he and another being the only shareholders, and each having a £1 share. In February the debtor purposed to assign to the company his assets in consideration of a sum of £100, but he had not received the money. His assets at that time were about the same as on December 31st, namely, £402. On March 4th he was informed that he was allotted six £100 debentures in the company, but he never had them. On July 4th he purported to mortgage the lease to his solicitor. The debtor was questioned regarding his assignment of the assets, and he replied that he considered the lease as part of the assets, but had kept it and debts amounting to £346 12s. 7d. owing to him. In May last he had received a letter from his solicitor relating to the transfer of one of the six debentures allotted to him and on June 21st he signed a transfer of the £100 debenture. On July 6th the debtor gave notice to his creditors that he could not pay any more. The examination was concluded, subject to the signing of the notes.

SANDS, Chaloner Wilkinson, High Street, King's Langley, Hertfordshire, electrical and wireless contractor. The receiving order herein was made on October 9th on the debtor's own petition. The first meeting of the creditors was held recently at 29, Russell Square, London, W.C.1, when according to the statement of affairs submitted there were liabilities amounting to £367 against assets of £103, thus leaving a deficiency of £264.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

317 201 General Electric Co., Ltd., and H. W. Cron. Electric coupling-devices. (16/7/28.)
317 202 G. Wall and Associated Electrical Industries, Ltd. Electricity meters combined with time-measuring devices. (16/7/28.)
317 203 S. H. Munro and D. E. C. Foster (trading as W. White and Co.). Electric switches. (18/7/28.)
317 209 General Electric Co., Ltd., and N. R. Campbell. Manufacture of photo-electric cells. (25/7/28.)
300 895 Forges et Ateliers de Constructions Electriques de Jeumont. Mechanism for producing step-by-step movements, particularly applicable to the switches of electrical control systems. (19/11/27.)
317 215 D. Montague and S. Montague. Aerials for wireless receivers. (31/7/28.)
317 217 C. Farrar. Screening wireless receiving-apparatus. (2/8/28.)
295 686 Electrical Research Products, Inc. Acoustic devices such as loud-speaking telephones. (17/8/27.)
317 221 A. F. Pollock and D. A. Pollock. Methods of reducing the intensity of unduly intense impulses in electrical amplifiers or loud-speaker circuits. (7/8/28.)
317 222 A. F. Pollock and D. A. Pollock. Loud speakers. (7/8/28.)
317 228 Siemens Bros. and Co., Ltd., and A. Rosen. Arrangements for measuring electrical quantities. (11/8/28.)
317 231 A. K. Croad (Hanovia Chemical and Manufacturing Co.). Therapeutical lamps. (17/8/28.)
297 818 Siemens-Schuckertwerke Akt.-Ges. Process for testing and starting the working of high-tension lines. (29/9/27.)
296 058 British Thomson-Houston Co., Ltd. Electric circuit-controller-. (24/8/27.)
317 237 W. T. Henley's Telegraph Works Co., Ltd., and P. Dunsheath. Insulation of electric cables. (24/8/28.)
317 239 Automatic Telephone Manufacturing Co., Ltd., and C. H. Archer. Electric heating-elements. (28/8/28.)
296 410 Loewe-Audion Ges. and Dr. E. Roemhild. Support for the electrode systems of electronic valves. (31/8/27.)
296 447 British Thomson-Houston Co., Ltd. Electric condensers. (2/9/27.)
296 677 Marconi's Wireless Telegraph Co., Ltd. Radio and the like high-frequency circuits. (3/9/27.)
312 031 British Thomson-Houston Co., Ltd. Sound-reproducing apparatus. (19/5/28.)
297 834 Associated Electrical Industries, Ltd. Thermally-responsive systems in or for electrical apparatus. (30/9/27.)
298 901 Siemens-Schuckertwerke Akt.-Ges. Means for driving machines by two mechanically-coupled asynchronous polyphase motors. (15/10/27.)
298 959 Telefunken Ges. fur Drahtlose Telegraphie. Thermionic valve transmitters for use in radio and other high-frequency systems. (17/10/27)
299 375 Soc Amon. le Nickel. Electrolytic extraction of metals. (13/4/27.)
300 640 Siemens and Halske Akt.-Ges. Depolarising-plate for galvanic cells. (17/11/27.)
313 512 Siemens-Reiniger-Veifa Ges. fur Medizinische Technik. Electro-medical apparatus. (13/6/28.)
301 030 Associated Electrical Industries. Ltd. Control systems for elevators, hoists, and the like. (23/11/27.)
301 043 British Thomson-Houston Co., Ltd. Mechanism for feeding wire in general, and in particular, for feeding a welding rod or wire in automatic or semi-automatic welding-machines. (23/11/27.)
301 908 Siemens and Halske Akt.-Ges. Telephone systems. (9/12/27.)
307 876 Scintilla Akt.-Ges. Electric startors for internal-combustion engines. (15/3/28.)
304 231 Furukawa Denki Kogyo Kabushiki Kaisha. Method of manufacturing storage battery plates and the product thereof. (17/1/28.)
304 592 British Thomson-Houston Co., Ltd. Continuous windings for electrical apparatus such as transformers. (21/1/28.)

Applications for Patents.

July 23rd.

22 603 H. W. Adey. Coils for radio signalling apparatus. (3/11/28.)
22 633 Adie and Co., Ltd., and B. W. Grimes. Electric circuits including smoothing elements.
22 631 Automatic Telephone Manufacturing Co., Ltd., G. A. Burns, A. E. Ereckson and T. R. Rayner. Supervision of apparatus at a distance.
22 673 Automatic Telephone Manufacturing Co., Ltd., and G. A. Burns. Fire alarm apparatus.
22 632 S. G. S. Dicker (N.V. Philips' Gloeilampenfabrieken). Thermionic valve detector circuits.
22 584 W. S. Drew. Colour changer for spot and floodlights.
22 657 J. J. Drumm. Storage batteries.
22 608 A. W. Harris. Regulating speed of electric motors.
22 609, 22 610 A. W. Harris. Loud speakers.
22 565 H. T. Harrison. Electric water heating and storage apparatus.
22 549 W. T. Henley's Telegraph Works Co., Ltd. Cast-iron pit frames for disconnecting boxes.
22 615 Kolster-Brandes, Ltd. Radio signalling. (8/8/28, U.S.)
22 536 H. A. P. Littledalf. Device to furnish test signal for picture receiving.
22 593 Nalder Bros. and Thompson, Ltd., and F. H. Nalder. Cock pieces for electric instruments, etc.
22 574 E. R. Ritter and Scherbius and Ritter. Electric switch. (7/9/28, Germany.)
22 545 E. Shulman. Electric junction box.
22 658 Siemens und Halske A.G. System for transmitting alarm signals. (20/12/28, Germany.)
22 659 Siemens und Halske A.G. Line protecting devices. (27/7/28, Germany.)
22 670 Siemens und Halske A.G. Remote impulse frequency measurement of output of different signs. (20/7/28, Germany.)
22 674 C. Scott-Snell. Apparatus for obtaining light and heat.
22 596 Ges. Dr. A. Wacker Ges. fur Elektrochemische Industrie. Manufacture of insulating material. (23/7/28, Germany.)
22 566 J. A. Whatnall. Radio sets.

July 24th.

22 732 Almeida Accumulators, Ltd., and L. A. Levy. Electric cells.
22 802 Automatic Telephone Manufacturing Co., Ltd., C. Gillings and W. H. Paulett. Telephone systems.
22 763, 22 764, 22 765, 22 766 W. E. Beatty (Bell Telephone Laboratories, Inc.). Combined motion picture and sound producing apparatus. (20/7/28.)
22 743 E. A. Bitton and H. Branton. Electric sound reproducers.
22 769 British Thomson-Houston Co., Ltd. Electric control systems. (24/7/28, U.S.)
22 730 J. N. Chaviara, J. F. Gill and F. J. Teago. Electrical propulsion of ships.
22 704 R. F. Christopher. Lighting device for automobiles.
22 678 J. A. Crabtree. Electric lamp holder switches. (16/5/28.)
22 679 J. A. Crabtree. Cord grips for lamp holders. (16/5/28.)
22 680 J. A. Crabtree and B. C. Harrison. Electrical pin and socket couplings.
22 696 G. Decombe. Reels for cables. (18/10/28, France.)
22 707 A. H. Diggle. Service of current to accumulators, etc.
22 753 E. V. Hayes-Gratze. Electroplating of motor vehicle radiators, etc.
22 754 E. V. Hayes-Gratze. Electrodeposition of metals.
22 755 E. V. Hayes-Gratze. Electrodeposition of chromium.
22 715 J. Grove. Brackets for electric globes.
22 796 W. Gusseff. Electrolytic treatment of metals.
22 770 International General Electric Co., Inc. Bonding layers of material together. (24/7/28, Germany.)
22 723 O. C. Jones. Magnetic separators.
22 697 A. E. M., E. G. O., and K. E. H. Pressler and O. Pressler Thuringer Vakuumsrohrenfabrik und Fabrik Wissenschaftlicher Apparate. Light electric cell. (6/8/28, Germany.)
22 805 Siemens-Schuckertwerke A.G. Connecting sleeves for lead cables. (22/11/28, Germany.)
22 804 Siemens und Halske A.G. Distant measurement apparatus. (25/7/28, Germany.)
22 741 J. Smyth. Transmitting sounds, messages, etc.
22 743 H. A. Storry, Ltd., and H. G. Bawtree-Williams. Electric sound reproducers.

July 25th.

22 832 H. R. and N. Allday. Electric igniters.
22 819 J. Anderson and St. Georges Engineers, Ltd. Cooling radiators for transformer tanks, etc.
22 866 N. R. Campbell and General Electric Co., Ltd.—Manufacture of photo-electric cells.
22 826 H. E. Dance. Apparatus for measurement of volt-amperes in a.c. circuits.
22 871 English Electric Co., Ltd. and T. Zweigbergk. Electric motor control.

COMING EVENTS.

Friday, November 1st. (to-day).

Institution of Mechanical Engineers.—Storey's Gate, St. James's Park, London. Thomas Hawksley Lecture, by Prof. H. L. Callendar, F.R.S., on "Critical Relations Between Water and Steam." 6 *p.m.*

Institution of Electrical Engineers (Meter and Instrument Section).—Institution, Savoy Place, Victoria Embankment, London. Chairman's inaugural address by Mr. E. W. Hill. 7 *p.m.*

Saturday, November 2nd.

Electrical Power Engineers' Association (West Yorkshire Section).—Great Northern Hotel, Leeds. Seventh annual dinner. 5.30 for 6 *p.m.*

Monday, November 4th.

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Informal meeting. Discussion on "Paris and the Pyrenees: Notes on some of the Technical Features of the I.E.E. 1929 Visit." (Opened by Mr. R. Borlase Matthews. With cinematograph and epidiascope illustrations.) 7 *p.m.*

Institution of Electrical Engineers. (Mersey and North Wales-Liverpool Centre).—University, Liverpool. Paper by Messrs. Johnstone Wright and C. W. Marshall on "The Construction of the 'Grid' Transmission System in Great, Britain." 7 *p.m.*

E.L.M.A. Lighting Service Bureau.—15, Savoy Street, Strand, London. Twentieth Illumination Design Course. Lecture (III) by Mr. T. Catten on "Selling, Electric Light to the Shopkeeper." 7.30 *p.m.*

Tuesday, November 5th.

Electrical Association for Women (South Wales and Monmouthshire Branch).—Visit to the City Lodge, Cardiff. Inspection of electrical apparatus for treating patients.

Electrical Contractors' Association (Derby Branch).—Ordinary meeting. 5 *p.m.*

Institution of Civil Engineers.—Great George Street, Westminster. Opening meeting. Address by the President. 6 *p.m.*

Electrical Society of Glasgow.—30, Gordon Street. Lecture by Dr. Eliz. Mudie on "Light in Health and Disease." 7.30 *p.m.*

Television Society.—Engineers' Club, London. Lecture by Mr. F. Langford-Smith on "Amplification and Television." 8 *p.m.*

Tuesday, November 5th-Saturday, November 16th.

"Daily Despatch" Smoke Abatement Exhibition, City Hall, Deansgate, Manchester. 11 *a.m.*-9.30 *p.m.*

Wednesday, November 6th.

Electrical Contractors' Association (Bath Sub-Branch).—Ordinary meeting.

Electrical Contractors' Association (Cardiff Branch).—Ordinary meeting. 2.30 *p.m.*

Institution of Electrical Engineers (Wireless Section).—Institution, Savoy Place, Victoria Embankment, London. Inaugural address by the chairman, Captain C. E. Kennedy-Purvis. 6 *p.m.*

Institution of Heating and Ventilating Engineers.—Swedenborg Hall, 29, Hart Street, Bloomsbury. "Notes on Electric Warming, with Special Reference to Low Temperature Panel Systems," by Mr. R. Grierson. 7 *p.m.*

Royal Society of Arts.—John Street, Adelphi, London. Inaugural meeting. Address by the Chairman, Mr. Ll. B. Atkinson on "Fifty Years of Electrical Science and Industry." 8.30 *p.m.*

Thursday, November 7th.

Electrical Contractors' Association (Bristol Branch).—Ordinary meeting. 11 *a.m.*

Electrical Contractors' Association (Newcastle Branch).—Ordinary meeting. 3.15 *p.m.*

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Papers by Messrs. B. A. G. Churcher and A. J. King, on "The Analysis and Measurement of the Noise Emitted by Machinery." 6 *p.m.*

Electrical Association for Women.—Visit to Messrs. Shoolbred, Ltd., Tottenham Court Road, London. Lecture by Mr. W. J. Jones on "Electric Light and Eyesight Preservation," with special demonstrations. 3 *p.m.*

Batti-Wallahs' Society.—Hotel Cecil, Strand, London. Luncheon. 12.30 for 1 *p.m.*

Friday, November 8th.

Institution of Electrical Engineers (North-Eastern Centre, Students Section).—Armstrong College, Newcastle-on-Tyne. Lecture by Mr. B. H. Leeson on "Centrovisory Control of Power Stations." 7.15 *p.m.*

Junior Institution of Engineers.—39, Victoria Street, London, S.W. Annual general meeting and election of officers. 7.30 *p.m.*

Saturday, November 9th.

Association of Mining Electrical Engineers (Western Sub-Branch).—Paper by Mr. G. E. Hider on "The Problem of Peak Loads."

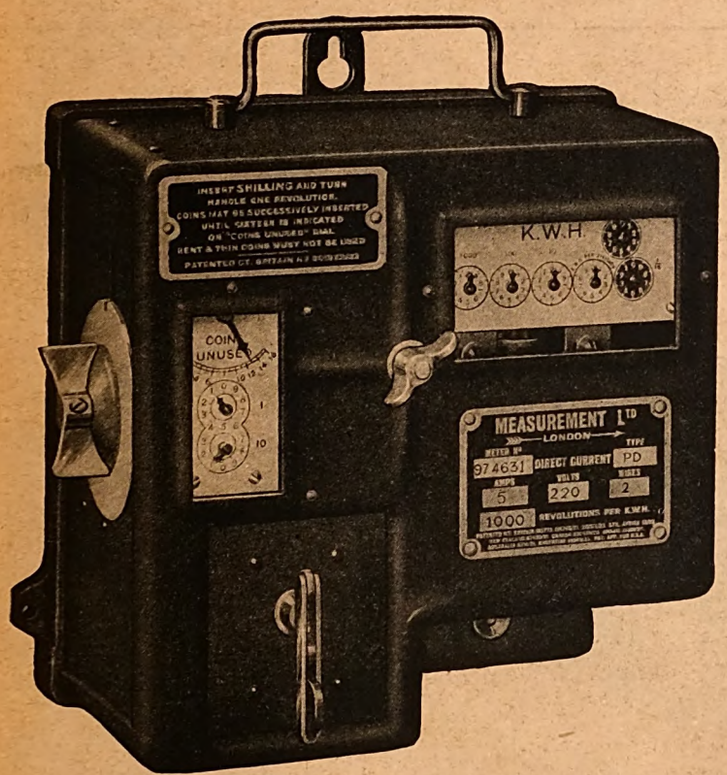
Vol. CIII.—No. 2684. Friday, November 8, 1929. [Registered at the General Post Office.] Sixpence

Your Guardian

against Bad Debts, Inaccuracies and Irregularities



THE outstanding advantages and sound British Construction of "Measurement" Meters are an insurance against unreliability and inaccuracy: special attention has been paid to immunity against fraud.

Write for particulars of our A.C. and D.C. prepayment Meters.

OUTSTANDING FEATURES.

i. The coin box is independent of the meter cover.

ii. Price change wheels can be fitted in situ in one minute.

iii. The operation of mechanism is independent of gravity, etc.

iv. The meters are small in bulk and light in weight, the A.C. prepayment meter weighing only 14½ lbs. and the D.C. prepayment meter 19 lbs.

PRICES ARE COMPETITIVE.

MEASUREMENT

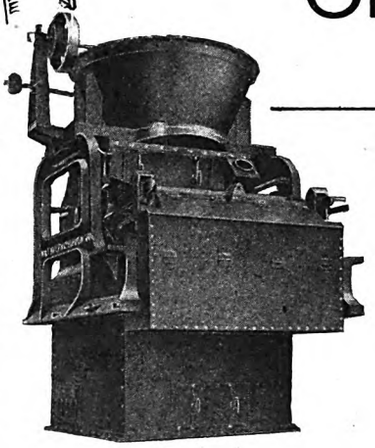
AVERY

ECONOMY IS BORN OF KNOWLEDGE.



AVERY PATENT AUTOMATIC WEIGHER FOR PULVERISED FUEL
LIST 1177.

The Avery No. 52 Automatic Weigher for Pulverised Fuel gives without dust escape, correct records of fuel consumption. The machine illustrated weighs 50 tons per hour from an Overhead Storage Hopper, and delivers to the pump. Thus, accurate records of fuel consumption are automatically kept, losses are instantly detected and economy achieved.

The Specialists in handling, weighing and blending machinery. Complete plants supplied.

Costly Canvassing.

A CONSIDERABLE amount of house-to-house canvassing for business is done in this country, and the bulk of it is devoted to the sale of household appliances. So thickly is some ground covered that most housewives look upon the canvassers as a nuisance. Moreover, it is a costly system of distribution, and, as a rule, fails utterly in provision of service after sales, for the simple reason that a commission salesman selling a speciality article has no interest in customer or user satisfaction once the sale is made and he has drawn his commission. A recent U.S.A. Department of Commerce report dealing with a certain market for vacuum cleaners, polishing and other machines, gives illuminating facts relating to the sale and distribution of a speciality sold on the instalment plan by salesmen dealing direct with the consumer. The retail price of the appliance in that particular market is nearly four times the landed cost! Sales representatives are divided into groups of eight to ten salesmen, each group under a sales chief who receives salary and commission. The individual salesman receives no salary, being entirely dependent upon the sales commission. The average period for which a salesman is employed is only three weeks. After the individual exhausts the possibilities of selling to his close friends and relatives, his lack of income from commissions makes it necessary for him to seek other employment. Losses are said to be considerable, but apparently the loss factor is discounted in determining final sale price. Cutting adrift from the recognised and well-established machinery of distribution through the retail trader does not appear, on this showing, to mean either more efficient or more economical distribution, but the reverse—which is, after all, scarcely surprising.

Marconi Royalties and Trade.

CONSIDERABLE dissatisfaction is evident in the electrical contracting industry with respect to the long delay in arriving at a satisfactory conclusion with regard to Marconi royalties, and, at the time of writing, agreement between the R.M.A and the Marconi interests appears to be as far off as ever. Since the terms of a proposed new licence were placed before the members of the R.M.A. nearly three months ago, certain of the patents covered by both the old and proposed licences have expired. On the other hand, other patents held by the Marconi Co. have increased in value from the point of view of royalties, and though by the expiration of such patents as that covering reaction the revenue producing qualities of the licence would appear to be less valuable, such is not the case. Both the R.M.A. and the Marconi Co. have everything to gain by an early settlement of the question, for a reduction in royalty charges would not only bring new enthusiasm to the trade, but would furthermore encourage the public to regard radio receivers more favourably as suitable gifts for Christmas. We do not suggest that either the R.M.A. or the Marconi Co. should enter into an agreement which is not the best compromise possible, but we nevertheless feel that it is time that the licence question was settled. Both the trade and the public are becoming impatient.

"The New Despotism."

THE business world will desire to add its quota to the thanks now being showered upon the LORD CHIEF JUSTICE for the service he has rendered in raising the fundamental issues dealt with in "The New Despotism." The story of the book is that having spent some eight or ten centuries in developing a system of democratic government, and in disposing of various despotisms from kings and barons downwards, we now find that a new and more subtle and tyrannous despotism, the despotism of the bureaucracy, has been unwittingly and silently created. It is only necessary to examine building regulations, details of taxation, or the com-

Digitized by Google

plications of a new enactment like the de-rating law of the last Government, to recognise how difficult the new position has become. Questions are constantly arising in the experience of business people, the answer to which depends upon the unchallengeable word of some inaccessible official. LORD HEWART, in his graphic way, sums up the matter by saying that these cases are in fact tried by a court where "one of the parties is absent; there is no hearing; the decision is given by the opposite party, and there is no appeal." LORD HEWART objects to the assumption by a bureaucrat of powers which have never been discussed, which arise out of the bureaucrat's own and undebated theories of what is right and proper, and from which a free and independent citizen has no escape and no right of appeal. But he might have gone on to discuss what we will describe as the collateral despotism that constantly arises out of these powers. As an illustration, a department armed with general powers may make a regulation to cover, let us say, some detail in regard to the guarding of machinery. It will then become the duty of a local official to see that machinery is properly guarded in accordance with such a regulation. From there the next step is easy. The official may have his own views on the general question of factory management, and will proceed to impose upon the unfortunate manufacturer all sorts of onerous conditions as the price of his licence or consent in the simple matter of the guard on the machine.

An Historic Instance.

AN historic instance of the development and use of this collateral despotism is to be seen in the well-established practice of the London County Council over music and dancing licences. The illustration is the better for the purposes of our argument because of the large existing measure of agreement with the practice of the London County Council. The Council has parliamentary powers which give it the right to grant or refuse music and dancing licences. It used these powers from the very start to impose a temperance policy upon music and dance halls. The Council said in the simplest and most direct manner, "We will only give you a music licence if you will undertake not to apply to another authority for a drink licence." This, although the County Council as such has nothing whatever to do with the drink question. When we remember that the liberty thus given to the L.C.C. spreads automatically to every bureaucrat in every Council office having any discretion in the granting or withholding of a licence or a permit or a pass for any industrial or business transaction, LORD HEWART'S case begins to assume its right proportions from the commercial and industrial point of view. The fact is that in these days the local officials, to say nothing of the trade union officials, have more power inside a business establishment than the owners or the managers of the business itself. The whole matter is highly controversial and will require a very great deal of study and debate.

Commercial Motor Transport.

THE exhibition of commercial motor vehicles which opened at Olympia, London, yesterday, again contains many electrical exhibits of outstanding interest. The luxury of some of the trolley buses shown rivals that of many of the cars seen at the recent Motor Show, while the number of electrical firms occupying stands at the exhibition indicates that manufacturers are fully alive to the potentialities of the commercial vehicle market with respect to fittings and accessories. During the last show, two years ago, we pointed out in these columns that the electric vehicle was receiving attention in the field of light delivery vehicles, and though the present exhibition again includes these vehicles, the number shown is small. Six wheeled electric trolley buses are again prominent, while those vehicles coming under the heading of petrol-electrics still maintain their popularity. The exhibition is well worth a visit, including as it does items of interest to manufacturers, supply authorities and contractors.

Illumination Aids Navigation.

NEWS of an interesting experiment reaches us from Amsterdam, where one of the Batavier vessels is fitted with a large illuminated arrow device immediately below the bridge. The purpose of the device, which resembles somewhat the direction-arrows fitted to many motor cars, is to supplement the syren signals used when docking or navigating crowded waters. Attention is drawn to the vessel by a syren blast, and instruction as to her course is given by an arrow, which in the vertical position, signifies "Straight ahead." On those occasions when visibility is poor the ordinary sound signals are used in conjunction with the device, and, so long as the arrow is sufficiently bright, is something of a "safety first" measure not hitherto enjoyed by seafarers. A demonstration of the system in London last week showed even in bright daylight the illuminated arrows are plainly visible. The idea has much to commend it for navigating rivers, and with suitable development would, no doubt, prove applicable to small craft as well as large.

Rural Electrification in Japan.

ACCORDING to latest information from Japan considerable progress is being made in the electrification of farming operations, and a new stimulus to greater activity in this direction is to be provided by Government-facilitated loans at low interest. Electric farm heating applications in Japan are not altogether parallel with British farm requirements, and electricity is already employed by Japanese farmers for such purposes as "silkworm nursing," the drying of cocoons, and tea roasting. Lighting also finds unorthodox employment with a connected load of 1 661 kW for exterminating bugs in the rice fields and fruit gardens.

A Salutary Lesson.

Now that the great N.E.L.A. celebration of the American invention of the incandescent electric lamp has been triumphantly concluded, with glowing notices in most of the public newspapers in this country, British electrical engineers generally are wondering why, with all the associations which exist to promote this and to develop that and the other, none was ready to enter the lists in defence of the memory of the late Sir JOSEPH SWAN. We have shared this wonder ourselves, and though the time has now passed for the launching of an effective counter-attack on the lamp invention, we hope that the lesson of "Light's Golden Jubilee" will not be forgotten when the time arrives for the celebration of further inventions such as the thermionic valve. Recent events have certainly shown the electrical industry's need of some organisation which can authoritatively and fearlessly put its views and claims on matters of general concern before the general public.

ELECTRICAL COMMUNICATIONS.

Special Alloys for Inductive Loading of Submarine Cables—Characteristics of New Insulating Material—A Record in Long-distance Telephony.

(*Concluded from page* 529).

DEALING with radio telephony, the President said that since the establishment of the London–New York system more than 25 000 successful conversations had been effected. The present traffic from all sources at each side averaged about 45 calls per day, and the average duration of calls was about six minutes. The division of the traffic averaged at this side: 95% from the United States; 4% from Canada; and 1% from Cuba and Mexico. At the other side they got 53% from Great Britain; 34% from France; 7½% from Germany; and 5½% from other European countries.

Although the general quality of the service might be regarded as satisfactory at the present early stage of transatlantic telephony, the possibilities of further developments in the art of linking radio circuits with telephone lines were such that the commercial data so far provided by the Anglo-American service was very far from representing the ultimate grade of service which would be obtained from such circuits.

Since radio was necessarily to some extent a broadcast method of transmission, the transatlantic telephone had been subject to the disadvantage that the conversations passing over its radio link might be picked up and understood by other parties. It was not at all an easy matter for an unauthorised listener to "tap" its communications. Methods of imparting a high degree of privacy had been devised and close attention was being given to their development.

Many of the special features of the transatlantic radio system, on which it depended for its commercial success, were devices intimately connected with, and in some cases borrowed from, the developments of line telephony. Thus the single side-band system of transmission, used on the original long-wave circuit, was developed originally in connection with the high-frequency multiplex system of telephony over land wires.

Additional Submarine Facilities.

Notwithstanding the high degree of stability which had been attained on the existing transatlantic radio-telephone channels, the system would gain greatly by the addition of a submarine cable channel to the facilities available. It had been felt that while such a cable would be so costly that, taken by itself, its provision would be financially impracticable, the expense could be justified in the case of a cable which formed part of a larger system, to which it would impart assured continuity of service and unchallengeable secrecy, as well as adding to the traffic-carrying capacity of the system.

The research laboratories of the American Telephone and Telegraph Co. had succeeded in producing remarkable improvements in the construction of ocean *telegraph* cables by the development of new metallic alloys for inductive loading, known as "permalloys." Its engineers were thereby encouraged to tackle the problem of the ocean telephone cable, with the result that last year the company announced that the Bell Telephone Laboratories had evolved a method of deep-sea telephone-cable construction which would be suitable for transatlantic operation. Work was now going forward actively on the development of a cable of this type for connection between London and New York, and it was possible that this circuit would be available for service as early as 1932. The new cable would yield only one additional telephone channel, but it would be a circuit of maximum reliability, free from the the variations characteristic of radio circuits. It was probable that a superposed telegraph channel would also be obtainable.

The route of the cable was not yet settled in detail, but it was probable that the main transatlantic link would extend directly from Newfoundland to Ireland, a cable length of approximately 1 800 nautical miles. From Ireland the circuit would probably be carried through submarine cable to Scotland, and thence by land cable to London, where it would terminate. It was expected that from Newfoundland the circuit would be carried through several sections of submarine cable to Nova Scotia, and thence by land circuits through Nova Scotia, New Brunswick and the New England States to New York City, which would be the other terminal.

The new cable would be of the continuously loaded type. For the loading material it was intended to use one of a new series of alloys designated as "perminvars." The conductor would be insulated with a new dielectric material known as "para-gutta." The attenuation represented by the main cable link between Newfoundland and Ireland would be immensely greater than that of any other telephone circuit yet planned. It would be such that the ratio of input to output power between the repeaters at its two ends would be about 10^{16}, or the equivalent of 150 decibels for the high frequencies of the voice range; i.e., received power would be one thousand-million-millionth of transmitted power. This decrement was, of course, far greater than that at which ocean telegraph cables were operated, and was of about the same order as that experienced on the transatlantic radio circuits themselves.

Special Features of the Cable.

The possibility of operating successfully through a line attentuation of this phenomenal magnitude depended upon two special features of the cable: first, the characteristics of perminvar, which permitted the use of a level of transmitted power much in excess of that which could be used in an ordinary telephone cable; and second, the careful shielding of the cable ends, for many miles from each shore, against the possibility of even the slightest interference from other electrical circuits. The received power would be so extremely low that even the minute currents caused by thermal agitation of the atoms of the conductor became an appreciable source of disturbance.

The end repeaters would be single-way amplifiers and, in order to make two-way conversation possible, voice-operated switching mechanisms would be employed to control the direction of transmission. Thus two persons would, by the mere act of speaking, alternately switch the transmitting amplifiers into action at each end as required, and conversation would proceed in a perfectly natural manner.

As showing that the dimensions of the earth's surface now set no bounds to the range of telephony, Col. Purves mentioned a long-distance test conversation carried out in association with the United States by two of his officers who visited Sweden last year in connection with the opening of communication between that country and America by the Anglo-American radio-telephone channels of the Post Office.

The chain of lines set up and spoken over on that occasion ran from Stockholm, via Berlin and Amsterdam, to London, and thence to New York by radio. From New York it was extended stage by stage via Chicago and San Francisco to Los Angeles, and back by another channel to New York, then once more to Chicago and back again to New York, with a final extension to the home of an American Telephone and Telegraph Co.'s official in New Jersey, from which a fair grade of conversation was exchanged with Stockholm.

The total length of the route traversed was about 14 000 miles, including approximately—270 miles of open-wire line in Sweden; 200 miles in submarine cables across the Baltic and North Seas; 1 050 miles in underground cables in Germany, Holland, and England, to London; 3 900 miles, London to New York, including the radio link of 3 200 miles and 700 miles in underground cables; 3 860 miles of open-wire line, worked by the high-frequency carrier system, and 4 850 miles in underground cables in the United States.

The aggregate length of copper conductor used on both sides of the Atlantic to carry this record long-line conversation was about 40 000 miles. The land-line equipment comprised 117 four-wire repeaters, 19 two-wire repeaters, 24 carrier-channel repeaters, and 6 cord-circuit repeaters, in addition to 8 echo suppressors and numerous other special devices.

Attempts to estimate the power which would be required to deliver currents of telephonic magnitude at the far end of such a circuit in the absence of repeaters suggested that the whole radiant energy of nature would fall immensely short of meeting the requirements, we should need to multiply nature by 10^{177}. The phenomenon known as the "photo-electric effect" had provided a new and useful tool for the communications engineer. Within the past few years it had been utilised in the development of apparatus for the telegraphic transmission of pictures, and of facsimiles of written messages and printed matter, both by wire and by radio. It had brought practical television well on the horizon, and had also enabled the communications engineers of the Bell Co. to solve the problem of combining the cinematograph with perfectly synchronised sound reproduction.

IRON-SILICON-CARBON ALLOYS.*

Constitutional Diagrams and Magnetic Properties—The Effects of Various Heat Treatments.

By T. D. YENSEN (Westinghouse Electric and Manufacturing Co., East Pittsburgh, Pa.).

THE discovery of the advantages of silicon steel for magnetic purposes by Hadfield in 1900, and the subsequent pointing out by Gumlich in 1901 and Campbell in 1902 of the importance of its high electrical resistance in reducing eddy

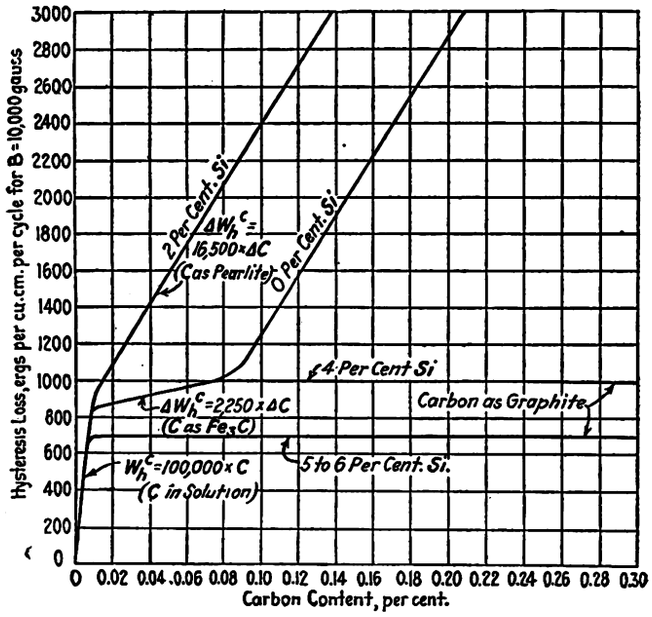

Fig. 1.—Effect of carbon on the hysteresis loss of iron-silicon alloys. All other impurities and effect of grain size eliminated.

currents, marked the beginning of a new era in the development of electrical machinery that has not yet been closed. During the intervening quarter of a century investigators in all parts of the world have studied the various phases of iron-silicon alloys, with the result that their magnetic properties have been greatly improved.

The author's paper on Fe–Si–C alloys published in 1924 was an attempt to correlate the magnetic properties of iron

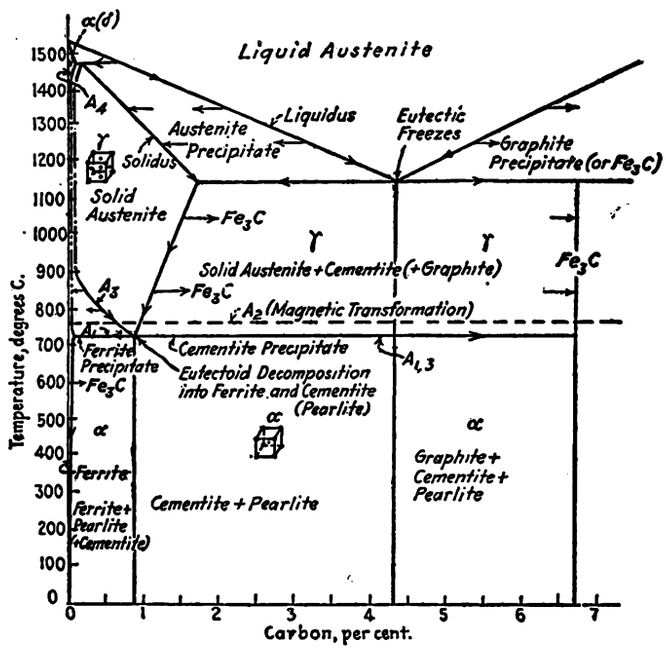

Fig. 2A.—Constitutional diagram for Fe-C.

and iron-silicon alloys with their chemical and structural characteristics. This was made possible, in the first place, by an improved method of carbon analysis whereby an accuracy greater than ±0·001% could readily be obtained, revealing for the first time that at room temperature the solubility of carbon in iron and iron-silicon alloys is not nil, but of the order of 0.008%. Another contributing factor was the type of test-pieces used, which were in the form of comparatively thick rings. These facilitated accurate testing, and minimised surface effects, particularly due to oxidation during annealing. With the regular 14-mil (0·36 mm.) sheet material this effect becomes very serious.

The enormous effect on the magnetic properties of carbon in solution (see Fig. 1), agreeing with that previously obtained by Gumlich for quenched high-carbon alloys, accounts for the previous confusion in regard to the magnetic properties of low-carbon alloys, and particularly the large variation in these properties with apparently the same chemical composition. This is now readily understood when we know that a variation of ±0·001% of dissolved carbon has approximately the same effect on the hysteresis loss and on other magnetic and electrical characteristics as ±0·1% of sulphur or ±0·03% of manganese.

Investigators attempting to determine the effect of impurities or grain structure on the magnetic properties of very

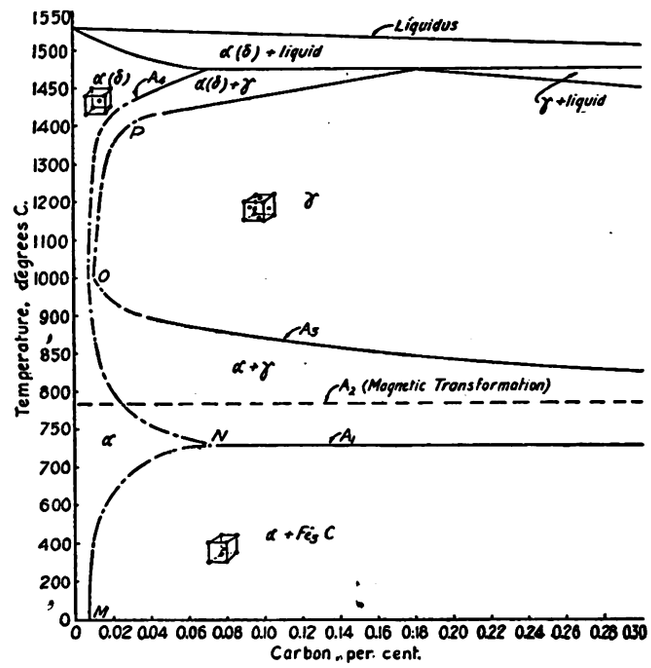

Fig. 2B.—Constitutional diagram for Fe-C.

low-carbon alloys without determining the amount of dissolved carbon and making proper allowance for it are thus leaving out of consideration one of the most, if not the most, important factor, and the results obtained can obviously not be expected to be consistent. Daeves fully realised the above difficulties, and confined his investigation to alloys in sheet form with a relatively high carbon content (more than 0·04%), in which the amount of dissolved carbon may be considered constant (0·008%), the remainder being in the form of free cementite (Fe_3C), with only a slight effect on the magnetic properties ($\frac{1}{40}$ to $\frac{1}{50}$ that of dissolved carbon). Daeves consequently confirmed qualitatively the author's results in regard to the effect of carbon, manganese, phosphorus, and particularly grain-size. Ruder's early results have thus received further support.

Von Auwers, on the other hand, experimenting with 2·6% silicon steel sheet annealed at 200 to 1 000 deg. C. in hydrogen, nitrogen, and *in vacuo*, and containing before annealing carbon 0·01, manganese 0·03, phosphorus 0·05, and sulphur 0·06%, could find no relation between the grain-size and the magnetic properties. This is very probably due to the fact that the annealed samples were not analysed for impurities, and the variation in final carbon content alone was undoubtedly great enough to mask the effect of variations in grain-size without considering the oxygen content.

* From a paper read before the Iron and Steel Institute.

Digitized by Google

As a matter of fact, no method of accurate carbon determination was available, so that the data in regard to this important impurity were unreliable even for the unannealed samples. An accuracy of ±0·01% is sufficient for carbon contents in excess of 0·02%, but not when it drops below 0·01%. This matter was also pointed out by Daeves in the discussion of a subsequent paper. More recently a large amount of data has been collected in Germany in regard to the effect of mechanical working and heat treatment on the properties of silicon steel.

Considerable work has also been done in recent years in regard to the purely metallographic phase of the Fe–Si–C alloys, so that we are beginning to get a fair amount of knowledge of their behaviour, although agreement as to details is still lacking, due to technical difficulties.

It has been known for some time that the A_3 (α–γ) transformation point is raised, and becomes increasingly faint, with increase of silicon, and that it disappears altogether for more than a certain silicon content, investigators differing as to the exact amount (1 to 2·5%).

The lowering of the A_4 (δ–γ) transformation point with increase in silicon (to 1·2%) was first observed in 1914 by Ruer, and this observation has since been amply confirmed. The fact that with increasing silicon the A_3 transformation point occurs at increasing temperatures and gradually disappears, while the A_4 point occurs at decreasing temperatures

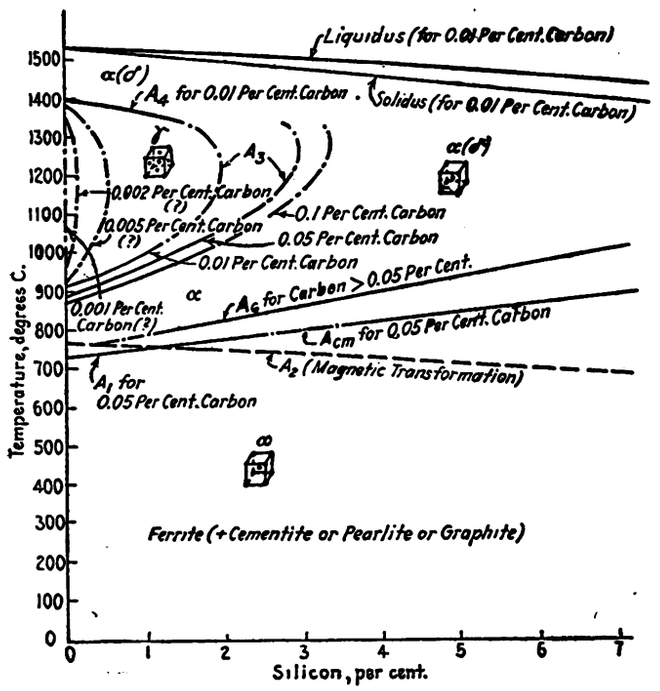

Fig. 3.—Constitutional diagram for Fe-Si.

and gradually disappears, coupled with the fact, established by Westgren and Phragmén, that the α and δ modifications are identical, naturally led to speculation as to the complete form of the Fe–Si diagram, particularly in regard to the A_3 and A_4 lines. When Hanson, in discussing the Westgren-Phragmén paper, spoke about "imagining an element added to iron which would at once lower the δ point and raise the γ point, under which condition a position would be reached where γ-iron disappeared from the system and δ- and α-iron became identical," it is difficult to believe that he did not have silicon definitely in mind. The present author, in June, 1923, made this notation in the margin of Hanson's remarks: "This may be the case with Fe–Si alloys," and on March 1st, 1924: "This *is* the case with Fe–Si alloys." In his paper in 1924, the author in discussing the effect of silicon on iron, consequently stated: ". . . while *with* silicon (4%) the normal grain-size is large, due to the *absence* of the A_3 transformation point. . . ."

When, therefore, Oberhoffer in 1924 presented his theory on the joining of the A_3 and A_4 lines with silicon above 1·3% it seems but fair to recognise that he had been anticipated by others. Daeves in 1926, Phragmén in 1926, and Oberhoffer, Von Moos, and Oertel in 1928, give Oberhoffer credit for being the first proponent of this theory.

The author has been engaged in the study of iron-silicon alloys since 1914, and has fully realised the necessity for a careful metallographic investigation of these alloys as a means towards an intelligent development of their magnetic properties; he was fortunate in being associated at the time with Norman B. Pilling. The investigation has recently

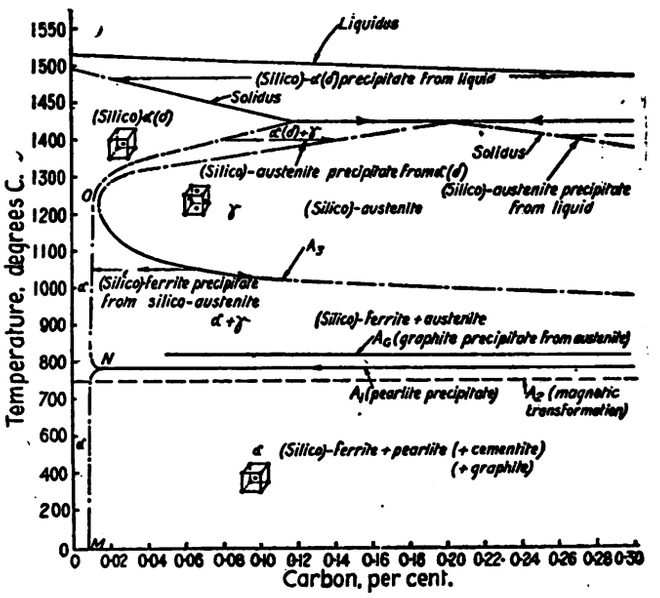

Fig. 4.—Approximate constitutional diagram for Fe-C with 2% of silicon.

been resumed through co-operation with O. W. Ellis and N. A. Ziegler, to whom the author is greatly indebted for information and suggestions in connection therewith.

The data obtained by Pilling and Halliwell have been collected and extensively used in drawing the constitutional diagrams shown in this paper. Pilling and Halliwell, however, did not investigate the δ–γ range, and the parts of the diagrams dealing with the solubility of carbon in α-iron are based partly on data obtained from other sources, and partly on hypothesis.

Constitutional Diagrams.

In Figs. 2A and 2B are shown the constitutional diagram of iron-carbon alloys, based on the most recent information available. The only part that is not strictly orthodox is that

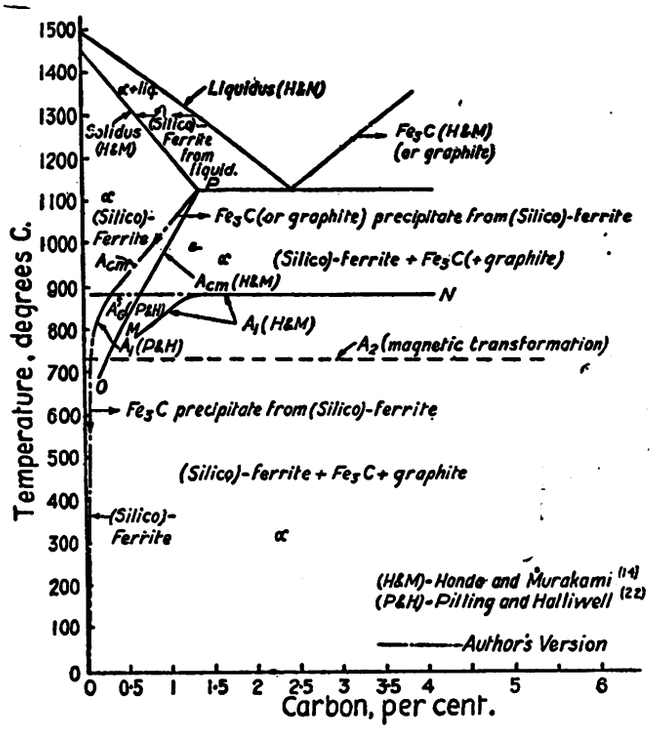

Fig. 5A.—Approximate constitutional diagram for Fe-C with 4% of silicon.

pertaining to very low carbon contents, shown in dash-and-dot lines to indicate uncertainty. The justification for these lines is as follows:

(1) From the author's data on the magnetic properties of Fe–C alloys (Fig. 1), corroborated by metallographic data,

Digitized by Google

the solubility of carbon in iron at room temperature is about 0·008%. That the solubility should be 0·05 to 0·06%, as held by Sauveur and Krivobok and by Hatfield, does not seem probable in view of this and later data, and must rest on a misinterpretation.

(2) Scott is probably the discoverer of the fact that the solubility of carbon at the A_1 temperature is at least 0·03%.

(3) Again, from the author's data, it appears that between 0·01 and 0·1% of carbon is precipitated as free Fe_3C, which can be explained by the curve *MN*. This is confirmed by

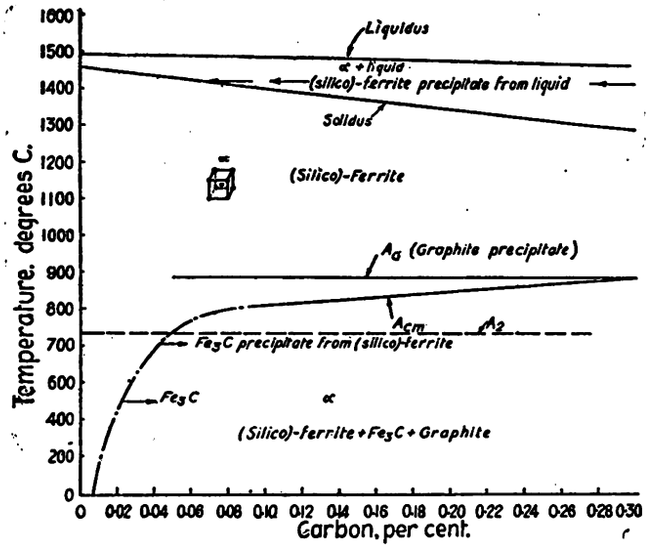

Fig. 5B.—Approximate constitutional diagram for Fe-C with 4% of silicon.

Whiteley's recent work on the solubility of cementite in α-iron, in which he finds that α-iron above 630 deg. C. dissolves appreciable amounts of Fe_3C (0·03% of carbon at 720 deg. C., in complete agreement with Scott), and that Fe_3C is precipitated as minute particles in the ferrite grains when samples quenched from about 700 deg. C. are reheated to 250 deg. C. or over. As to the exact solubility at the A_1 point, this may be even less than 0·03% for complete equilibrium, but it is quite possible that even slow cooling from a high temperature may retain at first as much as 0·1% of carbon in solution at 720 deg. C., this amount gradually decreasing by the precipitation of the excess carbon as Fe_3C at or below 720 deg. Work is in progress at the Westinghouse Laboratories for the determination of the actual solubility of carbon in α-iron at various temperatures.

Customary Assumptions.

(4) It is customary to assume the solubility of carbon in α-iron at 905 deg. C., and in δ-iron at 1 400 deg. C. to be zero, and that even pure iron (Fe) passes through allotropic transformations during cooling at these temperatures (from δ to γ at 1 400 deg., and from γ to α at 905 deg. C.).

There is apparently good reason for these assumptions; in the first place, the A_3 and A_4 transformations are always found for iron no matter how low the carbon content, and, in the second place, the lower the carbon content the more pronounced is the A_3 transformation. The author, however, has come to the conclusion that if iron free from all interstitial impurities, such as oxygen and carbon, could be obtained, no allotropic transformations would be found—that is, iron would crystallise from the liquid as body-centred cubes (α), and would retain this structure as it cooled to room temperature. He is of the opinion that iron changes its structure from the body-centred (α) to the face-centred (γ) cube at 1 400 deg. C., because the latter (γ) has a higher solubility for the interstitial impurities than the former. The reverse action, taking place at the A_3 point, is attributed to the decrease in the rate of diffusion of the carbon atoms as the temperature decreases, and to the tendency of the iron to return to the α structure whenever the visits of the "stranger" atoms become sufficiently infrequent to permit the change to take place.

The experimental evidence in support of the above hypothesis was given and discussed in the author's previous paper, and will only be briefly summarised here:

1. So-called pure iron contains a large amount of oxygen (up to 0·4%).
2. Some of this oxygen (0·02 to 0·05% at 20 deg., 0·2% at 1 530 deg.) forms a solid solution with the iron (interstitial element).
3. Oxygen in solution has a large effect on the physical properties of iron.
4. Oxygen can be most effectively removed by means of carbon and vacuum-fusion and vacuum-annealing, but it is difficult to strike a balance so as not to leave traces of either.
5. Oxygen can be removed by means of 2 to 3% of silicon. Silicon is a substitution element in the iron lattice, and has but slight direct effect on the magnetic properties.
6. The addition of 2 to 3% of silicon also eliminates the A_3–A_4 transformation.
7. Silicon eliminates the A_3–A_4 transformation largely because it removes oxygen from the iron lattice.
8. If iron can be obtained free from carbon, oxygen, and other interstitial impurities, it seems reasonable to assume that it will have no transformation points, even in the absence of silicon.

When the above hypothesis was announced at the meeting of the American Institute of Mining and Metallurgical Engineers, an interesting discussion by Sauveur, Krivobok, and Hayes followed. These speakers disagreed with the author's conclusions either from a theoretical or from an experimental standpoint. Gillette, of the Bureau of Standards, however, presented the first direct confirmative evidence in the form of heating and cooling curves for electrolytic iron treated in such a way as to remove carbon and oxygen as far as possible.

Electrolytic Iron.

In the first set of samples the iron was thoroughly oxidised, then crushed and compressed into cubes, and reduced with hydrogen at 1 000 deg. C. These samples gave no trace of any A_3 transformation point, whereas electrolytic iron crushed and compressed gave a distinct A_3 point. This evidence, however, was discredited, because it was doubtful whether all the oxide had been reduced, and the absence of the A_3 point may have been due to isolation of the Fe particles by oxide films.

In another set of samples the carbon and oxygen was largely eliminated by treatment of the electrolytic iron with an NH_3–N_2–H_2 mixture, and in these samples the intensity of the A_3 point was very much reduced. The definite proof of the hypothesis is a very difficult problem, on account of the great affinity of iron for impurities, and the efforts so far made in the Westinghouse Laboratories have been fruitless. Whenever thermal curves have been obtained the A_3 point has appeared, but magnetic and micro-analysis have indicated that contamination has taken place. The work is being continued, however, and others interested in the problem are invited to co-operate.

There is no need to consider the pure iron-silicon diagram separately in this connection, as all iron-silicon alloys contain more or less carbon, and without carbon (or with carbon $<0{\cdot}001\%$) the diagram would probably consist of the liquidus and solidus lines only. In drawing the diagram for Fe–Si the carbon content must therefore be definitely indicated, as is done in Fig. 3, which really is a superposition of several Fe–Si diagrams with carbon contents varying from 0·01%. The data for these curves are largely obtained from Pilling and Halliwell for the A_1, A_2, and A_3 lines, while the A_4 lines have been drawn on the basis of the results of other investigators. The uncertain parts are shown in dash-dot lines as before.

Fig. 4 is a diagram for 2% Fe–Si alloys with carbon as abscissa, constructed on the basis of the scant data available (shown in full) and on the author's hypothesis.

In Fig. 5A have been collected, the data available for 4% Fe–Si alloys (drawn in full), on the basis of which the author has constructed the diagram shown in Fig. 5B. It will be seen from Fig. 5A that the points that Honda and Murakami interpret as A_1 (pearlite points) for carbon greater than 1·5% coincide with Pilling and Halliwell's graphite (A_G) points for carbon less than 0·5%. It is further noticed that for carbon greater than 1·5% Honda and Murakami found both A_{cm} and A_1 points. Their A_1 points (*MN*) were obtained from cooling curves, while their A_{cm} points (*OP*) were obtained from quenching tests, and it is not improbable that the lower part of *MN* might actually coincide with *OP*, the discrepancy being due to loss of carbon not having been taken into account. Pilling and Halliwell took particular precautions against loss of carbon by oxidation by using a high vacuum, and careful analysis before and after taking the cooling curves showed no loss. The author is, therefore, of the opinion that Honda and Murakami's curves should be shifted to the left to coincide with Pilling and Halliwell's, and that the resultant single curve is a cementite (A_{cm}) curve, as indicated by dot-dashed lines in Fig. 5A. The horizontal part of *MN* is probably a graphite line (A_G).

Digitized by Google

These conclusions are partly based on the fact that, in the author's investigations, 4% Fe–Si alloys have never shown pearlite after very slow cooling, but only free cementite (Fe_3C) and graphite.

In the case of 6% Fe–Si alloys free Fe_3C does not appear, as graphitisation takes place readily during slow as well as during moderately fast cooling from 1 000 deg. C. For high silicon contents the equilibrium diagram consequently becomes simple. Even for high carbon contents, δ-iron does not appear, and α-iron prevails from solidification to room temperature.

By comparing the diagram of the magnetic properties (as represented by the hysteresis loss shown in Fig. 1) with corresponding constitutional diagrams (Figs. 2B, 4, and 5B for 0, 2, and 4% of silicon respectively) the variation of the magnetic properties can now be explained on the basis of the constitutional diagrams.

Considering first 0% of silicon, Fig. 2B shows carbon in solution up to about 0·008%, corresponding to the initial steep part of Fig. 1. With carbon increasing from 0·008 to 0·1%, it precipitates on slow cooling as free cementite, corresponding to the flat part of the diagram, and, for higher carbon, pearlite appears corresponding to the second steep part of Fig. 1.

For 2% of silicon, on the other hand, carbon above 0·008% appears as pearlite, without the intermediate step of free Fe_3C. The curve *MNO* in Fig. 4 would account for this. Confirmation in the form of cooling curves is lacking so far, the only evidence consisting of a few micrographs. According to the diagram it is possible to obtain carbon as graphite for carbon greater than 0·05% by long annealing at about 820 deg. C., in which case only a small amount of pearlite should be present, and the curve in Fig. 1 should become horizontal above 0·05% of carbon. Confirmation on this point is still lacking. The raising of the A_3 point makes it easy to obtain large grains by high-temperature annealing.

For 4% of silicon, carbon between 0·008 and 0·05, or perhaps 0·1%, is again precipitated as free Fe_3C. By annealing at 890 deg. C., graphitisation takes place more readily when the carbon exceeds 0·05% than with 2% of silicon, which accounts for the fact that the curve in Fig. 1 for 4% of silicon becomes horizontal for carbon greater than 0·1%. The absence of γ-iron makes it possible to get enormous grains for all carbon contents by high-temperature annealing.

With 6% of silicon graphitisation takes place so readily that it is difficult to obtain carbon in any other form than graphite above about 0·07% of carbon.

These diagrams also help to explain the various annealing and cooling phenomena that heretofore have had no satisfactory theoretical basis.

Why Magnetic Properties Improve.

For 0% of silicon, Fig. 2B shows why the magnetic properties improve as the annealing temperature is increased, as shown, for example, by the author's results in 1915. The permeability increases slowly as the annealing temperature is raised to 700 deg. C., then very rapidly as it is further raised to 800 deg. C., and again slowly for higher temperatures. Based on Fig. 2B, the unannealed forgings would be expected to contain more than 0·008% of carbon in solution (perhaps as high as 0·1% if the total carbon content were that high), because of the rapid cooling. Subsequent annealing and slow cooling tends to precipitate the dissolved carbon as free cementite, the more so the higher the annealing temperature, until the maximum precipitation occurs for slow cooling from 720 deg. C. Raising the temperature above 720 deg. should not affect the relative amounts of dissolved and precipitated carbon, and consequently should affect the magnetic properties only through grain-growth.

With 2% of silicon, the cooling rate from 780 deg. C. for low carbon contents (less than 0·02%) is of slight consequence, as carbon above 0·008% is precipitated as pearlite. For higher carbon contents there is a possibility of precipitating carbon as graphite by prolonged annealing at 820 deg. C., and this should result in a decided improvement of the magnetic properties, as already mentioned.

For 4% of silicon the cooling rate again becomes of prime importance, as seen from Fig. 5B. Carbon above 0·10% can here readily be precipitated as graphite by annealing at 890 deg. C., and the remainder (except the 0·008% that remains in solution) can be precipitated as free cementite by slow cooling.

Finally, it should be pointed out that it may be possible to reduce the amount of dissolved carbon in the finished material to a value below 0·008%, by extremely slow cooling, obtaining it in the form of cementite, pearlite, or graphite, with a corresponding improvement in the magnetic properties.

Conclusion.

In drawing the above constitutional diagrams the author has paid strict attention to the metallographic evidence available. As far as he is aware, there is no fundamental contradiction between the diagrams and the experimental data, although he admits having taken the liberty of making his own interpretation in some cases in which the experimental data do not agree. There are also a great many gaps that had to be filled in and that need direct confirmation, and it is hoped that this paper will serve as an incentive in this respect. The gaps are shown by dot-dashed lines, and should be regarded only as the author's idea as to the probable shape of the curves. By means of the above diagrams it is possible to explain the various magnetic phenomena exhibited by iron and iron-silicon alloys, both after slow and after rapid cooling.

It is interesting to note that predictions as to many of the constitutional features were first made on the basis of the magnetic properties, and that these predictions have subsequently been confirmed by careful metallographic investigation.

Magnetic testing is evidently much more sensitive in detecting small quantities of certain impurities, like carbon, and the form in which they exist, than is either metallographic or ordinary chemical analysis, and once the correct relationship has been established by ultra-careful means, magnetic analysis should be a powerful aid also in this branch of metallurgy.

INDUSTRIAL RESEARCH.

Its Bearing on British Electrical Development.

ON October 28th the first of the I.E.E. informal meetings of the new session was opened by the President, Colonel Sir T. F. Purves, who, in the course of his remarks, said that though the formation of the Department of Scientific and Industrial Research was an event which would continue to keep British industry anchored upon science, it was not enough. Those admirable supplementary bodies, the British Electrical and Allied Industries Research Association and its counterparts in other main branches of industry were also not enough. There would always remain a mass of practical problems that any industrial undertaking aspiring to regain and hold the markets of the world for this country must solve in detail for itself.

The very fact that scientific research had now, by universal consent, been made the business of the nation, might bring with it a new danger. The individual producing concern might become too trustful, and might be tempted to rely too much upon centralised sources of scientific information.

The report of the Committee on Industry and Trade indicated that the capital invested in the general electrical industry of this country was about 121 millions sterling and that the industry had only contributed about £50 000 to the Research Association in the five years ended 1926. It would be difficult to reconcile this fact with what was known of the excellence of British electrical equipment in the absence of a considerable amount of research by individual companies.

It was a difficult matter to assess the value of research to an industry in the form of a profit and loss account, because the result took on many different forms of value, for example, timely information thus obtained frequently prevented costly mistakes in the investment of capital. A celebrated leader of industry once expressed this view by saying that research enabled us to make our mistakes on a small scale. In his discussions, from time to time, with leaders of industrial undertakings carrying on research on a large scale, Col. Purves said he had always found the conviction that systematic research produced advantages far ahead of its cost.

Talking recently with Dr. F. B. Jewett, of New York, about the modern universality of scientific research in the industry of the United States, and the way in which it was rising to cater for the enormous *internal* demands of the country, he remarked that up to the present practically the whole effort was being made to provide for the needs of the home markets. " Our industry is facing *inwards*," he said, " and I sometimes wonder what will happen to the rest of the industrial world when it finds that, for continued life, it has to turn about, as it will some day, and face *outwards*."

Messrs. J. R. Bedford, H. Craske, W. Day, P. Dunsheath, W. A. Erlebach, A. F. Harmer, C. G. Garton, W. A. Gillott, J. G. Hines, A. N. D. Kerr, W. E. Lang, F. Ockenden, T. N. Riley, E. S. Ritter, J. F. Shipley, T. Wadsworth, and W. E. Warrilow, also spoke.

THE coating of metallic and non-metallic articles with a variety of metals by spraying is finding increasing application in the electrical industry. The pictures show (1) *Ends of railway rails sprayed with zinc.* (2) *Refrigerator coils coated with zinc. Some of these pieces were first covered with aluminium to which was applied a further coating of zinc.* (3) *Resistance units zinc sprayed.* (4) *Wood condensers coated with sprayed molten tin.* (5) *A* 500 000 *ft. length of* $\frac{3}{4}$ *in. paper tape coated with zinc* 0·003 *in. thick. Some details of the process are given in the accompanying notes.*

METAL COATINGS.

Process for Depositing Molten Metals by Spray Pistol—Some Electrical Applications.

THE possibility of applying metallic coatings of thicknesses from 0·001 in. upward to articles and parts of metallic or non-metallic construction, was recently made practicable by the pistol spraying process sponsored by the Metals Coating Co., Ltd.

The metal to be deposited is normally used in the form of ordinary commercial wire, but for special purposes metal dust or powder may be employed with a modified form of apparatus. A special type of spraying pistol is used and the wire is fed automatically from a reel into contact with an oxy-acetylene flame which melts the wire, and, in combination with compressed air, blows the atomised metal against the surface being coated at a velocity of about 3 000 ft. per sec. The metal, as it impinges against the surface, solidifies and practically becomes integral with the surface, from which it cannot be separated either by severe hammering or bending tests.

The pistol, which is known as the "Metalayer," is connected by means of a rubber hose to standard acetylene and oxygen cylinders, and also to a suitable supply of compressed air. The tool contains a wire feeding device which is rotated by a small air turbine through suitable reduction gearing. The feed mechanism pulls the wire from the reel and feeds it through the nozzle at a rate varying from 12 to 24 feet per min., according to the metal used.

The wire remains unaltered and nearly cold until it reaches a point about $\frac{3}{32}$in. from the nozzle. At this point the wire enters a reducing flame, and the minute particles of the molten spray are protected against oxidation, so that layer after layer may be deposited, if desired, the entire coating forming a coherent and adherent mass.

This metal-spraying tool weighs only $3\frac{1}{2}$ lb., and is manipulated by hand for most work, although for some purposes it is guided mechanically. The parts to be sprayed are first sand-blasted to obtain a clean open-grained surface. Then the surface is coated by merely holding the nozzle three or four inches from it and moving the tool about sufficiently to cover the entire area. In starting a new piece of work, the wire feed is adjusted by turning a small needle valve, which controls the flow of air to the turbine wheel.

For enlarging cylindrical parts, the work may be placed between lathe centres and revolved while a "Metalayer" is traversed lengthwise by the lathe carriage, in the same way that a turning tool is used.

Another important application in the case of cylindrical parts consists in applying a coating of some metal, such as copper, to withstand chemical action or corrosion, the coating in this instance being primarily for protection rather than as a means of enlargement.

The interior surfaces of tubes, even though small and of considerable length, may be coated readily by using a special internal attachment in conjunction with the "Metalayer" tool.

When comparatively small pieces are to be coated in bulk, a mass coating machine is used in conjunction with the coating tool.

The spraying process may be utilised for filling blowholes or other defective places in either grey iron, steel, or non-ferrous castings. Another application of considerable interest is the coating with aluminium of parts subjected to high temperatures to prevent oxidation and scaling.

PRECISE MEASUREMENTS WITH AN A.C. POTENTIOMETER OF THE LARSEN TYPE.

Some Interesting Applications—Accurate Measurement of the Ratio of Two Potentials and their Phase Difference—Other Uses.

By E. R. WIGAN.

AN alternating-current potentiometer which can be used at speech frequencies is an extremely useful piece of apparatus. Prof. Larsen described his delightfully simple device in 1911.* No doubt the lack of suitable oscillators at that time caused its value to be unrecognised. The Cambridge Instrument Co. now make a potentiometer containing Larsen's elements. This instrument by various ingenious additions has been made into a precision instrument. The "impurity" of the mutual inductance, for example, is reduced almost to zero.† It is surprising, however, that the original device had not been widely used before this. Larsen himself suggests its use for measuring the efficiency of transformers and the attenuation of telephone lines.

The Arrangement Explained.

It is possible that experimenters were deterred by the difficulties, which are described by Larsen, due to leakage currents. By a simple arrangement these difficulties can be overcome and a high degree of accuracy can be obtained from the potentiometer.

The modified arrangement is described in detail in Appendix (1). The apparatus required is as follows:—Audio-frequency oscillator and accessories. Standard Campbell mutual inductance. Subdivided calibrated 10 ohm slide wire resistance. Calibrated decade resistance box. Two small 1/1 current transformers. An a.c. milliammeter. "Listening point"—consisting of a high impedance telephone receiver movement coupled to a microphone button (forming an amplifying system) and a pair of low resistance head-telephones with a suitable battery. In addition various uncalibrated resistance boxes will be required. Means of measuring the frequency of the oscillator current will be necessary.

With this apparatus it is possible to build up a potentiometer which will measure the ratio of two potentials and their phase-difference with very great accuracy. The absolute value of the potentials depends upon the reading of a current meter and is therefore dependent upon the accuracy of that instrument. The "impurity" of the current from the oscillator will also cause errors in estimating the true value of the potentials. But the accuracy with which the ratio of two potentials can be measured depends only upon (1) the accuracy with which the balance point can be found, and (2) the changes of potential caused by leakage currents. As will be shown the knowledge of the ratio of two potentials is in many cases sufficient and of great value.

In this potentiometer owing to the amplification at the listening point the accuracy of balance is usually within the limits of accuracy of the calibration of the apparatus used, and on account of the special arrangement of the windings of the isolating transformers and the reduction of earth-capacity at the listening point the errors caused by leakage currents are extremely small. This has been demonstrated by a large number of tests (all made at 800 cycles per second). See Appendix (2).

Telephone Cables and Networks.

The most valuable application of a potentiometer which will measure ratios accurately is to the measurement of the input and output voltages of telephone cables and networks. At the present time a common method of measuring the attenuation factor of a short length of cable is to measure the "open" and "closed" impedances from either end. This method is inaccurate if the cable is long or of high attenuation. In this case the attenuation can be accurately measured at one frequency only—that at which the phase change becomes 180°. With the potentiometer, however, no limitations are set provided both ends of the cable are available.

There is, however, a possible source of error. At the output end of an attenuating network the voltages are very small. When the potentiometer "potential leads" are applied to this end of the network small leakage currents may flow through that lead in which there is no listening circuit. Owing to the high series resistance of these networks such currents may cause considerable potential differences in the series members and thus will disturb the already minute p.ds. at the output end.

Experiments have shown, however, that errors from this source are extremely small. Cases have been chosen where the input to output ratio was known accurately. The ratio

Digitized by Google

as measured by the potentiometer was within the limits set by (*a*) errors of the potentiometer scales, (*b*) error of uncertainty in the known ratio. This refers to very large ratios of the order of 20. See Appendix (3).

A potentiometer is of assistance in the design of telephone apparatus and networks. The relative magnitude and phase-relation of the potentials in all parts of a complicated circuit can be determined without introducing any measuring instruments into the circuit. In such cases considerable differences of potential may exist between two parts of the network. For example in Fig. 1 there is scarcely any difference of potential between $P1$ and $P2$ and A. But there is considerable difference of potential between $P1$ and $P2$ and C if B is large. These differences of potential tend to circulate current through the inter-winding capacities of $T1$ and $T2$, thus affecting the potentials in the network and also slightly altering the current in the potentiometer circuit. Tests in Appendix (4) indicate how small are errors from this source.

Testing Condensers.

There are various special applications of a potentiometer which are of interest. The effective series resistance of condensers can be measured very simply. This will recommend itself to those who have attempted this test on a large number of condensers by the Carey Foster Bridge with a Wagner Earth. The arrangement is seen in Fig. 2, where $C2$ is the unknown carrying a current indicated by I and set by $R3$. The system $M2R2$ constitutes a dummy condenser, where $M2$ (which is negative) represents the true capacity and $R2$ the effective series resistance at the testing frequency. It is essential to know the frequency, so a standard condenser $C1$ is introduced into the potentiometer circuit. $M1$ and $C1$ can then be made the elements of a Campbell frequency-bridge by applying the lead $P2$ to a terminal of $C1$. In testing the condenser the leads $P1$ $P2$ are applied to the terminals of $C2$. The potentiometer is adjusted to obtain silence in the telephones. The leads $P1$ $P2$ are then transferred without reversal to the terminals T. $M2$ and $R2$ are then adjusted until silence is again obtained. $R2$ then equals the effective series resistance of the condenser. It should be noticed (1) that the resistances and inductance used for the potentiometer need not be " pure " or of a known value, (2) that the inductance $M2$ must be " pure." If the value of $M2$ is also known the capacity of $C2$ is at once calculable.

A second application of this potentiometer is of some interest. Frequency can be measured in terms of a resistance and a mutual inductance. The arrangement (Fig. 3) is :—

$R2$ and $M2$ are in series in the testing circuit. The potentials across $R2$ and the secondary of $M2$ are measured by the potentiometer. If $R2$ and $M2$ are " pure " these two potentials are at right angles to each other. Then if A and B are the readings of the resistance and inductance scales of the potentiometer when measuring the potential across $R2$ and C and D are the corresponding readings when measuring the potential across $M2$, it can easily be shown that :—

$$\frac{D}{A}=\frac{M2}{R2} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (1)$$

$$\sqrt{\frac{C}{B}\times\frac{R2}{M2}}=w=(2\pi f) \quad . \quad . \quad . \quad . \quad . \quad (2)$$

For this test the resistances and mutual inductances must be " pure." For an example of this test see Appendix (5).

It should be noted that in all the above tests the two transformers used in the potentiometer circuits were of perfectly simple design, and in fact had in the case of $T2$ an inter-winding capacity at least seven times greater than was necessary. By introducing five layers of 5 mil. Empire cloth between the windings the inter-winding capacity of these transformers becomes about 100 M.M.F.

It should be noticed also that all tests have been made with a small oscillator giving in no case more than 5 m.a. in the potentiometer circuit. The power available in the neighbourhood of the balance point is therefore small, but by means of the listening-point arrangements accurate balances have been obtained.

The work on this potentiometer has been carried out in order to show that Larsen's potentiometer is, with the modifications suggested, capable of working to the limit of accuracy set by the apparatus used in constructing it, and that this apparatus can be found in any laboratory where accurate high-frequency testing is carried out.

Permission to publish this work has been granted by Mr. W. H. Grinsted, of the Telephone Department of Messrs. Siemens Bros. and Co., Ltd., Woolwich, to whom the author is indebted for criticism and advice.

APPENDIX.

(1) The potentiometer circuit is shown in Fig. 4 where

A=Ammeter.
M=Standard mutual inductance.
L=Listening point.
X=Load terminals.
P=Potential leads.

The two transformers $T1$ and $T2$ are ordinary open iron circuit telephone induction-coils. $T2$ is the normal transformer 1 400/1 700 turns. $T1$ has the same turns ratio, but the secondary is wound on in the opposite sense to the primary.

The connections of $T1$, $T2$ are :—

Inner ends of inner windings	4 and 4′
Outer „ „ „	3 and 3′
Inner ends of outer windings	1 and 1′
Outer „ „ „	2 and 2′

The condensers C and $C1$ represent the interwinding capacities as being concentrated at the two adjacent faces of the windings.

C=110 M.M.F. and $C1$=700 M.M.F.

Any adjusting resistances such as $R1$ and $R2$ must always be added in the position indicated. The position in the circuit of L and the secondary of M is important.

No resistance must be added between 3 and 3′.

The oscillator should not be closer than 6 ft. from the inductance.

No earthing of the apparatus is necessary.

The capacity to earth of the windings of L should be reduced as far as possible. The mechanical connection between L and the microphone button should be of insulating material and of some length (say 2 to 3 in.). The slide $R3$ could be read to 0·01ω and was accurate to ·001ω. The resistance $R4$ was accurate to 1 part in 10 000.

The mutual inductance was also accurate to 1 part in 10 000.

(2) Consider a circuit as shown joined to the load terminals X in Fig. 5.

Let us suppose that in measuring the potential across B an error is introduced by leakage. This error will be of the same order when measuring the potential across A provided $R2$ is large. If then E_{A+B} is measured it will be different from the sum E_A+E_B.

Four Tests.

Four such tests are set out below :—

Readings of Potentiometer Scales.		E_A	E_B	E_{A+B}	E_A+E_B	Resistance of B.
1	R Ohms	30·805	30·850	61·670	61·655	100 nominal.
	M m.henrys	8·520	8·540	17·060	17·060	
2	R	29·160	58·440	87·600	87·600	200 nominal.
	M	8·245	16·495	24·735	24·740	
3	R	21·350	42·730	64·080	64·080	200 nominal.
	M	8·650	17·320	25·975	25·970	
4	R	20·130	60·450	80·530	80·580	300 nominal.
	M	8·355	25·100	33·450	33·455	

In all cases $R2$=800ω ; C=1 000ω ; A=Standard 100ω. And f=796 ~. Potentiometer current=4·3 mA.

The decade box in the potentiometer circuit could be relied upon to 1 part in 1 000. The mutual inductance could be set to 0·01 m.henry, and was accurate to 1 in 10 000.

The difference between (E_A+E_B) and E_{A+B} is equal to the sum of the errors made in measuring E_A or E_B.

It will be seen that the errors are very small and less than the probable errors in the apparatus.

(3) In the case of a ratio of the order 20 to 1 it is not possible to measure both voltages equally accurately. The arrangement is made as in Fig. 6.

A and B are standard resistances accurate to 1 part in 10 000. A is made 10 (or 20) times B. Then the potential at Y is compared with the potential at B. And $\frac{A+B}{B}=11$ (or 21) ± 2 parts in 10 000.

To compare the voltage ratio as indicated by the potentiometer with the ratio as indicated by the known resistances, a skeleton network of high resistance was set up (Fig. 7).

Digitized by Google

E and C	D	Ratio $\frac{A+B}{B}$	Ratio $\frac{E+D+C}{D}$	Volts ratio measured $\frac{E_{(A+B)}}{E_D}=\frac{E_B}{E_D}\times 10$.
1 000	50	10	41·0	41·08
10 000	1 010	10	20·80	20·83
10 000	2 010	10	10·91	10·92
1 000	70	10	29·57	29·59
1 000	80	10	26·00	26·02

D was accurate to 1 in 1 000; E and C to 1 in 10 000.

(4) In Fig. 8 A and B are two resistances which can be connected to the terminals X by a reversing switch.

A was 100ω; B was 1 000ω.

A test was made at 796 cycles and with 2·0 mA flowing in the test circuit, that is the p.d. across B was 2·0 V.

The terminals a and c, and b and d were joined. The potential leads were applied to the terminals of A and the silent point was found. The connections were then reversed and so also were the potential leads. The silent point was found scarcely to have altered.

In the first part of the test there were 2·0 V available to produce leakage current, in the second part only a very small voltage. The leakage current produced by 2·0 V acting across the interwinding capacities of the transformers has therefore only a very small effect upon the balance conditions.

Taking two examples with slightly different values of current in the potentiometer circuit:—

	Readings of Potentiometer Scales R ohms	M milli h.
Test No. 1	58·73	8·800
	58·72	8·800
Test No. 2	48·98	4·853
	48·97	4·853

(5) A tuning fork of 791·2 (nominal) frequency was tested by this method.

A standard Campbell mutual inductance was used for the potentiometer circuit, with a standard non-inductive decade resistance.

$R2$ consisted of a 100ω standard resistance. $M2$ was a non-standard mutual inductance which was tested against the standard and was found to give a nearly silent balance point, and to have a mutual inductance of 30·20 m.h.

Using these fixed values for $R2$ and $M2$ four sets of readings were obtained by slightly altering the current in the potentiometer circuit:—

Test No.	Potl. across $R2$ R ohms	M m.h.	Potl. across $M2$ R ohms	M m.h.	f (calc.)
6 ..	.. 21·06	13·46	44·56	0·2825	790·7
7 ..	.. 25·61	14·23	47·13	3·440	790·2
8 ..	.. 29·45	14·775	48·93	3·955	790·2
9 ..	.. 32·97	15·21	50·37	4·425	790·3
					790·3 average

Error possible in each test 0·8 cycle.

During these tests the frequency of the oscillator output was kept at 1·8 cycles per sec. higher than the fork (9 beats in 5 seconds). The true frequency would appear to be 790·3 − 1·8 = 788·5. This was later confirmed by checking against a standard fork of 796 (±1 in 10 000) when 7·5 beats per second were obtained.

The true fork frequency was therefore 788·5.

INLAND TELEGRAPHS.*

A Forecast of Some Possible Developments.

By T. E. HERBERT, M.I.E.E.

IT is generally unsafe to attempt prophecy, nevertheless "where there is no vision the people perish." And so, I will venture to make an attempt to describe what I imagine will be the function of telegraphs some twenty or thirty years hence.

In the first place, the business community will have made the discovery that speeding up their methods will enable more business to be done with much less effort.

Every business office will be equipped with a teleprinter, and by means of a dial form of automatic switching, communications will be sent direct to the recipient. All the businesses where the office staff runs to even one typist will have the machine installed. In the case of very small firms, possibly the telephone connection may be used for the dual purpose, or perhaps several small firms may share a single telegraph wire.

The messages will be received on a form of receiving perforator in the main telegraph office of the town to which the recipient is connected, and in this way the message will be stored and sent in automatically to the recipient as soon as his circuit is free. It may be that several machines may be "lined up" on a rotary line switch with messages for a single subscriber, and will discharge their messages in sequence. This plan will enable the messages to be dealt with in a strictly routine manner in the same way as the morning mail, without fuss or flurry.

The telephone will, on the other hand, be used where discussion is essential, and all trivial inquiries made personally to important executives will be eliminated; surely I need hardly point out how much time can be, and is in fact, wasted by inquiries to particular people known personally to the caller for detail information which the executive has to obtain in a hurry while the telephone call is proceeding.

Sub-Audio Frequencies.

A service of the type I have sketched will need a large number of circuits, but these are already available, since it has been demonstrated that telegraphs can be worked at sub-audio frequency on telephone trunks without appreciable deterioration of the latter. When this source fails, voice frequency systems, or even multiplex systems, controlled by precision vibrators as regards the division of line, time will certainly meet the requirement.

There remains the problem of the delivery of messages. For the purely private messages where the recipient is not on the telephone—and the percentage of such messages to the total messages would tend to fall—there seems no alternative to delivery by messenger. If, however, the system as a whole can be made remunerative this does not seem a very serious matter.

The advantages of the plan I have outlined consist in transferring the human labour to the subscriber, but this does not represent any serious addition to his necessities, since the message can be telegraphed with just the same labour with which it would have in any case to be typed.

It only remains to add that salesmanship and adequate publicity are clearly essential to the early realisation of such a scheme. The engineering details would present no insuperable difficulties, but it may be interesting to point to a few other possibilities. In the first place, any telegraph message sent by telephone either from a telephone subscriber, a telephone kiosk or from a village Post Office or railway station would be typed as it is received at the main telegraph office, and would thus be transmitted to its destination; or perhaps the typewriter might have a perforating attachment to enable the message to be stored in the form of a perforated tape and so transmitted mechanically when a circuit is available.

The loss on telegraphs must ultimately be obviated, but, unfortunately, the problem cannot be said to have been solved by the Hardman Lever Report, by the recent Commission to America, nor yet by Lord Wolmer. On the other hand, the I.E.E. paper by Donald Murray† certainly did break new ground.

* Extracts from the Chairman's Address to the North Western Centre of the I.E.E., read at Manchester on October 22nd.

HAMS HALL.

Opening of Birmingham's New Power Station by the Duke of York—A Brief Description of the Plant Installed for Initial Development.

THE first section of the Birmingham Corporation Electricity Supply Department's great new power station at Hams Hall was officially opened by the Duke and Duchess of York on Wednesday. On the arrival of the Royal party at the power station, the Lord Mayor presented Mr. R. A. Chattock, the City electrical engineer, and Councillor H. K. Beale, chairman of the Electricity Supply Committee. The party then proceeded to the engine room, where Miss Esther Chattock offered a bouquet to the Duchess of York, and Councillor Beale presented members of his Committee, officials of the Department, and representatives of the contractors. The Duke of York inaugurated the supply by starting up one of the sets, after which Councillor Beale presented the Duke with a silver-gilt model of the concrete cooling towers as a souvenir of the occasion.

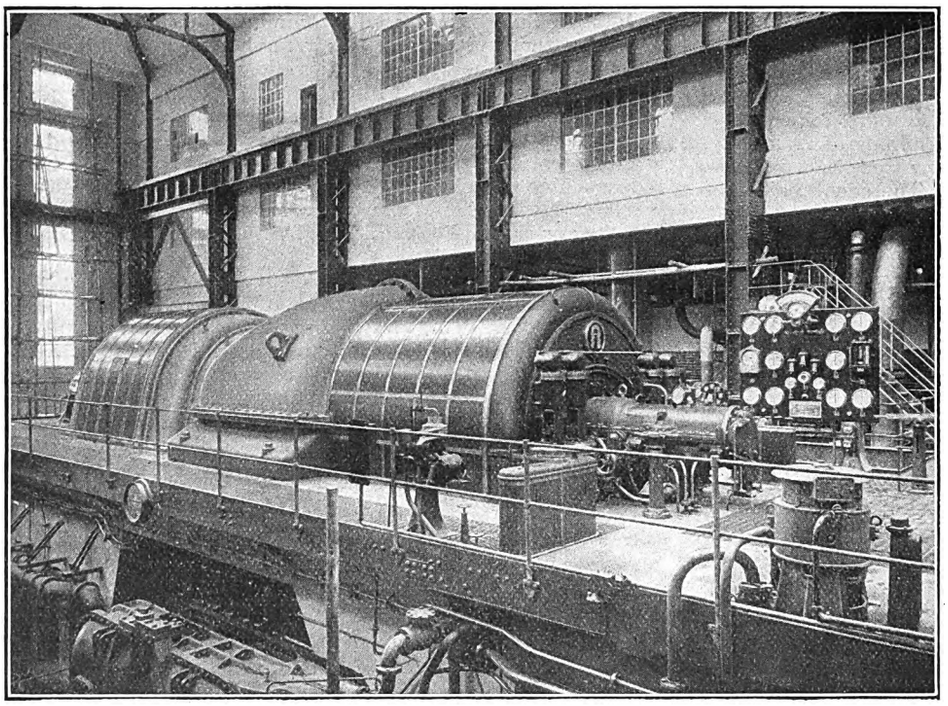

Fig. 1.—One of two 37 500 kVA turbo-alternators at Hams Hall: 11 000 V three-phase 25 cycles, 1500 r.p.m. (from turbine end).

The principal plant at present installed includes two main turbines and two house turbines constructed at the Fraser and Chalmers Engineering Works of the General Electric Co., Ltd. The main turbines have a maximum continuous rating of 30 000 kW and run at 1 500 r.p.m., while the house turbines have a maximum continuous rating of 1 875 kW at 3 000 r.p.m., and drive their respective generators through speed reduction gears. In all cases steam is supplied at 350 lb. and 700 deg., and the turbines are designed for 1 lb. per sq. in. absolute pressure at the exhaust.

The main turbines are of the single casing type, fitted with impulse blading throughout. The steam first expands in a velocity stage with two rows of moving blades, which are followed by three drums, of small to medium diameters, carrying 30 rows of blading, and the final expansion takes place in six single impulse stages of large diameter. All the blading, both moving and stationary, in the high pressure and intermediate pressure portions is completely machined, whereas in the low pressure portion the moving blades are machined all over, and the stationary blades are cast into the diaphragms. In the high pressure end the blading is made of nickel steel as far as the ninth stage of the first drum. Beyond this point all blading consists of stainless steel for the machined blades and rustless iron for the stationary low pressure blading.

The main shaft packing consists of a stationary bush made in halves, and a sleeve mounted on the shaft. The bush is centred in the casing by means of flexible fins, and strong flanges at either end render the necessary stiffening against distortion. In addition, circular keys are inserted between the packing flanges and the casing, with an expansion clearance for radial outward movement, but with a definite stop to prevent closing inwards. The flexible centring fins are so proportioned that no undue force is transmitted on the horizontal joint bolting of the casing. The sealing fins have less than 0·1 in. pitch.

The front end of the turbine casing is made of cast steel, the exhaust end of cast iron. The joint between the two parts lies in the region of pressure below atmospheric, and, in consequence, is subject to only moderate temperatures. The high pressure end of the casing forms the live steam belt, which is closed at the horizontal joint, the steam being admitted to the top half through external pipes. The casing is provided with three bleeder branches for feed

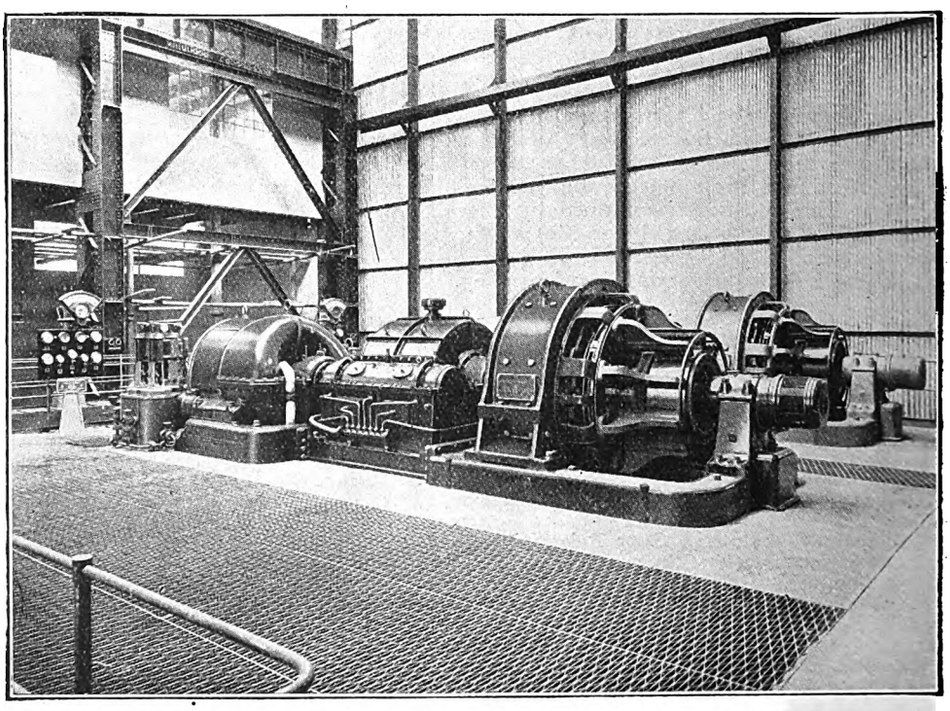

Fig. 2.—Two 1[875 kW geared turbo-generator sets at Hams Hall: 440/480 V, 500 r.p.m.; turbine speed, 3 000 r.p.m.

Digitized by Google

heating purposes. These are arranged after each of the three drums.

As the leaving energy of a stage preceding a bleeder branch is practically lost, advantage has been taken of a larger blading diameter in the next following drum in order to obtain the most favourable relation of blade length and mean diameter.

The residual longitudinal thrust of the rotor is taken up by two Michell thrust bearings. One of these carries the load, whereas the other is adjusted with a small running clearance to act as standby.

The main coupling is of the flexible claw type, which locates the longitudinal position of the alternator rotor. The coupling sleeve has two projections turned in the bore, by means of which projections and two steel discs the coupling sleeve is definitely fixed to the shaft ends.

On either side of the front bearing pedestal are arranged the steam chests, and there are four throttle valves for 0·4, 0·6, 0·8, and 1·0 load. Two live steam pipes, each with their own stop and emergency valve, lead to the left and right-hand side steam chests respectively.

The oil for the relay service and lubrication is obtained from two main oil pumps driven through worm gearing from the main shaft. A stand-by oil pump of the turbo type is provided, and is motor driven and automatically controlled. It is mounted on the oil tank, which has a capacity of 1 300 gals. The oil coolers, which are of the Serck type, are duplicated and provided with interlocked change-over valves.

Nine impulse stages, of which the first is of the velocity compound type, are provided in the house turbines.

Each of the first three stages is fitted with completely machined stationary blading of nickel steel, while the centre portions of the first two diaphragms are steel castings. No cast iron has been used for any part in the high temperature region. The remaining diaphragms are made of cast iron fitted with rustless iron blading. All moving blades are of stainless steel.

Live steam is admitted to the bottom half of the casing only so that the horizontal joint is not subject to live steam pressure. Three throttle valves control the steam. The oil pump on the turbine supplies oil for relay service and for lubrication of turbine gears and generator outboard bearing. An automatically-controlled motor-driven pump acts as standby.

Generating Plant.

The two main alternators, coupled to Fraser and Chalmers turbines, are of the General Electric Co.'s standard type, and are capable of a continuous output of 37 500 kVA at 0·8 p.f. (30 000 kW). The machines generate at 11 000 V three-phase 25 cycles, and run at 1 500 r.p.m. Cooling of the ventilating air (which is on a closed circuit) is effected by means of twin tubular type air coolers mounted in the foundation block beneath the alternator, and across its axis. The hot air from the machine is discharged downwards between the two sections of the cooler, divides and passes horizontally through the two sections and re-enters the alternator at both ends. Automatically-operated doors and louvres provide for the admission of air from the engine room and the isolation of the cooler sections in the event of failure of the water supply to the cooler, but the doors are so interlocked with the protective system of the alternator that they can be kept shut in case of emergency.

Due to transport difficulties it was necessary to build and wind the alternator stators on site under the main engine room crane. The reason for this will be better appreciated when it

Digitized by Google

is realised that the completed stator weighs 125 tons, whereas the heaviest single part of the stator to be brought to site weighed only 27 tons. The alternator rotor, which is built from a solid forging, weighs 45 tons, and was brought to site complete.

Driven direct from the end of the alternator rotor are the exciter and the auxiliary generator. These machines are

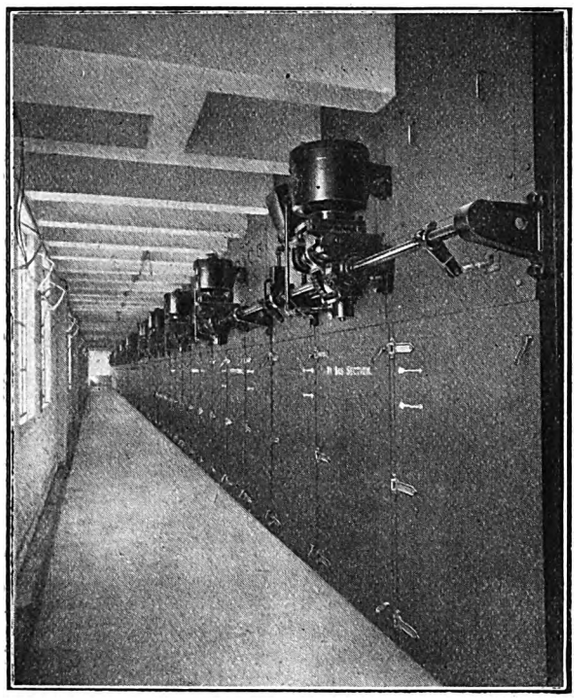

Fig. 6.—The 11 000 V high tension stonework cubicle switchboard (showing oil circuit breaker cubicles, solenoid operated).

electrically separate, but they are mounted in a common shell. Excitation is at 220 V, while the auxiliary generator is of sufficient capacity to supply one main circulating water pump and one main extraction pump with energy at 440 V.

There are two circulating pumps and two extraction pumps per set, one of which is normally supplied from the auxiliary generator and the other from the d.c. board, so that two separate and distinct electrical systems have to fail simultaneously before the set is shut down due to absence of power from the condenser auxiliaries. The d.c. switchboard can, moreover, be supplied from three separate sources.

The house service d.c. generators are one of the sources mentioned above. These two machines are also made by the G.E.C., and each gives 1 875 kW at 460 V. They run at 500 r.p.m., and are entirely standard.

Another d.c. supply for the station auxiliaries is given by the two G.E.C. motor-generator sets erected at ground floor level. They consist of 500 kW generators direct coupled to 750 H.P. motors supplied from the 11 000 V busbars through reactances. The sets run at 500 r.p.m.

The third source is the 440 V 2 000 Ah battery supplied by the Tudor Accumulator Co.

Auxiliary Drives.

Over 150 motors for auxiliary services, with a total capacity of over 10 000 H.P., have been supplied, ranging from fractional horse power machines driving remote controlled regulators, oil purifiers, etc., to the 750 H.P. motors of the motor generator sets. Special mention may be made of the circulating pump motors (two for each main set) which are d.c. vertical spindle machines, having an output of 400 B.H.P., with a speed range of 550/600 r.p.m., so that at light loads the quantity of circulating water may be reduced, with corresponding decrease in the power absorbed by the pumps. The extraction pumps in the pits on the boiler house side of the sets are also driven by vertical spindle d.c. motors, rated at 57½ H.P.

The boiler pumps are driven by two-pole 440 H.P. slip-ring induction motors. The special point of interest in these lies in the control gear. There is an ordinary hand-operated liquid starter connected in series with a slip regulator. When the liquid resistance is all out, the speed of the motor is 1 250 r.p.m. Between this speed and the maximum determined by the slip of the motor at the particular load the speed is automatically controlled by means of a Ruggles Kluijemann regulator, in such a way that the feed water pressure at the boiler is kept constant.

The twenty-five pulverisers are all driven by G.E.C. motors. Four pulverisers per boiler are connected to 120 H.P. two-pole induction motors at 1 475 r.p.m. and one per boiler to a 144 H.P. shunt-wound machine. The a.c. motors have totally enclosed slip-rings, while the d.c. are totally enclosed with a special cooling system for the air inside the casing. Each pulveriser has the coal feeder table driven by a small compound wound motor having a speed range of 400 to 2 000 r.p.m. obtained by series and shunt regulation. This gives complete control of the coal feed from the firing platform on which all the startors and regulators are mounted.

Switchgear.

The switchgear section includes numerous features worthy of comment. The equipment, all of which was supplied by the G.E.C., and manufactured at their Witton Works, includes a large 11 000 V stonework cubicle switchboard, electrically remote controlled, a d.c. flat back switchboard which is also electrically controlled, together with the control boards.

In addition there are several electrically-operated auxiliary switchboards, a low-tension a.c. board of the metal clad type controlling the house supply from two 1 750 kVA transformers, and a 33 000 V isolating link cubicle board on the e.h.t. side of the main transformers.

The whole of this switchgear is contained in the Switch House, a four-storey building adjacent to the main building. On the top two floors are installed the 11 000 V stonework cubicle board and the control board, the former occupying the greater portion of the two floors, while on the two lower floors are situated the d.c. and a.c. boards, auxiliary panels, and the 33 000 V isolating link cubicles.

The 11 000 V cubicle board is divided into 21 main panels, control being provided for the two 37 500 kVA turbo-alternators, six trunk feeders supplying power direct to various sub-stations, two 500 kW motor generator sets and two 1 750 kVA works supply transformers. There are also several cubicles containing busbar couplers, section switches and such necessary gear.

Main and transfer busbars are each provided with their own sets of isolating links, etc.

The equipment of the cubicles—which is practically the same for all the circuits controlled, with the exception that each alternator is supplied with a potential transformer and two oil circuit breakers, one for connecting to the main busbars and the other for the transfer bars—consists of an oil circuit breaker, isolating links and instrument transformers of Chamberlain and Hookham manufacture. The stonework cubicles are built up of slabs of moulded stone into a cellular construction forming compartments in which apparatus of different phase and polarity may be isolated so far as practicable. Steel plate doors fitted at back and front and fastened by padlocks are provided, while, in the case of the oil circuit breaker cubicles, the operating solenoids are mounted on the front. For all the circuits controlled the breakers have a rupturing capacity of 750 000 kVA.

The control room contains the necessary control boards for the remote electrical operation of the switchgear previously enumerated. These control boards extend down both sides of the room, facing each other, that controlling all a.c. circuits being on one side, while that controlling all d.c. circuits is lined up on the opposite side.

Dealing first with the a.c. board, this controls the alternator cubicles, six trunk feeder cubicles, bus section switch, bus coupler, works supply cubicles, and the two motor generator cubicles.

Each alternator control panel is equipped with two two-way control switches for operating the oil circuit breakers, red and green signal lamps indicating the position of the breakers. A further control switch operates a single-phase oil circuit breaker installed in the neutral earthing circuit of each alternator. The instruments on the panel include ammeters, power factor meter and indicating wattmeter, two synchroscopes (one for each set of bars), integrating watthour meter, regulator and governor motor controllers, air door relay and field suppression switch.

Each feeder control panel possesses an oil switch controller, ammeter, single pole leakage relay and a triple pole inverse time overload relay.

Digitized by Google

All the alternator, feeder, works supply and motor generator panels are equipped with the G.E.C. protective system (McColl patents).

Two large voltmeters mounted on a bracket at the end of the board indicate the main and transfer busbar volts respectively.

The d.c. control board is equipped with panels controlling the two auxiliary generators, the d.c. sides of the two 500 kW motor generator sets, battery and booster, trip circuit master control, works lighting and power, and the two house turbo-generators. Several blank panels are left unequipped for future extensions.

Engine room telegraphs and telephones are also installed in the control room, and are mounted on pedestals in front of the appropriate panels.

The d.c. switchboard is on the same floor level as the turbo-alternators, and is housed in one room. The positive and negative boards controlling the same circuit are separated from each other so that the board is split into positive and negative sections. The panels control the two 1 875 kW house turbo-generators, the two 500 kW motor generators, the boiler house works supply, auxiliary generators and condenser auxiliary, 220 V lighting circuits and battery. Thus three sources of supply are available for the d.c. board, namely, the house service generators, the motor generators, and the battery.

Most of these panels are equipped with a new type of d.c. circuit breaker which has recently been developed by the G.E.C. It is known as the line contact circuit breaker, which is said to give a greatly improved form of laminated contact. The laminations are in the form of standard vee-edged blades, bedding into corresponding grooves formed in the contact block. By using any number of these blades any capacity of circuit breaker may be constructed up to 20 000 A with ease, and without overheating. Those on the various d.c. switchboard panels vary between 1 000 and 4 000 A capacity.

By an ingenious feature of design, not only are the contacts self-aligning, but they are self-cleaning as, during the process of closing, a vertical sliding action is transmitted to the blade so that each surface is effectively cleaned at every operation of the breaker. The auxiliary metal contacts are designed to maintain their pressure even under short circuit conditions until the blade contacts are well clear of the top block. Sure and rapid breaking under the heaviest short circuit conditions is accomplished by means of the auxiliary carbon blocks and arc-breaking devices.

In the basement of the switch house are located the main 12 000 kVA feeder transformers, of Ferranti manufacture, together with the three G.E.C. 1 750 kVA works supply transformers, one of which functions as a spare. Each of these latter transformers is supplied with three-phase 25 cycle current at 11 000 V, stepping down to 440 V. The cables from the secondaries of the two transformers in use are taken to two incoming units of the low tension metal-clad switchboard situated on the same floor. This switchboard, which supplies power to the various boiler house drives, comprises 12 units, two incoming and ten outgoing, each unit being equipped with an oil circuit breaker of 150 000 kVA rupturing capacity.

The 33 000 V isolating link cubicles are also housed in the basement, together with the liquid earthing resistances for earthing the neutral points of the two main turbo sets, and the six main feeder transformers. Each of the latter is situated in a separate room, the six rooms running the length of the switchhouse. With each transformer is associated one of the 33 000 V isolating link cubicle switchboards previously mentioned, and the appropriate earthing switch.

(*To be continued.*)

OVERHEAD LINES OR UNDERGROUND CABLES?

Circumstances in which the 33 kV Feeder System might be Laid Underground—New Excavating and Laying Machinery—Comparative Costs with Two Systems.

By COL. R. E. CROMPTON and DR. ALFRED EKSTROEM.

THE part of the grid which we believe to be the most important, and on which most of the Central Board's capital will be spent, is the development of the 33 kV feeders radiating from the selected power stations to distribute in bulk to undertakings supplying the surrounding urban and rural districts.

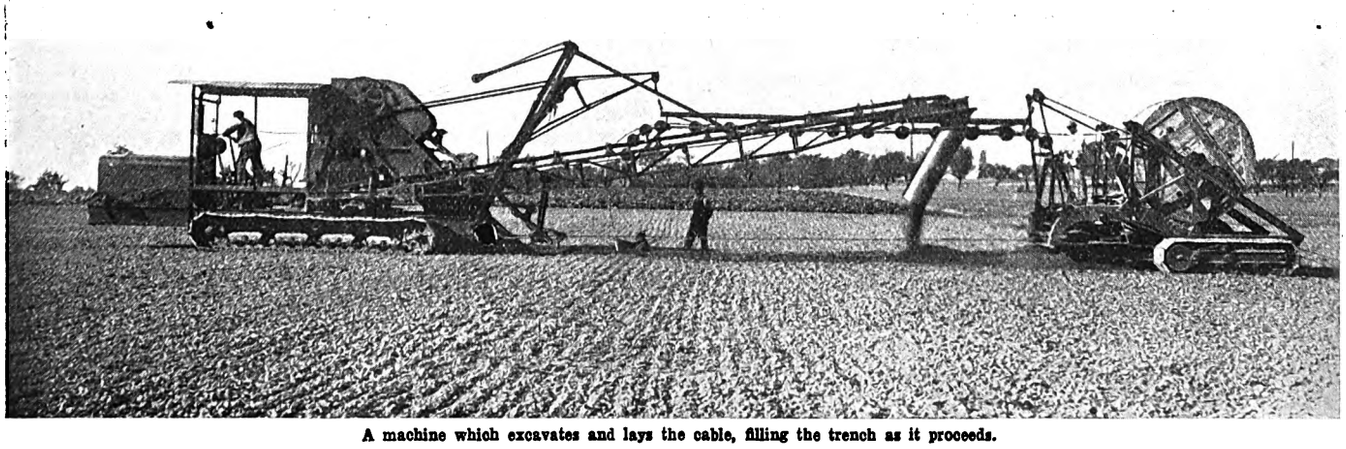
Only a few years ago nobody would have thought of building these systems other than with overhead line constructions, but modern engineering technique develops quickly and the cable manufacturing industry is in this respect no exception. Underground cables for 33 kV are now in extensive use and it is only a matter for economical consideration whether these lines should be built overhead or underground..

After considering the problem we maintain that by means of cable-laying machinery, such as that illustrated, the cost of laying the feeder cables underground can be reduced to a very low figure.

If the cable is laid at a depth of 4 ft. from the surface of the ground it will be sufficiently protected from damage by farming operations, so that for cables up to 20 kV the cost of steel-armouring can be saved, if necessary, for economic reasons. Again, the careful handling of the cable by this laying machinery will make it possible to reduce the strengthened construction necessary when the cable is to be laid by hand.

Again, the cost of wayleaves will be considerably lower when underground cables are used instead of overhead line construction, and there will be a certain saving in the actual length of the copper conductors due to the absence of catenary and avoidance of curves when an underground cable-line is used.

But even if, with the allowances mentioned above, the first cost of underground cables proves to be higher than that of overhead lines, this difference may be reduced by the following factors :—



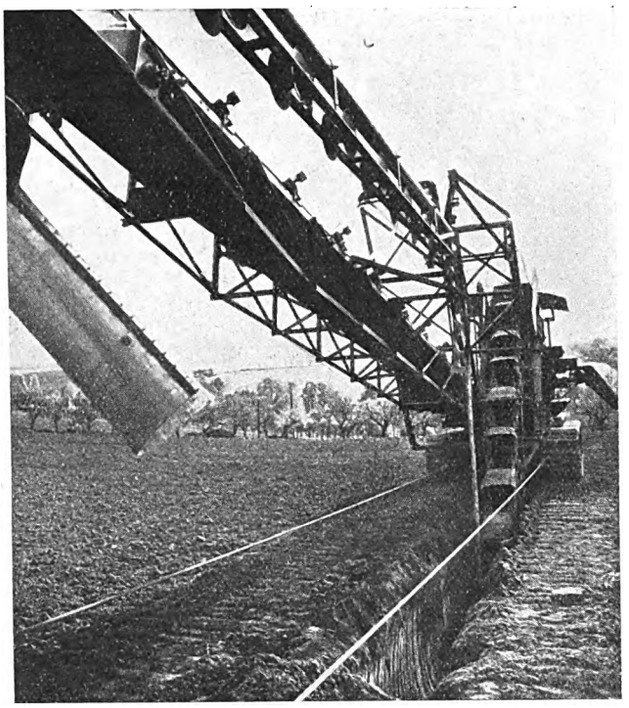
A machine which excavates and lays the cable, filling the trench as it proceeds.

Digitized by Google

(1) Underground cables have a considerably longer life than overhead lines, and, therefore, the annual depreciation cost will be reduced.

(2) There will be fewer disturbances and interruptions due to weather conditions in a supply with underground cables, and this of itself reduces the cost of inspection and maintenance, and the losses from interrupted supply.

(3) The more reliable service obtained by an underground cable supply is important to the consumers, especially for industrial undertakings.



View of cable-laying machine showing the excavating arrangements and the earth return chute.

(4) The supply by cable will improve the power factor in comparison with that for overhead lines.

An Example.

Let us now assume that two places have to be connected for supply by a 33 kV transmission line of either overhead three steel-aluminium wires, each equivalent to 64·5 sq. m/m. = 0·1 sq. in. copper, or, in consequence of suitable soil conditions, by an underground cable of 3 × 50 sq. m/m. = 0·0 775 sq. in. copper.

We assume that when using overhead lines the actual length of copper will be 22 miles = 35 km., but with underground cables it will be only 19 miles = 30 km.

First Cost:—1. Overhead Line.—(Equivalent to 3 × 0·1 sq. in. copper wires.)

We assume that the cost of an overhead construction as above, according to the specifications of the Central Board, will be about £1 000 per mile, to which we must add £4 4s. for capitalised cost of wayleaves per leg of the pylons. Thus:—

22 miles at £1 000	=	£22 000
Capitalised cost of wayleaves	=	880
Total		£22 880

2. Underground Cable.—(Compounded, steel-armoured, paper-insulated, 3 × 0·0 775 sq. in. copper wires, each core lead-covered.)

We assume that such an underground steel-armoured underground cable will cost £1 300 per mile delivered at the place where it is to be laid.* Thus:—

19 miles of cable at £1 300..	=	£24 700
Cable boxes, joints, cable laying, etc. ..	=	3 500
Capitalised cost of wayleaves	=	200
Total		£28 400

The first cost of an underground cable would thus be about 24% greater than that of an overhead line.

* Prices received from a plant on the Continent.

Annual Working Cost.

Overhead Line.	£	*Underground Cable.*	£
(1) 7% interest on £22 880 .. .. =	1 601	(1) 7% interest on £28 400 .. .. =	1 988
(2) 1·6% depreciation (corresponding to 25 years life of overhead line) .. =	366	(2) 0·35% depreciation (corresponding to 45 years life of cable) .. .. =	99
(3) 4% management and upkeep .. =	915	(3) 1¼% management and upkeep .. =	426
(4) Dielectric losses (not estimated).. =	0	(4) Dielectric losses (1·7 kW per mile), 32·5 kW × 8 760 hrs. = 285 000 kWh at 0·3d. per unit .. .. =	356
(5) Copper losses, 650 kW × 2 000 hrs. = 1 300 000 kWh at 0·6d. per unit .. =	3 250	(5) Copper losses, 716 kW × 2 000 hrs. = 1 432 000 kWh at 0·6d. per unit.. =	3 580
(6) Losses due to interrupted service =	250	(6) Losses due to interrupted service =	50
Total	£6 382	Total	£6 499

These figures show that the cost of energy supplied by the Central Board to distributing undertakings may not be appreciably greater when using underground feeder cables in place of the proposed overhead lines.

This example is obviously not applicable to all parts of Great Britain. In parts where the soil is not suitable for cable laying the costs may increase to such an extent that overhead line construction is necessary. It shows, however, that the question of laying the 33 kV feeder system underground ought to be taken seriously into consideration wherever the soil conditions are favourable.

Drop in Voltage on 33 kV Line for Transmission of a Load of 8 600 kVA.

(1) Overhead Line.—22 miles 3 × steel-aluminium wires equivalent to 3 × 0·1 sq. in. copper wires:—

Ohmic drop in voltage	$R = I \times r \times l$	= 1 430V
Inductive drop in voltage	$X = I \times m \times l$	= 1 320V
Total drop in voltage	$Z = \sqrt{R^2 \times X^2}$	= 1 950V

(2) Cable.—19 miles 3 × 0·0 775 sq. in. copper wire:—

Ohmic drop in voltage	$R = I \times r \times l$	= 1 590V
Inductive drop in voltage	$X = I \times m \times l$	= 365V
Total drop in voltage	$Z = \sqrt{R^2 \times X^2}$	= 1 970V

From the above it can be seen that an overhead line of 3 × 0·1 sq. in. regarding total drop in voltage is equivalent to a cable of 3 × 0·0 775 sq. in.

It should also be noted that in consequence of the large electric capacity of the cable, a better power factor (cos φ) is attained than when an overhead line is used.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Our House in Order."

[To the Editor.]

Sir,—I feel I must write and thank Mr. Donald Smeaton Munro for his amusing contribution to our controversy, and although I was greatly entertained thereby, I am sorry that I was not greatly helped.

Surely Mr. Munro is not serious when he says that we have got beyond the "What shall I do" stage; the quotations I gave in my summary of the position definitely indicate the opposite. And I can give other instances of the widely divergent opinions of those to whom we look for a lead.

For instance, concurrently with Mr. Munro's very definite statement in the last issue of The Electrician—"when we work to rules, it logically follows that inspection is necessary"—we find no less a person than Mr. Willoughby Ellis in "The Electrical Review" stating the exact opposite, as follows: "There is not the slightest need for an army of inspectors, or other officials, to administer such compulsory rules. Half a dozen prosecutions and convictions would do more to "cook the goose" of the shoddy worker than all the inspectors or 'compulsory registration' in the world." (Domestic Service, October 18th.)

Well, to continue Mr. Munro's theological similies, are we to believe in the gospel according to Donald, or in that according to Willoughby, to bring us to our Paradise? Even then,

Digitized by Google

I certainly do not expect to make a watertight compartment of the installation industry as Mr. Munro suggests. I am optimistic enough to think that there will always be sufficient contractors left to work out at more than one per town, and, in any case, I cannot think that our industry can be anything but better for the elimination of the incompetent. *Is* there no such thing as competition between, for instance, registered chemists?

There is undoubtedly, as Mr. Munro emphasises, a vast amount of apathy amongst contractors generally, but we must look for the cause of this. Many of these apathetic contractors *have* been registered, and *have* been members of the E.C.A., in some cases I know of have held office, and they must be reawakened to a sense of their responsibilities. How better can this be done than by letting them see the organised contractors going ahead with one voice and one policy, instead of twenty.

Mr. Munro must not think that I am in any way attempting to belittle the great progress made by the Register, or the valuable work done by the E.C.A. My own firm has been registered since the inception of the Register, and we have for years provided *two* members to the district branch of the E.C.A., one of us being its chairman. We therefore know what has been done, and can appreciate to the full the great amount of time and energy spent by our officers, mostly gratuitously, but we must not rest on our laurels. We want to get further and we *can* get further, but not until we know our own minds.

I am not particularly biased one way or the other; I may have leanings in one direction, but I believe I represent the view of the rank and file when I say we await a lead, something a little more definite than Mr. Munro's "work for the industry." We are all doing this, I hope, but our work will be the more effective if it is all in the same direction. As Mr. Willoughby Ellis himself says, earlier in the article I have already quoted, "it is most clearly apparent that the industry itself must entertain no two opinions on this vitally important matter."

To make a tangible start, will Mr. Munro bring his opinion into line with that of the President of the E.C.A., and thus "work for the industry?"—I am, etc.,

T. C. GILBERT.

Folkestone.

P.S.—I do not "claim" to be a Bolshevist, I have been *called* that, however.—T.C.G.

"Where *Is* That Battery?"

[TO THE EDITOR.]

SIR,—Since reading Mr. Raymond J. Mitchell's letter, which appears in your issue of November 1st, I have had the opportunity of also reading his letter of August 30th, in which he made the suggestion that a large sum of money should be put up to enable further research to be carried out with a view to possible improvement in storage batteries. Whilst in every way thoroughly appreciating what Mr. Mitchell means, I also think that now we have such a great improvement as the steel constructed, nickel-iron battery, we should at least be thankful for the really great work that has been carried on now for over twenty years with that particular object in view, namely the marketing of a real good engineering job in the form of storage batteries.

As regards battery performance, I think I can claim to be quite unprejudiced, for I have used many makes and types of accumulators during my experience, and I am very much surprised to learn that Mr. Mitchell claims that the nickel-iron battery has a commercial energy efficiency lower than the lead-acid cell, as I have found, in the course of many experiments, that there is not much to choose between them from the overall efficiency aspect, when subject to the strenuous duty and exacting demands of locomotive and road traction work. Even lead-acid battery medicine men have, at various times, admitted that the nickel battery is technically a superior piece of storage equipment, but, of course they point out that the cost is higher, that is to say the "first cost, is more for given output, etc. The truth of their views can be seen at the present time, when certain well-known, and experienced lead-acid battery manufacturers are to-day offering the "nickel-iron" cell as an approved alternative.

For a given commercial output, I am sure that Mr. Mitchell is well aware that the "nickel-iron" cell is lighter, and is much the better and cheaper of the two types, when capitalised out over the normal life of the locomotive or road vehicle. I am sure that the extensive research work which is going on in both camps at the present time will still further improve and, possibly, reduce the cost of storage equipment.

As I pointed out in my letter of October 18th in connection with the "Paragon" system, we have the very material advantage of still further reducing the weight of either type of battery, for given amount of ton-mileage duty done, and over given routes and weather conditions, by reason of the fact that we have improved the physical operating efficiency of battery traction generally, in the form of completely cutting out the tremendous resistance losses during "acceleration," and recuperating the "kinetic" energy so produced when stopping or running down grades, to a far greater extent than has been previously carried out. This results in a reduction of battery capacity of at least 30%, and it is for that reason that the cost of a complete "Paragon" locomotive, although fitted with a nickel-iron battery, is very little if any above the cost of an ordinary series-parallel locomotive fitted with a lead-acid accumulator.

The traction motor which is installed on the 100 H.P. "Paragon" battery locomotive has an electro-dynamic efficiency of 90%, so if Mr. Murphy has been able to produce a much smaller motor, such as would be required on a gross load of 12 tons, with an efficiency of 88%, it is very fine work, and should receive every possible encouragement. Now, in regard to regeneration, I have to thank Mr. Mitchell for his estimate that I get 10% return energy. I have to say that he is not quite right, though not far out for level road starting and stopping operations, but, when running down grades these locomotives are every day returning as much as 40 and sometimes 50% of the energy which they drew from the accumulator, when climbing the same grades at practically the same speeds. However, be that as it may, the great thing is that, if desired, we may have the material advantage of the long life of the nickel-iron battery at practically the same overall cost, besides all the even greater advantages of infinitely variable speed, both in acceleration and deceleration, apart from being in a position to run at any speed, without the electrical losses (all of which must be first put in, and then taken out of the battery) which are unavoidable in the normal type of series-parallel type of vehicle.

With regard to Mr. Mitchell's remarks about progress, I fail to see any improvement from the old single and two motor equipments which we had in use over 30 years ago, and can assure Mr. Mitchell that we had small motors, even in those days, having efficiencies as high as 85 and 87, but, owing to the absence of any other type of storage battery, and the high electrical losses which are unavoidable in such systems, that although many thousands of pounds sterling had been spent in the attempt, no improvement of a very highly technical nature has really taken place during the intevening period.

It is indeed interesting, however, to read Mr. Mitchell's statement that he has witnessed a recuperation of as much as 70% of the "retardation" energy, at all useful speeds; if he means 70% of the kinetic energy of the moving vehicle, I am sure that it is most excellent work.

I am still of the opinion that the time for a change has arrived, and it behoves accumulator traction engineers to do their best to forward the day when London, and many other large crowded cities, shall reap the great hygienic advantages of smokeless, noiseless, and poisonless operation of passenger and goods carriage, which can only be got from super-efficient electrically propelled vehicles.—I am, etc.,

WILLIAM P. DURTNALL.

London, S.W.1.
November 2nd.

"Sound Recording."

[TO THE EDITOR.]

SIR,—Further to Mr. Campbell Swinton's letter on the Electro-magnetic Method of Audio-frequency Recording, I, too, recall Dr. Poulsen's "Telegrafon" being demonstrated to me many years ago in Copenhagen.

To the best of my recollection Mr. Campbell Swinton was in Copenhagen at the same time. It was interesting to observe how different the recorded voice reproduced to the recorder, due, no doubt, to skull resonance.

On the other hand, when I listened to a reproduction of the demonstrating engineer's voice, it was *absolutely* recognisable, and, as Mr. Campbell Swinton remarks, only needed the addition of a modern valve for pure amplification.—I am, etc.,

H. ANTONY HANKEY.

London, W.6.
October 29th.

NEWS IN BRIEF.

New Zealand and the Pacific Cable—The World Power Conference—Liverpool Electro-Harmonics—The Adventures of a 45-ton Stator—Pulverised Fuel Lectures.

FOR working wireless sets without licences, 130 persons were summoned at Birmingham last week.

A bill confirming the sale of the Pacific cable to the Communications Co. passed the New Zealand House of Representatives on October 21st.

A meeting of the Women's Engineering Society will be held at the Lyceum Club, London, on November 19th, when Miss Winifred Pink will give an address.

Before a well-attended meeting of the Diesel Engine Users' Association on November 1st, Mr. J. G. Pearce (director, British Cast Iron Research Association), read a paper on "Modern Engineering Cast Irons and their Properties."

An electrical device for detecting dirt is reported to have been developed in New York.

Barking U.D.C. recommends a tender, amounting to £500, for the erection of a sub-station at Gale Street.

Guildford Corporation has placed a contract amounting to £47 647, for extensions at the generating station.

Eastbourne Electricity Committee has accepted a tender for the erection of a switch house at a cost of £4 600.

A woodpecker having made a transmission pole unsafe at Newark, Notts, the supply was recently suspended in order that repairs could be effected.

Glasgow Watch Committee has asked the General Manager of the Electricity Department to prepare an estimate of the cost of wiring the various fire stations.

At a meeting of the South Midland Centre of the I.E.E. on November 11th, Mr. H. W. T. Taylor will read a paper entitled "Voltage Control of Large Alternators."

Prince Chichibu formally opened the Engineering Congress and World Power Conference at Tokio on October 29th. The number of British delegates attending was 35.

A meeting of the Overhead Lines Association will be held at the I.E.E. on November 20th, when Mr. Borlase Matthews will deliver a paper, illustrated by cinematograph, entitled "Standard Intermediate Voltages for Rural Electrification."

There was a good attendance of members of the electrical trade at the first dinner and concert of the season under the auspices of the Liverpool and District Electro-Harmonic Society. Mr. P. J. Robinson, city electrical engineer, Liverpool, presided.

At the meeting of the Institution of Electrical Engineers, North Midland Centre, at the Hotel Metropole, Leeds, on November 12th, Mr. E. J. Evans will read his paper on "Feed Heating by Extracting Steam in Generating Stations," for which he was awarded a premium last session.

A meeting of the Institute of Fuel will be held jointly with the Institution of Electrical Engineers in the Lecture Theatre of the Institution on November 21st, when three papers will be presented, in abstract only, all dealing with the subject of low temperature carbonisation in connection with the production of electricity. Sir Thomas Purves will preside.

The Board of Education announces the award of two Whitworth Senior Scholarships of the annual value of £250 and tenable for two years, six Whitworth Scholarships of the annual value of £125 and tenable for three years, a Whitworth Prize of £10 to a candidate who qualified for a scholarship but was unable to accept it, and 24 Whitworth Prizes of £10 each to unsuccessful candidates for scholarships.

The Commissioners of H.M. Works, etc., invite tenders for alterations and extension of the Wick wireless station.

The annual general meeting of the Junior Institution of Engineers will be held at 39, Victoria Street, London, S.W.1, to-night (November 8th), at 7.30.

The value of wireless in educational development has been extensively recognised, but Sheffield is probably the first of the Universities to bring broadcasting into its curriculum.

The first ordinary meeting of the thirtieth session of the Scottish Centre of the I.E.E. will be held at the Royal Technical College, Glasgow, on November 12th, when the chairman, Mr. George Morgan, will deliver his inaugural address.

Shipley U.D.C. has had under consideration the question of the re-arrangement of the lighting of the Victoria Hall, made necessary by the recent alterations, and has decided to instruct the Electrical Engineer to obtain schemes and estimates.

Ripon Corporation has received an application from Messrs. Freeman, Hardy and Willis for one of their shop lights to be used as a night light at no cost to them. A scheme is to be prepared for various shop lights to be used for public lighting in the city.

The London office of Kalgoorlie Electric Power and Lighting Corporation has received a cable from Kalgoorlie stating that a heavy storm and lightning have damaged the terminal house and that repairs will take several days to complete.

At a meeting of the Institution of Mechanical Engineers, on November 29th, Mr. R. H. Parsons will open a debate on "The Registration of Reliable Tests for Power Plant Machinery." A meeting of the Graduates' Section will be held on November 18th, when Mr. A. G. Brown will give an address entitled "Artificial Lighting of Factories and Public Buildings."

A recommendation that automatic road traffic signals be installed at 21 additional points, making 38 in all, was discussed by Edinburgh T.C. on October 31st. It was decided that 11 of the selected sites be remitted for further consideration.

A 45-ton stator was removed by the English Electric Co., Preston, by road to the Ribble power station last week. A specially adapted vehicle, drawn by a traction engine, was used. The generator, to which the stator belonged had been taken to the company's works for reconstruction, and its capacity was increased from 12 500 kW to 15 000 kW.

One hundred and thirty members and guests were present at a supper given at the Duke of Cornwall Hotel, Plymouth, on October 26th, by the Devonport Dockyard electrical department, Mr. H. F. Hunt, superintending electrical engineer, was in the chair, and the guests included the director of electrical engineering at the Admiralty, Mr. W. McClelland.

A special course of five lectures dealing with pulverised coal, at the London County Council School of Engineering and Navigation, Poplar, on Wednesday evenings, commenced on November 6th, and a special course of six lectures on the principles of electric welding will take place on Friday evenings commencing on November 8th. The latter course of lectures, which will be delivered by Mr. J. T. Bush, commence at 7 p.m., and the former, which will be given by different specialists, at 7.15 p.m. The fees for each course, for residents in the County of London, if over 21 years of age, are 3s. 4d., and if under 21, 1s. 8d.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *dated November 8th, 1879:—*

The death was announced of Prof. James Clerk Maxwell.

A leading article emphasised the need for widening the scope of the Society of Telegraph Engineers to enable it to cater for the increasing applications of electricity in other directions.

* * *

TWENTY-FIVE years ago THE ELECTRICIAN *recorded that:—*

Mr. J. Wilson Swan received a Knighthood, and Mr. C. A. Parsons, the C.B., in the Birthday Honours List. Swan was also awarded the Royal Society's Hughes Medal "for his invention of the incandescent electric lamp and various improvements in the practical applications of electricity."

* * *

FIFTEEN years ago it was stated in THE ELECTRICIAN *dated November 6th, 1914, that:—*

Mr. Llewellyn Preece presented to the I.E.E. a marble bust of Lord Kelvin.

* * *

TEN years ago THE ELECTRICIAN *of November 7th, 1919, stated that:—*

Mr. W. R. Cooper resigned the editorship of THE ELECTRICIAN.

Negotiations were proceeding for the absorption of the business of Brown, Boveri and Co., by Vickers, Ltd.

Digitized by Google

PERSONAL.

MR. A. Dallow, electrician, had been re-elected unopposed a member of the Wolverhampton T.C.

Mr. T. Smith, electrical engineer, Haslingden, has been re-elected a member of the T.C.

Mr. T. R. McCandish, constructional engineer at Torquay electricity works for the past seven years, has secured a position with the Croydon Electricity Department.

Sir Hugo Hirst will give an address to the students of Faraday House Electrical Engineering College on November 18th at 11.30 a.m.

Mr. C. R. Westlake, assistant electrical superintendent to the Bedford T.C., has been appointed engineer and manager of Dumfries Electricity Department.

Mr. C. E. Hart has been appointed representative for handling the transformer products of the British Electric Transformer Co., Ltd., in Scotland and Northern Ireland.

Ald. G. B. Brooks, chairman of Marylebone (London) Electricity Committee, has been nominated to represent the Council as associate member of the Electrical and Allied Industries Research Association.

Mr. Harold W. Millatt, showroom superintendent of Chester Electricity Department, has been appointed sales engineer to the Bedford Electricity Department, at a commencing salary of £400 per annum.

There was an interesting ceremony at Newark last week, when Mr. A. J. Waring, the borough electrical engineer, was presented with a canteen of cutlery and set of carvers on leaving to take up his appointment at Felixstowe.

The marriage was solemnised at Biggleswade on October 31st of Mr. Charles Redvers Westlake, chief electrical engineer of the Dumfries County Council for the Gretna and Durnock district, and Miss Winifred Lucy Luxton Western.

Mr. W. Griegson Pickvance, managing director of Pickvance, Ltd., who was borough electrical engineer for Wrexham Corporation from 1907 until 1920, was elected a member of the Wrexham Town Council for the Maesydre ward last week. Mr. Pickvance has also had a consulting practice since 1920.

Estate of the gross value of £23 481, with net personalty £23 199, was left by the late Mr. Herbert Louis Leach, consulting engineer, who died on August 16th, aged 64 years. He left, among other bequests, £100 to the Institution of Electrical Engineers' Benevolent Fund, and a like sum to the I.E.E. Research Fund.

Hammersmith (London) Borough Council has appointed Mr. George Cheyne Law, deputy electrical engineer and manager to Barnes U.D.C., to a similar position in connection with the Hammersmith electricity undertaking, at a salary of £800 per annum, rising by increments of £25 to £900 per annum.

Practically the whole of the employees of the Plymouth municipal tramways and transport undertaking assembled on October 27th, when Mr. E. E. Ackland, chief assistant, made presentations to the departing engineer and general manager, Mr. H. P. Stokes, and his wife. Mr. Stokes, it will be remembered has accepted the position of general manager of the United Automobile Services Co., Ltd.

Power Lines, Ltd., are desirous of transferring Mr. Piercy from Ripon to Uttoxeter, where his services are required for the supervision of certain overhead construction. Ripon Electricity Committee desires Mr. Piercy to remain until the Littlethorpe and Bishop-Monkton distribution system and the connections at Ripon are completed, when a further application for his transfer will be considered.

Mr. E. S. Evans, who has been district engineer of the E.L.M.A. Lighting Service Bureau for the North-East Coast since its inception in 1925, and during this year has been manager of the E.L.M.A. stand at the North-East Coast Exhibition, sailed last week for South Africa, to take charge of lighting development work in that country. Mr. Evans's resignation represents a considerable loss to the lighting development in this country and South Africa will be richer by his efforts.

Obituary.

MR. GEORGE ARMSTRONG PEARSON.—On October 20th, aged 56 years. Mr. Pearson was lecturer in electrical engineering at Halifax Technical College.

MR. WILLIAM F. KING.—In 1869 he joined the staff of the French Transatlantic Cable Co., and in 1873 was appointed chief engineer to the Western and Brazilian Telegraph Co. In 1894 he started in business for himself at the Leith Electric Works, Leith.

BUSINESS ITEMS.

MR. ALEXANDER AULD has commenced business as an electrical engineer at Wellington House, Alloway Place, Ayr.

The telephone number of HOPKINSONS, LTD., Centrifuge Works, Huddersfield, has been changed to Huddersfield 3 469.

A DEPARTMENT of the factory of Messrs. Wm. Hollins and Co., Ltd., at Nottingham, illuminated by Geco reflectors and Osram gasfilled lamps.

MR. C. H. B. STANSFIELD, radio engineer, of Beckenham, has transferred his business to 5, Kelsey Park Road.

MR. W. A. GOODHEW, electrical and radio engineer, of Canterbury, has removed his business from 19, Sturry Road, to 22, Sun Street.

The Radcliffe offices of the LANCASHIRE ELECTRIC POWER Co. have now been transferred to the Kearsley power station, the postal address of which is Stoneclough, Nr. Manchester.

The Southampton branch of the GENERAL ELECTRIC Co., LTD., has been removed from 24, High Street, to 149, High Street. The telephone number has also been changed from Southampton 4463 to Southampton 5631-2-3.

The EDISON SWAN ELECTRIC Co., LTD., has opened new offices and stores at 9, Whimple Street, Plymouth, under the supervision of the Southampton depot manager, Mr. W. A. Maddick.

RD. JOHNSON, CLAPHAM AND MORRIS, LTD., advise us that they have been appointed wholesale distributors of E.L.M.A. lamps, and the showrooms at Lever Street, Manchester, have been reconstructed.

In connection with the electric cooking equipment on board the R101 airship, the AUTOMATIC TELEPHONE MANUFACTURING Co., LTD., point out that this equipment was supplied by them as sub-contractors to the Air Ministry, through the main contractors for the whole of the electrical equipment of the airship, HASLAM AND NEWTON, LTD., Derby, who also designed and manufactured the control switch gear.

A few years ago the Admiralty decided to adopt Yarrow land boilers for the boiler house extensions at H.M. Dockyard, Devonport North, and four units were supplied by YARROW AND CO., LTD. As a result of the performance given by these boilers, the company has just secured the order for a fifth repeat unit, comprising, as before, a "Yarrow" patent boiler, integral superheater, mechanical forced draught stoker, and cast iron economiser superposed in series. It will be recollected that this firm also supplied the latest boiler installation for Portsmouth Dockyard, comprising six water-tube land boilers.

BRITISH BROWN-BOVERI, LTD., inform us that they have secured the contract for the equipment of the two rectifier sub-stations required in connection with the electrification of the Madras suburban section of the South Indian Railway. The sub-stations will be located at Egmore and Minambakkam, and will each contain two 750 kW rectifier plants with h.t. and l.t. switchgear and feeder switchgear, the whole to be designed for automatic control. One sub-station will be fed with three-phase current at 5 000 V, and the other at 33 000 V, 50 cycles, the d.c. pressure being 1 500 V. The plants have to be capable of handling very heavy overloads.

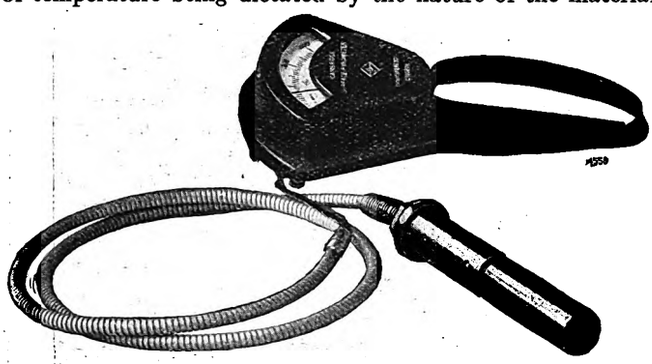
PLASTIC MOULDING.

Use of Surface Pyrometers for Temperature Maintenance.

IN the manufacture of plastic articles in heated moulds, satisfactory results can only be secured if the temperature is maintained within definite limits, the permissible variation of temperature being dictated by the nature of the material being moulded. Two new surface pyrometers (Models 33 and 34), just introduced by the Cambridge Instrument Co., Ltd., provide accurate and convenient means for quickly determining the inside surface temperatures of bakelite and other moulds, and of the heated surfaces of mould presses.



The Model 33 surface pyrometer of the Cambridge Instrument Co., Ltd.

Each instrument comprises a sensitive thermo-element connected by a short length of flexible steel armoured lead to a portable indicator calibrated to read directly in degrees of temperature. The thermo-element is protected by a cylindrical metal sheath which, when the thermo-couple is applied to the hot surface, is forced back against a spring so as to bring the end of the loop into contact with the surface.

When in use the thermo-couple is held in one hand and applied to the heated surface, while the indicator is held in the other. The instrument gives a steady reading almost instantaneously. In Model 33 (illustrated above), the thermo-couple is a thin flat strip formed into a small loop, and the sheath is directly attached to the end of the flexible leads. In Model 34, the thermo-couple is of wire form, flattened at the thermo-junction to form a small thin plate, and the thermo-couple sheath is pivoted to the end of a hollow metal rod which facilitates the application of the thermo-couple to surfaces which are not easily accessible.

In addition to their usefulness in determining surface temperatures of moulds, the instruments have also a wide field of utility in other manufacturing operations where it is necessary to ascertain surface temperatures with rapidity and accuracy. They may be used, for example, as insertion pyrometers for testing the temperature of field coils, etc., or as surface pyrometers for flat or curved surfaces as well as bearings, motor and generator parts, low tension bus bars, high tension cables, and other parts susceptible to a critical rise in temperature.

SCOTTISH CENTRE, I.E.E.

The Twenty-Ninth Annual Report of the Committee.

IN its report on the 1928–29 session the committee of the Scottish Centre expresses gratification at the continued prosperity of the Institution as a whole. During the session thirteen papers were read and discussed and the syllabus included a greater number of informal papers, dealing with matters of local interest, than has been hitherto customary. The average attendance at the ordinary meetings was 73. The session closed with a total membership of 738, being an increase of 41 on the previous year.

The Dundee Sub-Centre has recorded its ninth session of good work, the membership now reaching 57. The Students' Section has been specially active during the session and two of the student members gained Institution Premiums for their papers. The average attendance at the meetings held in Glasgow was 37, and at those in Edinburgh 26, giving the Section average as 31. The membership of the Section is now 157, and it is hoped that a better average will be forthcoming.

The committee regrets that greater support has not been forthcoming for the Golf Championship in connection with the Scottish "Centre Benevolent Cup."

IN PARLIAMENT.

Unemployment Relief and Electrical Development—Questions on Supply Failures.

IN the House of Commons on Monday, Mr. J. H. Thomas, Lord Privy Seal, gave an outline of his proposals for providing work to increase national efficiency, to stimulate exports and to improve industry's productive capacity. He mentioned that a further work programme amounting to £13 000 000 by the Underground Railways was under consideration, that the Central Electricity Board had placed contracts totalling £1 250 000 since July, and schemes were in existence covering nearly half the country. The Post Office, he said, was to spend £750 000 this year and £750 000 next year on telephone extensions.

Mr. Snowden (Chancellor of the Exchequer) stated, in reply to a question on Monday, that the terms of reference of the Committee of Inquiry into Finance and Industry would be "To inquire into banking, finance and credit, paying regard to the factors, both internal and international, which govern their operations, and to make recommendations primarily for the relief of industries, and calculated to enable these agencies to promote the development of trade and commerce and the employment of labour." He also made a statement as to the personnel of the Committee, which includes Mr. L. B. Lee, president of the Federation of British Industries, 1929–30, the Hon. R. H. Brand, a director of the Newcastle-upon-Tyne Electric Supply Co., and other companies, and Mr. J. F. Taylor, chairman of William Beardmore and Co.

Mr. Herbert Morrison, Minister of Transport, is informed that the Committee appointed under Part I of the Development (Loan Guarantees and Grants) Act has received an application for assistance in connection with various schemes which include a proposed railway running northwards from Finsbury Park.

In reply to questions as to whether he intends to introduce legislation requiring the certification and stamping of all electric meters, the Minister of Transport says representations in regard to this matter have been made to him by certain public authorities, and the matter is under consideration.

The Minister of Transport understands from reports in the Press that there have been certain temporary local failures of electric light supplies in the County of London during the last six months. He thinks that undertakers are fully alive to their statutory obligations as regards continuity of supply, but allowance must be made for unavoidable accidents. At present he does not intend to hold an inquiry.

Replying to a question by Major Glyn as to the average cost per point of electric light in cottages in Cumberland, Derbyshire, Northamptonshire, Essex, Hampshire and Berkshire, the Minister of Transport says he is not able to give the average cost of current per week, per lighting point, in cottages in the counties referred to. So far as he is aware there are only a few cases where electricity is supplied to small consumers at so much per lighting point. There are, however, a number of cases where the undertakers charge in accordance with a two-part tariff consisting of a fixed charge per quarter, plus a small charge per kWh for each.

LEGAL INTELLIGENCE.

Standard Telephones and Cables and Extension of Patent Period.

IN the Chancery Division on Monday, Mr. Justice Luxmoore heard an application under the Patents Acts for the extension of time of certain patents of the Western Electric Co., Ltd., to run.

Mr. Trevor Watson, said the application was made in respect of three patents of August 7th and September 6th, 1913, all of which had now expired. The application was made on behalf of Standard Telephones and Cables Co., who were the Western Electric Co. under another name. The latter operated in Great Britain for a corporation in Chicago to exploit its inventions. The nature of the inventions was improving long-distance telephony, but owing to the war the Post Office abandoned all constructional schemes, and the company became concerned on munition work, and they lost the whole period of the war, not coming back to their usual work till 1919. In fact, the company were dependent on the Post Office laying down long-distance lines. There was no opposition to the application.

His Lordship extended the patents from September, 1929, to August, 1934.

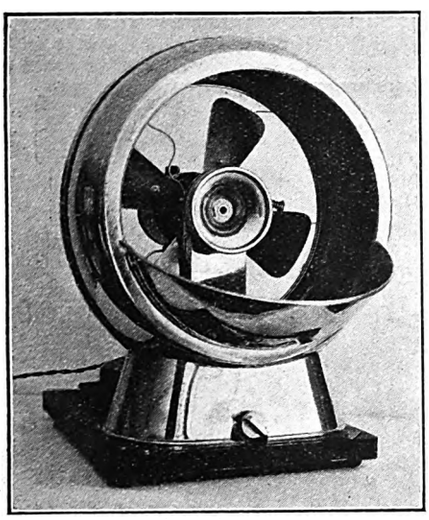
MATERIALS AND EQUIPMENT FOR MANUFACTURERS.

Apparatus for Purifying Air in Works, etc.—A "Carrier Ring" Coupling Device—New Equipment for Fighting Fires—Gas Analysis.

AN interesting air purifier put on the market by the ELECTRICAL EQUIPMENT AND CARBON CO., LTD., of Bank Buildings, 107, New Oxford Street, London, W.C.1, is the "Aerosan." This not only cleanses the air in the building, but also reduces it in temperature by—it is stated—some 50%. It is shown in an illustration on this page, and consists essentially of a combined exhauster and blower driven by an electric motor. A container at the base of the machine is fitted with a solution of "Aerosan essence"—a disinfectant supplied by the firm, and into this container dips a sprocket chain driven from the motor. The solution is thus drawn up gradually to a semi-cylindrical chamber, known as the diffuser, placed in a horizontal line with the centre of the fan. From this point it can be projected into the room in the form of a liquid spray or a vapour, according to the adjustment of a small handle on the side of the case. The surplus liquid runs down a copper tube to the container. A feature of this means of keeping a building disinfected is that the fan can be simply mounted on a bracket.

The Electrical Equipment and Carbon Co. has also introduced a new electric drilling machine, the "Mignon," with a capacity of 10 W. It has a form of switch which is easily operated with the lightest pressure of the finger, and a spirit level is provided. The dimensions are, outside diameter, 2¼ in., total length, 9½ in. The total weight is 2 lbs., 2 oz. The standard model is fitted with 3-jaw chuck for drilling up to 3 mm. in metal, and combined B.C. adaptor and plug; 6 mm. chucks for woodworking can be supplied as extras.

A new type of flexible coupling has been introduced by the POWER PLANT CO., LTD., West Drayton, Middlesex. This "carrier-ring" coupling combines two principles for obtaining flexiblity. There is flexibility due to the mechanical design, and flexibility due to the material used. It is an all-steel, dust-proof coupling of reasonably compact dimensions, with all working surfaces automatically lubricated by grease under pressure. The elastic elements consist of straight spring steel bars, mounted in a carrier ring, which is freely supported on a spherical extension of one of the coupling bosses. These flat steel springs thus form the link between the driving and driven parts of the coupling, and since they are mutually supported at the centre by the carrier ring, each is divided into two separate cantilevers. Then—since the deflection of a cantilever under load is of a parabolic formation—by shaping the teeth of the driving and driven parts of the coupling so that they conform to a parabolic contour of the same order as that described by the springs when under load, a progressive shortening of the length of the cantilevers and a corresponding increase of the permissible load is obtained. The equation is as follows, where W is the loading, L the length, E the modulus of elasticity and I the moment of inertia of a section of the spring.

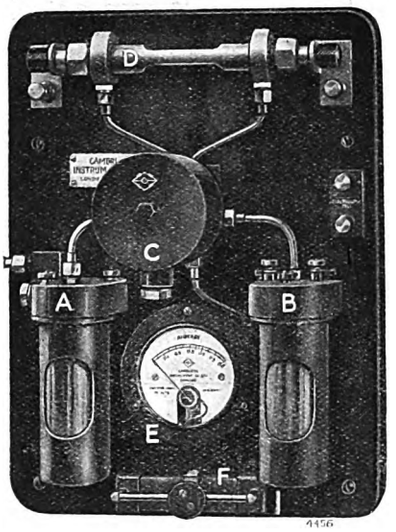


The "Aerosan" air purifier of the Electrical Equipment and Carbon Co., Ltd.

$$\text{Deflection } D = \frac{WL_3}{3EI}$$

$$W = \frac{3EID}{L_3} \text{ that is, W varies as } \frac{I}{L_3}$$

In this way the angular flexibility is obtained. As the springs do not restrict the movement of the two halves of the coupling in an axial direction—within the limits of the cover-ring and the halves abutting the carrier-ring—longitudinal movement is also allowed for. With offset and inclined shafts the coupling describes an elliptical path. As the carrier-ring is supported on a spherical pivot it is free to adapt itself in any way, and can thus lean towards one side or the other under the compulsion of the springs, as they rotate with offset or inclined shafts. The effects of misalignment are in every case minimised by the carrier-ring taking up a mean position.



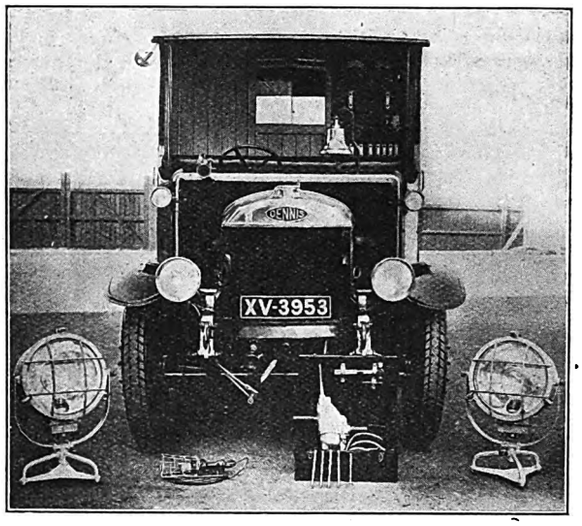
A "Cambridge" gas analyser used in the liquid air industry.

SADIA, LTD., of 22, Newman Street, Oxford Street, London, W.1, have supplied us with particulars of their latest time switches, designed on the Zbinden system. The standard Sadia switch consists of a precision clockwork movement with lever escapement and temperature compensating gear, fitted in the interior of an insulating dial ring; the transversely mounted switch roller contains the driving motor for itself and for the winding of the clock. Normally the apparatus is arranged for two in-and-out switching operations daily, and for this purpose there are four contact rings, arranged one behind the other, inside the dial ring. The contact rings follow a spiral path, and have a white point at their summit. By superimposing the two middle rings one of the two in-and-out switching operations can be avoided. Hand or automatic apparatus is available.

A new addition to the equipment of the London Fire Brigade is a high-speed emergency tender, provided with a self-contained generating plant for operating three powerful floodlights. The tender is constructed by DENNIS BROTHERS, LTD., of Guildford, and the electrical apparatus is by the GENERAL ELECTRIC CO., LTD. (Magnet House, Kingsway, London, W.C.2). The generator is of the standard Witton fan-ventilated type, giving 110 V, d.c., with a continuous rating of 3½ kW. The generator is shunt wound, has shield-type ball bearings, and runs at 1 650 r.p.m. It is installed under the driver's seat and run through an auxiliary gearbox from the main gearbox of the tender. The switchboard is fixed on the inside wall of the tender, adjacent to the driving seat, and carries a 6 in. diameter voltmeter and ammeter (of moving coil type), a 50 A, d.p. switch for the main circuit, and switchgear for the four distribution circuits. Spare fuses in dummy holders for quick replacement, and a shunt regulator are also provided. For these tenders a special form of cable reel has been designed. It consists of a steel drum—some nine inches in diameter with protected teak ends supported with clamping screws for securing the drum in any fixed position before and after paying out the cable. At each end of the drum a collector ring on an ebonite base is fixed, and current from the generator is fed to these by plunger contacts, which are fixed to iron brackets, with suitable insulation. Three such cable drums are fitted to each tender, and each drum accommodates 100 yards of 16/·021 twin core C.T.S. cable. A watertight pin plug is fitted at one end and two pin sockets at the other. The arrangement chosen allows the cable, complete with connections, to be removed from any drum, for connecting up the floodlights directly to the generator if required. Ordinarily, the supply to each of the three floodlights is by means of the open-type sockets on the switchboard. The floodlights are constructed of aluminium alloy castings and gunmetal, and are designed to house a

Digitized by Google

single-piece " Gecoray " silvered glass reflector for use with a 500 W standard gasfilled lamp. The hinged front is fitted with domed heat-resisting glass protected by a strong guard. A quick-focusing system is incorporated—the beam angle being controlled by one large adjusting screw. The units are watertight, and are mounted on wrought iron cradles



The emergency fire tender developed by Dennis Brothers, Ltd., and the General Electric Co., Ltd.

carried on special tripods of low construction, with spiked feet for gripping the ground or pavement. They can be stowed away in the small compartments designed for them on the tender.

The General Electric Co., Ltd., is now also supplying a new automatic commutating rectifier bearing the title " Akk-Emmar." The apparatus is stated to be light, compact and self-contained, and is suitable for charging wireless h.t. and l.t. batteries, motor-car accumulators, etc., and for giving single wave rectification for all non-induction circuits. Special features are the automatic polarity changer and the battery automatic cut-in and cut-out which make the operation of the rectifier entirely automatic.

The apparatus consists of a self-starting synchronous motor, which has mounted on its shaft extension an external combined commutator and slip ring, together with brush gear, for rectifying the alternating current. The switchboard is mounted on the same cast-iron baseplate as the motor. There are two models of the Akk-Emmar: No. 2, which is sized 20 in. by 25 in. by 13 in., and is suitable for charging all types of accumulators, and No. 4—26 in. by 26 in. by 13 in.—which is designed for continuous duty in garages. A particular feature claimed for this machine is its inability to interfere with radio reception. A further model is available, to give double wave rectification for cinema arcs and other purposes.

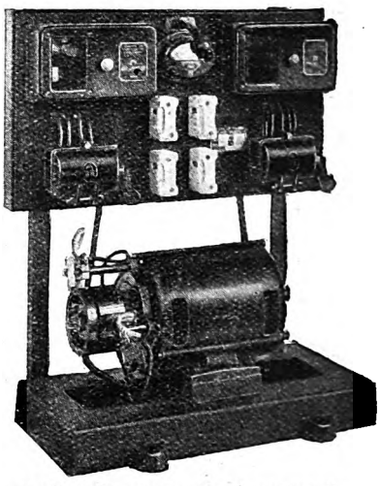
Many manufacturers, in the nitrogen industry, the artificial silk industry and the industries producing electrolytic oxygen and hydrogen, for example, have perforce to interest themselves in the analysis of gases. They may be glad to hear, therefore, of the newly-conceived application of Cambridge instruments to gas analysis. These instruments, which are manufactured by The Cambridge Instrument Co., Ltd., of 45, Grosvenor Place, London, S.W.1, are, for the most part, not new in themselves—it is the mode of their application to the solution of various problems in chemical analysis which is novel. The thermal conductivity method of gas analysis by means of the katharometer was devised by Dr. G. A. Shakespear several years ago, and since the War it has been used considerably in connection with the analysis of boiler flue gases. The method is now extended to the following applications amongst others:—The fixation of atmospheric nitrogen. The liquid air industry. Measurement of sulphur dioxide, organic vapours, oxygen in feed water, hydrogen in the ventilation ducts of submarine batteries, and of carbon dioxide in fruit stores. The cement industry and the rubber industry.

The method, of which the electrical principles—based on a form of the Wheatstone bridge—will need no introduction to our readers, possesses a number of advantages for the purposes of gas analysis. It is capable of detecting very minute changes in gas composition, and the measurements obtained are independent of the rate of flow of the gas. The method may be applied not only to simple and complex mixtures of gases but also to chemically inert gases, and to gases which, though not inert, do not take part in any reaction that may be employed in a measuring device of the chemical type. Continuous direct readings are obtained, and there is no need for intermittent withdrawals of samples. The gas mixture is not altered in composition during the measurement, and when a measurement has to be made at a given point in an enclosed space, there is, we understand, little or no disturbance of the distribution. The time lag is low—the time taken to reach a correct reading depends on the rate of molecular diffusion, on the magnitude of the change in composition to be measured, and on the accuracy necessary for the particular test. In a hydrogen-air mixture, in which the hydrogen content is rising steadily, the lag is about 13 seconds, while the meter will measure a given change in the hydrogen percentage to a new steady value in about 60 seconds—when accuracy within 1% is desired. Another feature of the system is the possibility of connecting several meters to one indicator or to one recorder; all parts are standardised and interchangeable. Little attention is required—the absence of chemicals eliminates the replacement of exhausted reagents.

The little jobs frequently take as long as the big jobs—sometimes they take longer—and for this reason any i expensive gadget which speeds up such jobs is always we comed. Messrs. W. T. Henley's Telegraph Works Co., Ltd., have just introduced a little time saver for making soldered bonds on the lead sheathing of cables. It requires no expert knowledge to use and produces thoroughly effective bonds. This device, known as the Henley Bonding Mould, is shown in the accompanying illustrations, and the following brief instructions explain how it is used:—" Scrape a bright patch on the lead sheathing, fasten the Henley Bonding Mould and earthing strand in position, using the chain fastener, and tighten by means of the milled edge nut as shown in the illustration. Sprinkle a pinch of powdered resin on the strand and lead through the circular opening in top of mould and then fill up with solder. To remove the mould after cooling slack back the nut and unhook chain." Three sizes are made to suit the following cable diameters measured over the lead sheathings:—

Inches.	Mms.
Above 0·945 up to 1·22	(24—31)
Above 1·22 up to 2·008..	(31—51)
Above 2·008 up to 3·11	(51—79)

The Chloride Electrical Storage Co., Ltd., Clifton Junction, Manchester, have recently placed upon the market a handy cell filler which they have designed to reduce to a minimum the time and trouble taken in " topping up " cells of their Exide-Ironclad and Exide batteries with distilled water. This cell filler is particularly useful for situations in which the cells are rather inaccessible, since it enables the battery attendant to fill to the correct level even when this cannot be watched through the vent plug hole. When the liquid reaches the correct level a small lamp is automatically illuminated, and the operator then releases a pinch valve, thereby shutting off the further flow of water. By topping up the cells to the correct height and no more, the density of the electrolyte is maintained at a regular value far more easily than is possible by the old uncertain method of filling up by a jug or syringe. All the cells in a battery can be topped up in this manner very rapidly, accurately, and without spilling of water. The cell filler should prove useful to large users of electric vehicles and trucks, motor omnibuses, and commercial vehicles, and to owners of battery service stations.



The " Akk-Emmar " automatic commutating rectifier.

British Insulated Cables, Ltd., Prescot, Lancs, have sent us particulars of " Copperweld," a wire product consisting of a core of tough steel on to which is welded a heavy layer of electrolytic copper. The " Copperweld " process of welding is stated to unite steel and copper so closely that the weld

Digitized by Google

cannot be destroyed by hot rolling, cold drawing, forging, bending, twisting or sudden changes of temperature. The copper cannot crack, strip or flake off, so that the wire has a strength approaching that of steel with the corrosion-resisting properties of copper. There are two grades—the standard tensile and the extra high tensile. Standard tensile "Copperweld" is made in two degrees of conductivity, 30% and 40% respectively, of the conductivity of hard-drawn copper, with a breaking load varying between 28 and 45 tons per sq. in. according to the size of wire. Extra high tensile "Copperweld" is made in 30% conductivity only and has a breaking load of 62·5 tons per sq. in. in all sizes.

One of the principal applications for which "Copperweld" is suggested is telephone lines. The three significant considerations for an overhead telephone line—strength, good transmission and low cost—appear to be well catered for by "Copperweld," which, assuming similar span lengths and equal sags for the same temperature, has a load capacity 50% to 75% greater than hard drawn copper. The speech-transmitting qualities for the sizes usually adopted are claimed to be well within commercial limits for telephone lines of moderate length. One hundred and thirty miles of loop of No. 14 S.W.G., ·080 in. diameter "Copperweld," 40% conductivity, has a speech transmission equivalent of 30 miles of standard cable.

The following table is suggested for consideration where it is intended to instal overhead wires for police, fire alarm or railway signal circuits. The comparison is between wires strung side by side on poles spaced 100 ft. apart, each wire being given a sag of 1 ft. when erected at 60 deg. F. For purposes of comparison each wire has been assumed to retain its modulus of elasticity up to the breaking point of the wire :—

Size and kind of Wire all treble braided.	Weight in lbs. per mile.	Approximate external load on Wires required to break them at 0° F.	Relative Factor of Safety.
·102 in. "Copperweld" ..	250	2·47 lb. per lin. ft... ..	100%
·081 in. ,, ..	178	1·65 lb. ,, ,,.. ..	67%
·102 in. H.D. Copper ..	260	1·40 lb. ,, ,,.. ..	57%

Single "Copperweld" wires can be jointed in the same way as copper wires.

In the manufacture of "Copperweld" a round steel billet 40 in. long is cleaned and centred in a cylindrical mould, leaving an annular space. The mould and billet are then raised to a high temperature and the annular space is filled with molten copper. The resulting billet is hot rolled down to a diameter of $\frac{3}{8}$ in., after which the rod is cold drawn to the required size by the usual processes, the proportion of copper to steel remaining constant throughout the operations.

The B.E.N. Patents, Ltd., 92, Tottenham Court Road, London, W.1, have introduced two new items of equipment, the first being a tyre repair unit. This is an outfit for tyre casing repair work, and whereas hitherto such work has been performed by means of a portable electric drill, to which are fixed the necessary attachments, B.E.N. Patents point out that this type of tool is not really suitable for the job, especially where repair work is being carried out on heavy covers. For this reason the B.E.N. flexible drive unit has been produced. These machines are made in two types—model A, mounted on a castor base tripod, and model B, which is designed for mounting on a bench. The design of both is such that the motors swivel and the shafts are free to rotate through 360 deg. The second new machine is a radiator filler valve and in introducing this new item B.E.N. Patents point out that the unit is designed to meet the desire amongst garages and filling stations to dispense with the water can or bucket. The tail piece is designed to take either $\frac{1}{2}$ in. or $\frac{3}{4}$ in. hose.

ELECTRIC LOCOMOTION.

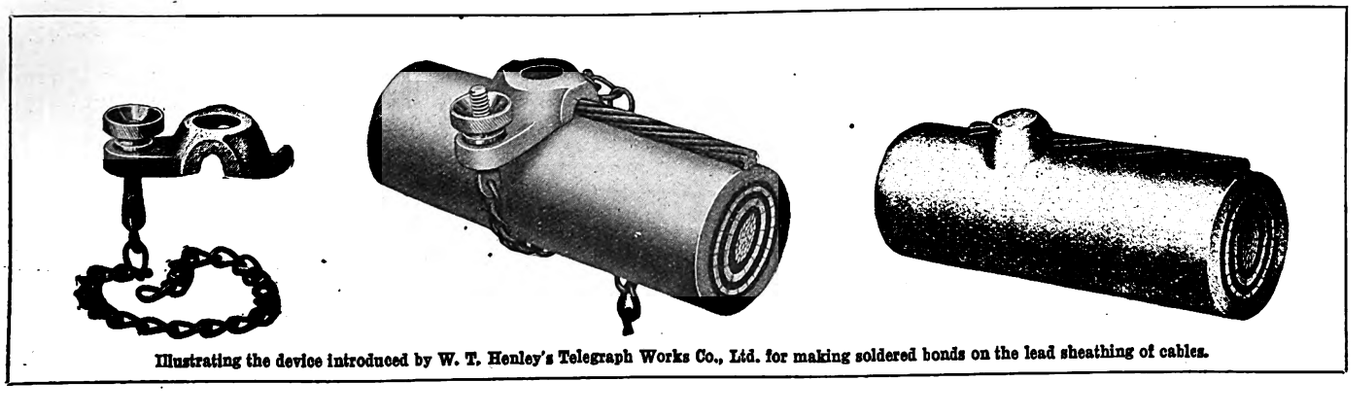
Express Locomotives of the Paris-Lyons and Mediterranean Railway.

THE P.L.M. Railway Co., have recently put into service, on the Mt. Cenis line, electric locomotives which are, it is believed, the most powerful single-unit locomotives yet built. These locomotives which have a one-hour rating of 5 400 H.P. at wheel rim, are capable of developing a maximum speed of 80·7 m.p.h.; they are operated with direct current at 1 500 volts. The electrical equipment of the locomotives was supplied by the Société Oerlikon, of Paris, while the mechanical part was built by the Société de Construction des Batignolles, of Paris. The contract in question comprised four such locomotives. The locomotives are equipped with six driving motors, each built as twin motors and arranged for forced ventilation. The current is collected from the overhead line by means of two pantograph current collectors and from a third rail by means of four contact shoes on either side of the locomotive. All the switchgear serving for grouping the motors, for cutting in and out the starting resistances and for reducing the field, and also the main circuit breakers in the motor circuits are built in the form of electro-pneumatically operated contactors. There are 58 contactors in all. Part of them are operated by means of the master controllers in the drivers' cabs and part by inter-dependent interlocking contacts. Another feature is that the whole equipment is divided electrically into two halves, so that in the case of a break-down of any essential part of the equipment, such as contactor, reverser or starting resistances, the locomotive can still run with one half or the other.

AUTOMOBILE ELECTRICAL ASSOCIATION.

A new trade association was inaugurated on Thursday, October 24th. Membership is open to electrical repairers, but it is intended more specifically for the benefit of those who are interested in the servicing and repair of automobile electrical equipment. This is obvious from the conditions of membership, it being a rule that the Association shall be confined to those whose business is mainly that of servicing the electrical equipment of automobiles and other electrical services, but not engaged in the repair of engines, chassis or coachwork. A strong and representative committee was formed, comprising the following: A. W. Bridges (A. W. Bridges, Newcastle-on-Tyne), J. J. Davis (Express Magneto (Repairs) Electrical Co., Ltd., Yeovil), E. G. Ford (Autocar Electrical Equipment Co., Ltd., London), J. E. Hardy (J. E. Hardy, Glasgow), F. H. Jennings (F. H. Jennings, Dudley), A. E. Ponton (A. E. Ponton and Sons, Bournemouth), J. E. Reilly (Reilly and Brookes, Bolton), J. Robertson (John Robertson (Belfast), Ltd., Belfast), J. Shaw (Magneto Repairs (Leeds), Ltd., Leeds), E. S. R. Thorne (Thorne Bros., Worthing). Readers who are interested should communicate with the Secretary, Automobile Electrical Association, 2, Tichborne Court, High Holborn, London, W.C.1.

We have received from Varley (Oliver Pell Control, Ltd.), 103, Kingsway, London, W.C.2, a radio catalogue which illustrates and describes, not only sets, but also components which the company has just put on the market. With each component purchased an instructional booklet is issued, which not only informs the customer how to use the particular component which he has purchased, but also gives him information regarding other apparatus.



Illustrating the device introduced by W. T. Henley's Telegraph Works Co., Ltd. for making soldered bonds on the lead sheathing of cables.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

BRADFORD CORPORATION, November 9th.—Twelve months' supply of stores to the tramways department, including electrical fittings for tramcars, insulating material, insulated bolts, copper controller contacts, etc. Schedules, etc., from Mr. R. H. Wilkinson, general manager, 11, Forster Square, Bradford.

CENTRAL ELECTRICITY BOARD, November 9th.—Supply and erection of overhead 33 000 V transmission lines in South Lincolnshire, in connection with Mid-East England scheme. Specification (No. M.E.E.—S.L.1) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

WEST RIDING EDUCATION COMMITTEE, November 9th.—Electric light installation at Ferry Fryston Ferrybridge Council School and schoolhouse. Specification, etc., from Mr. C. Harris, divisional clerk, Education Offices, Knottingley.

FORFARSHIRE EDUCATION AUTHORITY, November 11th.—Electric light and power installations at Arbroath High and Technical Schools. Specifications, etc., from Messrs. Begg, Peebles and Shaw, 27, Rutland Square, Edinburgh; deposit £2 2s.

DEWSBURY GUARDIANS, November 12th.—Supply and laying of electric cable at Staincliffe Institution. Specification, etc., from the clerk, Mr. E. T. Tunnicliffe, Wellington Street, Dewsbury.

Flectric Crane.

MANCHESTER CORPORATION, November 12th.—Supply and erection of 5-ton electrically driven overhead travelling crane. Specifications, etc., from the General Manager, Corporation Tramways, 55, Piccadilly, Manchester.

MANCHESTER GUARDIANS, November 12th.—(1) Covering steam and hot water pipes with non-conducting material; and (2) supply of electrical switchboard, at Crumpsall Institution. Particulars from Mr. E. Hargreaves, superintendent of works, Union Offices, All Saints, Manchester.

SWALLOWNEST HOSPITAL, November 13th.—Electric light installation, for South Rotherham and Kiveton Park District Isolation Hospital Committee. Specifications, etc., from the clerk, Mr. A. H. Styring, 6, North Church Street, Sheffield; deposit £1 1s.

TYNE IMPROVEMENT COMMISSION, November 14th.—Twelve months' supply of electrical accessories and incandescent lamps (section 22), etc. Forms of tender from Mr. A. Blacklock, secretary, Tyne Improvement Commission Offices, Berwick Street, Newcastle-on-Tyne.

BELFAST EDUCATION COMMITTEE, November 15th.—Electric light installation at Harding Memorial Public Elementary School, Cregagh Road, Belfast. Specification, etc., from the Education Architect, Victoria Street, Belfast; deposit £1 1s.

FRAMLINGHAM PARISH COUNCIL, November 15th.—Supply and fixing of an electric pump and gearing to the water supply known as Jeaffreson's Memorial Well, Framlingham. Specification can be seen by appointment, with the clerk, Mr. H. C. Taylor, Double Street, Framlingham.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, November 15th.—Supply and erection at Ironbridge power station of (*a*) two 6 000 kVA, 33 000/3 300 V, 50 cycle, indoor type transformers, with off-load tap changing switches; (*b*) two 1 200 kVA, 3 300/400/230 V, 50 cycle, indoor type transformers, with off-load, tap changing switches; (*c*) two 150 kVA, 3 300/400/230 V, 50 cycle, indoor type transformers, exclusive of tap-changing switches. Specification (No. 7) and form of tender from Mr. E. F. Hetherington, at the offices of the Authority, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

WAREHAM CORPORATION, November 16th.—Four centrifugal pumps and electric motors, with automatic control, etc. Specifications from Mr. W. E. Blizard (Messrs. Lemon and Blizard), Castle Lane, Southampton; deposit £2 2s.

GLASGOW CORPORATION, November 18th.—Electric lighting installation at Shieldhall Hospital. Specifications, etc., from the General Manager, Electricity Department, 75, Waterloo Street, Glasgow.

MID-GLAMORGAN WATER BOARD, November 18th.—Electric lighting work, supply of transformers, switchboards, meters, etc., in connection with construction of pumping station, etc., at Schwyll, Ewenny, near Bridgend, and installation of electrical depth transmitters on various reservoirs, with cables, etc. Specifications, etc., from the Board's Offices, Bridgend, or from Messrs. Thomas and Morgan and Partners, civil engineers, Pontypridd; deposit £2 2s.

WARRINGTON CORPORATION, November 18th.—Supply of e.h.t. sub-station switchgear. Specification, etc., from Mr. F. V. L. Mathias, borough electrical and tramways engineer, Warrington; deposit £1 1s.

EAST RETFORD CORPORATION, November 19th.—Electrically driven centrifugal borehole pump (60 000 gall. per hour.) Specification from Mr. S. O. Pacey, Gas and Water Electricity Offices, East Retford; deposit £2 2s.

WALLINGFORD RURAL DISTRICT COUNCIL, November 19th.—Electric light wiring of 34 houses at Cholsey, Berks. Specification, etc., from the Clerk, 7, St. Martin's Street, Wallingford.

FIFE EDUCATION AUTHORITY, November 20th.—Electrical work at reconstructed Cowdenbeath School. Schedules (£1 1s. deposit) from Mr. Geo. Sandilands, architect and master of works, Education Offices, Kirkcaldy.

ALLOA CORPORATION, November 23rd.—Electrical installation work in connection with erection of 36 houses at Ashley Terrace, Alloa. Schedules, etc., from Messrs. J. Melvin and Son, architects, Mar Street, Alloa.

MANAGERS OF CENTRAL LONDON SCHOOL DISTRICT, November 23rd.—Electric motor, with reduction gearing, startor, etc. Specification from Mr. G. P. Morrell, clerk to the Managers, Greenford House, Hanwell, London, W.7.

PLYMOUTH CORPORATION, November 25th.—Supply of steel lamp columns. Specification, etc., from the City Electrical Engineer, Electricity Department, Armada Street, Plymouth.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

INDIAN STORES DEPARTMENT, November 12th.—Battery charging motor generators, transformer and oil switch, for Simla wireless station (order No. N. 10 159). (Reference B.X. 5 774.)

NEW ZEALAND POSTS AND TELEGRAPHS, November 12th.—Four-conductor telephone operators' cords. (Reference B.X. 5 685.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, November 12th.—Supply of 15 kW generating set for installation on the "Maui Pomare" (tender No. 369). (Reference B.X. 5 683.)

NEW ZEALAND POSTS AND TELEGRAPHS, November 12th.—Supply of v.i.r. cables (P. and T. 151/1914). (Reference B.X. 5 826.)

NEW ZEALAND RAILWAYS, November 12th.—Supply telegraph line material, including copper wire, insulator caps, spindles, arm-bolts, etc. (Reference B.X. 5 824.)

NEW ZEALAND RAILWAYS, November 12th.—Air compressors, machine tools and electric motors. (Reference A.X. 8 736.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 12th.—Transmitters and associated parts (schedule C. 477). (Reference B.X. 5 653.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 12th.—Receivers and associated parts (schedule C. 477). (Reference B.X. 5 656.)

CHILEAN STATE SUPPLY DEPARTMENT, November 14th.—Telegraph material. (Reference B.X. 5 746.)

INDIAN STORES DEPARTMENT, November 14th.—Supply and erection of crude oil engine-driven d.c. generating set, motor generator set and switchgear, for Military Engineering Services, Razmak (order Nos. N. 9 886 and 10 075). (Reference B.X. 5 744.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, November 14th.—Supply of 400 000 lb. of hard drawn copper wire, 2 000 lb. of soft drawn copper wire and 2 000 lb. of soft drawn tinned copper wire (tender No. 173). (Reference A.X. 8 510.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, November 14th.—Telephone cable, terminal strips and paper sleeves (tender No. 1 565). (Reference B.X. 5 813.)

BOMBAY, BARODA AND CENTRAL INDIA RAILWAY Co., November 15th.—(1) Primary battery supplies; and supply of (2) gasfilled and vacuum lamps, (3) overhead contact wire and stranded catenary cable. Specification (10s.) from the secretary, Mr. S. G. S. Young, The White Mansion, 91, Petty France, Westminster, S.W.1.

SOUTH AFRICAN RAILWAYS AND HARBOURS, November 15th.—Supply of 42 000 lb. of galvanised signal wire and 31 500 lb. of galvanised point wire (tender No. P.S. 2 025). (Reference A.X. 8 712.)

ANGORA POSTS, TELEGRAPHS AND TELEPHONES, November 16th.—Supply of telephone wire, cable boxes and insulators. (Reference B.X. 5 846.)

INDIAN STORES DEPARTMENT, November 17th.—Supply of electric cables for 12 months (order No. 9 920). (Reference B.X. 5 808.)

GREAT NORTHERN RAILWAY (IRELAND), November 18th.—Six or 12 months' supply of stores, including electric fittings, lamps, cable and wire (form 11), and signalling materials (form 26). Tender forms (1s. each), from the Secretary, Amiens Street Station, Dublin.

INDIAN STORES DEPARTMENT, November 18th.—Supply and erection of two 20 kW oil engine driven d.c. generators, etc. (order No. N. 10 253). (Reference B.X. 5 757.)

NEW ZEALAND POSTS AND TELEGRAPHS, November 18th.—Resistance spools (P. and T. 151/1 832). (Reference B.X. 5 716.)

EGYPTIAN MINISTRY OF THE INTERIOR, November 19th.—Supply of 160 H.P. Diesel-electric generating set for Manfalout power station (Assiut Province). (Reference B.X. 5 720.)

NEW ZEALAND POSTS AND TELEGRAPHS, November 19th.—Telephone transformers (P. and T. No. 151/1807). (Reference B.X. 5 718.)

NEW ZEALAND POSTS AND TELEGRAPHS, November 19th.—Automatic wall and table telephones (P. and T. No. 151/1 825). (Reference B.X. 5 717.)

Telephone Equipment for Australia.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 19th.—Supply of telephone generators and motor generators (schedule No. C. 479). (Reference B.X. 5 662.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 19th.—Motor generators (schedule C. 486). (Reference B.X. 5 694.)

INDIAN STORES DEPARTMENT, November 21st.—Supply of h.d., high conductivity, bare, solid copper conductors, for overhead power transmission, for one year (order No. N.10 280). (Reference A.X. 8 759.)

JOHANNESBURG MUNICIPALITY, November 21st.—Supply of tramcar axles, gear and pinion wheels, etc. (Reference A.X. 8 750.)

CHRISTCHURCH (N.Z.) MUNICIPALITY, November 23rd.—Supply of pump and electric motor, for Beckenham pumping station. (Reference A.X. 8 737.)

VICTORIAN ELECTRICITY COMMISSION, November 25th.—Watt-hour meters, recording instruments and remote metering equipment, for Metropolitan terminal stations and sub-stations (specification No. 29/92.) (Reference B.X. 5 614.)

VICTORIAN ELECTRICITY COMMISSION, November 25th.—Switchgear, for Yallourn power station (specification No. 29/103). (Reference B.X. 5 636.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 26th.—Vitreous resistances, each consisting of wire element wound in vitreous spool, for telegraph battery feeds (schedule C. 489). (Reference B.X. 5 696.)

Melbourne Switchgear Contract.

MELBOURNE CITY COUNCIL, November 27th.—Totally-enclosed, metal clad, 6 000 V, three-phase switchgear (specification No. 1 000). (Reference B.X. 5 708.)

MELBOURNE CITY COUNCIL, November 27th.—Supply of 600 V d.c. switchgear (specification No. 1 001). (Reference B.X. 5 734.)

VICTORIAN RAILWAY COMMISSION, November 27th.—Indication transformers for railway signalling (contract No. 43 412). (Reference B.X. 5 737.)

VICTORIAN RAILWAY COMMISSION, November 27th.—Supply of automatic oil switches (contract No. 34 411). (Reference B.X. 5 735.)

WESTERN AUSTRALIA GOVERNMENT, November 29th.—Supply and erection at Perth of (*a*) boiler house equipment, and (*b*) 12 500 kW turbo-generator and condensing plant. Specifications (£1 1s. for each; not returnable) from the Agent-General for Western Australia, Savoy House, Strand, London, W.C.2.

EGYPTIAN MINISTRY OF THE INTERIOR, November 30th.—Diesel engine driven electric lighting installation at Abou-Tig. (Reference B.X. 5 791.)

BLOEMFONTEIN MUNICIPALITY, December 2nd.—Supply of two electrically driven low lift pumping units and two electrically driven high lift pumping units, with cables, starters, valves, etc. (contract No. 18, 29/30).

BLOEMFONTEIN MUNICIPALITY, December 2nd.—Supply of copper conductors, poles, transformers, switchgear, etc., for electrification of Mazelspoort Waterworks (contract No. 19, 29/30). (Reference B.X. 5 825.)

INDIAN STORES DEPARTMENT, December 3rd.—Ceiling and table fans. (Reference B.X. 5 672.)

VICTORIAN ELECTRICITY COMMISSION, December 9th.—Supply of 3 000 kVA transformers and spares (specification No. 29/119.) (Reference B.X. 5 775.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 10th.—Switchboard keys and parts (schedule No. C. 496). (Reference B.X. 5 776.)

THE staff dinner of British Insulated Cables Ltd., was held on October 28th, at the Adelphi Hotel, Liverpool, and some of the staff and guests are seen in the photograph. The toasts were short and to the point. Owing to the fact that there were 650 diners, dinner was served in two rooms, Mr. G. H. Nisbett, the managing director, speaking in one room and Mr. J. A. Smith, a director of the company, addressing the other. A concert followed the dinner, the artists being the B.I. Prize Quartette (members of the B.I. Silver Band), Miss Margaret Rees and Mr. Foden Williams. A conjuror, included in the programme, produced an "order," to be completed in three weeks, for the electrification of the line from Liverpool to London; this was "accepted" by Mr. Nisbett. Dancing concluded a successful evening.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 10th.—Electric lamps, lamp caps and sockets for telephone purposes (schedule C. 497). (Reference B.X. 5 783.)

GATOOMA (SOUTHERN RHODESIA) MUNICIPALITY, December 12th.—Two fire-tube boilers, steam engines, alternators and switchboard, etc. (Reference A.X. 8 749.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, December 16th.—Supply and erection of electrically-driven pumping plant, with ironwork, crane and gantries, for Junee water supply. (Reference A.X. 8 740.)

Oscillograph Equipment.

VICTORIAN ELECTRICITY COMMISSION, December 16th.—Oscillograph equipment. (Reference B.X. 5 692.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 17th.—Secondary batteries (schedule C. 505). (Reference B.X. 5 777.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 17th.—Telephone fuses, heat coils and protectors (schedule C. 498). (Reference B.X. 5 784.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 17th.—Loading coil pots (schedule C. 499). (Reference B.X. 5 785.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, December 27th.—Telegraph material, including g.i. tubular arms, insulators, upper tubes for poles, etc. (tender No. 175). (Reference A.X. 8 734.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, December 28th.—Supply and erection at site of Mankabad Barracks of three Diesel engine driven electric generators, and sinking of two wells. Specifications (£1 os. 6d., not returnable) from Chief Inspecting Engineer, 41, Tothill Street, Westminster, S.W.1.

EGYPTIAN MINISTRY OF PUBLIC WORKS, January 4th.—Supply and erection at site of Meadi Barracks, Cairo, of two Diesel engines to drive existing generators. Specifications (£1 os. 6d. not returnable) from Chief Inspecting Engineer, 41, Tothill Street, Westminster, S.W.1.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of testing instruments (schedule C. 504). (Reference B.X. 5 786.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of timing clocks (schedule No. C. 507). (Reference B.X. 5 762.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of contact pressure testers (schedule No. C. 516). (Reference B.X. 5 821.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of telephone hand sets (schedule C. 526). (Reference B.X. 5 823.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 13th.—Supply of four-point jacks (P. and T. 151/1897). (Reference B.X. 5 840.)

VICTORIAN ELECTRICITY COMMISSION, January 13th.—Supply of 2 200 V switchgear and accessories (specification No. 30/2). (Reference B.X. 5 827.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBORUNE, January 14th.—Supply of ringing motor-generator sets, for automatic telephone exchanges. (Reference B.X. 5 839.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 14th.—Supply of telephone indicators (schedule C. 518). (Reference B.X. 5 822.)

NEW ZEALAND GOVERNMENT RAILWAYS, January 15th.—Supply of automatic telephone exchange equipment for new station at Auckland. (Reference B.X. 5 841.)

VICTORIAN ELECTRICITY COMMISSION, February 3rd.—Electrically-driven mobile coal-trimming machine, for Yallourn power station. (Reference A.X. 8 681.)

VICTORIAN ELECTRICITY COMMISSION, February 10th.—Supply of sine wave generating equipment and accessories (specification No. 30/3). (Reference B.X. 5 844.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Switchgear and controlling equipment. (Reference B.X. 5 798.

Tenders Accepted.

LONDONDERRY ASYLUM.—L. D. Cooke, electric light installation, £425.

WORKSOP GUARDIANS.—R. Shaw and Son, re-wiring Kilton Hill Infirmary, £295.

ARKLOW HARBOUR BOARD.—Ednmundson, erection of occulting light on pierhead, £251.

MIDDLESEX COUNTY COUNCIL.—Hackbridge Cable Co., cable for Porters Park Asylum, £275.

BELFAST CORPORATION.—Vaughan Crane Co., Ltd., two overhead cranes for sub-stations, £258.

GLOUCESTERSHIRE COUNTY COUNCIL.—Bevan and Son, electric light installation at Wotton and Barnwood Mental Hospitals, £10 000 (estimated).

TORQUAY CORPORATION.—British Thomson-Houston Co., Ltd., £482; spare apparatus and accessories required for 7 000 kW turbo-alternator, £482.

TYNEMOUTH CORPORATION.—Mackintosh Cable Co., Ltd., supply of cable, £389 4s. 6d.; J. H. Holmes and Co., supply of switchboard at Ingleside sub-station, £79 10s.

MARYLEBONE (LONDON) BOROUGH COUNCIL.—Metropolitan-Vickers Electrical Co., Ltd., supply of portable relay testing transformer set, £450. (Recommended.)

DEAL CORPORATION.—South-East Kent Power Co., electric light installation at Town Hall, £81. Also tendered: G. A. House, £108; E. W. Smith, £113; C. O. Clark, £105.

LIVERPOOL CORPORATION.—Tramway special trackworks: Adelphi Junction (portion), Hadfields, Ltd., £1 029; three standard crossovers, Titan Trackwork, Ltd., £370 each.

GLASGOW CORPORATION.—A. Reyrolle and Co., Ltd., double tier switchgear, £536; Electrical Apparatus Co., meters, £587 10s.; John Grieve and Co., electric crane, £385; Crompton-Parkinson, Ltd., replacement of 12 motors, £326 10s. (All recommended.)

NEWRY URBAN DISTRICT COUNCIL.—Curran Bros., electric wiring of Town Hall, £502. Brooks, Thomas and Co., whose tender, at £470, was originally accepted, were not prepared to go on with the contract because they had not got the wiring of the Technical School also.

BARKING URBAN DISTRICT COUNCIL.—A.C.E.C., supply of 1 100 yds. of 0·25 four-core cable, £918; Pooley and Austin, supply of switchgear for erection at works of Messrs. Cross, Sherwood and Heald, Ltd., £107 10s.; Derby Cables, Ltd., supply of 1 500 yds. of 0·1 sq. in. four-core cable, £690. (All recommended.)

Telephone Equipment.

GENERAL POST OFFICE.—Batteries, Synthetic Ammonia and Nitrates automatic private branch telephone exchange equipment (Billingham, Stockton-on-Tees), Premier Accumulator Co. (1921), Ltd.; Telephone exchange equipment, Gerrard, Automatic Telephone Manufacturing Co., Ltd.; Harrow, Automatic Telephone Manufacturing Co., Ltd., Merrylee (Glasgow), General Electric Co., Ltd.

SALFORD CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., supply and erection of switchgear for Trafford sub-station, £176; Ferguson, Pailin, Ltd., supply and erection of 33 000 V switchgear at Frederick Road station, £1 174; Fuller Electrical and Manufacturing Co., Ltd., supply and erection of 10 000 kVA, three-phase, 33 000/6 600 V, step-down transformer at Trafford sub-station, £2 860. (All recommended.)

CROYDON CORPORATION.—Turbo-alternator, etc., Metropolitan-Vickers Electrical Co., Ltd., £76 851 (accepted) and £74 396; C. A. Parsons and Co., Ltd., £74 640 and £74 980; British Thomson-Houston Co., Ltd., £76 200, £78 543, £77 625, £77 963 and £74 241; English Electric Co., Ltd., £71 260, £79 512, £81 860 and £84 801; Richardsons, Westgarth and Co., Ltd., £77 800, £76 550, £76 500, £75 150, £73 900 and £73 850; Fraser and Chalmers Engineering Works, £73 147 and £75 647; Brush Electrical Engineering Co., Ltd., £71 220. Cooling tower and circulating water culvert—one concrete tower, Van Iterson type, 164 ft. high, A. E. Farr, £18 753; also tendered, Purdie, Lumsden and Co., Ltd. (withdrawn), £16 680; Wilson, Lovatt and Sons, £20 291; Yorkshire Hennebique, £20 365; Joshua Henshaw and Sons, £22 650; L. J. Speight, Ltd., £22 654; Foundation Co., Ltd., £26 290; one concrete tower, not Van Iterson type, 140 ft. high: Film Cooling Towers, Ltd., £16 000; Davenport Engineering Co., Ltd., £20 469; three wooden towers, 160 ft. high: Premier Cooler and Engineering Co., Ltd., £15 180; Film Cooling Towers, Ltd., £15 600; Davenport Engineering Co., Ltd., £16 139. Boiler-house plant, Babcock & Wilcox, Ltd., £108 809 (adjusted price £101 712); also tendered: J. Thompson, Ltd., £84 954; International Combustion, Ltd., £86 545; ditto powdered fuel scheme, £86 658; Stirling Boiler Co., Ltd., £108 865; Vickers Boiler Co., Ltd., £113 840. Switchgear, English Electric Co., Ltd., £47 220 (adjusted price for Corporation requirements, £44 227); also tendered: British Thomson-Houston Co., Ltd., £49 102; General Electric Co., Ltd., £49 223; A. Reyrolle and Co., Ltd., £49 968; Metropolitan-Vickers Electric Co., Ltd., £50 538; Ferguson, Pailin, Ltd., £51 069. Note.—The English Electric Co.'s adjusted price for Corporation requirements is £44 227.

WORK IN PROSPECT.

ALDERSHOT.—Erection of new school, at Manor Park. Particulars from Mr. James Neave.

ARNOLD.—50 or 60 houses for U.D.C. Particulars from Surveyor.

BLACKPOOL.—Erection of amusement hall at the Winter Gardens. Particulars from Messrs. Hughes and Stirling, architects, Liverpool.

BRADFORD.—Adaptation of Poor Children's Mission for use as a cinema. Particulars from Mr. F. J. Hudson, Thurnscoe Road.

BRAINTREE.—20 houses at Bocking, for R.D.C. Particulars from P. Berry and Co., contractors.

BRIGHTON.—Rebuilding of Nos. 193-4, Western Road as offices and flats, to cost £10 600. Particulars from Borough Engineer.

CAMBRIDGE.—Conversion of "Old Vic" into showrooms and offices. Particulars from Messrs. North, Robin and Wilsden, architects, or A. Negus and Son, contractors.

CARDIFF.—Secondary school at North and New Zealand Roads, to cost £42 136. Particulars from City Engineer, or Mr. W. S. Eglen, contractor, Cardiff.

CATTERICK CAMP.—Conversion of the Miss Sande's Soldiers Home Cinema into swimming baths, to cost £5 000. Particulars from Messrs. Tarran and Eyre, architects, Middlesbrough.

CHISLEHURST.—18 shops, at Platt's Wood Road and Station Square. Particulars from Messrs. Montagu Holmes and Sons, architects, 35, Paternoster Row, E.C.4.

COVENTRY.—Additional classrooms at Balsall Street School. Particulars from the County Architect.—New Wesleyan Central Hall. Particulars from Mr. C. Redgrave, architect.

COWDENBEATH.—Electrical work, etc., in connection with the reconstruction of Broad Street school, for Fife E.A. Particulars from Mr. G. Sandilands, architect, Kirkcaldy.

DEWSBURY.—New secondary school for girls. Particulars from Mr. H. Dearden, borough engineer.

DONCASTER.—New central school. Particulars from Mr. E. V. Dyson, architect.

EASTBOURNE.—Bandstand, dancing hall, etc., at the Redoubt, to cost £35 000. Particulars from Borough Engineer.

EAST HAM.—Alterations to Empire Kinema, Barking Road. Particulars from Mr. W. S. Trent, architect.

EAST WICKHAM.—New church of St. Michael. Particulars from Mr. J. F. Ford, architect, 35, Finsbury Square.

ELLESMERE PORT.—100 houses, for U.D.C. Particulars from Mr. J. M. Hudson, surveyor.

FARNWORTH.—Extension to St. James's Schools, to seat 400 and to cost £5 000. Particulars from Mr. F. Thorpe, architect, Oldham.

GLASGOW.—354 houses at Ashfield, Possilpark. Particulars from the Town Council Housing Department.

HANLEY.—Factory extensions to premises of Twynfords, Ltd., Cliff Vale, Hanley. Particulars from Messrs. Scrivener and Sons, architects, Hanley.

HAYES.—104 houses, at Hayes Gate Estate. Particulars from Mr. R. T. Warren.

KNUTSFORD.—Alterations and extensions to hospital administrative block. Particulars from Mr. W. Kennedy, architect, or L. Brown and Sons, Ltd., Wilmslow, contractors.

LONDON (HOLBORN).—Rebuilding of 7-18, High Holborn, for Prudential Assurance Co. Particulars from Mr. J. H. Pitt, architect.

MIDDLETON.—Permanent clinic, in Durnford Street, to cost £6 500. Particulars from Mr. D. Harrison, borough surveyor.

ORRELL.—New clinic and child welfare centre, in Orrell Road. Particulars from Mr. S. Wilkinson, Preston.

OXFORD.—42 houses at Green Road. Particulars from Messrs. Ives and Rushley.

PRESTON.—Erection of a new grammar school at Leyland. Extensions to the grammar school at Hutton. Particulars in both cases from Mr. Stephen Wilkinson.

RETFORD.—Additions to Retford and District Hospital, to cost £5 000. Particulars from Messrs. Brierley and Rutherford, architects, York.

RICKMANSWORTH.—New schools, for Royal Masonic Institution, to cost £350 000. Particulars for first portion from Denman and Son, architects, or A. Boxall, quantity surveyor.

STOCKTON-ON-TEES.—Extensions to old telephone exchange premises, for Stockton Co-operative Society, Ltd. Particulars from Mr. Halt, architect.

WIGAN.—Additional accommodation at Beech Hill School. Particulars from Borough Engineer.

TRADE PUBLICATIONS.

MACHINE tool control is dealt with in leaflet 305, just issued by BROOKHIRST SWITCHGEAR, LTD., Northgates Works, Chester.

Tee or junction boxes for use with C. T. S. cables, is the subject of leaflet No. 2065 (October, 1929), just published by SIEMENS BROTHERS AND CO., LTD., Woolwich, London, S.E.18.

An attractively coloured showcard just published by Berry's Electric (1928) Ltd.

The MARCONIPHONE CO., LTD., 210/212, Tottenham Court Road, London, W.1, has published a revised edition of the "Marconi" valve catalogue which gives full particulars of all types.

PHILIPS LAMPS, LTD., 145, Charing Cross Road, London, W.C.2, have issued four new folders dealing with electric lamps. The references are No. 101L (general list), No. 173L ("Duo-Savelite"), No. 181L ("Argento"), and No. 182L ("Arlita").

The D.P. BATTERY CO., LTD., Bakewell, Derbyshire, has issued a special folder dealing with "Kathanode" 'bus lighting batteries. Another publication, entitled "Kathanode Goes Racing," deals with the employment of these batteries in connection with the operation of totalisators.

The IGRANIC ELECTRIC CO., LTD., 149, Queen Victoria Street, London, E.C., has issued new publications with respect to radio components and receivers. The numbers of these new issues are 6 494 ("Neutrosonic" short wave set), 6 500 (5-valve portable), 6 628 ("Phonovox" pick-up), 6 496 ("A.C.3" receiver), 6 629 and 6 501 (components).

We have received from LIGHTING TRADES, LTD., of Oriel House, 30-31, Farringdon Street, London, E.C.4, in association with the Welsbach Light Co., Ltd., a copy of a new catalogue of electric lighting glassware containing a wide and varied range of patterns. This is the first catalogue issued jointly for the two companies and supersedes any previous publication.

PETTERS, LTD., Westland Works, Yeovil, have sent us a copy of catalogue, publication No. 1 716, showing the Atomic Diesel stationary type oil engine. This catalogue contains a review of the merits of the two-stroke cycle engine, as compared with the four-stroke cycle engine, and a fairly complete technical description of the various parts of the engine itself.

ELECTRICITY SUPPLY.

London Frequency Changes—Proposed Extensions at Southend, Stockport, Bradford and Portsmouth—Hull's Record Week—The Supply Industry in Penang—Suggested New Boiler Plant at Bath—Marylebone (London) B.C. and the London Power Company.

BARNSLEY T.C. has applied for a loan of £6 330 for distribution mains extensions.

Guildford Electricity Committee is seeking sanction to borrow £4 770 for street lighting.

Tynemouth Electricity Committee seeks sanction to a loan of £10 000 for mains and services.

Southend Corporation has applied for sanction to a loan of £68 000 for the purchase of electrical plant.

Seaham Harbour Electricity Committee proposes to borrow a further £6 000 in connection with assisted wiring.

St. Pancras (London) Electricity Committee is to convert 80 street lamps from gas to electricity at a cost of £356.

South Shields Lighting Committee has adopted a scheme for the conversion of all gas street lamps to electricity at a cost of £42 865.

Eastbourne T.C. seeks sanction to borrow £5 000 for extensions of sub-stations, and £25 000 for further mains and services.

An offer of Birkenhead T.C. to supply current to the district by means of overhead lines has been accepted by Greasby Council.

Stockport T.C. is recommended to apply for a loan of £171 000 in connection with the development of the Millgate electricity works.

Grimsby T.C. has applied to the Electricity Commissioners for sanction to extend the plant at the generating station at an estimated cost of £63 000.

Ballymena U.D.C. intends to apply to the Northern Ireland Electricity Commissioners for a Special Order authorising the Council to supply electricity in the district.

Keighley T.C. has received sanction from the Electricity Commissioners to the borrowing of £18 090 for mains, substations and equipment, and street lighting fittings.

Bermondsey (London) Electricity Committee has obtained sanction to borrow £20 000 for mains and services; £7 500 for meters and £13 500 for consumers' wiring installations.

West Lancashire Rural District Council is making application for a loan of £6 015 in connection with a scheme for supplying electric cookers, kettles and a free wiring scheme.

Bradford Electricity Committee recommends the purchase of property at a cost of £36 000 from the Bradford Dyers' Association for extension of the Valley Road power station.

Strood R.D.C. has agreed to an application by the Kent Electric Power Co. for permission to extend its mains, partly overhead and partly underground, from Rochester to Snodland.

Droxford R.D.C. has approached the West Hampshire Electricity Co. with a view to the provision of additional compulsory distribution mains in certain parts of the district.

Southend-on-Sea T.C. has received sanction to a further loan of £25 623 for land, buildings, and mains, required in connection with the change-over in certain parts of the borough.

Manchester Electricity Committee is to erect a transformer station in Cumberland Street, Deansgate, at a cost of £40 000. Sanction is to be sought for borrowing £250 000 for mains extensions.

Shinley Electricity Committee has agreed that the minimum fixed half-yearly charge should be 17s. 6d. in the case of domestic consumers and £2 2s. in the case of house and shop consumers.

Portsmouth Electricity Committee is to ask for sanction for loans of £100 000 for mains and services; £40 000 for sub-station equipment; £10 000 for h.t. mains in the city, and £2 700 for transformer kiosks.

At a recent public meeting at Ide Hill it was decided, subject to the consent of the R.D.C., that a supply of current should be given to the village by the Sevenoaks Electricity Co. by means of overhead lines.

Hull Electricity Department created a record during the week ended October 19th, by connecting 270 houses for domestic supplies of electricity. Applications received in six months for domestic supplies number 7 627.

The revenue of the George Town, Penang, municipal electricity department in 1928 was £155 782, the gross profit £69 769, and the net profit £27 952. Electricity sold amounted to 10 879 514 kWh, an increase of 1 296 466 kWh.

The Minister of Transport has announced that he is unable to accede to the application of the Durham and Cleveland Electricity Co. for permission to erect overhead cables for the supply of current to certain streets at Barnard Castle.

Holme Cultram U.D.C. has given its consent to an application for a Special Order by Old Silkstone Collieries, Ltd., of Dodsworth, near Barnsley, to supply current within the urban district, subject to a main being carried through Abbey Town.

Lewisham (London) Works Committee recommends that two miles of the main roads in the borough be provided with improved lighting, one mile to be dealt with by the South Metropolitan Gas Co., and one mile by the South Metropolitan Electric Light and Power Co.

The Electricity Commissioners for Northern Ireland are to issue a licence to Mr. Hamilton, of Kilkeel, for the electric lighting of Warrenpoint. At a recent inquiry the Commissioners considered four schemes for the district, including one for supply in bulk from Newry's new station.

Rochdale Electricity Committee recommends the Council to replace the existing generating plant at the electricity works by modern turbo-generating plant of such capacity as may be found necessary. The Committee is satisfied that the proposed installation would substantially reduce the generating costs.

London County Council has consented to a proposal of the London Electric Supply Corporation, Ltd., to alter its existing periodicities of supply from 85 cycles and 25 cycles to 50 cycles and to establish an a.c. system at 230/400 V, at first in addition to, and subsequently in substitution for, the existing system.

Barking Electricity Committee has received sanction to borrow £1 200 for buildings; £16 870 for mains and services; £4 875 for transformers and switchgear, and £950 for house wiring installations.—The U.D.C. is asking sanction to a loan of £3 100 for laying additional mains to the Hertford Road district.

The Unemployment Grants Committee has sanctioned 50% interest on a loan of £33 174 for the change-over from d.c. to a.c. in Accrington's local supply. The amounts sanctioned included £22 750, for 25 years, in respect of mains; £9 000 for seven years for change of motors; £1 500 for ten years for meters.

Bath City Council has agreed to ask for powers to borrow £35 829 for additional plant, mains and sub-stations. It is proposed to instal an additional 60 000 lb. per hour boiler, with accessories, at an estimated cost of £22 540, and to provide new sub-stations and additional mains, to cost £13 289.

Ribchester P.C. has discussed an electricity scheme. Mr. Gill has submitted details of a scheme, including a power house, and estimated to cost about £5 000. Mr. Gill suggests the formation of a company, and that householders should take up shares to the amount of about £25 per house. A canvass is to be made.

Marylebone (London) B.C. has considered a report from its Medical Officer of Health, after 28 observations, on the emission of smoke and grit from the generating station of the London Power Co., St. John's Wood, and the Council has decided that it justifies the service of a statutory notice under the Public Health (London) Acts.

London County Council has refused consent to the County of London Electric Supply Co., Ltd., to erect an overhead electric transmission line across the portion of Becontree south of Ripple Road, as it is thought that the erection of an overhead line in the position proposed might seriously prejudice the future development of this part of the estate.

Londonderry Corporation has approved of a recommendation of the Electrical Engineer that in order to encourage the use of electricity for shop window lighting after peak-load hours, the Corporation should, in the case of early closing shops, charge a special rate of 3d. per kWh for shop window lighting between closing time and midnight, except Saturdays and Sundays.

The street lighting service of Coychurch village came into operation on October 25th. The electrification of Vale of Glamorgan villages has been proceeding apace during the past few years, with the result that Cowbridge, St. Hilary, Llandough, Llantwit Major, Llanmaes, Aberthin, Pencoed, Ystradowen, and several smaller villages, have now their own electricity supply. Current is taken from the South Wales Electrical Power Distribution Co.

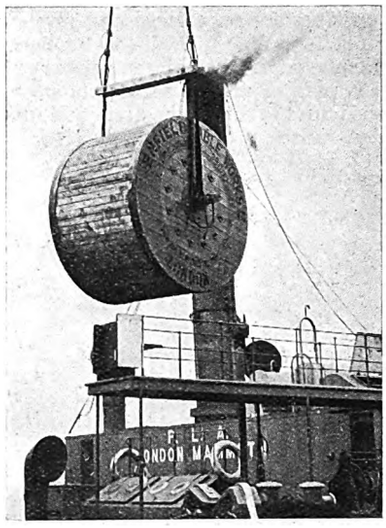
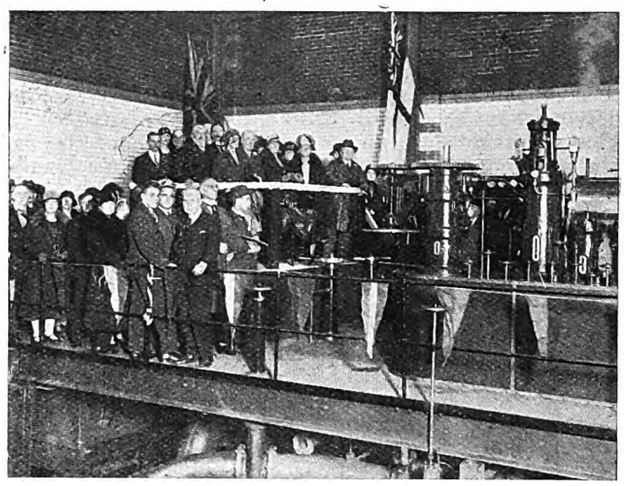
ELECTRICAL PICTURES.

The November window display of the E.D.A. reminds us that Christmas spending commences this month. The display utilises the cube blocks which were introduced last season, and if desired the figure of Father Christmas may be omitted. The colour scheme is chiefly red and black.

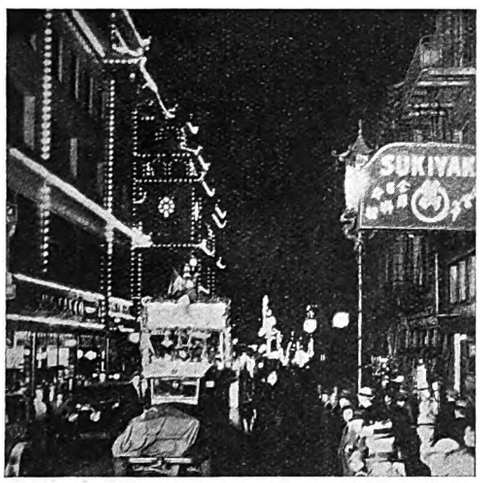


Part of the consignment of 33 000 V cable which is to be submerged in Sydney Harbour, in connection with local electrical development.

The stand of Ferranti, Ltd., at the recent Manchester Radio Exhibition. The stand was finished in white, blue and gold, and was floodlighted throughout the show. The special public address arrangements and the loud-speaker feed to all stands were other Ferranti features.



Group taken on the occasion of the opening, on October 31st, of the new extensions at the Central power station of the Stoke-on-Trent Corporation. The new plant includes a 12 500 kW turbo-alternator, this being the fifth set of Metropolitan-Vickers manufacture in the Central station.



A scene in San Francisco's "Chinatown" during the recent celebrations in connection with the eighteenth anniversary of the birth of the Chinese Republic.

An unusual view of the Coliseum at Rome during the "Edison Celebrations." All places of historic interest as well as public buildings were floodlighted for some days previous to October 21st, the final scenes of the official celebration period being something of a carnival show.

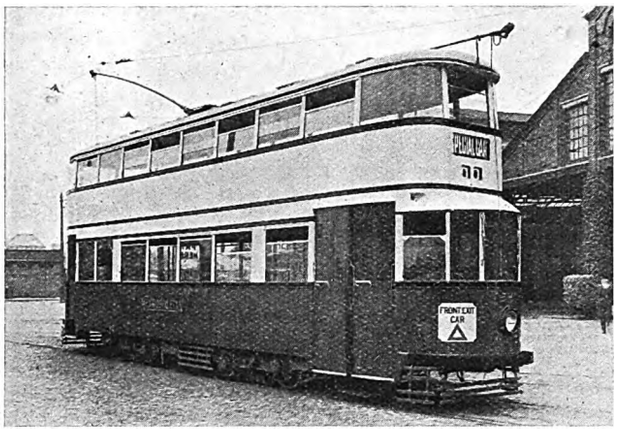
ELECTRIC TRACTION.

G.I.P.'s First Main Line Electrified Service Opened.

THE Great Indian Peninsula Railway inaugurated service on Tuesday on a large and important section of the first main railway line in India to be electrified, namely, Bombay to Poona, a distance of 131 miles. The electrification of this line is part of an extensive scheme which includes suburban service in the Bombay area and main line service on two inland routes.



A new M.E.T. car which was put into service in North London, on Wednesday.

The L.N.E.R. Co. hope to include, amongst development schemes now being drawn up, the electrification of the company's London suburban lines.

It is expected that the conversion of St. Ann's Well Road and Wilford Bridge (Nottingham) tramways to a trolley bus service will take place about the middle of November. A dozen trolley vehicles have been ordered and an advanced stage has been reached in the overhead equipment work. A great extension of the railless trolley system is projected at Nottingham. Powers are to be sought to obviate the necessity of applying for permission to make changes of system upon particular routes.

Mr. William Marsh, engineer and manager of Brighton tramways, has reported to the Tramway Committee that the re-arrangement of the supply feeders which was made in the autumn of 1927 now appears to be inadequate. During the last pre-war year the consumption of current was 1¾ million kWh, this year it will be about 4¼ millions. It will be necessary to provide some larger cables for some districts, those displaced being used elsewhere to supplement smaller ones in their turn. The Committee has authorised Mr. Marsh to carry out the necessary re-arrangement and to requisition from time to time whatever new cables may be required.

A train on the Buenos Aires Great Southern Railway, hauled by a Diesel electric locomotive, recently made a non-stop run of 775 miles in 20 hours and 37 minutes, an average of about 37¼ miles per hour. The train, composed of the locomotive and two coaches, had a total weight of 159 tons. On several parts of the journey a speed of 46½ miles per hour was reached. The power plant consists of a Beardmore eight-cylinder four-cycle Diesel engine giving 375 B.H.P. at 700 r.p.m. direct coupled to a Metropolitan-Vickers 300 kW compound wound d.c. generator. The oil consumption was about 2·805 lb. per mile run.

At a recent meeting of Belfast Corporation, Ald. W H. Alexander asked whether the reforms outlined in the M'Clure report in 1927 with regard to the Corporation tramways had been carried out, and how much of the £31 408 (the amount of the saving in salaries and wages which the M'Clure Committee considered necessary) had been made during the past year. The chairman of the committee, Coun. M'Clure, said the trams were losing £2 000 per week from bus competition until the agreement was entered into to purchase the rival bus services. For the present year, at the present rate of running cost, the saving in working cost would be equal to £66 148. They would not touch the wages so long as satisfactory results could be obtained by proper organisation. Since he had learned by experience that the public preferred a tram at 2d. to a bus at 3d., he was no advocate for tearing up the tram lines and putting on buses. The Corporation has decided to seek powers to run railless trolley cars in the city.

LIGHTING LECTURES.

Extensive Programme Arranged for November and December.

THE E.L.M.A. Lighting Service Bureau has arranged for a comprehensive programme of lectures to be given between now and the end of the year, and these will cover practically every phase of lighting. The lectures will be given in various parts of the country as below :—

Date.	Audience.	Place.	Subject.	Time.
Nov.				
8th	Specialist ..	Edinburgh ..	Architectural Lighting	7.30 p.m.
11th	20th Design Course	Savoy Street	Industrial ..	7.30 p.m.
	Guildford Display Association	Guildford ..	Shop lighting .	7.30 p.m.
	Rotary Club ..	Aldershot ..	Modern Lighting	1 p.m.
12th	Forum Association	Rugby	Modern Lighting Methods	—
	E.A.W.	Rugby	Home Lighting	—
12th	Elliot Stone .	Savoy Street	Shop Lighting .	7 p.m.
	Chamber of Commerce	Clacton	Shop Lighting ..	7 p.m.
13th	Chamber of Trade	Bedford.....	Shop Lighting ..	7.30 p.m.
	Specialist	Bristol	Floodlighting ..	7.30 p.m.
	Trade	Manchester .	Glareless Light .	—
	Ironmongers' Association	Savoy Street	Shop Lighting ..	7.45 p.m.
14th	E.P.E.A.	Cardiff	Floodlighting ..	7 p.m.
	Rotary Club .	Gosport	Modern Lighting	1 p.m.
	Rotary Club .	Watford	Modern Lighting	1 p.m.
15th	E.A.W.	Gloucester ..	Home Lighting .	—
18th	20th Design Course	Savoy Street	Floodlighting ..	7.30 p.m.
	West of England Display	Exeter	Shop Lighting ..	7.30 p.m.
19th	Rotary Club .	Lytham.....	Modern Lighting	1 p.m.
	Rotary Club .	Jarrow	Modern Lighting	1 p.m.
	Public	Torquay	Home Lighting .	7 p.m.
	Public	Darlington ..	Home Lighting .	7.30 p.m.
20th	E.A.W.	Cardiff	Home Lighting .	7.30 p.m.
	Rotary Club .	Stepney.....	Modern Lighting	1 p.m.
21st	Rotary Club .	Sittingbourne	Modern Lighting	7 p.m.
	Rotary Club .	Acton	Modern Lighting	1 p.m.
22nd	Works and Roads Congress	London	Street Lighting .	3 p.m.
25th	20th Design Course	Savoy Street	Architectural Lighting	7.30 p.m.
26th	Rotary Club .	Greenwich ..	Modern Lighting Methods	1 p.m.
	Rotary Club .	Littlehampton	Modern Lighting Methods	1 p.m.
	Specialist	Sheffield	Industrial Lighting	7.30 p.m.
	Associated Municipal Engineers	Savoy Street	Industrial Lighting	3 p.m.
27th	Golders Green Chamber of Commerce	Savoy Street	Shop Lighting ..	4 p.m.
	Rotary Club .	Hinckley ...	Modern Lighting	1 p.m.
	Specialist	Liverpool ...	Industrial Lighting	7.30 p.m.
28th	Specialist	Newcastle ..	Industrial Lighting	7.30 p.m.
29th	Specialist	Edinburgh ..	Industrial Lighting	7.30 p.m.
Dec.				
2nd	20th Design Course	Savoy Street	General Problems	7.30 p.m.
	Engineers' Association	Southampton	Industrial Lighting	7.30 p.m.
	Specialist.....	Nottingham	Industrial Lighting	7.30 p.m.
3rd	Specialist	Birmingham	Industrial Lighting	7.30 p.m.
	Rotary Club .	High Wycombe	Modern Lighting Methods	1 p.m.
	Rotary Club .	Wimbledon..	Modern Lighting	1 p.m.
4th	Specialist	Bristol	—	7.30 p.m.
	Architectural Association	Edinburgh ..	Architectural Lighting	—
9th	Rotary Club .	Wigan	Modern Lighting Methods	1 p.m.
	Rotary Club .	Upper Norwood	Modern Lighting Methods	1 p.m.
10th	Rotary Club .	Aberdare....	Modern Lighting	1 p.m.
	Rotary Club .	Bromley	Modern Lighting	1 p.m.
11th	Rotary Club .	Erith	Modern Lighting	1 p.m.
17th	Rotary Club .	Wellington .	Modern Lighting	1 p.m.
18th	Rotary Club .	Maidenhead .	Modern Lighting	1 p.m.
20th	Rotary Club .	Hull	Modern Lighting	1 p.m.
31st	Rotary Club .	Paddington .	Modern Lighting	1 p.m.

COMPANY NEWS.

Big Rise in Price of Metropolitan Electric Supply Co.'s Shares—General Electric and Associated Electrical Industries' Ordinary also Rise—Hydro-Thermal Power Co.'s Avonmouth Power Scheme—Directors' Reports and Dividend Announcements.

THE augmented list of electrical share quotations which we publish for the first time this week shows several outstanding features. The ordinary shares of the Metropolitan Electric Supply Company, which are to be increased by the creation of another half-million, have risen from 47s. 6d. to 56s. 3d., an improvement in a week of 8s. 9d. North Metropolitan, on the other hand, are 5s. lower, at about 52s. Midland Counties Supply ordinary shares have changed hands at under 30s., to which the price has been marked down from last week's quotation of 33s. Clyde Valley shares have also been sold, and have fallen half-a-crown, from 41s. 3d. to 38s. 9d. Other weak supply shares have been Newcastle and District, which have receded from 28s. 9d. to 27s. 6d. ; Yorkshire, from 35s. to 34s. ; and Scottish Power, from 30s. 6d. to 30s. On the other hand, County of London ordinary have hardened from 51s. 6d. to 52s. 6d., and Shropshire, Worcestershire and Staffordshire, 6% preference, from 21s. 6d. to 22s. In the manufacturing section, General Electrics have recovered from 45s. to 48s. 9d. Associated Electrical Industries ordinary shares have been in demand, the price improving 2s. 6d., from 31s. 3d. to 33s. 9d. Among cable manufacturing companies, W. T. Henley's ordinary shares are down 2s. 6d. to £6 5s., British Insulateds show a bigger proportionate decline from £4 to £3 17s. 6d., and Enfield Cable Works have at £4 17s. 6d. shed 1s. 3d. Cables and Wireless issues have again been an active market, but show little change on balance. Marconi's International Marine shares at 43s. 9d. are 1s. 3d. to the good. The ordinary stock of the American Telephone and Telegraph Co. has risen 5 points to 245.

Although the recent set-back in America has not had any material effect upon our market for electrical shares, prices in numerous instances stand at an attractive level. Newcastle and District and Scottish Power shares, to both of which we have referred, can be purchased to yield approximately 5½ per cent. The dividend on the former has been 7½ per cent. for each of the last two years, while the Scottish Power Co. for each of the past seven years has distributed 8 per cent.

OXFORD ELECTRIC CO., LTD.—Div. at rate of 7% p.a., less tax, has bn. declared.

DUBILIER CONDENSER CO. (1925), Ltd.—Usual half-yearly div. on 7½% cum. pref. shs. will be payable on Nov. 30.

W. T. HENLEY'S TELEGRAPH WORKS CO., LTD.—Intm. div. of 1s. 6d. p. sh., less tax, on ord. shs. will be paid on Dec. 2.

METROPOLITAN ELECTRIC SUPPLY CO., LTD.—A mtg. was held on Wednesday to consider a resolutn. to increase cap. to £2 500 000, by creatn. of 500 000 £1 ord. shs.

EDISON SWAN ELECTRIC CO., LTD.—Pft. for 18 months to Dec. 31, 1928, £21 036. Div. amtg. to £9 000 was paid on ord. shs. for year to June 30, 1928. To deb. sinkg. fund £2 000; to res., £2 500; fwd. £12 619.

ELECTRICAL SECURITIES HOLDING CO. (JAPAN).—This co., with cap. stk. of three million yen, has been incorporated in Tokyo. It proposes to own stks. and bonds of electric, gas, railway and other companies.

CITY OF BUENOS AIRES TRAMWAYS CO. (1904), LTD.—Qrtrly. div. at rate of 5% p.a., less tax, to Sept. 30, 1929, will be payable on Nov. 16. Transfer books are closed from Nov. 8 to 14, inclusive, for preparation of div. warrts.

Marconi International Interim Dividend.

MARCONI INTERNATIONAL MARINE COMMUNICATION CO., LTD.—Intm. div. of 5% (1s. p. sh.), less tax, is payable in respect of year 1929. Coupon (No. 35) may be left at Head Office, Marconi House, Strand, London, W.C.2, for four clear days for preparatn. of div. warrts.

ANGLO-PORTUGUESE TELEPHONE CO., LTD.—Hldrs. of 7% 1st mtge. convertible deb. stk. are reminded that their option to convert their stk. into fully paid ord. shs. expires at the close of this year. Applications and stk. certificates must be lodged at the company's transfer office by Dec. 2.

BRISTOL TRAMWAYS AND CARRIAGE CO., LTD.—Directors propose to subdivide present £10 pref. and ord. shs. into shs. of £1 and to apply for the quotation of the pref. and ord. shs. on the London Stock Exchange. An extraordinary mtg. to consider the necessary resolutns. will be held on Nov. 26.

NATIONAL TELEWRITER CO., LTD.—Net pft. for year ended June 30, 1929, £1 190, agst. £1 254, makg. credit blce. £7 159. New license from Postmaster-General for use of telewriters on Post Office private wires, directors state, will be granted on satisfactory terms for 14 years from April 30 last. It is proposed to pay div. of 2d. p. sh. (agst. 2½d.) on pfd. ord. of £1 each.

NEW ENGLAND POWER ASSOCIATION.—This co., which is controlled by International Hydro-Electric System, a division of International Paper and Power Co., produced 1 292 759 000 kWh in the first nine months of this year, 32% greater than in the corresponding period of 1928 and 64% greater than in the first nine months of 1927. Its output in the twelve months ended Sept. 30, 1929, was 1 690 778 000 kWh, an increase of 30% over its output in the twelve months ended Sept. 30, 1928.

SOCIETE INTERNATIONALE D'ENERGIE HYDRO-ELECTRIQUE (SIDRO).—Subscriptns. are invited until Nov. 15, incl., for 117 000 one-fifth part ord. shs. at 1 750 fr. The new issue of part shs. is offered by pref. to hldrs. of 650 000 pref. shs. and 44 000 ord. shs. of 1 250 fr. divided into 220 000 part shs. of one-fifth, bearing the numbers 1 to 44 000, part shs. 1 to 5, who have the opportunity of subscribing: (1) Non-reducible—a part sh. of one-fifth ord. sh. for 8 pref. or part of one-fifth ord. sh. presented in support of the subscriptn.; (2) reducible—the remaining 8 250 part shs. of one-fifth new ord. shs., together with those which have not been absorbed by the exercising of the non-reducible subscriptn. rights. The offices at which the lists are open include those of Baring Bros. and Co., 8, Bishopsgate, E.C.2, and J. Henry Schroder and Co., 145, Leadenhall Street, E.C.3, London.

NORTH AMERICAN CO.—An increase in earngs. of 30.39% over previous year is reported for the twelve months ended Sept. 30, 1929, by this co., the largest electric light and power producing concern under single ownership in the United States. Amt. available for common stk., after all operatg. exes., int. charges, pfd. divs., depreciatn. and reserves, is $26 952 012 (£5 390 402), equivalent to $5.17 p. sh. on average number of common shs. outstandg. during year, compared with $20 668 750 (£4 133 750), or $4.40 p. sh., for precedg. twelve months. Gross earngs. for year under review amtd. to $145 624 060 (£29 124 812), agst. $130 668 369 (£26 133 674) last year, while operatg. exs. increased to $75 846 726 (£15 169 345), compared with $67 723 091 (£13 544 618) for previous year. Appropriatns. for depreciatn. reserves are shown at $15 399 988 (£3 079 998), increase $1 745 691 (£349 138) over figure for Sept. 30, 1928.

ASSOCIATED GAS AND ELECTRIC CO.—Directors are giving to stkhldrs., hldrs. of fully registered convertible securities, and certn. other security hldrs., of record at Oct. 31, rights to subscribe for one $8 interest-bearing allotmt. certificate for ea. eight shs. of stk. or ea. $800 principal amt. of fully registered convertible securities then held. Each allotmt. certificate will entitle hldr. to receive on or after July 1, 1930: (1) One sh. of common stk., class A, of General Gas and Electric Corporation as at present constituted or five new shs. after completn. of pendg. split-up proceedgs.; (2) one-fifth share of $5 div. series pfd. stk. Associated Gas and Electric; and (3) one deb. right of Associated Gas and Electric as at present constituted or five rights on completn. of proposed split-up. It is proposed to split up the common stks. of General Gas and Electric on the basis of five new shs. for each one sh. outstandg. The $5 div. series pfd. stk. of Associated Gas and Electric ranks on an equality with all other outstandg. pfd. stks., is entitled to divs. at annual rate of $5 p. sh. in priority to class "A," class "B" and common stks., and is redeemable at $102 p. sh. The directors of Associated Gas and Electric have declared regular qrtrly. div. on class "A" stk. payable Nov. 1 at rate of 1/40th of a sh. of class "A" stk. for ea. sh. held.

TELEPHONE MANUFACTURING CO., LTD.—The Board has formulated its scheme for segregating the assets, and an extraordinary gen. mtg. has been called for 11.30 a.m., on Nov. 25, at Cannon Street Hotel, London, E.C., to consider the directors' proposals. It is intended:—(*a*) To wind up company voluntarily; (*b*) to register Telephone Rentals, with cap. of £600 000 in 5s. shs., as a hldg. concern for the 17 subsidiary undertakgs. which instal telephone instrumts. and other apparatus on a rental basis; and (*c*) to register Telephone Manufacturing Co. (1929), with cap. of £250 000 in 5s. shs., to acquire business of mfg. telephone and ancillary apparatus for the installatn. companies, General Post Office, etc. Present authorised and issued cap. is £1 000 000 in 10s. shs., and it is proposed that for every sh. shhldrs. shall receive at the rate of one 5s. sh. in the new holding co. and one 5s. sh. in the new mfg. co. for every two held. The present scheme was prompted by the fact that, while the installatn. side of the business showed a pft, this was offset through losses incurred by unremunerative prices received by the mfg. side under contracts, principally with the General Post Office. The directors consider that by removing the burden of mfg. losses from the installatn. pfts. some return on the cap. should be possible. The Board also believes the reorganisatn. should place the mfg. co. on a pft.-earng. basis.

Company Meetings.

PHILIPS' GLOWLAMPWORKS, LTD. (HOLLAND).—At the general meeting on Monday, the shareholders unanimously adopted a proposal to increase the capital. Replying to questions, Dr. Philips announced that he anticipated a greatly increased output, particularly of wireless sets, and ascribed the recent dismissals to rationalisation and the introduction of new machinery.

WILLIAM BEARDMORE AND CO., LTD.—At the meeting on October 24th, Mr. L. C. Ord, who presided, said the Indian State Railways had ordered two Diesel electric locomotives, which were under construction and almost completed, and a mobile 100 H.P. Diesel generating set had been supplied to the engineering department of His Majesty's Post Office. A great future was anticipated for this form of motive power for railway traction and for other purposes, in the development of which the company had taken a leading part and was continuing to do so.

RHODESIAN ANGLO-AMERICAN, LTD.—At an extraordinary meeting of the company last week, Sir E. Davis (chairman) said it was in the interests of the whole of the Northern Rhodesian mining industry that there should be made available suitable and cheap power. With this object in view, it was proposed to form a company to inquire into the possibility of the creation of a large hydro-electric power station, a preliminary report upon which had been made by Mr. F. E. Kanthack. The site of the power station was situated slightly over 100 miles from the copper mines. The project was one that warranted full investigation.

ATLAS LIGHT AND POWER CO., LTD.—Mr. W. Sandford Poole, presiding at the meeting on October 30th, said, in reference to the sale of the company's Argentine interests, the total purchase price of £8 878 000 (of which £8 500 000 represented capital, and £378 000 interest and other credits

Digitized by Google

for revenue account) had been received. With regard to the holdings in two tramway companies in Montevideo, which were excluded from the sale, all legal formalities for the fusion of the companies had been completed, but full liberty to run the combined businesses as one had not yet been obtained. The company was fortunate in having large sums of money available for investment at a time when prices were depressed, and shareholders might rest assured that the Board would do their best to invest these funds wisely as and when they considered the time had arrived. A resolution was passed to change the name of the company to the Atlas Electric and General Trust, Ltd.

RUTHS STEAM STORAGE, LTD.—Mr. W. S. Eyre, presiding at the meeting on Monday, said last month three of the directors, with two other British engineers, travelled to Germany and there saw the starting up of the Ruths steam accumulator plant at the Charlottenburg station, and inspected the organisation which Dr. Ruths had built up in Germany. It was a convincing demonstration of the magnitude of the value and scope of the system. The chairman of the Central Electricity Board, when approached with the request that they should send one of their engineers with the company's directors to investigate the Charlottenburg plant, said at once: "We are glad to do this for two reasons: first, I feel that it is desirable to look into all matters that may have a bearing on our own technical problems, and, secondly, I feel that it is our duty as a public board to take whatever steps we can to further any technical development that promises to be of assistance to British industries." He now came to a matter of major importance, and that was the future of Dr. Ruths' system in the central electricity stations throughout the world. A reference had already been made to the visit paid by some of the directors last month to Germany. In the party were two outstanding British engineers, who saw the Charlottenburg plant actually at work, and also visited a smaller though important peak-load installation in the city of Chemnitz, where it had been giving very satisfactory results for the past two years. Dr. Ruths' German company had recently received contracts for two peak-load accumulator plants similar to the Charlottenburg installation, though smaller, one for the city of Gothenburg and one for the city of Hattingen. Both these plants were under construction, and there were peak-load projects under consideration by the authorities in 18 of the leading cities in Europe.

HYDRO THERMAL POWER, LTD.—At the statutory meeting, held on October 30th, at 3, Victoria Street, London, Brig.-Gen. E. L. Spears (chairman) said their company owned the world's patent rights of an invention calculated to put a new value on water power. The system consisted of a combination of well-known elements, all of which were already in commercial use. Its novelty was the co-ordination of these elements in such a manner as to produce a result which had never before been obtained. Technical details had been dealt with fully in the report by the company's consultants, Messrs. C. S. Meik and Buchanan, and Messrs. Kincaid, Waller, Manville and Dawson, which had been put before the shareholders. Briefly it was claimed that the company's system provided a means of utilising water power resources with an important saving on capital and working costs. It was applicable to numerous hydro-electric schemes at present under consideration, as well as others whose conditions had hitherto been adjudged uneconomical. It also for the first time made practical the commercial utilisation of intermittent and fluctuating sources of hydraulic power, such as the rise and fall of tides. To demonstrate the practicability and commercial utility of the system, it was decided to instal a unit at Avonmouth Docks to operate under actual tidal conditions, and this unit would be in operation within three or four months. The firms engaged upon the manufacture of the plant were Messrs. Heenan and Froude, Ltd., in conjunction with the English Electric Co., Ltd., Messrs. Ruths Steam Storage, Ltd., and Messrs. Boving and Co., Ltd. Literature which has been issued states that the inventor of the system is Mr. Paul Shiskoff, and that the following are features of the scheme. The plant includes a water turbine coupled to an electric generator, while coupled also to the water turbine will be a water heater to absorb the surplus power. The water thus heated will be retained in a thermal storage vessel at a temperature corresponding to a high pressure, and the power so conserved will be used when required to drive another generator and so provide the additional energy required under special conditions of load, or will be primarily at command to generate power at such stages of the tide when the main water turbines could not be employed on account of the small difference in level betwen the impounded water and the river. The water for the turbines will be withdrawn from the Avonmouth Docks and discharged into the river over such period as will admit of an economical difference in head, and when this does not obtain, the power generation will be changed over to the storage system. The present experimental plant will be approximately of 250 H.P. capacity, and the primary and secondary generators will be of 50 kW each.

New Companies.

J. S. TOWELL, LTD.—Cap., £50 000. Electrical installers, etc. A first director: J. S. Towell, Wide Bargate, Boston.

BRENT ENGINEERING CO., LTD.—Cap., £100. Engineers, electrical and wireless engineers, etc. Reg. Office: 31, Walbrook, London, E.C.4.

LUMINIFEROUS SIGNS, LTD.—Cap., £8 000. Electrical appliances, etc. Solicitors: C. Butcher and Simon Burns, 32, Gresham Street, London, E.C.2.

HIGH TENSION WIRES, LTD.—Cap., £100. Manufacturers of wireless goods, mechanical and electrical engineers, etc. Reg. Office: 17, Ironmonger Lane, London, E.C.2.

JOHN COSENS, LTD.—Cap., £3 500. To acquire business of ironmonger, electrician, etc., now carried on by W. T. Cosens at 62/64, Bohemia Road, St. Leonards-on-Sea, as "John Cosens."

GODMAN BRITTAIN AND NUTTER, LTD.—Cap., £2 100. Manufacturers of and dealers in internal combustion steam, electrical, Diesel and other vehicles. etc. Solicitors: Boyce, Evans and Sheppard, 14, Stratford Place, London, W.1.

H. GILL AND SONS (HULL), LTD.—Cap., £2 000. To acquire business of electrical, radio and general engineers, etc., carried on at Hull by C. S. Gill, Millicent G. Gill and L. V. Gill as "H. Gill and Sons." Reg. Office: 328, Holderness Road, Hull.

HERD AND CO., LTD.—Cap., £500. Electrical and mechanical and electrical engineers, manufacturers of and dealers in electric, magnetic, telegraphic, telephonic and other appliances and apparatus. Reg. Office: D2, Exchange Buildings, Liverpool.

LAMLITE SIGNS, LTD.—Cap., £1 000. Designers and manufacturers of and dealers in animated, scintillating, brilliant-reflex, mechanical, electrical, flashing, rotating and other advertising signs, etc. Reg. Office: 5/7, Savile Row, Newcastle-on-Tyne.

HENDON LAMP AND ACCESSORIES CO., LTD.—Cap., £1 000. To acquire business of electrical engineer and contractor and dealer in electrical accessories, appliances and apparatus carried on by C. D. Falcke at 104, Southampton Row, W.C., as "Hendon Lamp and Accessories Co."

MOULDING DEVELOPMENTS, LTD.—Cap., £1 000. To adopt agreement with Speyer Schwerdt and Co. (1929), Ltd., and to carry on business of manufacturers, importers and exporters of and dealers in insulators; telegraphic, telephonic and electrical engineers, etc. Reg. Office: 5 and 7, Golden Lane, London, E.C.1.

THE LEAD MARKET.

In sympathy with the weakness in other metals and influenced by events in Wall Street, the market last week, according to James Forster and Co., opened easier by 5s. per ton, while later prices were flat, and a further 20s. per ton lower, November lead selling down to £22 2s. 6d., and January to £22 5s. A slight reaction set in towards the end of the week, but subsequently relapsed. The American official price dropped from 6·90 cents to 6·50 cents, a fall of 35s. per ton.

Closing prices on November 1st were £22 3s. 9d. for November, £22 5s. for December, £22 6s. 3d. for January, and £22 7s. 6d. for February, about 23s. 9d. per ton lower on the week.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

BAILEY AND INCLEDON, LTD., electrical engineers, 34, Duke Street, London, S.W.1. In pursuance of the provisions of the Companies (Consolidation) Act, a meeting of the creditors of the above was held on November 4th, at Anderton's Hotel, Fleet Street, E.C., when a statement of affairs was submitted which showed liabilities of £4 178 (£2 421 to the trade) and assets estimated to realise £3 395, less preferential claims of £2 286, leaving net assets of £1 109.

It was reported that late in 1928 one of the directors sued the company in respect of arrears of directors' fees, and recovered some £200. At a later date a further action was commenced, and subsequently the company passed resolutions for voluntary liquidation. The summarised trading profit and loss account for the period from August 19th, 1926, to October 18th, 1929, showed that the company's expenses were £4 007, whilst the directors' remuneration had been £2 965. The gross profit was £2 350, on a turnover of £27 683, and there was a net loss of £4 623. The deficiency account at October 18th, 1929, showed that the issued capital of the company was £3 000, whilst the amount written off the book debts, stock, work in progress, goodwill, etc., was £1 446. There was a deficiency as regards contributories of £6 069.

It appeared that the company was formed about the middle of August, 1926, to take over a business previously carried on by Mr. Bailey and Mr. Incledon. During the first two years the company took over some partly completed contracts, and they showed some very heavy losses, and during the first year, owing to an error in estimating, a large contract showed an actual gross loss of over £500.

It was decided that Mr. E. H. Hawkins, of Messrs. Poppleton, Appleby and Hawkins, should be appointed as joint liquidator with Mr. Weller, the liquidator appointed by the company. The following are creditors: Baxter, E. J., Watford, £1 568; B. D. and Co., London, £110; Bergman Electric Wire Co., Ltd., £65; Brindley, F. and B., £76; Bern, G., Ltd., £10; Coquantin, M., and Co., £38; Courtin and Walsh, Ltd., £53; Falk, Stadelmann and Co., Ltd., £72; Homefinders (1915), Ltd., £10; International Lamps, £42; Keith and Blackman Janes, Ltd., £37; Seeman (Arnold) and Co., £43; Shaw (John) and Sons, Ltd., £58; Turner and Evans, £25; Wholesale Electric Lamp Co., Ltd., £46; creditors under £10, £11.

London Gazette, etc.

Company Winding-up.

MANCHESTER PRIVATE TELEPHONE AND ELECTRIC LIGHTING CO., LTD. Winding-up Order, October 28th.

Winding-up Petition.

STANDARD PLATINUM CONTACTS, LTD. A creditor's petition for winding-up has been presented by Henrion Carbons, Ltd., Kinnaird House, Pall Mall East, London, S.W.1, electrical engineers, and is to be heard at the Royal Courts of Justice, Strand, W.C.2, on November 11th.

Companies Winding-up Voluntarily.

BRITISH ELECTRICAL REPRODUCTION CO., LTD. By reason of its liabilities, October 28th. R. L. Latimer, chartered accountant, appointed as liquidator. Meeting of creditors at 4B, Frederick's Place, Old Jewry, London, E.C.2, on Tuesday, November 12th, at 12.30 p.m.

UNIVERSAL AND GENERAL RADIO CO., LTD. By reason of its liabilities, October 26th. H. N. Murray, Revenue House, 7–8, Poultry, London, E.C.4, chartered accountant, appointed as liquidator.

WIRELESS LIGHTS, LTD. By reason of its liabilities, October 30th. G. Hay, chartered accountant, of the firm of Spain Brothers and Co., 45, London Wall, E.C.2, appointed as liquidator. Meeting of creditors, at 40, Hatton Garden, E.C.2, on Friday, November 15th, at 9 a.m.

Bankruptcy Information.

WESTBURY, Leslie William, lately trading as L. W. WESTBURY AND CO., and also as the WALSALL RADIO CO., at 146, Lichfield Street, Walsall, wireless goods dealer. Receiving order, November 1st. Debtor's petition.

Application for Discharge.

HURLES, Edward James Gordon, 8, Blackfriars Road, London, S.E., wireless dealer. Hearing, November 29th, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

Order Made on Application for Discharge.

HYDE, Hubert Algernon, 148, Weston Park, Crouch End, North London, lately 2, East Street, Bromley, Kent, wireless dealer. Discharged November 22nd, subject to judgment for £90.

Bankruptcy Proceedings.

STONE, George Frederick Amos (trading as THE STONE MANUFACTURING CO.), electrical accessories manufacturer, 108, Great Saffron Hill, London. The statement of affairs in this bankruptcy shows liabilities £2 279, of which £1 921 are returned as expected to rank, and net assets £30. The debtor commenced business on his own account in June, 1920, with £150 to £200 savings as capital, under the style of the General Maintenance Electrical Co., 14, High Street, Pinner. He shortly afterwards took in a partner and they continued trading under the same trading name until September, 1921, when the business was absorbed by Modern Electric Supply Co., Ltd. which was formed for this purpose. He was afterwards appointed sales manager, and remained with the company until it went into liquidation. In September, 1923, with under £200 as capital, he commenced business on his own account as a wholesale dealer in gas and wireless goods under the style of Lighting Supplies Co., at No. 2, Finsbury Place, E.C. This was successful, and two further shops were taken at Nos. 4 and 5, Finsbury Place. In July, 1925, he formed Finston Manufacturing Co., Ltd., who took over the last-mentioned business and traded from 45, Horseferry Road, S.W.1; as vendor he was allotted shares and was appointed joint managing director, which position he held until July, 1927. The company subsequently went into voluntary liquidation. In July, 1927, with £80 borrowed capital, he commenced trading as an electrical accessories manufacturer under the style of Stone Manufacturing Co., at 108 and 109, Great Saffron Hill, E.C.1. He was handicapped by insufficient working capital, and ceased tradiug on July 12th last, when he called his creditors together and executed a deed of assignment in favour of a trustee, but a bankruptcy petition was eventually presented and these proceedings ensued. Since July 20th last he has been employed as a traveller at a salary of £3 10s. per week.

STRATHDEE, Andrew Knox Ewart, trading as EMSCO RADIO, 923, Romford Road, Manor Park, London, electrical engineer. Adjudicated a bankrupt on July 6th last, with ranking liabilities estimated at £614, the debtor applied to Mr. Registrar Mellor in the London Bankruptcy Court last week for his order of discharge. The Official Receiver said that the assets, which were valued by the debtor at £310, had realised £55, and further small sums might be recovered from book debts. The debtor, who began business as an electrical engineer in November, 1918, began in November, 1922, also to deal in wireless apparatus. He attributed his insolvency to his ill-health, to bad debts, and to depreciation of stock on account of removals and storage. The Official Receiver opposed the application on the grounds that the debtor's assets were not of a value equal to 10s. in the £, and that he had omitted to keep proper books of account. His Honour suspended the discharge for three months.

ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by GEE AND CO., *Patent and Trade Marks Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.*

CLARIFOIL.—501 048. Class 50. Films or pellicles made from cellulose acetate or other cellulose derivatives or cellulose, and sold in the form of sheets, bands or strips, for wrapping or packing or electrical insulating purposes. British Celanese, Ltd., Celanese House, 22 and 23, Hanover Square, London, W.1; manufacturers. March 18th, 1929. To be associated with No. 501 049 (2 687.)

KLARIFOIL.—501 049. Class 50. Films or pellicles made from cellulose acetate or other cellulose derivatives or cellulose. and sold in the form of sheets, bands, or strips for wrapping or packing or electrical insulating purposes. British Celanese, Ltd., Celanese House, 22 and 23, Hanover Square, London, W.1; manufacturers. March 18th, 1929. (To be associated with No. 501 048 (2 687).)

DORIAN WIRELESS.—500 027. Class 8. Wireless telephonic and telegraphic apparatus. The Dorian Wireless Co., Ltd., Canberra House, 315, Regent Street, London, W.1; manufacturers of portable wireless receivers. February 14th, 1929.

SUPACON.—501 917. Class 8. Electric cables. Superlamp, Ltd., 92 and 94, Paul Street, London, E.C.2; wholesale dealers in electrical and radio goods. April 18th, 1929. (By consent.)

ATSA.—500 794. Class 8. Philosophical and scientific instruments. Société Anonyme Accumulateurs Tudor, 60, Chaussee de Charleroi, Brussels, Belgium; manufacturers. March 8th. 1929.

MEMOTA.—502 077. Class 8. Thermostatically controlled switches for use in connection with electric motors. Midland Electric Manufacturing Co., Ltd., M.E.M. Works, Barford Street, Birmingham; manufacturers. April 24th, 1929. (To be associated with No. 337 390 (1 760) and others.)

PEDIGREE.—504 217. Class 8. Instruments and apparatus for radio-signalling, sound reproducers and thermionic amplifiers, gramophones, gramophone pick-ups, and parts of same. Harold Taylor, "Woodhill," Ormes Lane, Compton, Wolverhampton; radio engineer. July 4th, 1929.

A.B.L. BEZEG (sign).—501 200. Class 13. Plug connectors, wall plugs, utensils, plugs, plug sockets, complete lead-in connections for electrical apparatus and appliances, and heating elements for electric stoves, all being metal goods. Bayerische Elektro-Zubehor Aktiengesellschaft, 6A, Wagnerstrasse, Lauf, near Nuremburg, Germany; electrical engineers. March 23rd, 1929. Registration of this trade mark shall give no right to the exclusive use of the letters "A.B.L." In use the words "plug connectors" may appear on the mark or may be varied by the substitution of the names of other articles included in the specification of goods.

ELFA.—500 525. Class 8. Electric batteries (not for medical purposes). Naamlooze Vennootschap Werktuigenfabriek "Rotator," Valkenburgerstraat 5A, Amsterdam,; manufacturers. February 28th, 1929. (To be associated with No. 500 526 (2 686) xiii.)

"FULCAPAC."—503 321. Class 8. Electric batteries (not for medical purposes). Symphony Gramophone and Radio (Foreign), Ltd., trading as The Fulcapac Battery Co., Chesham House, 150, Regent Street, London, W.1; dealers in wireless apparatus. June 4th, 1929.

RESERWATT.—504 710. Class 8. Ignition batteries for internal combustion engines. Société des Magnetos R.B., 2 to 8, Rue Ernest Lefevre, Paris, France; manufacturers. July 23rd, 1929. (Date claimed under International Convention, April 11th, 1929.)

HARLIE.—504 832. Class 8. Wireless telephonic apparatus and parts thereof and gramophones. Harlie Brothers, 3, Balham Road, Lower Edmonton, London, N.9; manufacturers and merchants. July 27th, 1929.

AGAPHONE.—504 919. Class 8. Gramophones and records and accessories therefor; and wireless telephonic apparatus. Lionel Black, 147, Holborn, London, E.C.1; merchant and importer. July 30th, 1929.

DYSONUS.—505 010. Class 8. Philosophical and scientific instruments. Hardyson Radio, Ltd., 13, Market Street, Huddersfield; manufacturers of musical and scientific instruments. August 2nd, 1929. (To be associated with No. 505 011 (2 686) ix.)

ELFA.—500 526. Class 13. Electric hand torches. Naamlooze Vennootschap Werktuigenfabriek "Rotator," Valkenburgerstraat 5A, Amsterdam; manufacturers. February 28, 1929. (To be associated with No. 500 525 (2 686) viii.)

TOASTMISTRESS.—503 947.—Class 18. Electric toasting stoves. Waters-Genter Co., 213 to 217, North Second Street, Minneapolis, Minnesota; manufacturers of electrical apparatus. June 25th, 1929. (To be associated with No. 502 773 (2 681.)

TURNLIGHT (sign). B493 287. Class 8. Electric batteries (not for medical purposes). Batterien-u Elemente-Fabrik System Zeiler Aktiengesellschaft, Rungestrasse 20, Berlin, S.O. 16; manufacturers. July 13th, 1928. User claimed from May 24th, 1924.

JUMBO. 502 066. Class 8. Talking machines and wireless telephonic and telegraphic apparatus and parts thereof. The Parlophone Co., Ltd., 1, Broad Street Place, London, E.C.2; manufacturers. April 23rd, 1929. To be associated with No. 299 534 (1 580) and others.

SYMMETAR.—505 066. Class 8. Philosophical and scientific instruments. I. G. Farbenindustrie Atkiengesellschaft, Mainzerlandstrasse 28, Frankfort-on-Main; manufacturers. August 6th, 1929.

JUMBO (sign). 502 597. Class 8. Talking machines and wireless telephonic and telegraphic apparatus and parts thereof. The Parlophone Co., Ltd., 1, Broad Street Place, London, E.C.2; manufacturers. April 23rd, 1929. To be associated with No. 299 534 (1 580) and others.

DUBLETO. 505 484. Class 8. Electric cables. Ward and Goldstone. Ltd., Samson Works, Frederick Road, Pendleton, Manchester; electrical engineers. August 23rd, 1929.

DYALMO.—505 352. Class 6. Electric lighting, power and ignition machines and parts thereof for motor vehicles and cycles. The M-L Magneto Syndicate, Ltd., Victoria Works, Lower Ford Street, Coventry; manufacturers. August 16th, 1929.

MAXITONE.—502 142. Class 8. Philosophical and scientific instruments. Lugton and Co., Ltd., 133 and 135, Old Street, London, E.C.1; talking machine factors. April 25th, 1929. To be associated with No. 368 312 (1952) and others.

CAMEL ACCUMULATOR (sign).—503 954. Class 8. Electric accumulators (not for medical purposes). Maurice Marks, trading as the Camberwell Supply Stores, 185, Camberwell Road, London, S.E.5; electrical engineer. June 25th, 1929. (By consent.)

CINEXPO.—505 459. Class 8. Philosophical and scientific instruments. Photo Marketing Corporation, 152, West 42nd Street, New York, merchants. August 21st, 1929.

IDEAL (sign).—501 395. Class 8. Wireless telephonic apparatus and parts thereof. Electradio Co., Ltd., 25, Westbourne Grove, London, W.2; manufacturers and merchants. March 28th, 1929. (By consent.) Registration of this trade mark shall give no right to the exclusive use of the word "Ideal."

SYMENTIS.—503 724. Class 50. Electrical insulating material, plastic compositions of phenol and formaldehyde for use as binding agents for electrical insulating material, electrical insulating panels made of material covered by Class 50. William Arthur Jones and Henry Allaun, trading in co-partnership, 74, Blackfriars Road, Salford; manufacturers. June 18th, 1929.

MASTOL.—503 725. Class 50. Electrical insulating material, plastic compositions of phenol and formaldehyde for use as binding agents for electrical insulating material, and electrical insulating panels made of material covered by Class 50. William Arthur Jones and Henry Allaun, trading in co-partnership, 74, Blackfriars Road, Salford; manufacturers. June 18th, 1929.

RANGER.—502 107. Class 8. Electrical dry cells (not for medical purposes). J. F. Smith (Birmingham), Ltd., 92, Hurst Street, Birmingham; merchants. April 25th, 1929.

JUMBO.—502 597. Class 8. Records. Wireless telephonic and telegraphic apparatus and parts thereof. The Parlophone Co., Ltd., 1, Broad Street Place, London, E.C.2; manufacturers. May 8th, 1929. To be associated with No. 299 534 (1 580) and others.

PANOPHASE.—502 301. Class 8. Electrically operated sound reproducing instruments and wireless telephonic and wireless telegraphic apparatus. Ernest John Allan, trading as the Radio and Electro-Acoustic Development Co., 8, Westfield Place, Dundee; manufacturer. April 30th, 1929.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

317 289 J. H. WILLIS. Chronological device, particularly adapted for use in determining the local times of foreign wireless or television programmes (21/1/29.)

317 291 F. NEWTON. Electric motors for driving spinning-cans and the like. (13/6/28.)

307 022 INTERNATIONAL GENERAL ELECTRIC CO., INC. Multi-stage centrifugal compressors with intermediate cooling. (1/3/28.)

317 110 R. GRAH. Plating with chromium. (22/6/28.)

317 301 W. E. WILLIAMS. Directional aerials for transmission and reception of electro-magnetic (wireless) waves. (13/2/28.)

317 302 B. SYKES. Voltage-regulators for electric generators. (13/2/28.)

317 409 R. LOMAX, J. R. GARNER, and P. C. WALKER. Electrical fuses. (16/2/28.)

317 494 F. W. GEE and FERRANTI, LTD. Electric transformers. (17/2/28.)

317 497 A. REYROLLE AND CO., LTD., and H. LEBEN. Electric protective systems (17/3/28.)

317 498 A. REYROLLE AND CO., and H. LEBEN. Electric protective systems. (17/3/28.)

317 503 IGRANIC ELECTRIC CO., LTD., and F. J. H. CHARMAN. Radio-receiving apparatus. (18/4/28.)

317 504 GENERAL ELECTRIC CO., LTD. (DR. A. JUST). Manufacture of electric discharge devices. (18/4/28.)

290 169 LOEWE-RADIO GES. Filler device for operating multi-stage thermionic amplifiers with supply units. (6/5/27.)

317 305 BRITISH THOMSON-HOUSTON CO., LTD., and A. T. STACE. Sound-reproducing instruments. (11/5/28.)

290 299 DR. S. LOEWE. Diaphragm for loudspeakers. (13/5/27.)

317 351 EDISON SWAN ELECTRIC CO., LTD., and T. F. STENT. Thermionic valve circuits. (14/5/28.)

317 416 A. L. MOND (I. G. FARBENINDUSTRIE AKT.-GES.). Method of charging electric furnaces. (14/5/28.)

317 354 D. E. BARNETT. Electrical terminals. (14/5/28.)

290 583 H. BERTLING. Method of and apparatus for artificially illuminating objects. (14/5/27.)

317 514 J. A. CRABTREE. Electric lampholder switches. (16/5/28.)

317.422 A. REYROLLE AND CO., LTD., and B. H. LEESON. Electric meters and selective remote-control systems employing such meters. (16/5/28.)

317 423 GENERAL ELECTRIC CO., LTD., and E. H. CRIBB. Telephone or like systems with amplifiers. (16/5/28.)

317 424 J. A. COLOMBI. Slip-rings and other current-collecting devices. (16/5/28.)

317 425 W. E. BEATTY (BELL TELEPHONE LABORATORIES, INC.). Strand-coating apparatus. (16/5/28.)

317 426 W. E. BEATTY (BELL TELEPHONE LABORATORIES, INC.). Electro-optical image-producing systems and apparatus therefor suitable for television. (16/5/28.)

317 429 A. WEST AND CO., LTD., and A. WEST. Oil-immersed switches. (16/5/28.)

317 517 A. WEST AND CO., LTD., and A. WEST. Electrical grid resistances. (16/5/28.)

291 027 SIEMENS-SCHUCKERTWERKE AKT.-GES. Electromechanical. hammers. (24/5/27.)

317 521 STANDARD TELEPHONES AND CABLES, LTD., and E. P. G. WRIGHT. Non-numerical switching arrangements for automatic and semi-automatic telephone systems. (18/5/28.)

317 522 STANDARD TELEPHONE AND CABLES, LTD. (G. DEAKIN and L. J. J. SCHREIBER). Dial switches. (18/5/28.)

295 930 STANDARD TELEPHONES AND CABLES, LTD. Sub-harmonic electric frequency-producers. (20/8/27.)

317 523 STANDARD TELEPHONES AND CABLES, LTD. (WESTERN ELECTRIC CO., INC.). High-frequency signalling systems. (18/5/28.)

317 528 W. E. BEATTY (BELL TELEPHONE LABORATORIES, INC.). Synchronising systems. (19/5/28.)

317 537 W. E. BEATTY (BELL TELEPHONE LABORATORIES, INC.). Synchronising systems. (22/5/28.)

317 547 AUTOMATIC TELEPHONE MANUFACTURING CO., LTD., and G. A. BURNS. Electrical signalling systems. (22/5/28.)

317 558 P. H. HULL and IMPERIAL CHEMICAL INDUSTRIES, LTD. Effecting chemical reactions in gases by means of electrical discharges. (31/5/28.)

292 122 E. PARVILLE ET CIE. Electric accumulators. (14/6/27.)

317 562 H. H. BERRY. Advertising-sign. (1/6/28.)

291 722 FELTEN UND GUILLEAUME CARLSWERK AKT.- GES. Method of impregnating high-tension electric cables. (3/6/27.)

317 566 G. W. HALE and RADIO INSTRUMENTS, LTD. Wireless receiving systems. (5/6/28.)

317 574 A. PREEN. Radio-receiving apparatus. (13/6/28.)

292 478 INTERNATIONAL GENERAL ELECTRIC CO., INC. Speed-controlling mechanisms for motor drives. (18/6/27.)

292 556 SIEMENS-SCHUCKERTWERKE AKT.-GES. Regulation of continuous-cycle absorption refrigerating-machines. (22/6/27.)

Applications for Patents.

July 26th.

23 055 F. S. ADKINS and R. W. CRABTREE AND SONS, LTD. Dynamo electric machines.

22 978 N. A. ALLEN, T. B. SCOTT and STANDARD TELEPHONES AND CABLES, LTD. Single core cable.

23 046 ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Circuit breakers. (22/8/28. U.S.)

23 048 ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Metal disc rectifiers. (22/8/28, U.S.)

23 080 AUTOMATIC TELEPHONE MANUFACTURING CO., LTD. and L. M. SIMPSON. Electrical indicator or display device.

23 012 W. E. BEATTY (BELL TELEPHONE LABORATORIES, LTD.). Reproduction of sound for films. (12/9/28.)

23 044, 23 045 E. A. BITTON, H. BRANTON, H. A. STORRY, LTD. and H. G. BAWTREE-WILLIAMS. Sound recording apparatus.

23 041 BRITISH TALKING PICTURES, LTD. Luminous discharge devices. (8/8/28, U.S.)

23 013 BRITISH THOMSON-HOUSTON CO., LTD. Oil-filled h.t. cables. (26/7/28, U.S.)

23 040 J. H. BROOME. Electric totalisators.

23 025 J. H. BURTON, RAILWAY SIGNAL CO., LTD. and W. S. ROBERTS. Rotary electromagnetic mechanisms.

23 023 J. E. CLARKE and LISSEN, LTD. Thermionic valves.

22 988 FELTEN UND GUILLEAUME CARLSWERK A.G. Submarine cables. (3/10/28, Germany.)

23 082 FERRANTI, LTD. (F. M. GENTRY). Thermionic valves or relays.

23 027 G. J. A. and L. FULLER. Galvanic batteries.

23 022 H. E. HUMPHRIES and SIEMENS BROS. AND CO., LTD. Electric selectors.

22 980 J. LUCAS, LTD., S. A. MASON, E. O. TURNER and H. E. WHITEHOUSE. Magnetos for engines.

22 944 H. F. Mc LOUGHLIN and SIMPLEX CONDUITS, LTD. Electric fuses.

22 947 H. F. Mc LOUGHLIN and SIMPLEX CONDUITS, LTD. Insulators of electric fuses.

22 948 H. F. Mc LOUGHLIN and SIMPLEX CONDUITS, LTD. Electric cables and distribution boards.

23 077 N. V. PHILIPS' GLOEILAMPENFABRIEKEN. X-ray tubes. (14/9/28, Holland.)

23 052 S. PRISNER and E. WENDER. Apparatus for transferring movements of body into variations in electrical current, etc.

23 085 SIEMENS-SCHUCKERTWERKE A.G. Trunk cables. (3/8/28, Germany.)

E

Digitized by Google

July 27th.

23 186 C. Arnold (Air-Way Electric Appliance Corporation). Apparatus for cleaning, disinfecting, etc.
23 142 Associated Electrical Industries, Ltd. and A. Tustin. Suspension of motors on electric vehicles.
23 143 Automatic Telephone Manufacturing Co., Ltd., T. R. Rayner and J. Smith. Telephone transmission systems.
23 110 E. A. Bitton, H. Branton, H. A. Storry, Ltd. and H. G. Bawtree-Williams. Devices for supplying current to thermionic valves from supply mains.
23 114 W. Booth. Electric switches.
23 122 F. J. Brislee and British Insulated Cables, Ltd. Insulation of electric wires, etc.
23 152 British Thomson-Houston Co., Ltd. Film supporting and driving apparatus. (27/7/28, U.S.)
23 185 Burgess Battery Co. Battery hand lamps. (1/8/28, U.S.)
23 109 C. Greenham. Electromedical appliances.
23 180 K. J. Jungholm. Electric switches, etc.
23 097, 23 098 B. E. Mace and A. G. Sutherland, Ltd. Gas, electricity, etc., meters.
23 061 23 062 J. Robinson. Electrical apparatus employing piezo-electric devices.
23 184 Siemens-Schuckertwerke A.G. Polyphase asynchronous motors. (28/7/28, Germany.)

July 29th.

23 300 Associated Electrical Industries, Ltd. and E. Y. Robinson. Vacuum tube devices.
23 304 Associated Telephone and Telegraph Co. Train control systems. (1/8/28, U.S.)
23 302 Automatic Telephone Manufacturing Co., Ltd. and L. M. Simpson. Electric totalisators.
23 189 F. Ball. Electrical testing devices.
23 276 A. C. Bamford and Chadburn's (Ship) Telegraph Co., Ltd. Apparatus for transmitting signals, etc.
23 277 A. C. Bamford and Chadburn's (Ship) Telegraph Co., Ltd. Ships' telegraphs, etc.
23 219 M. P. Favre-Bulle. Electric clock.
23 257 D. Christian, A. T. C. Moore and Siemens Bros. and Co., Ltd. Telephone systems.
23 209 C. W. Cox. Electric fuses.
23 287 S. English and Holophane, Ltd. Artificial sunlight lamps.
23 288 S. English and Holophane, Ltd. Directional street refractors.
23 191 E. E. Fournier d'Albe. Electromagnetic relays.
23 268 J. Y. Johnson (I.G. Farbenindustrie A.G.). Production of continuously burning electric arcs.
23 238 Kolster-Brandes, Ltd. Radio receiving apparatus. (28/7/28, U.S.).
23 303 N. V. Philips' Gloeilampenfabricken. Electric fuses. (14/9/28, Holland).
23 306 N. V. Philips' Gloeilampenfabricken. Electric lampholders. (7/8/28, Holland.)
23 307 N. V. Philips' Gloeilampenfabricken. Electric devices for measuring potential differences. (3/8/28, Holland.)
23 232 National Carbon Co., Inc. Chamber for electrostatic precipitation. (14/11/28, U.S.)
23 227 E. L. Peterson. Transmitting visions. (18/8/28, U.S.)
23 305 J. E. Pollak (Associated Telephone and Telegraph Co.). Telephone instruments.
23 298 Soc. Des Telephones Grammont. Artificial impedance for telephone repeaters. (24/11/28, France.)
23 237 Suddentsche Telefon Apparate und Drahtwerke A.G. Dry electric rectifiers. (8/8/28, Germany.)
23 291 Telefonaktiebolaget L. M. Ericsson. Mounting electromagnetic relays, etc. (4/8/28, Sweden.)
23 292 Telefonaktiebolaget L. M. Ericsson. Polarised call bells. (4/8/28, Sweden.)

July 30th.

23 434 J. L. Baird and Televison, Ltd. Television apparatus. (10/10/28.)
23 355 O. T. Blathy. Speed regulation of a.c. motors. (10/9/28, Hungary.)
23 404 British Thomson-Houston Co., Ltd. Anodes for electric discharge devices. (30/7/28, U.S.)
23 405 British Thomson-Houston Co., Ltd. Electric furnaces. (30/7/28, U.S.)
23 331 H. A. Chaplin and O. Fulton. Electrical transmission and reception of pictures, etc.
23 375 C. W. Denny. Electric plug and socket gauges, etc.
23 385 J. J. Dowling and K. S. G. Sommerville. Electrically recording changes in materials, etc.
23 395, 23 396 Electro Dynamic Construction Co., Ltd. and N. Pensabene. Dynamo-electric machines.
23 417 Falk, Stadelmann and Co., Ltd. (H. Mendel). Filaments for incandescent lamps.
23 415 General Railway Signal Co. Electric relays. (12/9/28, U.S.)
23 431 Siemens-Schuckertwerke A.G. Polyphase induction motors. (26/9/28, Germany.)
23 448 Siemens Schuckertwerke A.G. Arrangements for excitation of generators etc. (31/7/28, Germany.)
23 363 R. T. Smith. Wireless direction finding systems.
23 392 Westinghouse Brake and Saxby Signal Co., Ltd. Radio detectors. (27/9/28, U.S.)
23 393 Westinghouse Brake and Saxby Signal Co., Ltd. Railway traffic controlling apparatus. (12/9/28, U.S.)

July 31st.

23 568 Automatic Telephone Manufacturing Co., Ltd. and H. Jackson. Automatic switches for telephone systems, etc.
23 569 Automatic Telephone Manufacturing Co., Ltd. and C. Gillings. Telephone systems.
23 582 J. L. Baird and Television, Ltd. Television, etc., apparatus. (10/10/28.)
23 566 R. H. Barbour and Electrical Apparatus Co., Ltd. Auto transformers.
23 567 R. H. Barbour and Electrical Apparatus Co., Ltd. Induction regulators, etc.
23 498 T. E. Braumont and J. N. Waring. Electric heating.
23 500 L. E. T. Branch and K. L. Meyer. Electrical recording and reproducing apparatus.
23 550 British Thomson-Houston Co., Ltd. Automatic pressure regulators. (31/7/28, U.S.)
23 540 B. Caplan. Electric igniition of engines.
23 507 S. Frais. Electric accumulators.
23 551 International General Electric Co., Inc. Insulators for high pressure. (31/7/28, Germany.)
23 561 F. Krupp Grusonwerk A.G. Hydraulic lead cutting-off devices for lead cable presses. (15/2/29, Germany).
23 555 Landis-Gyr Soc. Anon. Electric contact mechanism. (23/8/28, Germany.)
23 530 J. E. Pollak (Associated Telephone and Telegraph Co.) Telephone systems.
23 576 Siemens and Halske A.G. Polarised relays. (2/8/28, Germany.)
23 575 Siemens-Schuckertwerke A.G. Electric purification of gases. (1/8/28, Germany.)
23 548 H. Souplis. Amusement devices employing electrically driven vehicles. (1/8/28, France.)
23 510 R. Sugden. Television, etc., systems.
23 492 Sulzer Freres Soc. Anon. Refrigerating machines. (18/10/28, Switzerland.)
23 585 Telefonaktiebolaget L. M. Ericsson. Electromagnetic relays. (4/8/28, Sweden.)

COMING EVENTS.

Friday, November 8th (to-day).

Institution of Electrical Engineers (North-Eastern Centre, Students' Section).—Armstrong College, Newcastle-on-Tyne. Lecture by Mr. B. H. Leeson on "Centrovisory Control of Power Stations." 7.15 *p.m.*

Junior Institution of Engineers.—39, Victoria Street, London, S.W. Annual general meeting and election of officers. 7.30 *p.m.*

Saturday, November 9th.

Association of Mining Electrical Engineers (Western Sub-Branch).—Paper by Mr. G. E. Hider on "The Problem of Peak Loads."

Institution of Electrical Engineers (South Midlands Students' Section).—Visit to Austin Motor Co., Ltd., Longbridge Works, Birmingham.

Monday, November 11th.

Electrical Contractors' Association (Hastings Sub-Branch).—Ordinary meeting.

Electrical Contractors' Association (Liverpool Branch).—Ordinary meeting. 3 *p.m.*

Institution of Electrical Engineers (Western Centre).—Bristol University, Old Fort, Bristol. Paper by Messrs. B. A. G. Churcher and A. J. King, on "The Analysis and Measurement of Noise Emitted by Machinery." 6 *p.m.*

Institute of Wireless Technology.—Engineers' Club, Coventry Street, London, W. Paper by Mr. Noel D. Cumming on "The Maintenance of a Modern Broadcast Station." 7 *p.m.*

Institution of Electrical Engineers (Meter and Instrument Section).—Savoy Place, Victoria Embankment, London, W.C.2. Discussion on "Temporary Expedients in Engineering." Opened by Mr. W. E. Highfield. 7 *p.m.*

Institution of Electrical Engineers (North-Eastern Centre).—Armstrong College, Newcastle-upon-Tyne. Paper by Lt.-Col. S. E. Monkhouse and Mr. L. C. Grant on "The Heating of Buildings Electrically by Means of Thermal Storage." 7 *p.m.*

Tuesday, November 12th.

Electrical Contractors' Association (Leicester Branch).—Ordinary meeting.

Electrical Contractors' Association (Swansea Branch).—Ordinary meeting.

Sheffield Illumination Society.—Visit to General Post Office. 6.30 *p.m.*

Institution of Electrical Engineers (North Midland Centre).—The Hotel Metropole, Leeds. Paper by Mr. E. J. Evans on "Feed Heating by Extracting Steam in Generating Stations." 7 *p.m.*

Institution of Electrical Engineers (North-Western Centre).—The Engineers' Club, Albert Square, Manchester. Paper by Mr. R. A. Chattock on "The Modern Use of Pulverised Fuel in Power Stations." 7 *p.m.*

Electrical Contractors' Association (Bournemouth Branch).—Ordinary meeting. 7.30 *p.m.*

Institution of Electrical Engineers (Scottish Centre).—Royal Technical College, Glasgow. Opening address by the chairman, Mr. G. Morgan. 7.30 *p.m.*

Wednesday, November 13th.

Electrical Contractors' Association (Eastbourne Sub-Branch).—South Street. Ordinary meeting.

Electrical Contractors' Association (Sheffield Branch).—Ordinary meeting. 5.30 *p.m.*

Institution of Electrical Engineers (Scottish Centre Students' Section).—Royal Technical College, Glasgow. Chairman's address by Mr. J. A. Cowan. 7.30 *p.m.*

Thursday, November 14th.

Institution of Electrical Engineers (North-Western Centre, Students' Section).—Engineers' Club, Albert Square, Manchester. Joint debate with the Institution of Mechanical Engineers (Graduates' Section). Motion to be that the present tendency to transfer transport from rail to road is to be deprecated.

Electrical Contractors' Association (Birmingham Branch).—Ordinary meeting.

Electrical Contractors' Association (Nottingham Branch).—Ordinary meeting.

Electrical Association for Women.—46, Kensington Court, London, W.8. At Home. 3 *p.m.*

Institution of Electrical Engineers (Dundee Sub-Centre).—University College, Dundee. Paper by Mr. A. Erskine on "The Economic Combustion of Coal." 7.30 *p.m.*

Friday, November 15th.

Institution of Mechanical Engineers.—Storey's Gate, St. James's Park, London. Lecture by Mr. Francis Hodgkinson on "Journal Bearing Practice." 6 *p.m.*

Electrical Development Association.—Royal Society of Arts, John Street, London, W.C. Lecture by Mr. E. E. Sharp on "Selling Time Switches." 7.30 *p.m.*

Junior Institution of Engineers.—39, Victoria Street, London, S.W.1. Lecture by Mr. W. T. Griffiths on "Nickel and its Uses in Engineering." 7.30 *p.m.*

Saturday, November 16th.

Institution of Electrical Engineers (North-Eastern Centre, Students' Section).—Visit to the coal distillation plant of the Newcastle-upon-Tyne Electric Supply Co., Ltd.

Association of Mining Electrical Engineers (South Wales Branch).—Cardiff. Paper by Mr. R. H. Morgan on "Electrical Measuring Instruments."

Paisley Association of Electrical Engineers. Visit to the Bussey Coal Distillation Co., Ltd., Glenboig, Lanarkshire. 3 *p.m.*

A Good Cause.

ONLY a few days remain before the result is known of the response made to Mr. HOWARD MARRYAT'S appeal for donations to put the capital fund of the Electrical Trades Benevolent Institution on a firm foundation. We therefore take this further opportunity to enlist the support of our readers in a cause which should interest every member of the industry. Those who are happily beyond contemplation of recourse to assistance from this ever willing but surprisingly needy helper of the needy could find no better way of marking appreciation of their good fortune than by providing one of the major sums now so urgently required to provide pensions for the numerous deserving cases which are known to the Institution. The others who are not so sure of what the future holds for them financially will do themselves and the E.T.B.I. a very good turn by sending along the small sum necessary for membership; by so doing they not only help to swell the funds of the Institution, but also qualify for the receipt of definite benefits if ever such assistance should be needed. It is a reflection on a great industry that its Benevolent Institution should always be appealing for funds. Let us all make some effort, no matter how small, to put it beyond the necessity to beg. One practical idea would be to pass round the E.T.B.I. collecting box at every electrical trade meeting between now and the date of the Festival Dinner. Other little ways of helping will naturally suggest themselves to those who really wish to lend their support to a very good cause.

British Electrical Production.

ALTHOUGH the monthly returns issued by the Board of Trade give a rough idea of the trend of United Kingdom trade it is obviously unwise to attempt to draw definite conclusions from such short-term records. The export of a big submarine cable order one month may, for example, give an appearance of retrogression to the export figures for the corresponding month of the following year in which no big item of cable is sent out of the country. A more balanced picture is, however, to be seen in the tables illustrating the "Economic Position in the United Kingdom" published in the "Board of Trade Journal." Taking the monthly averages for the period July-September in 1928 and 1929 these tables show an increase from 9·97 to 10·28 million insured workers employed, and an increase from 59·9 to 61·6 millions sterling in the declared value of exports. The figures relating to electrical engineering, based on the B.E.A.M.A. Index of Production show productivity percentages—taking the year 1924 as 100—of 84·1 in July-September, 1928, and 107·3 in the corresponding period this year. During the same period unemployment amongst insured workers in electrical engineering fell from 5·1 to 4·2 per cent., the lowest recorded since 1924.

An Important Survey.

ON November 28th, the British Electrical and Allied Manufacturers' Association will publish an important survey into the economic position and organisation of the British electrical industry. It represents the work of almost two years' continuous economic research into the main factors governing the growth of the industry and the development of its present predominance in export markets. It discusses in detail the modernisation of equipment in the basic industries, and shows how, through electrification, a new period of economic prosperity should take place in this country. The monograph also contains proposals advanced on behalf of the electrical industry for the expansion of production at home and the strengthening of the competitive position abroad, and, in view of the keen interest that is at present being taken in the unemployment question, these proposals have considerable significance. The picture given is that of an industry advancing steadily in strength and in pro-

Digitized by Google

ductive capacity during the post-war decade at a time when other industries in the country have been seriously depressed.

Some Interesting Facts.

SOME interesting sidelights are thrown on electrical development in the United States by a review issued by the North American Power Co., in commemoration of its fortieth year of existence. We in this country have become so used to hearing of the extraordinary strides which have been made in electrical development in America that it is with something akin to surprise that we read that "the pace at which the use of electricity has spread in the United States has been rivalled by the growth in population, and the field for expansion remains extensive." Although the total consumption of electrical energy in America last year amounted to 88 000 000 000 kWh, an increase of 10% over the previous year, it is estimated that less than 3% of the railway mileage is electrified; less than 75% of the industrial power load is electrically generated; less than 60% of the population have their homes wired; and over 90% of the farms are without a supply altogether. We commend these figures to the after-dinner speakers whose persistent delight is to tell us how we are "lagging behind" the other industrial nations.

A Whitehall Example.

MR. GEORGE LANSBURY has declared his aim to see that all Government offices set an example to the nation in smoke abatement, and has promised that before long every office in Whitehall will be burning nothing but smokeless fuel. While we would prefer to see them using a fuel that is not only smokeless but incombustible, we do not expect miracles from the First Commissioner of Works. But this desire of Whitehall to set an example to the nation may even yet be turned to electrical advantage if Mr. LANSBURY will but inspect the lighting arrangements in Government offices. There he will find the crude old-fashioned white opal shades, low wattage carbon filament lamps, and improvised extensions with long lengths of flex festooned across the rooms in a most haphazard manner. As much of this handiwork can be viewed by bus-top passengers the introduction of proper lighting equipment would soon enable the Government to set yet another example to the nation, and at the same time increase the working efficiency in Government offices.

Electrical Trade with Canada.

IN view of the overseas trade figures referred to in the next column, it is interesting to note, according to the Royal Bank of Canada, that Canada's electrical imports from the United States are over twelve times those from Great Britain. The actual declared value of Canada's electrical imports in the twelve months ended June 30th last, from the United Kingdom and the United States, were £2 021 441 and £26 803 601 respectively. These imports included a large number of domestic appliances, radio receivers and valves, all of which we could very well have supplied from this country at competitive prices in spite of transport charges. That the position is serious goes without saying, for the tendency in time will be for Canadian users of electrical apparatus to look upon the British product as, if not altogether foreign, then certainly something which is rarely used in that country. As we pointed out in these columns two weeks ago, the story from South Africa is the same, and yet we still fail to recognise the necessity for fostering the Dominion markets, or at least nothing appears to be done to remedy the position. The Board of Trade returns, published elsewhere in this issue, tell their own story, but no matter how good the telling, it would have been all the better were the Dominions more concerned with its conclusion.

Overseas Trade in October.

A GENERAL improvement in foreign trade was made during October when compared with the previous month, exports amounting to £64 589 448, or £9 485 191 more than September, and imports £11 910 100 greater at £110 278 884. The figures for the ten months, usually a better indication of trade conditions than those of a single month, show in the case of imports an increase of £18 492 652 when compared with the same period of 1928, and in the case of exports the same comparison gives an increase of £8 733 930. Total exports amounting to £608 000 554 were, however, no less than £28 338 727 in advance of the figures for the same ten months of 1927. In the month's trading there was little progress made in shipments of manufactured goods while the increased import figures were assisted by non-ferrous metals, machinery and electrical goods.

Electrical Figures.

THE position of the electrical industry in so far as it is affected by the overseas trade figures is indicated in our abstract of the Board of Trade returns on another page. For the month of October an improvement of £380 457 was made on the export returns for the same month last year, various wires, and cables other than submarine, alone accounting for an increase of £205 836. Ten months export trading showed an advance of £747 190 when compared with the same period last year. The total amount being £15 995 778. On the import side we accepted goods and materials greater in value by £356 625 than during October, 1928, while for the ten months of this year imports of electrical apparatus, when compared with the same ten months of last year, increased by £1 433 605. The month's trading, however, still shows an excess of exports over imports, a preponderance of £370 548 being shown on the September figures. For the ten months the position is even more satisfactory, with a favourable electrical trade balance approaching £9 500 000.

Employment or Amenities?

MR. FRANK HODGES did well in his speech at the November luncheon of the Batti-Wallahs' Society to point the implications of the activities of the various "preservation" societies should their reactionary efforts find success. Few of these anti-pylonists, fearing the desecration of some beauty spot, can previously have realised that they were aggravating the unemployment problem. Mr. HODGES has clearly shown how greatly employment of the annual influx of young persons into the labour market depends upon unrestricted activity and progress in the electrical world. A concrete example was furnished this week in regard to a proposal to establish china clay works on Broad Down, Dartmoor. The objectors claimed that the works would spoil the scenery. The promoters said the scheme would provide much needed employment for about 500 men. Which is nationally more important; amenity or employment?

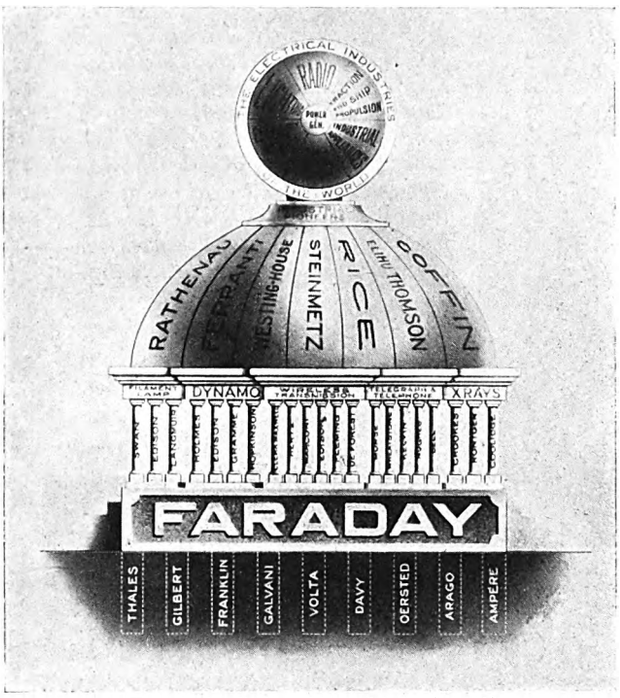
RATIONALISATION OF INDUSTRY.*

The Electrical Industry and its Potentialities—Need for Development of Domestic Consumption—Probable Quadrupling of British Electrical Turnover in Next Ten Years.

By A. P. YOUNG, O.B.E., M.I.E.E., M.I.A.E.

(*Concluded from page* 493.)

THE electrical industry is a relatively new growth studied in relation to some of the older basic industries, such as the textile, shipbuilding, coal, and steel industries, and it has been evolved almost entirely during the last 50 years. The



Mr. Young's visualisation of the great electrical edifice.

industry has grown out of a basic discovery made by Faraday nearly 100 years ago, when in the Royal Institution in London he discovered a method of producing an electric current from magnetism, which is known as the principle of electro-magnetic induction. In two years' time we shall be celebrating the centenary of this epoch-making discovery, and it is right that we should do so, because the whole of humanity is now appreciating—and will do so still more in the future—what it owes to the labours of this simple Englishman, who will go down to history as one of the greatest scientific investigators of all ages.

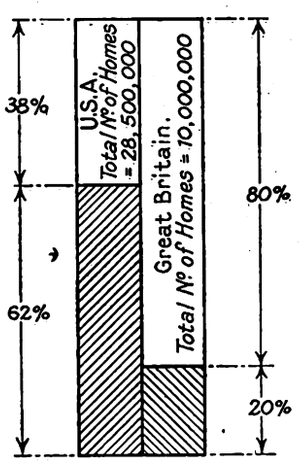


Fig. 1.—Chart showing relative progress in domestic application of electricity in Great Britain and U.S.A.

It is a striking fact that some fifty years elapsed after Faraday's discovery was given to the world, before the electrical industry which it established began to assimilate life. This fact in itself serves to show the rapid way in which industry has developed during the last century, because one of the outstanding features of industrial development at the present day is the short time lag between the making of a fundamental discovery and its application, by the engineer and industrialist, in the form of some serviceable entity, to meet human needs. This means that the activities of the electrical industry especially, will in a few years' time be concerned with the design, manufacture and installation of appliances which have not yet been evolved, so rapid has the translation of new ideas into serviceable commodities now become.

Although Faraday was one of the greatest of pioneers, and did work of fundamental importance which was of benefit, not only to the electrical industry, but to other industries—notably the steel, chemical and dyeing industries—he was but one of an army of pioneers, which by its efforts and sacrifice in the cause of science and industry, built up generation by generation the huge electrical edifice that we see around us at the present day.

We should take inspiration from the knowledge that the spirit, as I see it, behind the present rationalisation movement in industry, has always permeated the realms of pure scientific inquiry. For generations science has known no boundaries, and there has been complete freedom of scientific thought and discovery throughout the world. The material benefits which now surround us on every hand can be traced back in their origin to a relatively few scientific discoveries of fundamental importance which have been given to the world by pioneer workers in every land.

Complicating Factors.

The U.S.A. and Germany lead the world at the present time in the application of electrical energy to meet industrial and domestic needs, and one has to admit that this country is very backward in relation to such developments. The U.S.A. had a great advantage over ourselves in this respect because they began to move forward rapidly as an industrial nation just at the moment when the electrical industry started to grow and expand, and in one fell swoop they were able to pass—in the sphere of lighting, to take an example—from the old oil lamp to the electric lamp. On the other hand, we in this country had reached a high stage of industrial development by the time the electrical industry began to grow, and the complications arising therefrom, coupled with the inherent slow-moving traditions of the country, prevented such rapid progress being made with the new art.

One is happy to record, however, that this backward state of electrical development looks like being corrected during

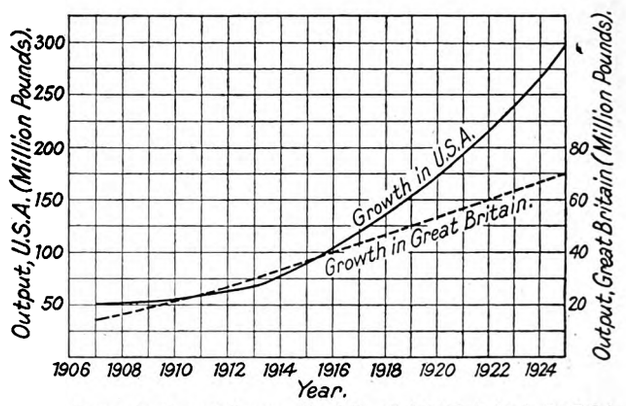

Fig. 2.—Curves showing relative growth of the electrical industry in the U.S.A. and Great Britain during the last twenty years.

the next decade, and the grid system of distribution that is being developed by the Central Electricity Board should, in the course of a few years, make electrical energy available to every home in every village, town and city throughout the land. The big expansion of the electrical industry which seems inevitable during the next ten or fifteen years will, it seems to me, come mainly from the enormous application thus effected, of electrical devices in the home, and some idea of the nature of this expansion which lies ahead of the British electrical industry, can be gauged from the diagram given in Fig. 1, which shows the relative progress already made in this country and the U.S.A. in applying electricity to the home.

At the present time nearly two-thirds of the homes in the U.S.A. are wired for electrical supply, whilst in this country only about one-fifth of the homes are in this happy condition. It is therefore true to say that the application of electricity

* From a paper read before the Rugby Engineering Society.

Digitized by Google

in the home objective to easing the burden of the housewife and thus elevating the whole standard of home life, has hardly begun in this country, and the following figures relating to conditions already achieved in U.S.A. clearly show the wonderful work which has still to be done by the British electrical engineer.

ELECTRICITY IN THE HOMES IN U.S.A.

No. of homes	28 500 000
No. of homes wired	17 596 000
No. of homes with Flat Irons	15 300 000
,, ,, ,, ,, Radio Sets	10 000 000*
,, ,, ,, ,, Vacuum Cleaners	6 828 000
,, ,, ,, ,, Clothes Washers	5 000 000
,, ,, ,, ,, Electric Refrigerators	755 000
,, ,, ,, ,, Electric Ranges	590 000
,, ,, ,, ,, Ironers	355 000

* 25% of these are operated from the mains.

The curves given in Fig. 2 show the growth of the electrical industry in U.S.A. and Great Britain during the last twenty years, and are of very special interest in relation to the potentialities of further expansion which now confront the industry in this country.

Probable Further Growth.

Taking into account all the considerations that I have mentioned, I feel it is reasonable to assume that the rate of growth of the electrical industry in Great Britain during the ten years from 1930 to 1940 will follow closely *the law of the growth curve actually realised in U.S.A. between the years* 1915 *and* 1925. On this basis it becomes possible to predict, with some degree of accuracy, the onward march of the growth curve for Great Britain shown in Fig. 2, and this result is depicted in Fig. 3. The estimated growth there given indicates an expansion of the whole electrical industry in Great Britain of just over 3 to 1 in the period 1930 to 1940, and if this result is realised, the turnover of the electrical industry by the year 1940 will have reached the tremendous figure of £290 000 000 per annum as compared with a present turnover between £70 000 000 and £80 000 000 per annum.

This country lives by its export trade, and the portion of the export trade of the world which Great Britain is able to secure will naturally have a big influence on the growth of the whole electrical industry during the next decade. The curves

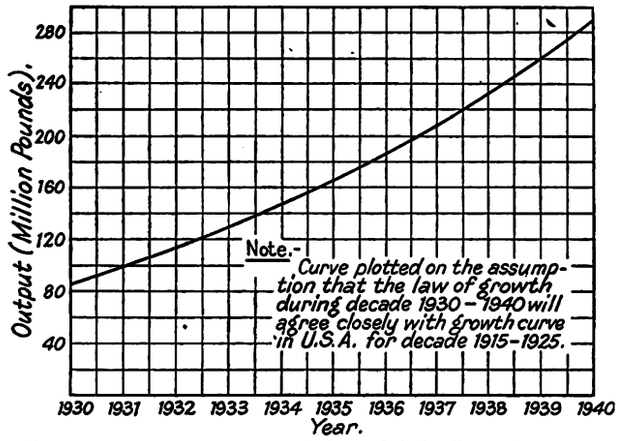

Fig. 3.—A prediction of British electrical growth during the next ten years.

given in Fig. 4 are, therefore, of interest, as they show the exports to the British Dominions in relation to the export trade of the world over the past six or seven years, and also indicate that Great Britain, over this period, was successful in securing a little more than one half of the total business which the Dominions had to place for electrical requirements.

Enormous Potentialities.

Despite the rapid growth that has taken place in the electrical industry during the past fifty years, mankind is still just about to enter the electrical age, and the development in the future of all the processes and appliances concerned with the generation, transmission and control of energy by electrical means is going to have a profound effect on the onward march of civilisation. We have just begun, so to speak, to travel the path of electrical progression, and the view is supported by considering the total output of electrical energy in the world at the time, in relation to the total consumption of energy derived from all sources. Information bearing on this question is given in a book published this year by the World Power Conference, entitled " Power Resources of the World," and the following figures are taken from this publication :—

World output of power derived from coal, oil, and water = 1 700 000 × 106 electrical units.

World output of electrical energy in 1927 = 190 000 × 106 electrical units.

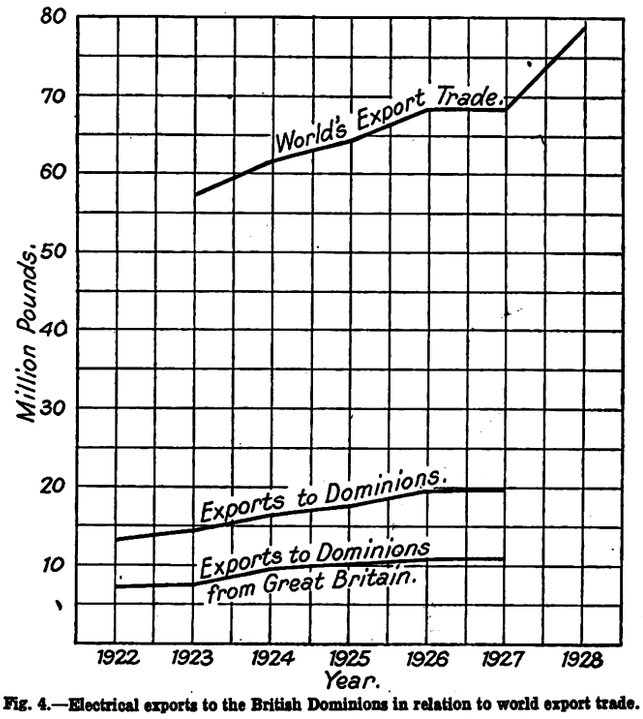

Fig. 4.—Electrical exports to the British Dominions in relation to world export trade.

These figures mean that the electrical power production during 1927 represented just over 11% of the total power production of the world. In the year 1924 the figure was approximately 9%. It is clear, therefore, that we have in the year 1929 only travelled a very little part of the journey, which must ultimately lead to the almost universal use of energy in an electrical form.

Electricity in the Iron and Steel Industry.

A special article in " World Power " for June gives some interesting information which I summarise below :—

MOTIVE POWER THROUGHOUT THE WORLD.

Country	Year	Total H.P. = H	Total Output finished Steel Tons	H.P. per ton finished Steel	H.P. derived from Electric Motors = H_1	Ratio $\frac{H_1}{H}$
Gt. Britain	1924	2 253 036	6 708 500	0·338	924 215	41%
France ..	1925	1 592 600	5 300 942	0·318	—	—
Germany ..	1926	3 817 969	11 495 600	0·332	2 848 600	75%
U.S.A. ..	1927	8 299 571	32 879 000	0·252	6 200 000	75%

To bring the British steel industry up to the standard of electrical development reached both in Germany and U.S.A. would mean increasing the H.P. derived from electric motors to the figure (75% of 2 253 036) = 1 690 000 H.P. This would represent an actual increase in H.P. of electric motors of just under 800 000, which, at the average price of 28s. per H.P. would give £1 120 000 additional business to the British electrical industry.

One of the greatest difficulties that confronts the electrical industry arises from the fact that the industry embraces such a large number of separate and distinct businesses involving the manipulation of a multiplicity of designs and innumerable materials, both metallic and non-metallic. In a modern electrical works one can see at one end of the scale, the manufacture of electrical filament lamps being carried out on intensive mass production lines by means of automatic machines that are almost uncanny in their operation, whilst at the other end of the scale, and possibly in the same works, one can see the manufacture of huge turbo-generators being undertaken, where the process of moving large masses of material, and the application of labour to it, is naturally carried out at a much slower rate—the very antithesis of mass-production.

Digitized by Google

Whilst it must be recognised that one of the greatest needs facing the industries of this country is that of moving continually in the direction of simplification and standardisation, this need in the case of the electrical industry is of paramount importance because of the very complexity of the problem that confronts the electrical engineer at the present day.

In this respect the British electrical industry is in a worse position than either the American or the German industry, because we are suffering very largely from the mistakes made in the early days of the development of the industry in this country.

One has only to cite the enormous range of voltages and frequencies that have to be dealt with by any electrical manufacturer, and the fact that even at the present day nearly one half of the homes in Great Britain that are wired for an electrical supply are fed with direct current, further complicates the situation. When the grid scheme, now in process of evolution, has been completely developed, the unification of current, voltage, and frequency will become general, but it will take many years to bring about this condition, which, when it does arise, will benefit the whole electrical industry, because of the simplification that will thus be effected.

Progress in Standardisation.

In the realms of standardisation, the British Engineering Standards Association has done excellent work, and it behoves every one, no matter what their sphere of action may be, to give this Association every possible encouragement, because, as I have already stressed many times, standardisation and simplification must be our watchwords if we are to achieve, in the future, that progress that is well within our grasp.

I attach tremendous importance to any form of propaganda that will encourage this line of thought, and especially in our schools, colleges, and technical institutes should there be recognition of the need of inculcating an outlook on world problems that is inspired with a desire to achieve things in the simplest possible way, so as to prevent unnecessary duplication and complication of serviceable commodities. Service through simplicity might well be a guiding maxim for every industry that desires progress.

Above all should the engineer clarify his outlook on any particular problem, realising that in the future the skill of the engineer will be judged largely by his ability to utilise materials, human labour, and scientific knowledge in such a way that they can be blended in the simplest possible form to give a definite service to humanity. Expressing it in another way, the ratio of service will, ultimately, I think, be taken as a measure of engineering skill and ability, because, other things being equal, any increase in this ratio will lower the manufacturing cost and thereby the selling price, thus permitting the sphere of usefulness of the particular commodity to be greatly extended.

In conclusion, I just wish to make a brief reference to the vitally important question of research in the electrical industry. It is true to say that the industrial army marching in the cause of service advances on its research organisation, because the degree to which research is encouraged and fostered in any particular industry controls, in great measure, the rate of progression that can and will be made by that industry.

With the spirit of peace now abroad throughout the land, and the possibility of limiting armaments and navies, one cannot but reflect on the quite astonishing impetus that would be given to world progress if a statesman had the courage to deflect just the cost of a single battle-cruiser (I believe in the neighbourhood of £6 000 000 or £8 000 000) into research channels. The stimulus given to industry and the improvement in efficiency effected by such a change would in a very few years return this expenditure many times over.

So far as I can determine, the amount of money spent on electrical research in U.S.A. is something of the order of three quarters of 1 per cent. of the total turnover of the electrical industry in America. In this country, whilst it is difficult to get accurate figures, it appears that our rate of expenditure in relation to the turnover is about one-third of what it is in America. The healthy growth of the electrical industry is so important to the Empire as a whole, that it does appear that the Government, whatever its particular colour might be, would be wise to give this problem of research more consideration, and any action which it might take to lubricate the wheels of research organisations throughout the land would react not only to its own advantage, but, more important still, to the great advantage of industry, the people, and the nation.

THE PYRENEES TOUR.

Use of Electro-Chemical Works for Load-levelling Purposes.

THE informal meeting held at the Institution of Electrical Engineers on November 4th considered some of the technical features of the I.E.E. 1929 visit to Paris and the Pyrenees. The discussion was opened by Mr. R. Borlase Matthews, and Mr. J. R. Bedford was in the chair.

In his remarks on the Pyrenees section of the tour, Mr. Borlase Matthews said that possibly the most instructive part of the trip was the reason for the existence of the electro-chemical and electrolytic works that were visited. However interesting these works were in themselves, the all-important point was that they were employed as load levellers. Their very existence made the hydro-electric system a commercial success, for a load-factor of nearly 95% was obtained.

Upon inquiry into the means whereby this desirable end is attained, it was discovered that it was largely a matter of tactful organisation. Apart from the fluctuating demands of the average generating stations during winter and summer and during night and day, throughout the Pyrenees, water shortages had also to be faced twice yearly, in February and in August. To combat inconvenience on this score, the common-sense arrangement was made with various manufacturing firms whereby their consumption was regulated according to the season of the year and the time of the day. These manufacturing concerns, usually of a chemical nature, when operated in this way, were of the highest value to the power supply undertakings. In the whole of France in 1926 (from statistics recently published) it was noticeable that out of 4 562 262 000 hydro-electrically generated units sold, 611 518 000 units were utilised in chemical and electro-metallurgical works; hence this class of consumption was nowadays a very important fraction of the whole output (about 13·4%).

All the forces of the generating companies (including the Midi Railway Company) were interconnected electrically, and were controlled through a central organisation known as l'Union des Producteurs d'Electricité des Pyrenees Occidentales. A "load-dispatcher," located at Tarbes, was in telephonic communication with all the stations and works. The arrangement made with the works was that they must at all times absorb any surplus current—or do without it at times of demand elsewhere. This arbitrary ruling was borne with a good grace, and the heavy load factor previously referred to was the result. Apparently, the social effects of such a system were not serious, or it could not prevail.

The Secret of Success.

Turning to the factories which played such an important part in providing a high load factor, it was remarked that the products of those works were chiefly for artificial farm manures—i.e., for a material for which there was a seasonal demand; hence stocks had to be built up in anticipation. This meant that a constant weekly output was not of prime importance. Previous experience elsewhere had been that electro-chemical and electrolytic works were industries which must work at full output all the time. The furnaces and processes were such that once started they could not be economically varied or closed down without serious financial loss. The secret of the success of several plants in the Pyrenees lay in the fact that they had been specially designed for putting into or taking out of service at short notice, and for using loads that could be varied very considerably to conform with demand elsewhere. For example, in the case of the calcium-carbide furnaces used at Lannemezan, it was of interest to note that one of these could be put into full operation from cold in three to four days, whereas the older type furnaces took a fortnight to get properly under weigh.

Mr. Ll. B. Atkinson said he felt that the 500 miles of Midi Railway electrified without using coal was a very significant thing, and he had taken opinions of Frenchmen upon the advantages of it. He believed that the gain to the railway was small, but nationally France had very greatly benefited by obviating the purchase of foreign coal. This more than set off the cost of new plant and of impounding the waterfalls.

Major T. Rich, commenting on the 95% load factor obtained in the Pyrenees, said this was calculated on the water power available, so the term was rather misleading.

Miss Atkinson, Mrs. H. E. J. Hall, Messrs. J. R. Bedford, A. C. Brown, A. J. Cridge, R. S. Downe, A. F. Harmer, W. G. C. Jackson, W. Rawlings and E. S. Ritter also spoke.

THE SCANDINAVIAN MARKET.

Impressions of a Recent Tour—Some Little-realised Possibilities for British Trade Expansion—German and Swedish Competition—Financial Conditions—A Recommended Trip for Commercial Travellers.

By SIR ERNEST BENN, Bt.

AFTER six strenuous weeks spent in an endeavour to see something of Scandinavia and the Baltic States, I come back to London convinced that here is a market whose possibilities are all too little realised by the British business classes as a whole.

I did not go to Scandinavia as a tourist, neither did I go as a commercial traveller; I took a middle course, and a course which in the result seems to me to have given me an exceptionally good opportunity to form impressions about these wonderful countries.

I accepted the invitation of the Economic Club of Copenhagen, of the Anglo-Norse Society, the British-Swedish Society, the British-Finnish Society, and the Anglo-Latvian Club to lecture. I was also entertained by Chambers of Commerce at Abo, Helsingfors, Riga and Copenhagen. I attended functions of several other trade associations, and in this way established a contact with commercial people, which enabled me to secure a very valuable insight into their methods and their affairs.

To begin with, all these people, from Copenhagen to Imatra, look English. You feel at home among them. You do not get that peculiar sense of the foreigner which is usually associated with travel abroad. These Northern peoples are of the same stock as ourselves; their build, their walk, their appearance look much like ours, and all that sort of thing helps, even in business.

Almost all these people speak two languages; some of them, like the Finns, speak three or four, for it is the exception to find a Finnish shopkeeper who has not got a smattering of Russian, does not speak Swedish and Finnish fluently, and who will not at the same time converse with you in English and German.

Looking at the matter as a publisher, I find in this part of the world a definite competition between German and English for supremacy as the common language, for all these people have to develop a common language. The new nationalism, that extraordinary phenomenon which has spread over Europe since the war, has thrust upon each of them the keen desire, such as we see in Ireland, to develop their own peculiar native language. Thus we get one million Estonians, three and a half million Finns, two million Latvians, six million Swedes, three million Norwegians, and three and a half million Danes, all clinging to abstruse methods of expression which they love, but which they frankly recognise as unsuitable for communication with the outside world. So that all these little peoples have thrust upon them; as it were, the necessity for speaking the language of one of the bigger races of mankind. The supremacy of English will depend upon the number of Englishmen who visit these parts, and the push of the Englishman in developing commercial relations.

There is another general consideration. All these peoples are very similar to the English in their habits. It is true they are still a long way behind the English home. They live, like most of the Continentals, in flats. But the Scandinavian flat is a good deal nearer to the English home than the German flat or the French apartment. They suffer from a climate which is similar to ours; they have our long evenings in the winter time, and they share to the full—and here I had many opportunities for observation—the Englishman's love of household gods and home comforts.

Cheap Transport of Goods.

On the practical side, trade between Great Britain and Scandinavia would seem to be easy. There are the usual difficulties of customs and passports which apply now to every part of the world; but transport is cheap. While the commercial traveller may not relish the idea of thirty-six or forty-eight hours on the North Sea, a case of goods is presumably above such considerations as sea-sickness. There are a dozen regular lines, and scores of other easy shipping communications, English, Danish, Swedish, Norwegian and Finnish ship owners, all competing for the trade. A parcel of goods can be sent from London or Hull or Newcastle to Stockholm or Helsingfors or Vyborg much more cheaply, and almost as expeditiously, as from Falkirk to Bristol.

To me, a woefully ignorant Londoner, the surprise of my tour was the entry into a succession of big, fine, highly-developed cities. It is perhaps a lamentable confession for me to make, but I did not expect to find an underground-railway at Oslo, nor was I anticipating, when I landed with some trepidation at Abo, on the rugged shores of Finland, to receive an invitation for dinner and to be told to adorn myself in a white tie and tails. The refinement and the finish of Stockholm, which equals any city that I know for the culture and the comfort of its life, was not so much of an eye-opener to me, but it must be confessed that the presence of fine motoring roads, over which I was carried in a £3 000 Hispano-Suiza car, after a ten-hour railway journey into what I had expected to be the barbaric hinterland of Finland, came to me as something of a shock.

The dozen cities which I visited each possesses miles and miles of fine shops, prominent among them florists' shops, which somehow seem to me to be rather the key to the whole situation. I have bought flowers in Bond Street, and paid through the nose for them; but Bond Street has nothing to teach the leading shopping centre in Vyborg.

Big Domestic Appliance Demand.

Everywhere I went the building trade is active. In Helsingfors alone there has been an over-building which has caused a reaction. Scandinavia, having escaped the war, never ceased building, and all these countries have been saved to a very large extent from the devastating activities of municipalities in this direction. The result is that nowhere is there any shortage of housing accommodation. The housing of the people is going rapidly up the scale; and, as might be expected, taking with it an ever-increasing demand for all the many things that go to make the better-class home.

On closer inspection I find the old story, the same degrading experience which awaits the Englishman who travels and inquires. Shops full of German goods, factories full of German machinery. I inspected several factories, printing, bookbinding, saw milling, paper making, pulp works, pottery works, electrical power stations, to name only a few. Swedish engineering, as might be expected, gets a very good show in most of the factories, but Germany holds the field.

Mr. A. H. Saastamoinen, the Finnish Minister in London, writing to "The Times" on October 31st, says that for every English traveller visiting his country, Germany sends twenty-five representatives. My observations and the figures both support this disconcerting view. Looked at in a broad way, the facts are very simple. The countries which I have named sell raw materials to us and buy their finished products from Germany. We depend upon them to a very large extent for our butter, our bacon, our eggs, and our timber. They depend upon us for next to nothing. The remedy to me is a very simple one. It is for British commercial travellers to take a trip to Scandinavia.

I crossed the Gulf of Finland in a gale, and was assisted across the rather slippery deck of the diminutive steamer which makes the daily journey, by a young Czech, who spoke the most perfect English. We struck up an acquaintance. He is the traveller for the Baltic States of a firm of jewellery manufacturers in Prague. He covers all the territory from Lapland to the Polish border, and he does the trip every three months. I gathered from him that the Finns pay their accounts on the nail, the Estonians are not quite as good, the Latvians want a little more attention from the counting house, while in Lithuania and Poland it is wise to ask for cash against delivery.

This little ship had about twenty-five passengers on board, and I questioned the captain about them. He assured me they were all commercial people, and that his passenger traffic was nearly all German.

I therefore commend a trip in this part of the world to our commercial travellers. Many of them no doubt have done the Norwegian fjords in a pleasure steamer, but the Scandinavian towns visited on business bent, will, I feel sure, disclose equal wonders of another kind.

ECONOMIES OF ELECTRIC COOKING.

Strong Selling Points for Supply Authorities and Contractors—Big Savings Possible with Capable Operation—The Need for Educating the Public.

By H. EDWARDS.

COOKING by electricity must present one of the most desirable forms of domestic load for which the power station engineer could wish. The consumption is relatively heavy when compared with other domestic loads, such as lights, irons, toasters, vacuum cleaners, and so on (but not, of course, fires); the load is fairly steady, day by day, and in the majority of cases the peak of the demand occurs during the day, and not when the lighting load is on the power station.

From the engineer's point of view, therefore, a large increase in the use of these cookers is very desirable, and as they are most excellent devices from the users' point of view also, it is, at first sight, rather difficult to understand why their use is not much more common. The real reason for the slowness of the general public to transfer their allegiance from the ubiquitous gas range to the electric cooker seems to be very largely the question of cost. Reluctance to make a change, fear of "shocks," doubts as to efficiency, supposed difficulty of operation, and other reasons may be put forward, but there appears to be a deeply-rooted idea that cooking by electricity is only within the reach of those with long purses.

It seems to the writer (who, though an electrical engineer, has nothing to do with the design, manufacture or sale of electric cookers, or the supply of power) that his personal experience as to the cost of running one may be of assistance to those to whose interest it is to push the sales.

The Cost Question.

The convenience and cleanliness of an electric cooker can readily be demonstrated by the salesman at the showroom, but he probably has much more difficulty in persuading the inquirer (or perhaps convincing is a better word) that she (or he) need not *necessarily* have larger bills for power if the cooker is purchased. Stress is laid on "*necessarily*," since the cost of running a cooker is very obviously dependent not only on the amount of power consumed, but on the way it is handled, and the cost per unit. The latter, of course, varies a good deal in different localities, but one penny per unit, for cooking and heating, is a figure which is fairly common now, and will probably be more so in the future. This is the charge which is being considered in this instance, and it is being compared with a charge for gas of 8¾d. per therm.

The period taken into account covers two years for the gas cooker and eighteen months for the electric cooker, so that a fair average has been arrived at in each case. It should be added that, for purposes of comparison, actual consumption figures only have been taken—i.e., no question of charges for hire or purchase of either type of cooker is included. In the case of the electric cooker, however, an electric kettle is included, as this is very largely used, and is operated off the same meter and main switch.

The figures obtained show that whereas the average weekly cost of gas cooking was 20·6d., that of electric cooking is 17·5d., an average saving of threepence per week, or 3s. 3d. per quarter. In the case under consideration the cooker is being paid for on the hire-purchase system, the quarterly payments being 26s. 8d. (including the kettle referred to above), so that we have at once the cost of purchase reduced by an appreciable figure. It may, of course, be said that such a result cannot be guaranteed and cannot be taken as applying to any case. The actual figures given are certainly those obtained in one individual instance, but there appears to be no reason why results quite as good should not be obtained by anyone—provided reasonable care and intelligence is exercised in the use of the cooker.

The point is that an electric cooker is *not* inherently extravagant in operation, and, if economy is important, then it can quite as easily be practised with this type as with a gas-cooker, if not more easily. A careful cook will be careful and an extravagant one will be extravagant, whatever the article with which she is working, but there is no reason why the electric cooker should be thought incapable of cheap operation.

But reduced consumption costs do not exhaust the economies possible with these cookers. A far more important saving is effected by the greatly reduced wastage of food. All persons who have anything to do with electric cookers are aware that the loss on electrically-roasted meats is very much less than with gas-cooked joints, but much more could be made of this point, which is really a most striking fact.

It is generally accepted that with a gas-cooker the loss on a roasted joint is from 20 to 30% of the raw weight; now with the electric oven this loss is in the order of 10%. This is the figure usually taken, but in the writer's experience it is rather on the high side. Tests on 10 joints (lamb, veal, pork and beef) showed an average wastage of 6·9% only. Taking, however, figures of 10 and 25% as average losses, the balance in favour of electric cookers is seen to be very striking indeed.

To put the matter in a more concrete form: take a 4-lb. joint at 1s. 6d. a pound, total cost 6s., or 72 pence.

	s.	d.
Loss when gas-cooked, 25%, equals ..	1	6
Loss when electrically-cooked, 10% ..	0	7½ (say)
Saving by cooking electrically	0	10½

Since some people prefer joints roasted longer than others, and since some meats (as pork) waste more than very lean joints, it will be obvious that this figure must not be taken as applying to *any* four-pound joint, cooked by *any* cook; it is, however, an average figure, and is, one would think, sufficiently convincing.

Most families have at least one joint per week, so it is safe to say that in the majority of cases from sixpence to one shilling is saved each week on roasted meats alone. In the writer's case it was found that a joint of a given size provided one extra meal (for two persons) when cooked in the electric oven, or, conversely, a smaller joint was large enough to give the same number of meals as of the gas-cooked joint.

Here, then, we have a reduction in the net cost of making the change to electric cooking from gas, of from 6s. 6d. to 13s. a quarter on food, plus the reduction in running costs; so that, in the present case, the quarterly cost of hire-purchase has been reduced by at least one-half, due to savings effected.

These results have not been obtained by experts in the use of electric cookers, or by any special means, but simply by a careful and capable cook, using the range with reasonable intelligence and exercising economy for which, as already stated, many opportunities are provided by these cookers. There is no reason at all why similar results should not be within the reach of great numbers of other users. (It might further be added that a servant has on many occasions been left to use the cooker in question, for all purposes, from boiling water to roasting a joint, and has been able to operate it quite successfully; this shows that these ranges are not difficult to operate, a contention which is sometimes put forward.)

While the price of a fair-sized cooker is admittedly rather high, many local authorities and supply companies have systems of hire-purchase, or hire, which frequently include terms which are really very favourable. For instance, one large company which operates in the Midlands charges, for a cooker of the size referred to in this article, 9s. 6d. a quarter for hire, and 30s. 8d. a quarter for three years for hire-purchase. From the figures given above it will be seen that the whole of the hire charge can be saved, and, say, one-third or more of the hire-purchase cost, so that the user really has a good bargain.

Points to Stress.

As regards other points which can truthfully be stressed in support of electric cooking, mention may just be made of cleanliness, absence of smell, no danger from leakage of gas due to taps being left on, cool kitchen (since so little heat escapes) and saving of decorations due to absence of fumes.

These points are, of course, obvious to anyone who thinks, but it is not so apparent why they are not brought more to the notice of the public.

In conclusion, the writer would suggest that much benefit might accrue to makers and retailers, as well as to supply companies, if an energetic advertising campaign were carried out, covering not only the technical papers, which are, of course outside the range of reading matter of the general public, but particularly the many magazines for the home (and especially for women), as this would act as a counterblast to the many advertisements of coal, gas and oil-cookers which appear in these periodicals, and would go a long way towards educating the people with regard to the benefits of electric cooking.

BOOK-KEEPING FOR CONTRACTORS—I.

Many Insolvencies due to Failure to Keep Proper Books—Vital Questions which the Books should Answer—The Only Reliable Business Chart.

By S. HOWARD WITHBY, F.C.I.

A FEW years ago the electrical contractor combining his engineering work with shopkeeping considered the keeping of a proper set of account books more or less a waste of time. If he desired to ascertain his financial position he would simply refer to his bank pass book, and after making what he considered an adequate allowance for his capital outlay in the form of business premises, motors, plant, machines, apparatus, instruments, and tools, etc., he would be able to determine to his satisfaction not only his position in relation to the business and to the outside world, but also the amount of profit made.

However reliable such methods may have been at one time, they are no longer available. Side by side with enormous developments in the world of engineering and equally great demands for electrical energy, a great expansion of the world's banking and commercial credit systems has taken place during recent years, necessitating the adoption of suitable book-keeping methods on the part of the electrical contractor anxious to keep a proper grip on his business. At the present time competition in both standard products and those of special design is so keen that cuts in prices and estimates, although essential to the maintenance of turnover, often result in grossly inadequate margins of profit, and unless the electrician is able to base contract prices on a reliable foundation, there is always the danger of undertaking unprofitable work.

That many contractors still think fit to neglect the book-keeping and accountancy side of the business can be proved by an examination of the bankruptcy files for the past ten years. Instead of being due to any inherent weakness of the individual concerns, a large proportion of insolvencies, deeds of assignment, and liquidations since the cessation of hostilities, is the direct consequence of failure to keep proper books.

It is quite possible for the contractor to possess a substantial bank balance and at the same time be hopelessly insolvent. Money may have been borrowed from friends to such an extent that the total present value of all the assets employed for profit-earning purposes may be much less than the total liabilities incurred in conducting the business as a whole. He may be actually sustaining a net loss each vear and withdrawing money from capital account instead of from revenue or income, but unless all the facts relating to the business have been recorded in a systematic and business-like manner, the contractor will be unable to avoid disaster.

As a matter of fact the need for a good system of book-keeping is of a three-fold nature, that is to say it is commercial, personal, and legal. It is a commercial necessity because the continued success of the business will depend to a very great extent on the accuracy of the records of pecuniary and trading transactions, and because a periodical tabulation of the figures will enable the electrical contractor to detect errors and irregularities and to avoid excesses before it is too late. It is a personal need, if only for the reason that in his capacity of financial commander the contractor must have a sufficient grip on the business to avoid the many rocks and shoals that surround him in the course of the daily routine, while the keeping of accurate accounts and the possibility of determining the exact state of his financial affairs at any time must always be a source of personal satisfaction. Moreover, no electrical contractor desires to pay more income-tax than his fair share, but in order to secure the maximum relief from taxation it will be necessary to produce accounts that will enable the taxable profit to be readily ascertained.

Key Information.

Now some of the questions frequently asked by the average busy contractor relative to his business are as follows :—

(1) What was the total of my sales of electrical goods last month (or any other period) ?

(2) How much is owing to me at present by debtors, and is too much capital being locked up in the form of book debts ?

(3) Is a sufficient internal check being exercised on all equipment, accessories, and other stores, and if not, what methods of control and supervision are called for ?

(4) What did my purchases amount to last month (or any other period) and under what headings did they fall ?

(5) Am I realising an adequate amount of profit, or have any contracts been carried out at a loss ?

(6) What are the sources of all my profits, and the cause or causes of my losses ?

(7) How much do I owe at the present time to creditors and trade suppliers, and am I taking full advantage of discounts allowed for the prompt settlement of accounts ?

(8) Of what do my management and working expenses consist, and under what headings could economies be safely effected ?

(9) In estimating the total cost of any particular job, am I able to determine the departmental, distributive, and other indirect charges with accuracy, and if not what improvements should be made in my system of costing ?

(10) Does the percentage of net profit in relation to the turnover and to the invested capital compare favourably with previous years or periods, and should any class of work be developed or suppressed ?

(11) What is the present value of all my assets, and the total of all the liabilities, and has proper provision been made for the depreciation of wasting assets ?

(12) What is the amount of my real capital, or the extent of the deficiency ?

Importance of Verification.

To be able correctly and readily to answer the above and other equally important questions, the book-keeping work will have to be divided into separate compartments, as it were, by keeping a number of subsidiary books, or books of original entry, as they are called, in addition to the ledgers. Moreover, in view of the fact that a balance sheet will have to be prepared exhibiting a true and correct view of the contractor's financial and trade position, it will be necessary to institute a system that will enable the clerical accuracy of the work to be verified, and in this connection the only satisfactory system of book-keeping is that known as double-entry.

The need for adopting double-entry methods arises from the fact that every business transaction has two sides, viz., a receiving side and a giving side. For example, when an electrical contractor sells a quantity of insulating material to a customer on credit, his stock has been reduced and his book debts have been increased, and it would obviously not be correct to record only one of these facts.

To give effect to such a transaction the goods or stock account should be credited with the value going out of that account, while the personal account of the customer should be debited with the value coming into that account, these two entries constituting the necessary double-entry.

Sales transacted on a cash basis have the effect of reducing the asset stock and increasing to a corresponding extent the asset cash, so that all cash sales should be credited to the goods or stock account, and debited to the cash or banking account, and the same principles will apply to every conceivable business transaction, each entry made on the left hand or debit side of one book or account having a corresponding entry on the right-hand or credit side of another book or account. The application of this principle will enable the accuracy of the contractor's set of books to be proved by preparing a list of all the debit and credit balances the totals of which should exactly agree with each other, and from the figures shown in this trial balance it will be comparatively easy to draw up a periodical trading and profit and loss account showing the gross profit realised and the net profit made or net loss sustained, and also a balance sheet indicating the amount by which the assets exceed the liabilities.

The electrical contractor should, therefore, look upon his account-books as constituting his only reliable business chart, and in these articles it is proposed to explain both the principles and the special features of electrical contractors' accounts by ignoring the theory of the subject and the use of technical terms, and by concentrating on those practical requirements experienced in the conduct of the financial side of the business. The next instalment will indicate the particular books which experience has proved necessary in the case of the electrical contractor, and the special purpose and value of each.

(To be continued.)

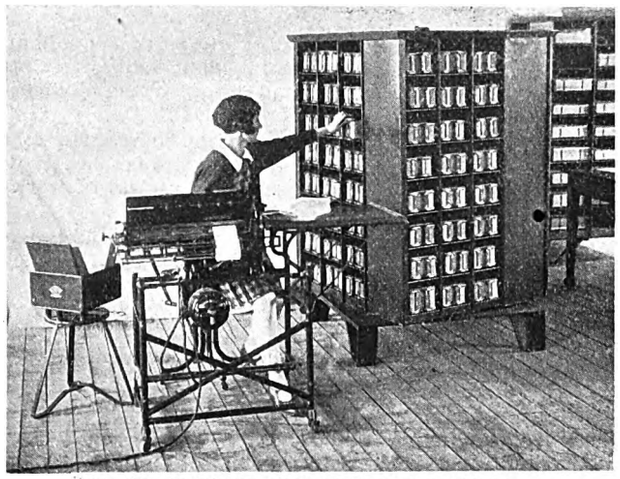
ELECTRICAL ACCOUNTING SYSTEMS.

Some Advantages of the Loose-leaf Method—Saving Time and Space with a Novel Machine Posting Equipment—Special Rulings for Electrical Purposes.

DURING the past few years the changes which have taken place in connection with works and office administration have been most marked, especially as regards the mechanisation of office routine work.

An efficient but simple ledger system is essential in these days to successful book-keeping. Bound ledgers, in addition



The "Double-Fast" machine posting equipment in use.

to their bulk, have other disadvantages, particularly as regards the allocation of space for separate accounts. Even with the utmost care and judgment, such allocation must necessarily become a matter of guesswork, whereas in the case of loose-leaf books, one sheet may be allotted to each account and others added from time to time when required. The loose-leaf ledger automatically expands, adapting itself to business growth. When a book becomes too bulky it may easily be divided into two volumes without in any way disturbing the accounts. Order and general arrangement are simplified, and may be altered at will, while several clerks can work at the same book at the same time.

Machine Accounting.

With regard to machine accounting, one great disadvantage of the system of loose cards contained in trays and trolleys is that it is just a little too convenient for a clerk to remove a particular account required for examination—and then to replace it in the tray in the wrong order.

This disadvantage has been overcome, in a very neat contrivance marketed by Kalamazoo (Sales), Ltd., of Northfield, Birmingham, and demonstrated the other day to a representative of THE ELECTRICIAN. The "Double-Fast" ledger, as it is called, is seen in the accompanying photograph fixed to a tripod on the right-hand side of the operator.

For posting, the ledger is inserted in a release box, which also acts as a rack, and when in this position the pages may be removed as required. When the operator has finished with the accounts the binder is released by pushing a lever, whereupon it is automatically locked. Individual sheets cannot be removed except when the ledger is fixed in position in the release box. The mechanism is simple and reliable, and is guaranteed for seven years. As may be seen the operator has within arm's length a revolving filing cabinet, which, in the example shown, has a capacity of 96 binders—or some 50 000 accounts. Every account is within easy reach of the operator while seated at the machine, and the floor space occupied by the equipment is only just over 1 sq. yd.

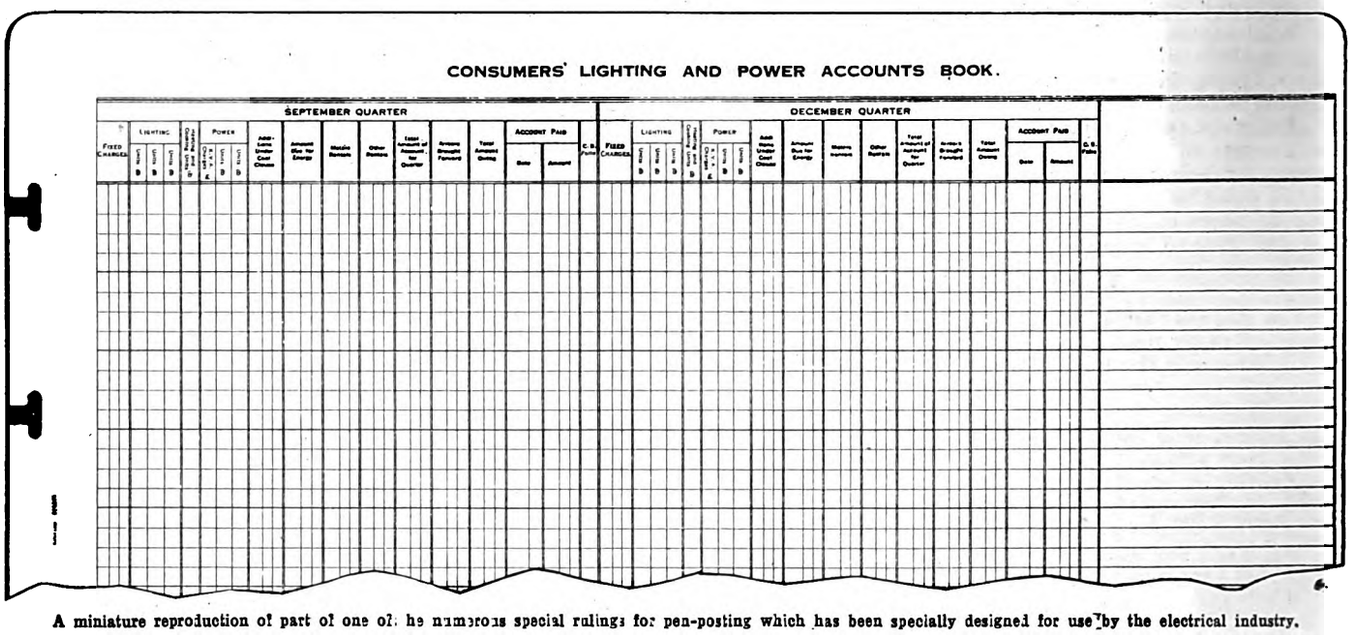
An installation of similar capacity, if card equipment were used, would require about 40 trolleys and trays occupying about 120 sq. ft. of floor space, and the interruption in the work and the time taken in changing from, say, the first tray in the rank, to the last, is bound to affect output.

Suitable Rulings.

The importance of accurate and convenient rulings cannot be over-estimated. We have in front of us a representative selection of the numerous rulings for consumers' lighting and power accounts, meter test sheets, maintenance and distribution cost records, assisted wiring agreement summaries, made at the Kalamazoo works. Accuracy of ruling is guaranteed. The firm's library consists of some 33 000 odd specimen rulings for pen and machine posting, and there is a special section devoted to the requirements of electricity undertakings, many of which employ the firm's products. These specimens are added to from time to time to suit the particular requirements of individual undertakings. There is also an advisory department for the benefit of potential customers.

A special process is employed in the rulings, which enables lines, column rules, and wording to be reproduced simultaneously, giving a bold and distinctive style, and complete accuracy. The sheets are not machine ruled, and so there is no necessity for continual adjustments, re-startings and separate machine feedings, which tend to increase the factor of error, and add greatly to the cost of production.

Several hundred originals of standard patterns applicable to many kinds of general work in electrical manufacturing, contracting, and electricity supply offices are available.



A miniature reproduction of part of one of the numerous special rulings for pen-posting which has been specially designed for use by the electrical industry.

ELECTRICAL DEVELOPMENT AND THE LABOUR MARKET.

Mr. Frank Hodges on the Effect of Obstructionist Propaganda on Unemployment—The Central Electricity Board's Reply to Yorkshire Coal Owners—Imminent Solution of the Sulphur Fume Problem.

OVER 160 members of the Batti-Wallahs' Society and their guests were present at a luncheon at the Hotel Cecil, London, on November 7th, Mr. H. L. Howard, the president, in the chair.

Mr. FRANK HODGES, who was the guest of honour, first referred to the present crisis in the coal industry, which he regarded as one of the periodical crises which come with the regularity of the monsoon. He hoped that the larger national interests would receive full consideration in the discussions of coal industry problems.

Bright Electrical Prospects.

Dealing with the electrical industry, Mr. Hodges said it was undoubtedly the most remarkable of the present industrial epoch. By its rapid growth, and its quick adaptation to changes in technique, it had expanded far beyond its original horizon in a period of time which could only be regarded as phenomenal. The future also promised further indefinite expansion. This great edifice had not been evolved without difficulty, but the youthfulness and inherent vigour of the industry had swept aside most of the obstacles.

Some idea of the industry's growth could be gained from an examination of the Electricity Commissioners' statistics, which showed that British electricity supply undertakings generated 4 250 000 000 units in 1920-21, a figure which rose to about 8 500 000 000 units in 1927-28. This rate of increase, only equalled by the motor-car industry, had been accompanied by an extraordinary growth in technical efficiency. It not only expanded, but it had expanded with a purpose, because that progress had beneath it a vast well of technical knowledge.

While output had increased by 100%, the industry's consumption of coal only rose by 57%, which showed that the problems of the boiler-house and the steam turbine had been satisfactorily tackled.

This growth in output was accompanied by a reduction in production costs, and this was the only kind of expansion possible in a healthy industry. In this respect the electrical industry complied with some of the fundamental principles of economical development.

Mr. Frank Hodges, whose speech at the Batti-Wallahs' November lunch is reported on this page.

The coal trade, Mr. Hodges continued, was under the ill-founded impression that the growing use of electricity necessarily meant a diminution in the use of coal. Actually the home consumption of coal was the same to-day as it was in 1913, and it was in the export coal trade that the decline had taken place.

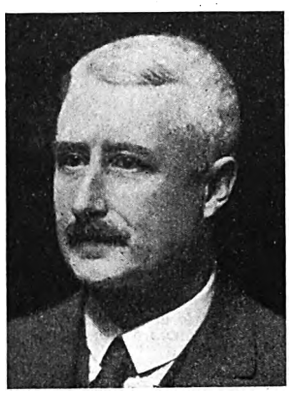
The growth of electricity had not decreased the use of coal by a single ton. On the other hand, it had stimulated the development of various kinds of process work which created a further demand for coal for steam-raising purposes.

The Yorkshire Collieries.

Referring to recent advertisements by a group of Yorkshire collieries, the tendency of which was against the operation of the national "grid" in that part of the country, Mr. Hodges said that if the grouped collieries could provide, on their low-grade fuels, electricity at a cheaper price than that at which the Central Electricity Board could give them a supply, the Board would not only approve their activity, but would take all their surplus output.

Mr. Hodges then considered the influence of electrical growth on our common social problems, the most formidable of which was unemployment. Each year some 400 000 young persons left school and became employable. These people could not find employment in industries that were in a contracting condition.

The two great expanding industries were those dealing with the production and use of electricity and motor-cars, and these between them absorbed a considerable proportion of this yearly addition to the labour market. If, therefore, any attempt, deliberate or otherwise, were made to obstruct the development of these industries it would undoubtedly result in closing up avenues of employment for our young people.



Mr. V. Watlington, who will address the Batti-Wallahs' Society at its December luncheon meeting.

Quite unwittingly, no doubt, certain societies existing for the preservation of rural amenities were working in this direction, as success on their part would restrict and hamper the natural expansion of the electrical industry. Such people should realise that electrical development was inevitable, and should use their influence not only to see that the work was done with the minimum interference with rural amenities, but also that such considerations should be compatible with sound economic principles.

Referring to the objections which were being made against certain proposed new power stations, Mr. Hodges said that, though there might be a belief abroad that our technicians were at the end of their resources when dealing with grit and sulphur, he could never be persuaded that our electrical and chemical experts could not effectively deal with these incidental problems. Even now he did not hesitate to say that these questions had been tackled sufficiently for us to know that they could, and would, be solved.

"National Perspective."

With regard to the objections against transmission lines, Mr. Hodges said that though pylons—to use the classic term—were not gossamer films floating over the downs, they were positively artistic in comparison with the bungalow towns and other disfigurements already there. The objections were, he thought, lacking in national perspective. If there was a beauty spot which could be preserved, the Central Electricity Board would go to any amount of trouble to avoid it, if possible. Unhindered progress with these electrical schemes would give the country what it most needed: creative work with results in the future and a partial solution of the unemployment problem now.

Those who wanted to see this country go ahead should give credit to the responsible authorities for doing everything possible to preserve rural amenities that was consistent with continuous progress. If electricity was allowed to develop along these lines, progress in the future would be even faster than it had been in the last twenty years.

Mr. WILLIAM MCCLELLAND, whose election to the vice-presidency of the Society was announced during the proceedings, moved a vote of thanks to Mr. Hodges. It was, he said, the plain duty of everyone to preserve the beauties of the countryside in a constitutional manner, but when a certain course was determined by means of arbitration we should all stand by that decision, and let the Central Electricity Board get on with its work.

MR. M. WHITGIFT, the honorary secretary, announced that the Society's next luncheon will be held at the Hotel Cecil, London, on December 5th, when Mr. Victor Watlington, managing director of the English Electric Co., will deliver an address.

ELECTRIC WARMING.*

Advantages of the Continuous System—Leaving the Installation on Automatic Temperature Control—Existing Types of Equipment Compared.

By R. GRIERSON, A.M.I.E.E., A.M.I.Mech.E.

VERY briefly stated, the advantages of a well-designed, modern, continuous electric warming system are: its entire invisibility in the decorated room; its adjustable automatic temperature control; its low operating temperature, and its perfect reproduction of the atmospheric conditions of the most desirable days of early summer, e.g., an evenly distributed warmth combined with a delightful feeling of fresh air, and all this in return for no labour or action on the part of the owner other than drawing a cheque for the bill.

An example of "Dulrae" panels applied to an existing ceiling. Various methods of decorative treatment may be applied if desired.

When people tell you electricity is expensive, reply at once with a question regarding the price at which current is available for continuous electric warming. Many people have installed electric fires with current at 2d. per unit, or 6d. per hour for a 3 kW fire. The ill-advised electrical enthusiasts who are responsible for these early installations for any purpose other than for intermittent heating are really the electrical industry's worst enemies.

At present 99% of the population have been educated to switch off electrical appliances when they are not actually required. In future we must remove the possibility of switching off continuous heating systems from the immediate locality of the user, and educate him to leave the installation on automatic temperature control. By this means he will obtain more comfortable conditions and a lower bill for energy.

Lack of Vision.

I cannot refrain from commenting on the lack of vision exhibited by the majority of supply authorities in failing to grasp the advantage which the continuous electric warming load offers when it is operated by automatic temperature control. Occupants of a room emit heat which standard authorities value at 350 and 400 B.Th.U. per hour per person, e.g., slightly more than one-tenth of a kWh per person. Living rooms, offices, etc., are occupied during the day, and also records show that the coldest period of the twenty-four hours occurs during the night. Hence the maximum load *must* occur during the night when the generating plant is running light. Surely such a load is entitled to a better rate than an electric fire load which is principally switched on during the cold and foggy days—when the load is heaviest. Yet in the majority of districts one heating rate is quoted for all types of equipment, and this is not infrequently a prohibitive rate for continuous, thermostatically controlled equipment.

One or two supply authorities have recognised the advantages of the continuous, thermostatically controlled type of heating load, and are offering a rate of ¾d. per unit between 9 a.m. and 7 p.m. and ½d. for the remainder of the period.

It is the price per unit which prospective consumers concentrate on—the cost of inattention of forgetful employees, children, and friends.

At this stage I want to fix attention on one vital difference between electrical and hot water heating. In the latter system, the maximum temperature that pipes, radiators, etc., can attain is fixed by the temperature in the flow pipe. Cover up your pipe or radiator with a blanket, and little or no heat is emitted and the water leaves the pipe or radiator at the same temperature as it entered.

With electrical equipment, however, the result is very different, because energy is being continuously supplied to the apparatus and a steady temperature is only attained when the heat loss balances the heat input.

Herein lies the danger of unguarded types of non-luminous heaters, which are within easy reach of floor level, e.g., the user may unwittingly restrict the heat loss by throwing over the heating equipment, either accidentally or intentionally, a blanket, coat, or other object. When I say intentionally, it may be with an idea of airing or drying the article.

Electrical devices have no final temperature, and the temperature may continue to rise under the conditions named until the ignition point of clothing, etc., is reached.

Excessive temperature cutouts may be employed, but they increase the cost, introduce unnecessary complications, and are apt to prove unreliable.

Available Types Surveyed.

Let us now make a very brief survey of the various types of equipment available, and note shortly the advantages and disadvantages of each:—

ELECTRIC FIRES.—Useful psychological and decorative effect; simple, convenient, and cheap in the plainer forms; quick response for intermittent heating; elements burn out and flexible conductors fail and require to be replaced from time to time. Temperature gradient very severe, e.g., temperature falls rapidly as distance from fire is increased, and heat shadows very marked. Excessively high temperature surfaces and thus liable to "burn" the air. Heavy loading in relation to cube of space to be warmed. Must inevitably cause heavy maximum loads on the mains. Chiefly regarded as boosters or intermittent heaters. Unsuitable for thermostatic control as effect of radiator switching on and off periodically would be a source of annoyance.

RESISTANCE WIRE CONVECTORS comprise resistance wires wound on suitable supports and enclosed in perforated sheet steel cases. Few advantages, except for the purpose of circulating warm air with all its objectionable features, and possibly also low first cost. Temperature of active parts is high and hence "air burning" is probable. Marked dusting will occur; life fairly good. Usually difficult to clean and also to treat in a decorative scheme. Occupies useful space.

ELECTRICALLY HEATED HOT WATER HEATERS.—Practically all the disadvantages of the ordinary hot-water radiator or convector, e.g., occupy floor space, soil decorations, and unsightly. Will freeze and crack if left out of use in exposed situations or even in ordinary rooms during periods such as last winter. Advantages are that no labour is involved and no boiler and pipes are required. Much too heavy to be portable, although admittedly transportable. Frequently emit noise for a period after switching on, and are, therefore, not very suitable for thermostatic control. Require a certain amount of attention in checking water levels.

PIPE HEATERS.—These consist of 2-in. pipes supplied and fixed in convenient lengths and are warmed by means of wires enclosed in the pipes. Disadvantages are—floor space occupied; high operating temperature, 180/215 deg. F., and hence "cooked" air and fire risk if heat emission is restricted. Advantages include cheapness and facility of application and low temperature grade. It is interesting to note that although we condemned steam heating pipes many years ago, chiefly on account of the high temperature surfaces, practically the same temperatures are in use to-day in this form of heater. The radiating surface is only 0·62 ft. super per lineal foot and little if more than 33⅓% or 0·2 ft. super can have a useful effect in the room.

PLATE HEATERS.—A special form of panel having relatively small surfaces and operating at comparatively high temperatures: Composed of a ceramic material having a glazed sur-

* From a paper read before the Institution of Heating and Ventilating Engineers on November 6th.

Digitized by Google

face. The disadvantages include the difficulty of incorporating and concealing the panels either in the structure or in the decorative scheme, due to the high operating temperature and the glazed surface; the high temperature must inevitably cause excessive convection and dusting effects and a steep temperature grade is inevitable. The advantages include small dimensions due to the high loading, easy cleaning, portability and practical indestructibility.

THERMAL STORAGE SYSTEMS.—These incorporate the principal parts of a central hot-water system, e.g., pipes and radiators or panels, and only differ in the fact that large electrically heated and heavily insulated water cylinders replace the boilers. The capital costs involved and space occupied are considerable, but, of course, labour is reduced to the vanishing point. The *raison d'être* for the introduction of this equipment is the low rates offered by supply authorities for current taken during the night, the elimination of fuel storage space and stock construction, and also the reduction in the labour costs. The heaters may be operated at either 6 000 or at 400 V, depending on whether the electrode or the immersion heater system is adopted. A notable example of this system may be seen in the new offices of the Underground Co. Rates as low as 0·25d. per unit have been offered for this system for current taken between the hours of 10 p.m. and 8 a.m., e.g., 10 hours per day active and 14 hours storage.

DULRAE PANEL SYSTEM.—This is the system with which I have been intimately connected during the past few years. The principal advantages include ease of incorporation in the structure, and, therefore, invisibility; low temperature grade; low operating temperature; perfect atmospheric conditions; elimination of labour and maintenance cost; nothing to freeze, ignite, or short-circuit; no floor space occupied; perfect automatic temperature control and low operating costs. The disadvantages—well, I have yet to learn of any, except, possibly, a slightly higher initial cost.

The cheapest and simplest form of construction is the embedded type, e.g., insulated conductors having a comparatively high resistance embedded in plaster which is carried on a cork slab and secured to cement asbestos backboards. Standard sizes are 6 ft. by 2 ft.; 4 ft. by 3 ft.; and 3 ft. by 1 ft., all being approximately 1½ in. thick. The 3 ft. by 1 ft. for use, four in series, on 200/250 V systems, has been found specially useful for fixing between the floor joists and also for situations in which long narrow strips of warmth are desirable.

To meet specifications calling for a more mechanical type of element, metal tubes fitted into headder boxes are also provided, naked conductors being employed, which are insulated from the tubes by means of beads or glass tubes. This type may be safely buried in concrete floors. For wall fixing hairpin type tubes are employed, the headder box being fixed behind the skirting.

A New Type.

Another type in course of development embodies a ⅜ in. thick smooth plaster board incorporating the element. This is intended for direct fixing to existing ceilings where the projection of the standard type might be considered an objection. The cork insulation is fitted between the floor joists.

All standard panels are designed for a maximum surface temperature of 120/125 deg. F., when fixed horizontally on a ceiling and operated in still air. Under automatic temperature control, the temperature, providing adequate surface is installed in relation to the heat loss, averages 85/90 deg. F. even on cold days. Loading averages 40 W per sq. ft. of active surface, or 400 W for the standard 6 ft. by 2 ft. or 4 ft. by 3 ft. standard panel.

These low temperatures involve extended surfaces which are inevitably more costly than small high temperature sources of heat, but records clearly prove that such initial costs are quickly offset by the lower operating costs. Take a room which costs £25 to equip and is loaded to 2 400 W. The probable consumption is at the rate of 1 750 kWh installed, or 4 200 kWh at 0·6d. per unit, this is £10 10s. per year. With any other system it would probably be £15 per year.

In new buildings, and where possible in existing buildings, it is intended that panels should be sunk into the ceiling, and that the finished surface of the ceiling should be absolutely flat. In this way, convection currents and dusting are eliminated. Where this procedure is not practicable, panels are applied to the ceilings and project below the finished surface, but there is always a risk that small convection currents will cause dusting and slight discoloration in the immediate vicinity of the panels in the course of time. However, the cost of an annual coat of whitewash is not very serious, and a decorative moulding, fixed in the angle formed between the edge of the panel and the ceiling is very effective.

Flexibility of Control.

The permutations and combinations of control methods are innumerable. To mention only a few:—

(*a*) Switching of individual panels in sections of 400 W. (*b*) Series/parallel switching in groups of 2, 4, or 6. (*c*) Thermostatic control of all panels in one room. (*d*) Thermostatic control of the main supply and individual switching of room panels. (*e*) Several panels switched on permanently and the remainder controlled by thermostats.

The best method is, of course, thermostatic control of each room. At first it was thought desirable separately to switch panels adjacent to windows, but whether or not the result is due to the opacity of the glass to low temperature heat rays, the fact remains that in my own office, containing two large windows facing north, no draughts are traceable even in severe weather, with all panels on automatic temperature control. A further objection to independent switching of panels adjacent to windows is that the daily consumption of energy in an ordinary room is frequently less than the loading of one panel, e.g., 0·4 units/hour or 9/6 units for 24 hours.

On direct current circuits, solenoid operated mercury tubes are provided, the operating coils of which are switched by the thermostat. This is due to the fact that the neatest and most convenient form of thermostat available will only deal with very small continuous currents, e.g., from half to one ampere on direct-current circuit.

In figuring on automatic control, care has to be taken in large rooms to see that the load switched has a reasonable relation to the mains of the supply authority, e.g., it would probably be impracticable to switch blocks of, say, 20 kW, off and on at ten or twenty minute intervals without a flicker in the lights being noticeable. The capacity of the standard thermostat is from 10 to 12 A at 230/240 V, e.g., from 2 300 to 2 900 W. Where larger loads are required to be switched, additional thermostats are required, or one thermostat can be arranged to control the coil of a contactor switch, or parts of the panel may be switch-controlled.

Where the supply authority has a pronounced peak load occurring regularly, say, between the hours of 4 p.m. and 5.30 p.m., it would be possible, due to the heat storage of the building, entirely to switch off the whole installation, or alternatively, on a.c. currents to switch in a choke to limit the total load to a predetermined limit between the hours named.

The coke or oil-fired boiler has one advantage over the electric method—it is always possible to force the boiler and thereby temporarily to increase the normal power of the installation at the expense of slightly lowered efficiency. Once an electric system is fixed and connected to a constant pressure system, the maximum heat emission is fixed. Therefore, it is essential to decide at the outset whether the electric system is to be boosted by electric or coal fires during spells of very severe weather or where abnormal heat is required, or whether the electric system is to take care of all possibilities.

Normally we figure on a 30 deg. rise for staircases, landings, halls and vestibules, and 40 deg. for living rooms, offices, bed rooms and bathrooms unless otherwise directed.

In the house of the future, much greater care will be taken in regard to heat insulation, and in all probability, gale-type windows and cork-lined walls, floors and ceilings will be a feature.

For a temperature rise of 30 deg. F., we find that the watts per cu. ft. calculated by the ordinary methods average 0·63 or, say, 22 superficial feet of panel per thousand cu. ft. of space, e.g., the surface required is approximately 2·25% of the cube. For a 40 deg. rise the rating is approximately 0·84 W per cu. ft., 30 sq. ft. per thousand cu. ft. of space, or 3% of the cube.

All these figures are based on continuous use of panel surface, e.g., the structure is prevented from getting cold, which is quite a different proposition from warming it up. A further point for consideration is the temperature maintained in adjoining rooms, especially in office blocks, if tenants pay for their own current on separate meters.

The essential fact in locating panel surface is that it must be fixed where it is equally exposed to all the occupants of the room. The part where this condition is most efficiently complied with is in the ceiling.

(*To be concluded.*)

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Overhead Lines or Underground Cables?"

[To the Editor.]

Sir,—I hope readers will not be misled by the extraordinary article which appears in your issue of November 8th, on "Overhead Lines or Underground Cables." An article of at least similar length would be required to deal with the errors, but the following must, at the moment, suffice. The authors (Col. Crompton and Dr. Ekstroem) have underestimated the cost of laying 33 kV cables, and the costs and claims incidental to cutting trenches across farm land. It must not be thought that the wayleaves will be any less expensive for this trench than for an overhead line, indeed, my experience leads me to suggest that it would be very much greater. Moreover, the claims from farmers for damage done during the operation of laying would be very heavy indeed. There are difficulties, not mentioned, as to field drains and crops which will be injured; boggy land, small boulders, tree roots, etc., not shown on the field where the machine is illustrated.

There is no reason to suggest that a shorter route could be taken by underground cable than by an overhead line across country, in fact, the reverse is undoubtedly the case in England. It is not necessary to take high pressure overhead lines along hedgerows to-day, as we can give spans of 200/300 yards quite easily.

I do not think that any engineer would suggest that the capital cost of an underground 33 kV line could be anything less than twice that of a reasonable overhead line. The annual working cost table also is as distorted as the capital cost table.

All I ask at the moment is that your readers should be cautious in accepting the figures, especially as the scheme involves the use of an expensive machine, for which surely some allowance will have to be made.

I conclude by asking Col. Crompton and Dr. Ekstroem to show us the machine at work, and to produce detailed costs of work done, and claims, in England across average farm land.—I am, etc.,

W. Fennell.

Northwich, Ches.
November 9th.

Electric Cooking is Cheap.

[To the Editor.]

Sir,—I have been interested to see in the October 18th number of The Electrician an article dealing with the cooker competition at the Brighton Electrical Exhibition.

The matter of cooking costs is one in which I have taken considerable interest, as, when I installed an electric cooker, it was with considerable doubts as to the wisdom of this course. Consequently I took very careful tests (and am still taking them) on a meter which reads the cooker consumption only. The figures obtained have been of great interest and have proved to my satisfaction that the supposed high cost of electric cooking is really a fallacy.—I am, etc.,

"Elcook."

October 21st.

"Our House in Order."

[To the Editor.]

Sir,—I notice in the symposium of electrical installation contractors' views, under the heading of "Our House in Order," in your issue of November 1st, that there is a reference in the contribution by Mr. Morris to a fire which was started in a house where it was found that "in several cases the tubes were lying on the gas pipes and the leaking electricity for want of a better earth than the tubing of its own system, which from the foregoing remarks will be seen to have no continuity to earth, 'went for' its deadly rival the gas pipe."

The question of clearance between electrical wiring conduits and gas pipes is a matter of considerable importance. During the erection of a house in which I was interested, I found, in the course of a visit of inspection, that the workman putting in the gas pipes had laid them on top of the electric lighting conduits at several points, the electric light contractor having put his equipment first in position.

I asked the gas man whether he had any instructions or regulations directing him as to the safeguards he had to take in running gas pipes near electric lighting wires and conduits, and he assured me he had no special instructions, and appeared to be surprised that any were necessary. Of course, I had matters put right, but if I had not been present when the carcase of the building was exposed with the flooring not completed, the dangerous conditions would have been hidden. I wrote to the gas company pointing out the dangers, but beyond an acknowledgment heard nothing further about the matter. It seems to me that in a matter of this kind, where there are two potentially dangerous commodities, there should be an agreed procedure between the various undertakers as to the precautions to be taken by the second-comer.

In case there should be criticism that gas is not needed where electricity is available, I would point out that when the local company charges 8d. per unit for lighting and 3d. for heating, an all-electric house is out of the question for people of moderate means, such as electrical engineers.—I am, etc.,

November 8th. S. C. B.

"Advertising for Electrical Contractors."

[To the Editor.]

Sir,—With reference to the letter in your last issue from Mr. D. Winton Thorpe, in reply to my very mild criticism of a page of his booklet, I am quite in sympathy with the idea that is in Mr. Thorpe's mind, that we should guide the public towards securing safe electrical installations. All that I suggest is that it is not advisable to do this by telling people that electricity is "treacherous." It is quite possible to choose some other way; for instance, we might talk about "that blown fuse," and suggest that this can be avoided, with all the trouble it brings, by having electricity installed by the advertiser. "Fit and forget," in fact.

The booklet referred to, a copy of which Mr. Thorpe has kindly sent on to me, is certainly a very good piece of work, and, taken as a whole, will make for electrical development. In fact I consider that every undertaking or firm who by propaganda or in any other way increase their business, are doing a service to the whole electrical industry, and advancing the cause of electrical development. The object of my Association is to assist all such firms and undertakings, and when we ask the industry to help the Association, we are really asking those in the industry to help themselves, as the Association, not being allowed to make a profit, devotes the whole of its expenditure to increasing the use of electricity, and the industry, as a whole, therefore benefits.—I am, etc.,

W. A. Vignoles,
Director and Secretary.
British Electrical Development Association.

London.
November 4th.

"Concrete Pole Designs and Costs."

[To the Editor.]

Sir,—In answer to Mr. Fennell's remarks in your issue of October 4th, may I point out that wood poles commonly used in this country are not restricted to short-span construction. On the other hand, short-spans range from 50 to 450 ft., depending on what part of the world we are in, and on whether we are considering steel structural or wood pole construction. The engineers of the C.E.B. would certainly consider a 450-ft. span quite short, and, the wood "A" frame or structure for equal loading and similar conditions cannot be considered as 900-ft. *normal* span, common to the steel construction of the "grid." Steel is inherently intended for long spans, closely followed by reinforced concrete, and lastly by wood; also, due to their relative durability and variability, etc., for spans best suiting each material, the pole *line* is the more generally correct basis of comparison.

Mr. Fennell says: "Mr. Taylor has introduced so many variables into his comparisons . . . that in the absence of full details there would be great possibility of undiscovered error." These words tend to show that Mr. Fennell does not understand what he has read. The figures of initial first costs are plainly given, the total annual costs are just as clearly explained in terms of three different and independent depreciation annuities for a wide practical range under A, B and C, any of which may be taken; and, finally, the relative grand total costs are a multiple of the respective years of life, any one of which may be taken. This process can easily be checked backwards.

Mr. Fennel also stated: " . . . all light ferro-concrete work in which any is subject to tension and vibration is open to

Digitized by Google

suspicion. . . ." He should know that the basis of every pole design is tension stress, and a pole is wrongly designed, made, and/or installed if it is open to suspicion due to being subject to tension. A light pole is very flexible and easily and safely withstands all the vibration its proper and usual installation subjects it to.

In the same paragraph he says: " . . . I, for one, sympathise with the Electricity Commissioners in their insistence upon a higher factor of safety than for steel structures if the strength of the filling is taken into consideration in the calculations." From these words we are to understand that because the strength of the " filling " is added to the strength of the steel, a higher factor of safety should be used for strengthened, supported and totally protected steel than for steel minus these advantages. The factor of safety of one material is distinct from the other. Steel may be subjected to a working stress of 17 000 lb./sq. in., while tension stress in concrete is kept below 250 lb./sq. in.; moreover, the ratio of Es/Ec is as high as 15 times. The consistency of steel strength is excellent, but concrete is most inconsistent, and, increasing the factor of safety of the steel has no practical effect on the concrete strength. As one illustration: a plurality of materials form part of electrical machinery, but a strong material is not expected to help a relatively weaker—each material must take care of itself and be sufficiently strong in itself to meet the requirements of practice. Why not the concrete? It is wrong to say that the ratio $2\,600/750=3{\cdot}5$ is constant. This is decidedly so in the case of hollow-type poles of general makes.

Mr. Fennell stated further: " I do know that of all the methods of construction ferro-concrete is the least adaptable to local conditions, and the most doubtful as to its cost basis and construction details." If these words came from one with practical experience of this construction the words would tend to condemn reinforced concrete pole construction. It may be taken that Mr. Fennell would accept a pole construction showing on paper the steel-member dimensions marked on each panel or the frame (this being the usual information given to purchasers, and rarely, if ever, checked by calculations), yet he is openly hostile to top dimensions plus total material quantities for a pole (quantitites he should be able to check), which are more than he would get or expect when purchasing a wood pole, which may be as variable and uncertain in strength as concrete. These relations represent common purchasing methods, and tend to indicate the personal " factor of ignorance " and prejudice.

If Mr. Fennell had properly understood the design basis he would have found that the tension allowed by the Electricity Commissioners was purposely made greater, a surplus overhead clearance allowed for, and no more than twice the strength allowed for the two-pole frames. Ordinarily, the the tension should be that specified in the B.S. Spec. No. 125, the length of pole reduced, and the strength of two poles taken as four or five times that of one pole. As for wood poles, the writer uses double the pole strength and not $(5\pi d3/32)/(\pi d\ 3/32)$.

When one speaks of a construction, it is only just and proper to scope the world for its usefulness, and penetrate and extend beyond jungles and forests and swamps, journey across prairies and veldts, pass into icebound regions where blizzards are common, and soar upwards on to the roof of the world. Into all these, sometimes unwillingly, the writer has penetrated to practise and further electrical progress. Is it not proper that these conditions should be dealt with in addition to those of Mid-Cheshire?

Since 1904 the writer has been constructing " long span " wood pole and frame and structure lines. In those days, and in some countries, the factor of safety was what we made it, and the factor of experience (not " factor of ignorance ") was the only true guide for the lines which have more than justified reliability. As already explained, the " long span " may mean any length from 200 to 2 000 ft., depending on the country, location, one's experience, and whether we are dealing with wood props for a colliery or rural line, or a national " grid " steel structures. A rural line along a tortuous road, or a colliery using wood props for secondary supply, would call a 200-ft. span quite long.

Mr. Fennell continued his criticism by saying: " Mr. Taylor should be more cautious in his claims." He then repeated himself by saying the reader should " . . . be very cautious when accepting a statement made in advance of even experimental construction." There is no need to go any further into this point other than say it may tend to ease the mind of Mr. Fennell, if I also point out that all I ask him to do is accept my proposition. He will then be shown a national " grid " (equal to the main transmission " grid " of this country) reinforced concrete pole line of the identical design and construction under dispute, but of the " H " type. Moreover, when the proposition has been accepted, there are other surprises in store to satisfy " factor of ignorance."

On the above expression, which Mr. Fennell has coined from the factor of safety, will he now tell your readers that his views on the subject of reinforced-concrete pole design and construction and the operation of such pole lines are not based on actual practical experience? I would here venture to inform him that before he started this criticism, he unknowingly had, and no doubt still has, almost under his nose, a view of the reinforced concrete pole construction under discussion, and that this line has already more than proved the guaranteed strength *in situ* under very trying climatic conditions.

As a final note to Mr. Fennell's criticism, I would like to say that whether or not I have " anything up my sleeve " (as a Cabinet Minister recently put it) is neither here nor there, and no more so than why white ants have boycotted Mid-Cheshire. The fact remains that the " air of mystery " is of Mr. Fennell's own making and understanding; and, this being so, I have no desire to add to his mystification.—I am, etc.,

WILLIAM T. TAYLOR.

London.
October 5th.

Funds for the E.T.B.I.

[TO THE EDITOR.]

SIR,—You will be glad to hear that in response to my appeal on behalf of the Electrical Trades Benevolent Institution, donations of £500 or over have been made by:—

Sir Hugo Hirst (for the G.E.C.); Mr. Frankenburg (Greengate and Irwell Cable Co.); Messrs. Merz and McClellan; Mr. J. A. Crabtree; Sir George Sutton; Mr. Dane Sinclair; and Sir T. O. Callender, and other large cheques have been received. In addition, a very great number of regular subscribers have kindly increased their subscription.

We now require some £7 000 to enable the Institution to face the new year in security, with a capital fund of £50 000. I shall be very glad to hear from any of your readers willing to assist in making up this sum. Any contributions from 5s. upwards will be most gratefully received.

The Festival Dinner and Dance will be held at the Savoy Hotel on November 26th. The tickets are 25s. each, from the secretary, Capt. Keeping, 9, Southampton Street, Holborn, W.C. I hope that as many of your readers as possibly can will accept this opportunity of giving themselves and their ladies a first-class treat, and of helping the E.T.B.I. at the same time.—I am, etc.,

H. MARRYAT.

London, E.C.1.
November 12th.

POINTS OF VIEW.

We have in the short wireless wave a new problem of extra ordinary penetrating power. Nobody knows as yet where its limitations are or what it is destined to reveal. We are like a blind man who has just acquired the use of his fingers, and is feeling about in the dark.—*Mr. E. E. Fournier d'Albe.*

* * *

About three years ago we supplied 200 [gas] cookers for a new housing scheme. I can venture to say that not more than half of these cookers have ever been used inside for any other purpose than storing pit clothes or keeping rabbits.—*Mr. W. V. Marshall.*

* * *

It is wrong to say that a woman cannot adapt herself to a mechanical career, nor is it correct to say that she has no inventive turn of mind.—*Miss C. Haslett.*

The eighth annual ball organised by the staff of the South Wales Electrical Power Distribution Co. in aid of the Pontypridd Hospital was held recently, over 300 persons being present. Mr. Robert Roper, resident engineer of the company, was chairman of the organising committee.

Mr. H. Evans, of the St. Helen's Cable Co., Slough, and his partner have survived the first round of the foursomes competition of the Slough Estate Golfing Society, and they are strongly fancied for the trophy.

CONTRACTING EPISODES.

Leaves from the Notebook of an Old Electrical Engineer.

By "ELCON."

MY earliest experience of matters electrical, was when my employers obtained a concession to light a certain small market town. Producer gas plant, with one dynamo and a battery, sufficed to supply their own works and a limited 100 V, d.c. network.

The gear, with the exception of the battery, was put in by our own men, but for the battery an "expert" was called in, and I was turned over to assist him. His well dressed and cleanly appearance won my juvenile admiration, while his "air" as he got on with the job, cigarette in mouth, largely decided for me that electrics were a nicer job than grubbing about on greasy, oily engines and sooty old boilers.

The battery being duly erected and the plant ready for running, the "expert" decided to get his acid mixed overnight for filling up on the following morning. A nice, big, old galvanised iron tank originally used as a cattle water trough being available, was duly commandeered, the acid mixed and left to cool off.

On our arrival next morning we hadn't got any acid, but we had one of the finest sieves you could wish for.

* * *

While on the subject of batteries, I recall the case of a fine yacht calling in at one of the Scottish ports for overhaul. This yacht was equipped with two dynamos and two Edison alkaline batteries, any combination of which could be used as required. The batteries were carefully taken ashore, washed out, and refilled with sulphuric acid !

* * *

At another shipyard, the foreman electrician sent four labourers to fetch from the stores to the ship a new armature to replace one that had been damaged. One of the hands returned to say there was no hand cart available, and that it was too heavy to be carried. The reply to this was: "What the —— ——, ain't the —— thing round, can't you —— well roll it down here." And they did: and they got another armature: *and* they got another foreman.

* * *

One firm I was with supplied two enclosed arc lamps for use in series outside a shop in an adjacent town. The local contractor—a real kerbstoner—to whom they were supplied, came back to say there was something wrong with them. A visit to the job revealed that our packer had sent all negative carbons, and the local man, to make these fit the larger positive grips, had carefully wrapped them with black tape.

* * *

A certain firm had the task of stripping down a large multipolar motor and the replacing of some damaged field coils. The pole tips were of the type where the overhang is unequal, and when reassembling, the mechanic getting some reversed, found he could not get the last in place. The remedy, to him, was easy. A hack saw soon got rid of the offending surplus.

* * *

Another brilliant boy was sent to a job to join up a small direct-coupled steam set in connection with a small yacht installation with battery. When run up, the polarity was found to be opposite to the terminal marking, so a telegram was sent to headquarters asking for an engine to be sent running the opposite way.

* * *

One mains job I was working on was supervised by an engineer doing similar duty in another town some 50 miles distant. When making a preliminary test it was found that the cores of a three-core feeder had been crossed. As the boxes had been compounded in, it was decided to take advantage of the engineer's absence to open the cable just outside the box and make a further cross to bring matters right. This was done, tests completed, and no one was the wiser.

* * *

In a certain not so small town, a gasfitter undertook the wiring of a small house, some 8 points. In the cellar all appeared to be in order, two mains hanging down from a d.p. switch with fuses as required. The test proving satisfactory, connection was made, and a look round the house taken to see that all was O.K. Not a single light would glow, and later investigation showed that the whole of the lights and switches were in series. Mr. Gasfitter had started from the one main and gone on round the house and arrived at the starting point with the other end.

A job that came my way, was to change over the lighting of a small hotel (some 300 lights) from a private 100 V plant to the company's mains at 240 V. The novelty in this job was to be found in the fact that every light came back separately to a "dis" board, and was wired with 7/20 or 7/16 cable, enough copper being on the premises to start another Golconda, I learned from the original proprietor, then retired, that he had employed two electricians direct, and had paid for the material as used and ordered by them. Some commission raked off, worth handling, would no doubt be the solution.

* * *

A little job that came my way in the early days was the wiring of three ceiling roses with one switch at the back of a small shop window. The casing and capping was run and the wood blocks in place exhibited 4 and 4 and 2 wire ends, respectively, when the local resident engineer dropped in. I was promptly asked what the deuce I thought I was doing with all those wires in the blocks, and was rather at a loss to know what the rumpus was all about. Finally, I was ordered to make T-joints at each point. My explanation about looping in carried no weight, and I was told it would not work my way. After he had left, the job was promptly finished, and as we did our own meter work, mains connecting, etc., the light was got going before he returned an hour or so later. As I could not refrain from telling him I had not carried out his instructions, but had left things as they were, I landed myself with the job of stripping down a point to show him, and was then told: "Well, anyway, it is shoddy work, and don't do it again."

* * *

A certain town some years ago possessed a single-phase alternating current system, and motors were an almost unheard-of thing. A certain wiring contractor, receiving an order to fit a motor to run a hoist and chaff cutting machine, proceeded by installing the motor on the second floor and placed it close to double doors opening on to the street. As the motor was belted to a line of shafting through the medium of a loose pulley, and was secured to somewhat aged floor boards by coach screws, the reader will not be surprised to hear it was returned to the makers, it having been found insufficiently strong to withstand the fall to the roadway below when the belt was shifted over.

* * *

A curious little 25 V private installation I once had to overhaul before connecting to the Corporation 230 V supply, had been installed by an amateur. Said amateur had evidently carefully perused that type of instruction book which depicts a long run of wire taken to the far side of a square to equalise the drop on the respective leads, and had religiously followed it out. The method of protecting the wiring where it dropped from the wood casings running along the top of the floor joists to the underside of the ceiling below was decidedly unusual. The wires were bared and churchwarden pipe stems threaded over the conductors, the ends of the stems terminating respectively in the casing and ceiling rose. The insulation of the whole was so good that it could have been accepted as it stood, had not the odd position chosen for the fuse distribution boards prevented this being done. These boards, two of them, were placed under the floor boards, and were accessible only after the piano, carpet, etc., had been moved. This arrangement did not, however, matter much, as the dynamo and engine could never have raised energy enough to blow the fuses fitted.

* * *

A kit of tools one of our hands carried consisted of an old razor, a screwdriver, and a pair of dentist's forceps (a jolly handy tool, too !); anything else he required he borrowed or acquired. Referring to tool kits, I once, for a bet, completely wired (casing and capping surface work) a small shop with no other tools than a bradawl and pocket knife. This arose out of an old timer's remark: "You can always tell a good workman by the rotten lot of tools he totes around."

* * *

The meter reader visiting the small shop of Mr. "A," one foggy day, observed lights burning in the next door shop of Mr. "B," and as "B" was not on his list of calls, went in to make inquiries. "B" informed him he had had the lighting in his shop window some six or seven months and that So-and-So had carried out the job. After finding that So-and-So had joined up "B" to "A's" wiring, it was easy to get "A" to agree to the idea of "B" paying part of the bill, though "B" was not so easy to convert to the plan.

(To be continued.)

ELECTRICAL WINDOWS & CHRISTMAS TRADE.

Ideas for the Contractor—Getting away from the "Chimney Incident"—Some Interesting American and Canadian Examples.

By ERNEST A. DENCH.

ARE you one of those electrical retailers who are "sick and tired" of re-hashing Santa Claus and the chimney incident? If so, your courageous desire to deviate from the conventional gift window display will receive moral support from what other dealers did last season.

It's the easiest thing to deck out a window with a synthetic fireplace, a cardboard Santa cut-out, and his over-filled pack pouring its contents on the floor. It is, in fact, the lazy man's way of tackling Christmas as a merchandising event.

But the man with ideas, or the man who is open-minded about adapting the ideas of other far-sighted dealers to his own requirements, will glory in the scope of this subject. He will, nevertheless, "clip its wings" if his thinking apparatus does by chance become too far removed from sound practice.

This is not to put Santa "on the shelf." There is still plenty of vigour in the genial old chap, but like the good actor he is, he should be given a new merchandising act every December, to invest him with freshness.

The following display highlights should enable you to develop complete displays in ways that recommend themselves to you.

Kerr's, of Coldwater, Michigan, attached a lifesize cutout of Santa Claus alongside an electrical washer. With each revolution of the machine, the figure jumped up and down.

The California Oregon Power Co. brought "The Spirit of St. Nicholas" up to date by laying out the window as an aerodrome landing field. A toy aeroplane, named "The Spirit of St. Nicholas," was about to make a flight. Pilot Santa (a costumed doll) was in charge. A tiny cone indicated the direction of the wind; the latter coming from an electric fan hidden in one corner. While the landing field had been cleared of snow, the wintry mantle was scooped up around the sides, ploughing through which were four small Santas, each drawing his own sled piled with electrical gifts, unwrapped.

The Miami Electric Co., of Indiana, were responsible for the precedent of Santa making a midnight call upon a modern farm dwelling. The painted back scene was of the exterior of a farmhouse; the interior well lighted. Staggering under his load along the carriage drive was Santa, bearing a lighted lantern. His sleigh, parked nearby, disclosed a radio set. The window sold both the idea of farm lighting equipment and appliance gifts.

Freeport, Illinois, has no use for the orthodox "Christmas Opening." Instead, a "Mother Goose Comes to Town" pageant is held; each co-operating store rallying with a visualised nursery rhyme playlet in its "opening" display. No two nursery rhymes are alike; each retailer agreeing to take a certain subject and work it out for himself.

The Boyington Electric Shop chose "To bed, to bed, you sleepy head," the main item being a miniature house, all the rooms in which were furnished and wired. The furnishings included tiny replicas of an electric washer, vacuum cleaner, lighting fixtures, a radio set, a lighted Christmas tree, and cooking devices. Doll children in the nursery were being put to bed by their mother, a larger doll.

Chernin Brothers, of Glace Bay, Nova Scotia, had a clever two-in-one display. Toy electric railways circled the countryside, with cotton wool, mica snow, and tiny spruce trees on the floor, including a frozen lake (silvered glass). The cotton wool snow covered hidden boxes, the repositories of small appliance gifts. The red curtained background bore a large Santa Claus cut-out, which was made to perform a periodic set of motions.

The Knoxville Power and Light Co. gave to a display of electric trains a novel twist by a "Touch the Spot" device. By touching the small mirror-like disc on the window glass, the spectator illuminated the darkened window and set the toy railway in motion, or stopped it as well.

Ideas noted in use by other retail trades with electrical appliance gift application were "The Shadow of Santa," and "Open the Gates of Goodwill Castle." The first involved a black cloth background, against which was affixed a white silhouette cut-out of Santa Claus. His footprints—cardboard soles embedded in the mica snow floor—suggested that he had just passed. Plenty of gifts were on show, backed up by the sign, "The Shadow of Santa. Come Inside for the Gift Reality."

"Open the Gates of Goodwill Castle" required a painted back curtain of a medieval castle exterior, showing the moat and fortified gates and turrets, or the battlements constructed with appliance cartons. The floor area was devoted to electrical gifts, accompanied by a forceful piece of copy, such as "Again Comes the Opportunity to Open the Gates of Goodwill Castle. Our store is an inviting gateway to goodwill-increasing gifts."

One of the window displays which has been specially designed by the E.D.A. in connection with the December Selling Campaign. Other windows intended for use during December will be published next week.

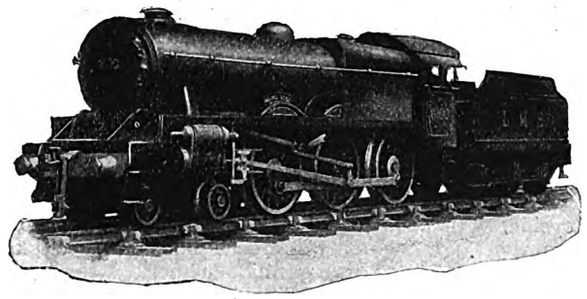
ELECTRICAL GIFTS FOR CHRISTMAS.

Electrical Appliances and Novelties for Promoting Christmas Trade—Suggestions from Manufacturers.

THIS month sees the start of the additional trading always associated with the Christmas festivities, and this year more than ever public attention is being directed torwards those small and large domestic appliances which lend themselves to the spirit of giving electrically. During the current month the special E.D.A. window display is serving as a



The electrically driven model of the "Royal Scot" by Bassett Lowke, Ltd.

reminder to the public that presents will soon need to be purchased, while the December window displays are equally convincing that the best gifts are those which are useful, labour-saving and at the same time inexpensive. To assist contractors in the matter of stocks and items with which to dress their windows we give below details and illustrations of a number of suggestions received from manufacturers, and though for reasons of space it has not been possible to cover the whole field suitable as electrical gifts, many of the appliances described will be new to the electrical contracting industry.

Electric fires are always a welcome present at Christmas, and some popular models are produced by BELLING AND Co., of Bridge Works, Southbury Road, Enfield. The company's "projector fire," which is rated at 1 kW, is suitable for heating rooms sized about 12 ft. by 10 ft. by 9 ft. The 2 kW size is recommended for rooms up to 16 ft. by 14 ft. by 9 ft. Hotplates are another idea for Christmas and the Belling plate, economical to run, would make a pleasant and unobtrusive addition to any sideboard. The finishes available are polished copper and nickel plate.

Among the large number of portable wireless sets on sale this season, some of which are described later in this article, may be mentioned the "Chakophone Warwick" portable four, manufactured by THE EAGLE ENGINEERING CO., LTD., of Eagle Works, Warwick. Its particular features include low first cost, light weight (approximately 20 lb.), solid black walnut case and low battery consumption. The cost of h.t. maintenance is stated to average 7s. 6d. every four months. A pentode valve is included in the circuit.

J. DYSON AND CO., LTD., St. Stephens House, 2, Coleman Street, London, E.C.2, suggest their 3-valve screened grid receiver, and also their 4-valve portable screened grid set, which is offered in an attractive oak cabinet. Eliminators are useful presents in these days of all-mains operation, and with the new regional stations wave-traps also may in some cases make very useful presents. We give below tabulated details of some of the Dyson products.

The Model D.H. "Godwinex" h.t. eliminator for d.c. mains has 3 positive tappings, with a maximum current output of 20 mA at 150 V. The Model D.P. eliminator, also for d.c. mains, has a maximum output of 50 mA at 200 V and 4 positive tappings. The Model A.H. eliminator is an a.c. type with 3 positive tappings with a maximum output of 15 mA at 150 V. Another a.c. unit is Model A.H.W., with an output of 15 mA at 130 V. Other a.c. eliminators have outputs of 30 mA at 160 V. The Godwinex "all-mains" unit for a.c. mains has 4 h.t. positive tappings. There are five negative grid bias tappings up to 25 V and low tension variable for 3, 4 and 6 V valves. The maximum h.t. output is 50 mA at 200 V, and the maximum l.t. output 1 A.

The GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway London, W.C.2, appears to be fully alive to the opportunities afforded by the seasonal demand, and states that its whole resources are directed as much to co-operation with the trader as to the pleasure and content of his patrons. The wide range of "Magnet" appliances now covers almost every form of utility in the home, and also includes items of more personal interest than ordinary domestic apparatus. For the home there are vacuum cleaners, electric irons, toasters, kettles from 2 to 6 pints capacity in copper or nickel plate finish; for the kitchen are offered the "Minor" cooker—which is particularly suitable for flats, bungalows and small households of three or four persons—boiling plates, warming plates and neat copper saucepans which have also their use in the nursery or sick room. For the boudoir or dressing room there are electric hair-driers and curling irons, massage vibrators, electric shaving pots and reflected-light shaving mirrors. There are also many attractive designs of electric fires from the portable type of pedestal heater which can be operated from the lighting circuit, to those of higher loading. In all of these may be found interesting features of design and a selection of finishes to enable a fire to be chosen to harmonise with any ordinary scheme of interior decoration. Other attractive presents are the gramophone motor attachment, and sewing machine motors. The Osram Music Magnet Kit is another present of the kind which should ensure gratitude from the most ungrateful.

When fires are chosen for Christmas gifts buyers will be well advised to turn to the range offered by THE JACKSON ELECTRIC STOVE CO., LTD., of 143, Sloane Street, London, S.W.1. These are fitted with reflector elements of the "plug-in" type. The reflector is designed to give the maximum radiant heat and is, we are informed, manufactured by the use of special dead-accurate presses and tools, ensuring that no variation is possible in the relative positions of elements and reflectors. The heat generated is diffused by the curvature of the fire front and reflectors, thus giving a very wide distribution. Attention should be paid to the fact that the makers have practically overcome discolouration by heat of the delicate oxydised finishes on these models by the arrangement of the reflector and the reflector housing. The majority of the fires are constructed in sheet metal, making them light and portable, but among the new season's models is a range of cast fires which, although hardly portable, are most attractive. The reflectors are made in a special alloy and the standard finish is highly polished nickel plate. Chromium plated reflectors can be supplied at an extra cost. Carrying handles are provided on all portable models. Special attention is called to the new "Fabric" finish models. The majority of these fires can be obtained in this finish in four colours :—Chinese grey, bronze, red and blue. This finish is "non-metal" and is a pleasant contrast to those fires finished only in brass and copper tints. All wiring on the fires is carried out in solid rod. Porcelain insulators and foot press switches are used so that the fires are satisfactory in damp climates. All models have one bar connected direct to the main to comply with wiring regulations and are complete with 6 ft. heavily insulated flexible. The reflectors are not lacquered and as it is an easy matter to remove the element, the reflector is easily cleaned with a little plate powder. The (750 watt) element is of the "plug-in" type so that where changes of voltage are necessary this can be done in a few seconds without the use of tools. The spiral is wound helically to fireclay formers, which are built up in sections to prevent fracture under heat, and this can be replaced, if required, in a few minutes without the necessity to purchase a complete element. The formers are held together with a rod of special alloy to withstand the heat generated, and the pins and sockets, are of special metal.

Many of the Jackson fires have been recently described. Among other models is the "Atom" heater, which is claimed to be better than a bowl fire. It will rapidly heat a small room, and can also be used for preparing tea, toast, eggs, meat, potatoes, puddings, vegetables, toasted tea cakes, etc. The supports for this adaptable heater are so constructed that it can be made to stand nearly upright, for heating the room, or be moved into a horizontal position for supporting a kettle or saucepan. The loading is 750 W, the element is of the plug-in type and the finishes available are ebonite black, or blue, bronze, grey or red "Chinese Fabric." A chromium plated reflector can be supplied as an extra.

One of the latest electrical appliances in the domestic field is the health motor, and it is quite possible that in some instances such motors might be chosen for Christmas gifts—they would certainly be a novelty, though where presents for acquaintances are concerned one can foresee that caution is necessary, owing to the health motor being considered a specific for obesity as well as a form of bracing exercise for the already healthy. The particular feature of the "Thor" health exerciser, which is marketed by the Thor Department of THE EDISON SWAN ELECTRIC CO., LTD (1a, Newman Street, London, W.1.), is that it is designed normally for fixing to a door, instead of to a heavy-weight table or a special bracket. Behind this part of the design is the idea that few tables to be found in bedrooms are suitable for clamping between the jaws of a vice. A door, however, is universally available, and the health exerciser will see to it that the user does not get a cold through a possible draught. If, however, for the sake of privacy or any other reason the door method is considered unsuitable, two other devices, known respectively as the wall base and the window bracket, can be utilised. The wall mounting bracket is made in two parts, one to be attached permanently to the appliance and the other for securing permanently to some suitably solid part of the house's framework. The first part fits into the second, where it is held in position by a thumb screw. The exerciser can thus be removed from its mounting base when it is not in use. The window bracket is made to hook over the window sill outside the window. It must be mounted at the extreme end of the window—not near the centre. When the bracket is in position the sash is lowered on to it, and the clamping screw tightened. To change the fixture it is only necessary to remove the two screws which secure the door bracket to the exerciser and substitute the base or bracket to be used, fastening them with the same two screws and making certain that the latter are screwed well home.

A two-piece adaptor is provided, enabling the motor to be run from either a lamp socket or a wall plug. The model of the Thor exerciser which our representative examined in the showrooms was of a green colour—no doubt a future development will be a range of tones to enable the motor to harmonise with the room.

A New Vacuum Cleaner.

Another new Thor appliance is a vacuum cleaner, which is reasonably priced, of the upright, self-contained type. It has a sweeping nozzle 13½ in. wide, a bristle brush inside the nozzle and a large swivel-castor designed to make the machine feel light and be easy to handle. There is a very complete set of attachments including brush, extension arms, and nozzles and adaptors for stairs, walls, upholstery, curtains, etc. A rubber tube for blowing dust out of radiators, pianos, etc., is provided. Among other constructional features are the placing of the bag on the right side of the cleaner, to keep it away from the operator, and a spring which holds the handle upright when not in use, together with a convenient device for locking the handle in any desired position.

"Thor" washing machines are already well known. The latest addition to the range is the "Thor Agitator No. 1." a combined washer, wringer and ironer. It has a "life-time tub," finished inside and out in oven-baked porcelain enamel, a full-width top opening, and a rubber-guarded lid—a round guard of wear-proof rubber encircling the top of the tub where the cover fits in; vibration is thus eliminated and water cannot splash through. The rotary ironer is stated to heat as quickly as an ordinary flat iron; it has an ironing surface equivalent to that of ten ordinary irons, and, it is stated, will do the same amount of work in one-third of the time. The user merely lifts off the wringer of her Thor washer and places the ironer in position.

THE BENJAMIN ELECTRIC, LTD., Brantwood Works, Tariff Road, Tottenham, London, N.17, suggest their Dim-a-Lamp as a very suitable Christmas gift. This fitment consists of a compact and indestructible rheostat manipulated by chains to reduce the normal current through the lamp filament. It has five positions, each corresponding to a given amount of light. Beginning with "full-on" the successive steps are "one-half light," "one-fourth light," "just visible," and "out." The advantages of the Dim-a-Lamp to users in the home is obvious; the makers lay stress on the pleasant ease with which groping in the dark may be avoided, and, alternatively, the saving of energy as compared with having a lamp burning at full brightness—but to us it seems that a more striking virtue of such regulation is its value in children's nurseries, where by simply pulling a chain all the trouble of nightlights is avoided. The term Dim-a-Lamp is used by the makers to designate a complete lamp provided with the regulating attachment—several models are offered, including shaving lights and portable lamps for hanging from the upper rail of a bed. The Dim-a-Lite adaptor is a combined plug and socket which can be interposed between any electric lamp and its ordinary socket, thus giving the five-way regulator.

Another Labour-Saving Device.

There are many who are sure to appreciate wash boilers at Christmas and those looking for a well-appearing though solidly constructed type, may be interested in the "Arora" shock proof boiler made by THE ARORA CO., of Loughborough. This boiler is constructed on the lines of those heated by gas. There is an inner boiler of 10 gallons, having four heating tubes in the sump, with removable perforated cover, all of copper, tinned after making. The top lid is recessed to prevent dripping, and the outer case is galvanised, enamelled blue. It is sold complete with two yards of cable (three cores for live conductors and one for earthing) for coupling to a three-heat control switch. The consumption is three units per hour, but with the control switch it can be regulated to 1½ or ¾ units per hour. The special construction of the sump plate automatically stirs the boiling water into constant rotation, driving the hot suds through the clothes. This automatic circulation, assisted by the copper condenser at the back of the hinged lid, keeps the steam within the boiler itself, so that the atmosphere of the wash-house or kitchen is left free and dry. The heating elements of the Arora wash boiler are the usual reliable Arora heating tubes, totally enclosed. It is said that a full boiler of clothes can be washed for an approximate cost of 3d. for current. The specification shows that the boiler is supplied with proper earthing arrangement to obviate any risk of shock. Another interesting line is the "Arora" "Halo" fire. This is a glowing and cheerful companion for chilly occasions, and an invaluable companion all day during the winter.

A really delightful suggestion for an inexpensive and yet most attractive and novel gift is found in the electric night light of JOHN SHAW AND SONS, (WOLVERHAMPTON) LTD., of Wolverhampton. This night light or watchstand is supplied in the form of an owl, bulldog or monkey, as the purchaser wishes: an illustration in these pages shows the owl. Strongly made of cast metal, finished in bronze, these should prove one of the most popular Christmas selling lines. The eyes are electrically illuminated and provide an excellent night light, and in addition, a hook is provided to take a watch on which the illuminated eyes project a beam of light—clearly lighting up the watch face. Current is supplied by an ordinary 4½ V flash lamp battery, and is controlled by a lever switch conveniently located at the front of the stand.

The "Everbright" pocket lamp of the RUNBAKEN MAGNETO Co., Tipping Street, Manchester, has been designed to meet the need for a lamp that can be thoroughly relied upon to give a continuous light for a number of hours. The case is made of moulded bakelite. An unspillable accumulator, a miniature of those used in the London Police lamps, is fitted, providing sufficient current to give continuously 9 to 10 hours of brilliant light. The re-charging is a very simple matter and can be carried out without removing the battery from the lamp. Plug and socket connections enable the battery to be connected through a battery charger to the nearest lamp holder, the battery being fully charged in a few hours. It can also be recharged similarly from any motor car. A focussing attachment can be added to the standard lamp. This gives an exceedingly strong concentrated light which can be used for observing distant objects. Other features of the lamp are as follows:—all parts interchangeable; black or brown finish; 5-plate unspillable battery, 9 to 10 hours continuous light; metal parts lead plated to prevent corrosion; chart for registering date of last charge; model 264A can be re-charged without removing battery, and is fitted with spare bulb and clip; and the weight is 8½ ounces.

New Fires.

ELECTRICAL UTILITIES, LTD., of Tudor Works, Park Royal, London, N.W.10, are now marketing a new design of fire, utilising their standard "infra-ray" element. The fire is fitted with detachable trivet for carrying a small utensil or a plate of food, etc. The fire has been so designed that the casting weight counterbalances the trivet, so that it is possible to put up to 4 lb. in weight upon the trivet. The loading can be either 1 or 1½ kW, and the prices are reasonable. It can be supplied in the new fabric finishes, which are attractive

and appear to be proving popular this season. Their "Lilies" fire can be supplied in grey, green, brown and white vitreous enamels, and also in red, blue or black "fabric" finish.

THE ELECTRIC HEATING CO., of George Street, Croydon, suggest a "Utility Frame" for converting a household electric iron into the equivalent of a hotplate. The iron has merely to be turned with the sole plate facing upwards and slid into the frame, where it is held in place by spring runners. An asbestos pad, which is laid with its metal side on the iron, helps to spread the heat over a larger area. As a low-priced method of learning the electric heating habit this device may certainly have its uses.

The Electric Heating Co. also suggest their "Elect" Marcel pattern waving iron. The "Elect" waving iron is stated to be reliable and well constructed. It is heavily nickel-plated and polished.

An immersion heater would certainly make a useful Christmas gift, and various types and sizes are made by GEORGE GREEN AND CO., of Chapel Road, West Norwood, London, S.E. 27. A heater of this type may be fitted very easily to a tank or cylinder, and an adaptation to electric heating is, therefore, a simple and inexpensive mattter. An immerser fixed in the storage tank of an existing hot-water installation is a useful auxiliary or alternative to the coal range, and is a great boon in the early morning. The design of the elements in the "Gee-Gee" heater permits the rapid transference of the heat to the surrounding liquid.

The "Universal" 5-valve portable of the IGRANIC ELECTRIC CO., LTD., 147, Queen Victoria Street, E.C.4, has much to commend it. Consisting as it does of two screened-grid h.f. stages, detector, and two l.f. (one power valve). The frame aerial is carried in the lid of the case, in which is also contained the adjustable cone-type loud speaker. Tuning is effected by vernier drum control. Variable reaction and volume controls are also incorporated, and these, combined with the stability of the screened-grid valves, ensure good control. This receiver can be run from a mains unit if desired, battery connections being brought out to a suitable plug. The separate battery case, however, contains two 54-volt h.t. batteries, and a 20 Ah (actual) 2 volt non-spillable accumulator, and will, of course, operate the receiver under all conditions. The grid bias battery is accommodated in the receiver itself. The range is stated to be exceptionally good, both indoors and out. All distant stations of medium power on both long and short wave-length bands are easily received at good strength, and the change-over from one wave-length band to the other is effected by means of a simple switch. The receiver is directional, and if placed on the turntable on the battery case, it can be freely swung in the direction to give maximum strength on any given station. A small compass on the panel will facilitate this operation.

LISSEN, LTD., of Worple Road, Isleworth, Middlesex, also offer a portable wireless set for Christmas. Although the Lissenola five valve portable is simple in its operation, its long range qualities are distinctly good. All the main British broadcasting stations may be received at loud-speaker strength. For certain reception the maximum distance is fifty miles in the daytime during the summer. The majority of the principal foreign stations are stated to come in at excellent loud-speaker strength, especially when the directional effect obtained by turning the receiver to the best receiving point is borne in mind. The use of an outdoor or small indoor aerial, with earth, will increase range and strength.

Mention should also be made of the "Passport" receivers of HART COLLINS, LTD., 38A, Bessborough Street, London, S.W.1. These are made in two types—namely, portable and transportable, the first consisting of a battery-operated self-contained 4-valve equipment, and the other is a 3-valve mains-driven outfit. The portable model measures 14¾ in. by 12 in. by 8½ in., and employs the popular screened-grid valve; the all-electric set is also of the screened-grid type, all accessories, including the loud speaker, aerial and earth being self-contained.

Another suggestion is the "McMichael Super Range Portable Four." This receiver is manufactured by L. McMICHAEL, LTD., of Slough. The circuit comprises a single stage of tuned h.f. amplification, employing a screened-grid valve, followed by a detector and two stages of l.f. amplification. The difficulty of the inherent high anode consumption of the D.E.P. 215 output valve is overcome by careful selection of h.t. and grid bias values. The total h.t. current consumption is, in fact, rated at 9 mA. The four valves are housed in a narrow well and are screened by means of a hinged aluminium lid. Hinged bases are provided for the screened-grid and output valves. Tendencies to microphonic noises are prevented by cotton-wool packing. A very neat control panel is provided, tuning being effected by two knurled, edgewise knobs; the right-hand control operates the tuning condensers of both frame and h.f. circuit, the left-hand control being a compensating device for bringing the two tuned circuits into resonance. The other two controls are a combined range switch and filament rheostat and a reaction control. The company's super-screened portable four is a cabinet receiver in figured walnut. This is a receiver in which quality has in no way been sacrificed to price, and it has two screened-grid valves, giving the radio-frequency amplification, with a pentode for magnification in the audio-frequency stage. This receiver has a "valve" switch which in addition to switching on the set will grade the volume at will.

TRUPHONIC RADIO, LTD., Truphonic House, Hanover Park, London, S.E.15, are now supplying the "Melo-Set" portable in suit-case form. It offers the same simplicity of operation, the same wide choice of stations at home and abroad, the same richness of tone as the ordinary Melo-Set. The suit-case

A Hart Collins "Passport" portable.

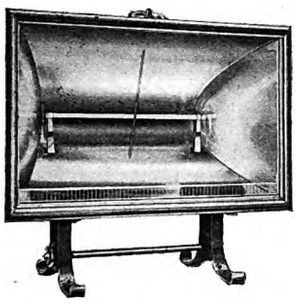
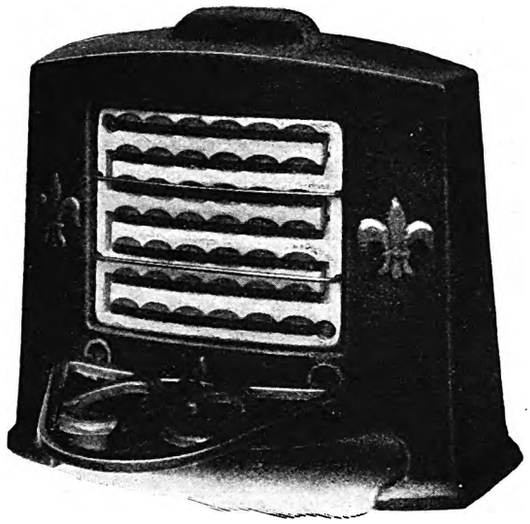
The Ferranti fire in another new design.



The Ferranti single bar fire in plain but attractive finish.



The "Lillies" fire of Electrical Utilities, Ltd., fitted with trivet.

A new model introduced by The General Electric Co., Ltd.

model is sturdily built and attractively designed. It is no bigger than a portable gramophone. There is a choice of two case coverings—either rexine or real hide.

The ultra air chrome screened-grid set, manufactured by the ULTRA ELECTRIC, LTD., 661–663, Harrow Road, London, N.W.10, employs four Cossor valves, a screened-grid high-frequency valve, detector and two transformer-coupled, low-frequency valves. Both the aerial and the h.f. stages are independently tuned. Long and short waves are controlled by two simple switches. The tuning range of the short wave band is 240 to 580 metres and 750 to 1 950 metres for the long wave band. Tuning is effected by two edge-operated drums mounted close together with coarse and fine movement. Reaction is incorporated. In readiness for the regional scheme, a station rejector is fitted, which, it is claimed, permits the reception of other stations without any interference from a powerful nearby transmitter. Its sound reproducing system comprises the air chrome speaker.

THE BRITISH RESISTOR CO., LTD., Clare Road, Halifax, suggests the Imbery-Whitehouse electric heat accumulator. The principle employed in this warmer dispenses with the necessity for any electrical connections to the heater when in use in bed. Thus is eliminated any possibility of shock, and the apparatus is "full-proof" in use. Compared with the present types of hot water bottles, where no small amount of labour in filling and carrying is needed, the present warmer is exceedingly popular. It can also be used as a utility device for keeping plates and other utensils warm, when not in use for its specific purpose, and motorists also will find it useful. The dimensions of the heat accumulator are 12 in. by 6 in. by 3 in. All parts are to gauge and interchangeable. Special alloy metals of heat-resisting properties are used in its construction. The heater is constructed to operate on all voltages from 100 to 250 inclusive. The total watts rating is 500. The heating elements are of special type. They operate at a low temperature which ensures cool operation of the terminals and other working parts. The outer container is of welded sheet metal and filled with dry refractory sand of a special nature to give good heat absorption. The outer container and plug connections are nickel plated. Two yards of special flex with adaptor are provided as standard with the heater. The type B. 1 heat accumulator is guaranteed for a period of two years from date of despatch.

SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., 38–39, Upper Thames Street, London, E.C.4, offer a wide range of domestic appliances, some of which are illustrated in these pages. The same company also suggests "Cosyglo" electric fires as being suitable for Christmas gifts, while the Xcel range also possesses many possible sales. Hotplates, bathroom fires, bowl fires, electric cookers, etc., are also suggested. Electric towel rails commend themselves as suitable presents, and in a climate such as ours, where a bath or face towel usually remains damp for some hours after use, these hold out many possibilities.

Whilst considering subjects for Christmas trade the wide range of electrical toys now available should not be overlooked. The "Marklin" series, for instance, obtainable through the W. SEELIG ORGANISATION, 23, White Street, Moorfields, London, E.C.2, includes a comprehensive range of motors for electric drive. These can be operated from either a two or four volt accumulator and are made for driving other plants, toys, boats, etc. Other types are available for use with a.c. mains, while switchboards, searchlights, dynamos, and similar toys are well worth considering.

The same firm also supplies railway sets for running from the supply mains, the voltage being reduced to a maximum 20 by means of transformers in the case of a.c. and motor generators, in the case of d.c. Accessories, such as signals, signal-boxes, lamp standards, etc., also for 20 V operation are also available.

Electrically operated toys are also made by BASSETT LOWKE, LTD., of Northampton. These include battery driven motor boats, railway stock, locomotives, rails and points. An electrically driven model of the "Royal Scot" is included in the range and this for operation with a 6-8 V accumulator. These electric models are very exact in their fidelity to the prototype, including such details as the slope of the firebox top, the outside steam-pipes, the cab with side-windows, the miniature chimney, the self-trimming tender, and every other detail which forms a part of the distinctive outline of the "Royal Scots." Only in the matter of the reduced size of bogie wheels has it been necessary to depart from scale; in this connection prospective users of the model should be reminded that it is undesirable to run a lengthy model of this type, which measures 18 in. overall and weighs 4¾ lb., over curves of less radius than 3 ft.

NEWS IN BRIEF.

The L.C.C. and its Tramway Department—The L.N.E.R. and Electric Cooking—Car Batteries and Merchandise Marks—Birmingham E.C.A. and the E.T.B.I.

MANCHESTER City Architect is to obtain tenders for the electric lighting of the Nell Lane depot.

Bexhill Health Committee recommends the adoption of electric lighting at the isolation hospital.

Hertfordshire Education Committee has decided to instal electric lighting at Barnet Byng Road C.C. School, at a cost of £150.

Contracts for the erection of electricity sub-stations in Kingsway and in Newfields (Tunstall), at £1 415 and £650 respectively, have been placed by Stoke-on-Trent Corporation.

A new all-electric cooking and refrigerating kitchen and restaurant car on the L. & N.E.R. 8.30 p.m. Hook Continental express from Liverpool Street was put into service last week.

At a general meeting of the Royal Institution last week, with Sir Robert Robertson, treasurer and vice-president, in the chair, Col. G. R. Crosfield and Mr. E. H. Neville were elected members.

The Standing Committee of the Board of Trade is to consider applications for Orders-in-Council to require the marking with an indication of origin of imported motor-car accessories, fittings and batteries.

The Birmingham Branch of the E.C.A. is holding a dance at "Tony's" Ballroom, Hurst Street, on November 29th, in aid of the E.T.B.I. Tickets, 2/6 each are obtainable from Mr. S. Dagnall, 420, Stratford Road, Sparkhill, Birmingham.

The annual congress of the British Institute of Radiology, incorporated with the Röntgen Society, will be held at the Central Hall, Westminster, on December 4th, 5th and 6th. A trade exhibition will be held in connection with the congress, and the Sylvanus Thompson and Mackenzie Davidson Memorial and other lectures will be given.

A Church Council meeting at Great Chart has decided that a faculty be applied for in order that the church may be lighted electrically.

Local electrical contractors have expressed their intention to support the arrangements made by Douglas Electricity Committee with respect to showrooms.

Hull Corporation's cooker hiring scheme which was inaugurated recently has been very successful. The engineer has been authorised to secure the services of a lady to give electric cooking demonstrations.

A meeting of the Institution of Electrical Engineers, North Midland Students' Section, will be held at the Hotel Metropole, Leeds, on November 19th, at 7.30 p.m., when a discussion, "Should the Railways be Electrified," will be opened by Mr. H. J. Fraser.

Mr. Hugh Quigley states, in an article in "World Power," that home production (in Canada) of purely electrical products covers about 80% of the market requirements, the remainder being met in 1927 by 16·7% from the United States and 2·1% from Great Britain. The obstacles placed in front of British trade are to be found, above all, in the developments of power finance, and the only possibility of meeting such competition lies in a more determined effort to bring to the attention of Canada the technical and economic capacity of the British electrical industry.

LOOKING BACKWARD.

FIFTY years ago according to THE ELECTRICIAN, *dated November 15th, 1879:—*

The use of electric light in "The Times" offices was extended to the making-up room.

It was stated that in laying the original Red Sea cable 106 miles were stretched to 107, this being one of the causes of failure.

An appreciation of James Clerk Maxwell, who died on November 5th, said that "he was not simply a man of science . . . His love of humour was so apparent that those who were not most intimately acquainted with him frequently found it hard to decide when he was in earnest."

* * *

TWENTY-FIVE years ago THE ELECTRICIAN, *dated November 18th, 1904, recorded that .—*

The National Telephone Co. was refused permission to place wires over the Thames at Wallingford.

Mr. Swinburne urged the cultivation of the business side of engineering, "as this is more remunerative than purely technical or professional work."

* * *

FIFTEEN years ago it was recorded in THE ELECTRICIAN *of November 13th, 1914, that :—*

Differences between contractors and central station engineers were discussed at a meeting of the "Point Fives" Association.

* * *

TEN years ago THE ELECTRICIAN, *dated November 14th, 1919, stated that :—*

Mr. W. S. Foale, engineer and manager of the Portsmouth Electricity Department, died, aged 46 years.

Mr. Thomas Clark retired from the service of the Telegraph Construction and Maintenance Co., with whom he had been connected for over 54 years.

Tenders are invited for the erection of a telephone exchange in Bayswater, London.

A tender for the erection of a sub-station, to cost £2 672, at Norman Lane, Eccleshill, has been accepted by Bradford Corporation.

Torquay Electricity Committee has given permission to the East Devon Electrical Association for Women to visit and inspect the Newton Abbot power station on January 2nd, 1930.

The next meeting of the Institute of Fuel will be held at University College, Nottingham, to-day, Friday, when a paper will be presented by Dr. J. W. Whitaker entitled "Coals and Their Impurities."

Mr. E. J. Jennings, secretary of Birmingham Electric Supply Department, lectured to the members of the Birmingham and Midlands Branch of the Electrical Association for Women at the Birmingham Y.M.C.A., on October 31st, on "Supply Undertakings and the Domestic Consumer."

The third lecture of the 20th E.L.M.A. Illumination Design Course took place on November 4th, and was attended by a representative gathering of the electrical industry, numbering 95. The address was delivered by Mr. T. Catten on the subject of "Selling Better Lighting to the Shopkeeper."

Sir Hugo Hirst presided at the dinner of the Incorporated Society of British Advertisers on October 30th at the Hotel Cecil, London. Sir Edward Crowe, comptroller-general of the Department of Overseas Trade, said the proverb "good wine needs no bush" was inaccurate to-day. The best goods needed the best advertisements, and they should see that the article came up to the description in the advertisements. Exhibitions were a very good way of advertising.

Mr. W. Imrie Smith delivered an address on Modern Lighting Methods, at a Rotary Club Luncheon in Edinburgh, on October 31st.

The intermediate and final examinations prescribed by the Board of Trade under the Register of Patent Agents Rules, 1920 and 1926, will be held by the Chartered Institute of Patent Agents, at Staple Inn Buildings, London, W.C.1, in April next.

The Calcutta Electric Supply Corporation has decided to construct a tunnel under the river Hooghly for the accommodation of cables and electric mains supplying the east bank of the river. The contract for the construction has been placed with John Cochrane and Sons, Ltd.

London County Council Highways Committee, reporting in regard to the resignation of Mr. J. W. J. Townley, electrical engineer in the tramways department, states that 26 applications for the vacant position were received, five candidates were invited to attend for interview and one of the selected candidates subsequently withdrew. The response to the advertisement was disappointing and it has therefore considered what further steps should be taken for filling the position. The Committee is of opinion that, in order to widen the field of candidature, the remuneration attaching to the position should be increased, and it proposes that an inclusive scale of salary of £1 700 a year, rising by annual increments of £100 to £1 900 a year, should be fixed.

OVERSEAS TRADE.

Electrical Exports for Ten Months £9 405 064 in Excess of Imports.

UNITED Kingdom exports of electrical machinery, apparatus and material during October amounted to £1 925 580, an increase of £380 458 when compared with the same month last year. Similar exports for the ten months of 1929 amounted to £15 995 778, or £747 190 more than during the corresponding period of 1928. Imports of electrical goods during October last amounted to £1 007 423, as against £650 798 during the same month last year, the increase being £356 625. During the ten months of this year imports, by comparison with the same months last year, increased by £1 433 605.

The excess of exports over imports during October was £918 157, an improvement of £370 548 on the September figures. For the ten months the excess was £9 405 064.

Exports of rubber insulated wires other than telegraph and telephone improved during the month by £28 140; similar wires other than rubber insulated, by £91 779; telegraph and telephone wires other than submarine, by £85 917. Other large increases were recorded in shipments of telegraph and telephone instruments excluding valves, electric glow lamps, switchboards and various electrical goods.

The increased value in imports was brought about largely by electrical machinery, increase, £40 130; telegraph and telephone instruments, £160 901; electric glow lamps, £47 344, and batteries and accumulators, £27 169.

The following are detailed figures :—

	Month of October		Ten Months.	
	1928.	1929.	1928.	1929.
	£	£	£	£

PERSONAL.

SIR Felix Pole, chairman of the Associated Electrical Industries, Ltd., has returned to England from the United States.

Miss G. F. Sharp, daughter of Mr. E. E. Sharp, of Venner Time Switches, Ltd., has published a new book, entitled, "The Rising Sun."

Mr. J. F. Richards, rolling stock superintendent of Oldham Corporation Tramways, has been appointed general manager in succession to Capt. J. C. Jackson, who is leaving for a similar position at Plymouth.

Mr. E. E. Rosen, managing director of Ultra Electric, Ltd., greeting Mr. F. Marchev, president of the Temple Radio Corporation, on the latter's arrival at Southampton recently.

Lt.-Col. N. H. Firmin has been presented with a gold cigarette case by the chief officials of the Newcastle-upon-Tyne Electric Supply Co., Ltd. in connection with his leaving the company to take up an appointment in London.

Coun. F. Stafford Clark, who has since 1927 been chairman of the Electricity Committee, has been elected Mayor o Bromley, Kent.

Mr. John Walsh, electrical engineer, Blackburn, who has represented St. Mark's Ward as a Conservative for the past eight years, was defeated in the recent municipal election by 48 votes.

At Oxford University on Tuesday, Congregation passed a decree conferring the title of Reader in Engineering Science upon Mr. E. B. Moullin, of King's College, Cambridge, a lecturer on engineering in that university. Mr. Moullin is well known for his work on wireless, and has largely reorganised the Engineering School at Cambridge.

An interesting event took place at St. Pancras (London) station on November 9th, when Mr. John Ritchie, late commercial manager of the Marconiphone Co., Ltd., was presented with a portable receiver on the occasion of his leaving for Australia, where is he to manage the Australasian Branch of the Gramophone Co. (H.M.V.). The presentation was made by Mr. C. W. Charlesworth general manager of the company.

The Nobel Prize for Physics for 1928, it is reported from Stockholm, has been awarded to Prof. O. W. Richardson, F.R.S., Yarrow Research Professor of the Royal Society and Director of Research in Physics at King's College, London. Professor Richardson is best known for his research work relating to the emission of electrons from hot bodies. It was he who named the science of the behaviour of these electrons "thermionics." For his work in this subject he was awarded the Hughes Medal by the Royal Society in 1920.

An interesting function was held at the Reform Club, Sheffield, recently, when a number of business friends gave a complimentary dinner to Mr. A. E. Jepson, who has left the General Electric Co., Ltd., Sheffield, to take up a position, as already announced, with the Manchester branch. Coun. Melling was in the chair, supported by Mr. T. Beardsell, and a gold wristlet watch, suitably inscribed, was presented by Mr. H. Clarke. This follows a presentation made by the Sheffield staff of the G.E.C. to Mr. Jepson of a Sheffield plate candelabra, on September 16th.

Obituary.

MR. W. E. HELLIER, on November 3rd. He was publicity manager of Venner Time Switches, Ltd.

MR. NAROTTAM MORARJI, at Bombay. He was a director of the Tata Hydro-Electric Power Supply Co., Ltd.

PROF. G. F. CHARNOCK, on November 7th. He was honorary secretary of the Bradford Engineering Society, and died the day after the opening of the Bradford Engineering Exhibition. He had been Professor of Engineering at Bradford Technical College since 1903.

SIR HENRY KIRK, on November 9th, aged 81 years. He was selected in 1902 to be Director-in-Chief of the Indo-European Telegraph Department, and retired in 1912. He was the senior delegate for India at the International Telegraph Conferences held in London in 1906, and 1912, and at Lisbon in 1908.

LEGAL INTELLIGENCE.

General Electric and Marconi's Agreement "Unlimited as to Time."

MR. JUSTICE EVE, in the Chancery Division, on November 6th, gave judgment which he had reserved in the case of the General Electric Co., Ltd., against Marconi's Wireless Telegraph Co. Ltd., and also in the case of the same plaintiffs against Marconi's Wireless Telegraph Co. and the M.O. (Marconi Osram) Valve Co., Ltd. Both cases related to two agreements, one between Marconi's Wireless Telegraph Co. and the General Electric Co. and the other between these companies and the M.O. Valve Co.

The question raised was whether, as the General Electric Co. said, the agreements were permanent, or whether, as Marconi's Wireless Telegraph Co. said, they either were for a definite term or had been determined. Marconi's Wireless Telegraph Co. and the General Electric Co. formed the M.O. Valve Co. to acquire from the General Electric Co. a factory and equipment owned by them at Brook Green for the manufacture of radio valves, and Marconi's Wireless Telegraph Co. said the obligation of the parties were co-terminous with the lease of the factory. The General Electric Co. took an opposite view.

His Lordship, in the course of his judgment, said: Could he imply from the fact that a term of ten years was fixed for the lease, an agreement either that the adventure was to be existent for that period and no longer—in which case it would have automatically come to an end when the lease expired—or alternatively, that any party might by reasonable notice put an end to it on or after the date when the lease ran out? He did not think he could. The agreement was indefinite and was unlimited as to time. Some term had necessarily to be fixed for the duration of the lease, but there was not a word in the document to indicate that any of the obligations undertaken by the contracting parties outside those embodied in the lease were to subsist only so long as the lease was running. The more he examined the document the less able did he feel to raise any implication that the parties contemplated their relationship as being in any way dependent upon the leasehold term. In his opinion it was not. The result was that the applicants were entitled to a declaration that the agreement was not determined on May 25th, 1929, and Marconi's Wireless Telegraph Co. had no power to determine it. The costs must be paid by Marconi's Wireless Telegraph Co.

Rochdale and Terms of an Agreement.

In the Manchester Chancery Court on October 28th the Vice Chancellor, Mr. Courthope Wilson, K.C., had before him a petition in which the plaintiffs were the Lancashire Electric Power Co., Ltd., and the defendants were the Rochdale Corporation. The Court was asked to decide a question as to the construction of clause 7 in an agreement between the parties dated November 22nd, 1926.

Mr. Craig Henderson, K.C., and Mr. J. Bennett, appeared for the plaintiffs; Mr. C. E. R. Abbott represented the defendants.

Mr. Henderson said the agreement provided for the supply of electrical energy in bulk to the Corporation at a price made up of a kilowatt charge and a unit charge. Either party might give six months' notice in writing to the other requiring the prices to be revised, and must state in the notice the grounds upon which, and the manner in which, they desired the prices to be revised. In the event of disagreement as to the revision of prices the dispute was to be referred to arbitration. On September 27th, 1928, the Town Clerk sent to the plaintiffs a notice requiring the prices to be revised as from March 31st, on the ground that as the maximum demand of the Corporation had increased the kilowatt charges should be reduced. The matter was referred to Dr. S. L. Pearce, the engineer-in-Chief of the London Power Company, when differences arose as to the proper construction of clause 7 of the agreement. The Corporation claimed that the arbitrator could only consider the revision of prices specified in the notice, which set forth the grounds upon which and the manner in which the Corporation desired the prices to be revised. The company contended that the whole question of revision was referred to the arbitrator, whose duty it was to determine a reasonable price having regard to all the facts and circumstances proved before him, without being in any way restricted by the original notice. With the consent of the arbitrator the parties agreed that this question should be decided by the Court.

The Vice Chancellor held that if one party gave notice of revision, satisfying the condition precedent of clause 7, the whole matter was at large when it came before the arbitrator. Therefore he made a declaration that the arbitrator had power to consider any revision of prices upon which a disagreement had taken place after notice given, and that the whole question of revision, and not merely any specific revision which may have been asked for by one party by a preliminary notice, was referred to the arbitrator, and it then became his duty to determine such price as to him seemed reasonable.

The costs of these proceedings would be costs in the arbitration unless the parties had already made an agreement about them.

Valve Holder Patents.

In the Chancery Division on November 7th, Benjamin Electric, Ltd. and the Igranic Electric Co., Ltd., sought an injunction to restrain Garnet Whiteley and Co., Ltd., from infringing the plaintiffs patents for improvements in wireless valve holders.

Mr. Trevor Watson, for the plaintiffs, said the infringement complained of was the selling by the defendants of certain valve holders. The defendants admitted the sale, but pleaded that the holders they sold did not infringe the plaintiffs' patents, and that those patents were invalid. The patents in question related to holders for valves used for rectification and amplification in wireless telegraphy and telephony and the inventions aimed at the provision of valve holders which would be shock absorbing and also ensure sufficient rigidity of electrical contact.

At the conclusion of the arguments on Monday, his Lordship intimated that he would take time to consider his judgment.

IN PARLIAMENT.

Appointment of Additional Electrical Inspectors of Mines.

IN the House of Commons on November 6th Mr. Gordon Macdonald moved for the appointment of a committee of inquiry to make suggestions for new legislation relating to mines. He said the whole body of mining regulations made in 1911, before the introduction of electrical machinery, needed thorough revision. In the course of the debate, the Secretary for Mines (Mr. Ben Turner) announced his intention of appointing additional electrical inspectors of mines, whose duty would be mainly that of inspecting electrical plant below ground. He hoped to appoint four, including one at head office. The motion was agreed to.

Railways Nationalisation.

Mr. F. A. Broad moved a resolution in the House of Commons on November 6th expressing the opinion that the solution of our transport difficulties would only be found in the nationalisation of railways and long distance road transport. An amendment disapproving of the motion and recommending that the House should decline to anticipate the report of the Royal Commission was defeated, but Mr. Broad's resolution was talked out.

Replies to Questions.

The rental for a telephone circuit to a private residence is already less by 30s. per annum than for a circuit to business premises. The costs of providing and maintaining the circuit and equipment do not depend on the amount of use made of the service. A further reduction in the rental is not practicable at present.

The question of improving the telephone service between this country and South America is engaging the attention of the Postmaster-General.

Amongst the schemes of development which the railway companies propose to carry out consequently upon the repeal of the Railway Passenger Duty are the following: Great Western Railway Co., substitution of electric light in gas-lit stock, £80 000; L. and N.E. Railway, substitution of electric light in gas-lit stock, £56 000; Southern Railway, electrification of lines between Coulsdon and Brighton, between Redhill and Guildford and between Preston Park and Brighton, £2 100 000.

In regard to the London Power Co.'s Battersea power station scheme, an interim report of the government chemists on the precautions proposed to be taken for consumption of smoke and prevention of evolution of oxides of sulphur has been received, and is under consideration.

The Minister of Transport has been informed that the L. and N. E. Railway Co. has under consideration schemes for the improvement of Liverpool Street (London) Station and the electrification of the suburban area served by that station.

COMMERCIAL MOTOR TRANSPORT.

Brief Descriptions of Some of the Electrical Exhibits at Olympia—Trolley-Buses, Petrol-Electrics and Portable Tools Among the Items Shown.

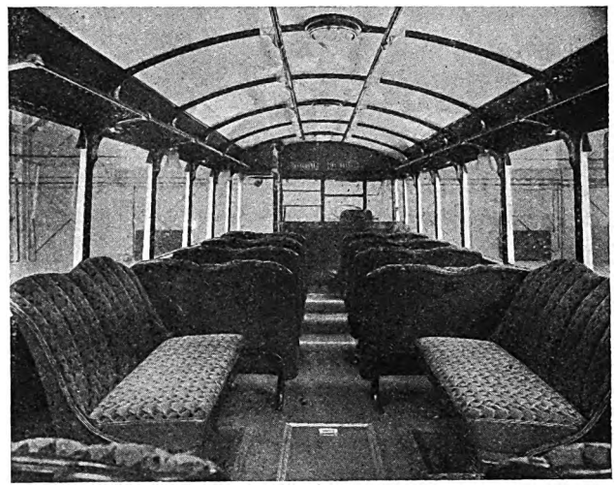
JUDGING from a visit to the Commercial Motor Transport Exhibition which opened at Olympia, London, on November 7th, one of the most likely large-scale applications for electricity in the field of road transport is the trolley-bus. Several of these vehicles are on view, and among them may be mentioned that produced by THE ENGLISH ELECTRIC CO., LTD., of Queen House, Kingsway, London, W.C.2. This bus accommodates 56 passengers, and has an overall length of 28 ft. 6¾ in. The layout has been kept as simple as possible, a special twin motor mounted near the centre of the vehicle transmitting the drive to the rear bogie through a cardan shaft. The bogie is arranged with a third differential—accommodated in the front of the foremost axle—to ensure that the two axles are equally loaded under all conditions. The bogie is provided with double swivelling points, which equalise the load on each axle under all conditions of braking and acceleration. Three separate brakes are provided. The electric brake works on the transmission, the braking being obtained by operating the motor as a generator and dissipating the energy in the resistance. The effective and even braking thus afforded can be used from all speeds down to a minimum stated to be approximately 4 m.p.h. Secondly, there is an air brake operating on each of the six wheels; on the rear bogie the air-cylinders are mounted directly on the axles, enabling brake rigging to be reduced to a minimum. The third brake, which is manual, operates on the four rear wheels. The electric motor is a D.-K. 122 twin, rated at 80 H.P. It consists of two armatures mounted on the same shaft and in the same frame. The motor is of the interpole self-ventilated type and is made in a specially flat shape so as to give a low floor height and small angle of drive at the universals, while retaining the advantage of the short propeller shaft. Although the motor has been specially designed, with a view to giving the maximum of lightness, none of the usual features of the "English Electric" traction motor have been sacrificed. Dynamic balancing is one of the new features which have been incorporated.

The foot-operated controller is mounted at the side of the driver's seat. It is of the cam shaft contactor type, having a total of eight power notches, made up of four series, three parallel and one reduced field. It is fitted with a ratchet and pawl operating mechanism, whereby it can only be advanced one notch at a time, to ensure even acceleration. The electric brake has four notches, and braking is obtained by means of a foot pedal adjacent to the controller pedal—a brake changeover switch is first actuated, and the resistance is then cut out in steps through the main controller in the same way as when operating on power. The resistances are of the continuous unbreakable strip type, and are carried on the side frames of the chassis.

The twin trolleys mounted on the roof enable the vehicle to operate at a distance of 16 ft. to either side of the centre line between the trolley wires.

An electric trolley-bus shown by the English Electric Co., Ltd.

GUY MOTORS, LTD., of Wolverhampton, also show a trolley-bus, the motor of which is a special compound wound machine The vehicle is capable of smooth yet rapid acceleration, while a stable position of the power pedal is claimed to be maintained at all speeds. At the same time gentle retardation is provided on down grades and on the level, reducing the use of mechanical brakes to a minimum. Under slow traffic conditions it is said to be unnecessary to introduce resistance in series with the motor unless speeds under 10 m.p.h. are involved—and even then only a relatively small amount of resistance will be required.



The interior of one of the buses shown by the Brush Electrical Engineering Co., Ltd.

The motor is a Rees-Roturbo special compound interpole, rated for 60 B.H.P., 500 V and 900-2 500 r.p.m. Its capacity for heavy overload is in accordance with B.S.S. No. 173/1928. The armature appears to be of the standard drum type, the coil being held in the slots by hardwood wedges. The shunt field coils are former wound, insulated with micanite and taped. The series field coils are wound with double cotton covered wire, stoved, impregnated in vacuo under pressure, and similarly insulated.

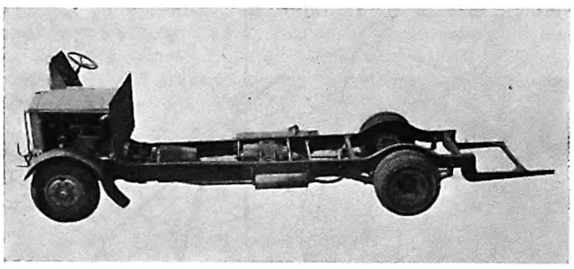
The control gear consists of a "Stevens" combined drum-type controller and shunt regulator, mounted on an aluminium case. The controller actuates a contactor panel of standard manufacture. The starting resistance is of the unbreakable non-corroding type, designed specially for heavy traction service. Mounted on an aluminium case is a patent reversing switch, which is mechanically interlocked with the control lever so that the controller cannot be operated with the switch in the "off" position. Thus, by combining shunt and series winding with regulating resistance an easy start and smooth acceleration are obtained; the series starting resistance is actuated by contactor gear in conjunction with the power pedal control, the current on each contact being reduced to a negligible amount.

To prevent the voltage of the generator rising above the line voltage when the vehicle is coasting with the power pedal in the "off" position and with the outside supply cut off a resistance is automatically brought in circuit with the shunt winding, to keep the voltage of the machine within safe limits. A further safety device can be provided to retard backward running of the vehicle if the trolley pole leaves the line. This consists of an additional pair of contactors which short-circuit the armature and series coils of the motor immediately the line current is broken. The arrangement is stated to limit the run-back speed of the vehicle to 2 or 3 m.p.h.

Another trolley-bus exhibit is the six-wheeled chassis manufactured by RANSOMES, SIMS AND JEFFERIES, LTD., of Orwell Works, Ipswich. The model is one of a fleet of six which is being supplied to the Nottingham Corporation. It is constructed to carry a double-deck, top-covered body, having a seating capacity for 60. The main-frame members of the chassis are constructed in high-tensile steel, and are braced with pressed-steel and tubular cross-members. The bogie

Digitized by Google

which is built under Thornycroft patents, employs two inverted, semi-elliptic springs on each side. In addition to the usual two differentials working in a lateral direction, one in each side of the bogie, a third is provided to distribute the drive equally between the two axles. This construction is claimed to increase the life of the tyres, and to decrease current consumption. The motor, which is constructed to B.S.S. for traction motors, is an 80 B.H.P. double-armature type of Ransome's manufacture. with series-parallel control. The Marles steering system is employed, and the steering column is well raked. The brake pedal controls a Westinghouse gear,



A petrol-electric chassis of Tilling-Stevens Motors, Ltd.

which brings into operation shoes on all six wheels. The hand lever controls shoes on the wheels of the bogie. The Ransome cam gear is incorporated—it expands both sets of shoes on each drum when the service brake is called upon, but only one set of shoes per wheel when the hand lever is applied.

TILLING-STEVENS MOTORS, LTD., of 5, Iddesleigh House, Caxton Street, London, S.W.1, are exhibiting a four-wheeled petrol-electric chassis with forward steering and 16 ft. wheelbase; Dunlop pneumatic tyres, size 36 in. by 8 in., are fitted—single front and twin rear. This chassis is designed for passenger bodies with seating for 52. The engine has a Treasury rating of 36·15 H.P., and is stated to develop 95 H.P. There are four cylinders, bore 4¾ in., stroke 6 in. The final drive is by worm. The C.A.V. "Myt" constant voltage system of electric lighting is fitted.

An interesting novelty is on view on the stand of GENERAL MOTORS, LTD., of The Hyde, Hendon. It takes the form of a travelling shop; by means of a small electric motor the sides of the van can be expanded beyond the wheels and the roof can be raised, so that the interior is enlarged. The salesman is thus able to display his wares during tours of villages.

THE BRUSH ELECTRICAL ENGINEERING CO., LTD., of Falcon Works, Loughborough, is exhibiting two examples of bus bodies, one single deck saloon type and one double-deck top-covered type. The single deck saloon bus body has front entrance and door, and a seating capacity of 30 passengers. The vehicle is mounted on a chassis of the Leyland Lion 4 type, having a wheel base of 16 ft. 7¼ in., the overall length being 26 ft. and the overall width 7 ft. 6 in. The body is built to the registered designs of the British Electrical Federation, Ltd., and incorporates a new type of seat upholstered in blue lozenge moquette. A novel form of parcel rack, with which the interior lamps are combined, is fitted, the ceiling immediately above being covered with leather. The general furniture is chromium plated, with grabs and other such fitments covered in blue composition material to match the upholstery scheme. The inside lining panels are covered in blue rep, with cappings and finishers in mahogany. The double-deck top-covered bus body had a seating capacity of 24 passengers in the lower saloon and 26 passengers upstairs. This vehicle is mounted on a Crossley six-cylinder 38/110 H.P. double-deck chassis with forward steering. The overall length is 25 ft. 11⅞ in., the overall width 7 ft. 5 in., and the wheel base 16 ft. 7½ in. It embodies several new features, particularly in regard to ventilation. The lower saloon has air extractors along each side, and the front end is fitted with two ventilators of a new movable panel type. The upper saloon has a three-piece roof, with ventilators along each side; these, together with the panel ventilators, are covered by provisional patents. A parcel rack is provided over each wheel arch, and internal fittings are chromium plated. The interior woodwork is in light oak and mahogany, with rep-covered lining panels.

C. A. VANDERVELL AND CO., LTD., Acton, London, W.3, are devoting their stand chiefly to the compensated voltage-control dynamo lighting system, which is standardised on a large number of motor buses and coaches. This system consists of a simple shunt wound dynamo, used in conjunction with a voltage regulator. The system is being demonstrated under actual running conditions on the stand, The other exhibits include the Luvax shock absorbers and Luvax-Bijur chassis lubricating system.

THE BRITISH THOMSON-HOUSTON CO., LTD., Alma Street, Coventry, is showing a number of magnetos—designed for use on commercial vehicles of all kinds—and also combined magneto-coil ignition sets, impulse startors, automatic ignition timing devices, flexible magneto couplings with infinitely variable adjustment, and Fabroil silent timing gears.

The Hobart "one day battery charger," exhibited by FREDK. J. GORDON AND CO., LTD., of 92, Charlotte Street, London, W.1, enables one to charge a full size startor battery in 6-8 hours, so that the motorist can bring his battery in the morning and be sure of having it fully charged the same same night. The charger is entirely automatic and with the constant potential system it is impossible to overcharge the battery. The equipment is of the motor generator type, with two commutators giving an output of 50 and 100 A at 15 V and 7½ V respectively. The Hobart electrical test bench is a complete unit for testing dynamos, startors, magnetos, coil ignition and batteries. It is fitted with a variable speed reversible motor capable of handling all types of electrical equipment.

A large range of accessories is on view at the stand of B.E.N. PATENTS, LTD., 92, Tottenham Court Road, London, W.1. Two models of car washer are displayed—the "B.E.N.-Myers," and the "B.E.N.-Myers Universal one-gun." Models of air compressors suitable for almost every requirement are included; capacities from 1-124 c. ft., per min. Air-cooled, water-cooled, fully automatic and semi-automatic types are provided. A complete series of B.E.N. portable electric tools is also exhibited, including drills, decarbonising outfits, valve grinders, valve refacers, combination reamer and decarbonising machines, toolpost grinders, bench and pedestal grinders, buffers and sanders.

Another exhibit among the accessories which is of electrical interest is on the stand of FLEXIBLE LAMPS, LTD., 59, New Oxford Street, London, W.C.1. It consists of "Rubbelite" tail lamps which, being made of rubber, are unbreakable and vibrationless. The "Rubbelite" lamp is stated to be practically foolproof. In the most interesting model, which is a patented combined stop-signal and rear lamp, two separate lampholders with connectors supply the illumination to the two compartments; wiring up is a simple operation, the flex being screwed in the interior of each compartment with no necessity for soldering. The division between the upper (or stop-signal) part of the lamp is made of rubber moulded in one piece with the rest of the lamp. This construction, it is pointed out, obviates the risk of the dividing piece working loose, with the possibility that the "stop" sign may be more or less permanently visible. The lamps are fitted with wide windows which will illuminate thoroughly either a rectangular or square plate. Extra glasses are supplied, so that in the event of a collision breaking the rear glass the spare can instantly be inserted and the journey resumed.

THE SOCIAL SIDE.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

BRAINTREE GUARDIANS.—Electric light installation at the Institution. Particulars from the Clerk.

LIMERICK MENTAL HOSPITAL.—Electric lighting installation throughout hospital.

BELFAST EDUCATION COMMITTEE, November 15th.—Electric light installation at Harding Memorial Public Elementary School, Cregagh Road, Belfast. Specification, etc., from the Education Architect, Victoria Street, Belfast; deposit £1 1s.

FRAMLINGHAM PARISH COUNCIL, November 15th.—Supply and fixing of an electric pump and gearing to the water supply known as Jeaffreson's Memorial Well, Framlingham. Specification can be seen by appointment, with the clerk, Mr. H. C. Taylor, Double Street, Framlingham.

Ironbridge Power Station.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, November 15th.—Supply and erection at Ironbridge power station of (*a*) two 6 000 kVA, 33 000/3 300 V, 50 cycle, indoor type transformers, with off-load tap changing switches; (*b*) two 1 200 kVA, 3 300/400/230 V, 50 cycle, indoor type transformers with off-load, tap changing switches; (*c*) two 150 kVA, 3 300/400/230 V, 50 cycle, indoor type transformers, exclusive of tap-changing switches. Specification (No. 7) and form of tender from Mr. E. F. Hetherington, at the offices of the Authority, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

COLWYN BAY URBAN DISTRICT COUNCIL, November 16th.—Supply, erection and laying of e.h.t. and l.t. overhead lines and cables for Glan Conway and Llysfaen supply. Specifications from the Engineer, Electricity Offices, Colwyn Bay; deposit £1 1s.

LANCASTER CORPORATION, November 16th.—Supply of medium tension, four-core, paper insulated, lead covered, steel tape armoured cables of British manufacture. Specification, etc., from Mr. G. C. Milnes, borough electrical engineer, North Road, Lancaster.

WAREHAM CORPORATION, November 16th.—Four centrifugal pumps and electric motors, with automatic control, etc. Specifications from Mr. W. E. Blizard (Messrs. Lemon and Blizard), Castle Lane, Southampton; deposit £2 2s.

BOOTLE CORPORATION, November 18th.—Electric light installation in dressing pavilion and conveniences at Orrell playing, fields Captains Lane, Bootle. Specification, etc., from Borough Engineer, Town Hall, Bootle.

GLASGOW CORPORATION, November 18th.—Electric lighting installation at Shieldhall Hospital. Specifications, etc., from the General Manager, Electricity Department, 75, Waterloo Street, Glasgow.

GLASGOW CORPORATION, November 18th.—Electric lighting installation in connection with Janefield Street re-housing scheme. Specifications, etc., from General Manager, Electricity Department, 75, Waterloo Street, Glasgow.

MID-GLAMORGAN WATER BOARD, November 18th.—Electric lighting work, supply of transformers, switchboards, meters, etc., in connection with construction of pumping station, etc., at Schwyll, Ewenny, near Bridgend, and installation of electrical depth transmitters on various reservoirs, with cables, etc. Specifications, etc., from the Board's Offices, Bridgend, or from Messrs. Thomas and Morgan and Partners, civil engineers, Pontypridd; deposit £2 2s.

WARRINGTON CORPORATION, November 18th.—Supply of e.h.t. sub-station switchgear. Specification, etc., from Mr. F. V. L. Mathias, borough electrical and tramway engineer, Warrington; deposit £1 1s.

EAST RETFORD CORPORATION, November 19th.—Electrically driven centrifugal borehole pump (60 000 gall. per hour). Specification from Mr. S. O. Pacey, Gas and Water Electricity Offices, East Retford; deposit £2 2s.

MANCHESTER GUARDIANS, November 19th.—Supply and erection of electric hospital bed lift at Withington Institution, Nell Lane, West Didsbury, Manchester. Particulars from Mr. Hargreaves, Union Offices, All Saints, Manchester.

WALLINGFORD RURAL DISTRICT COUNCIL, November 19th.—Electric light wiring of 34 houses at Cholsey, Berks. Specification, etc., from the Clerk, 7, St. Martin's Street, Wallingford.

FIFE EDUCATION AUTHORITY, November 20th.—Electrical work at reconstructed Cowdenbeath School. Schedules (£1 1s. deposit) from Mr. Geo. Sandilands, architect and master of works, Education Offices, Kirkcaldy.

ALLOA CORPORATION, November 23rd.—Electrical installation work in connection with erection of 36 houses at Ashley Terrace, Alloa. Schedules, etc., from Messrs. J. Melvin and Son, architects, Mar Street, Alloa.

MANAGERS OF CENTRAL LONDON SCHOOL DISTRICT, November 23rd.—Electric motor, with reduction gearing, startor, etc., Specification from Mr. G. P. Morrell, clerk to the Managers, Greenford House, Hanwell, London, W.7.

SALFORD CORPORATION, November 25th.—Electric travelling and slewing jib crane (2½ tons capacity). Specification, etc., from the City Electrical Engineer, Frederick Road, Salford.

PLYMOUTH CORPORATION, November 25th.—Supply of steel lamp columns. Specification, etc., from the City Electrical Engineer, Electricity Department, Armada Street, Plymouth.

STONE (STAFFS) URBAN DISTRICT COUNCIL, November 25th.—Overhead 11 000 V transmission line (2 300 yds.), outdoor sub-stations (2–50 kVA), l.t. overhead distribution (1 400 yds.), services, etc. Specification from Mr. W. M. Selvey, Independent Buildings, Sheffield; deposit £2 2s.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC., November 28th.—High tension and low tension switchgear, transformer and cables, for H.M. Office of Works' generating station, South Kensington, S.W. Specification, etc., from the Contracts Branch, King Charles Street, London, S.W.1; deposit £1 1s.

STOCKPORT CORPORATION, December 2nd.—Supply and erection of 6 600 V switchgear, comprising metal-clad, compound-filled switch units. Specification (No. 3A) from Mr. R. Lee, borough electrical engineer, 23, Tiviot Dale, Stockport; deposit £1 1s.

NEWBURY CORPORATION, December 5th.—Electric motors, starting gear and centrifugal pumps, with ancillary works, at pumping station. Specification, etc., from Messrs. Howard Humphreys and Sons, 28, Victoria Street, Westminster, S.W.1, on and after November 18th; deposit £3 3s.

STEPNEY (LONDON) BOROUGH COUNCIL, December 5th.—Installation of wireless receiving equipment and apparatus at each of the Council's three hospitals, with l.t. charging machines. h.t. generators, motor to drive generators, accumulators, etc. At the three hospitals the requirements include 1 160 pairs of headphones and 24 loud speakers. Specifications, etc., from the clerk, Mr. S. McClelland, Bancroft Road, Mile End, E.1; deposit £1.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

BOMBAY, BARODA AND CENTRAL INDIA RAILWAY CO., November 15th.—(1) Primary battery supplies; and supply of (2) gasfilled and vacuum lamps, (3) overhead contact wire and stranded catenary cable. Specification (10s.) from the secretary, Mr. S. G. S. Young, The White Mansion, 91, Petty France, Westminster, S.W.1.

SOUTH AFRICAN RAILWAYS AND HARBOURS, November 15th.—Supply of 42 000 lb. of galvanised signal wire and 31 500 lb. of galvanised point wire (tender No. P.S. 2 025). (Reference A.X. 8 712.)

ANGORA POSTS, TELEGRAPHS AND TELEPHONES, November 16th.—Supply of telephone wire, cable boxes and insulators. (Reference B.X. 5 846.)

INDIAN STORES DEPARTMENT, November 17th.—Supply of electric cables for 12 months (order No. 9 920). (Reference B.X. 5 808.)

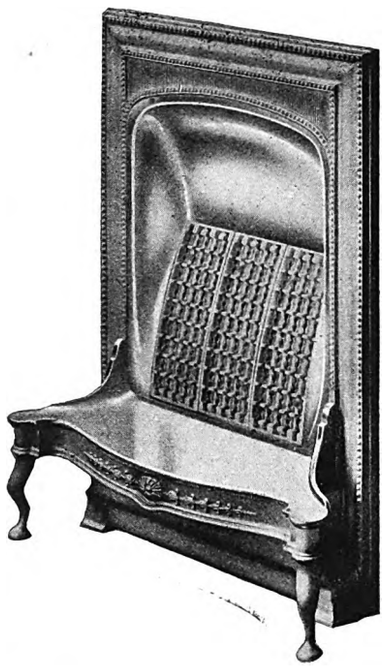
GREAT NORTHERN RAILWAY (IRELAND), November 18th.—Six or 12 months' supply of stores, including electric fittings, lamps, cable, and wire (form 11), and signalling materials

Digitized by Google

(form 26). Tender forms (1s. each), from the Secretary, Amiens Street Station, Dublin.

INDIAN STORES DEPARTMENT, November 18th.—Supply and erection of two 20 kW oil engine driven d.c. generators, etc. (order No. N. 10 253). (Reference B.X. 5 757.)

NEW ZEALAND POSTS AND TELEGRAPHS, November 18th.—Resistance spools (P. and T. 151/1 832). (Reference B.X. 5 716.)



AN attractive 3 kW fire introduced by Domestic Electrification, Ltd., is the "Townsend." The finish is art bronze with chromium plated reflector and fender top.

EGYPTIAN MINISTRY OF THE INTERIOR, November 19th.—Supply of 160 H.P. Diesel-electric generating set for Manfalout power station (Assiut Province). (Reference B.X. 5 720.)

NEW ZEALAND POSTS AND TELEGRAPHS, November 19th.—Telephone transformers (P. and T. No. 151/1807). (Reference B.X. 5 718.)

NEW ZEALAND POSTS AND TELEGRAPHS, November 19th.—Automatic wall and table telephones (P. and T. No. 151/1 825.) (Reference B.X. 5 717.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 19th.—Supply of telephone generators and motor generators (schedule No. C. 479). (Reference B.X. 5 662.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 19th.—Motor generators (schedule C. 486). (Reference B.X. 5 694.)

DUBLIN BOROUGH COMMISSIONERS, November 20th.—Electric lighting and power installation at City Abattoir, North Circular Road, Dublin. Specification from the City Engineer, 28, Castle Street, Dublin, or Mr. F. McArdle, architect, 29, Rosemary Street, Belfast; deposit £3 3s.

INDIAN STORES DEPARTMENT, November 21st.—Supply of h.d., high conductivity, bare, solid copper conductors, for overhead power transmission, for one year (order No. N. 10 280). (Reference A.X. 8 759.)

JOHANNESBURG MUNICIPALITY, November 21st.—Supply of tramcar axles, gear and pinion wheels, etc. (Reference A.X. 8 750.)

SOUTH INDIAN RAILWAY CO., LTD., November 22nd.—Lighting, power and signalling switchgear for stations, in connection with Madras electrification. Specifications, etc. from the company's offices, 91, Petty France, London, S.W.1.

CHRISTCHURCH (N.Z.) MUNICIPALITY, November 23rd.—Supply of pump and electric motor, for Beckenham pumping station. (Reference A.X. 8 737.)

EGYPTIAN MINISTRY OF EDUCATION, November 23rd.—Diesel engines, electric motors, machine tools, etc. (Reference C.X. 3 146.*)

VICTORIAN ELECTRICITY COMMISSION, November 25th.—Watt-hour meters, recording instruments and remote metering equipment, for Metropolitan terminal stations and sub-stations (specification No. 29/92). (Reference B.X. 5 614.)

VICTORIAN ELECTRICITY COMMISSION, November 25th.—Switchgear, for Yallourn power station (specification No. 29/103). (Reference B.X. 5 636.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 26th.—Vitreous resistances, each consisting of wire element wound in vitreous spool, for telegraph battery feeds (schedule C. 489). (Reference B.X. 5 696.)

MELBOURNE CITY COUNCIL, November 27th.—Totally-enclosed, metal clad, 6 000 V, three-phase switchgear (specification No. 1 000). (Reference B.X. 5 708.)

MELBOURNE CITY COUNCIL, November 27th.—Supply of 600 V d.c. switchgear (specification No. 1 001). (Reference B.X. 5 734.)

VICTORIAN RAILWAY COMMISSION, November 27th.—Indication transformers for railway signalling (contract No. 43 412). (Reference B.X. 5 737.)

VICTORIAN RAILWAY COMMISSION, November 27th.—Supply of automatic oil switches (contract No. 34 411). (Reference B.X. 5 735.)

WESTERN AUSTRALIA GOVERNMENT, November 29th.—Supply and erection at Perth of (*a*) boiler house equipment, and (*b*) 12 500 kW turbo-generator and condensing plant. Specifications (£1 1s. for each; not returnable) from the Agent-General for Western Australia, Savoy House, Strand, London, W.C.2.

EGYPTIAN MINISTRY OF THE INTERIOR, November 30th.—Diesel engine driven electric lighting installation at Abou-Tig. (Reference B.X. 5 791.)

BLOEMFONTEIN MUNICIPALITY, December 2nd.—Supply of two electrically driven low lift pumping units and two electrically driven high lift pumping units, with cables, starters, valves, etc. (contract No. 18, 29/30).

BLOEMFONTEIN MUNICIPALITY, December 2nd.—Supply of copper conductors, poles, transformers, switchgear, etc., for electrification of Mazelspoort Waterworks (contract No. 19, 29/30). (Reference B.X. 5 825.)

INDIAN STORES DEPARTMENT, December 3rd.—Ceiling and table fans. (Reference B.X. 5 672.)

VICTORIAN ELECTRICITY COMMISSION, December 9th.—Supply of 3 000 kVA transformers and spares (specification No. 29/119). (Reference B.X. 5 775.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 10th.—Switchboard keys and parts (schedule No. C. 496). (Reference B.X. 5 776.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 10th.—Electric lamps, lamp caps and sockets for telephone purposes (schedule C. 497). (Reference B.X. 5 783.)

GATOOMA (SOUTHERN RHODESIA) MUNICIPALITY, December 12th.—Two fire-tube boilers, steam engines, alternators and switchboard, etc. (Reference A.X. 8 749.)

CHRISTCHURCH DRAINAGE BOARD, December 13th.—Supply and installation of four electrically-driven automatically-controlled pumping plants, each consisting of two horizontal centrifugal pumps with direct-coupled electric motor (contract No. 29/420); and two horizontal type, 3 H.P. a.c. motors direct coupled with centrifugal sewage pumps (contract No. 29/421). (Reference A.X. 8 788.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, December 16th.—Supply and erection of electrically-driven pumping plant, with ironwork, crane and gantries, for Junee water supply. (Reference A.X. 8 740.)

VICTORIAN ELECTRICITY COMMISSION, December 16th.—Oscillograph equipment. (Reference B.X. 5 692.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 17th.—Secondary batteries (schedule C. 505). (Reference B.X. 5 777.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 17th.—Telephone fuses, heat coils and protectors (schedule C. 498). (Reference B.X. 5 784.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 17th.—Loading coil pots (schedule C. 499). (Reference B.X. 5 785.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, December 27th.—Telegraph material, including g.i. tubular arms, insulators, upper tubes for poles, etc. (tender No. 175). (Reference A.X. 8 734.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, December 28th.—Supply and erection at site of Mankabad Barracks of three Diesel engine driven electric generators, and sinking of two wells. Specifications (£1 0s. 6d., not returnable) from Chief Inspecting Engineer, 41, Tothill Street, Westminster, S.W.1.

EGYPTIAN MINISTRY OF PUBLIC WORKS, January 4th.—Supply and erection at site of Meadi Barracks, Cairo, of two Diesel engines to drive existing generators. Specifications (£1 0s. 6d., not returnable) from Chief Inspecting Engineer 41, Tothill Street, Westminster, S.W.1.

Digitized by Google

EGYPTIAN MINISTRY OF PUBLIC WORKS, January 6th.—Supply and erection of plant for supply of filtered and unfiltered water, including pumps, electric motors, etc. (Reference A.X. 8 746.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of testing instruments (schedule C. 504). (Reference B.X. 5 786.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of timing clocks (schedule No. C. 507). (Reference B.X. 5 762.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of contact pressure testers (schedule No. C. 516). (Reference B.X. 5 821.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of telephone hand sets (schedule C. 526). (Reference B.X. 5 823.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 13th.—Supply of four-point jacks (P. and T. 151/1897). (Reference B.X. 5 840.)

VICTORIAN ELECTRICITY COMMISSION, January 13th.—Supply of 2 200 V switchgear and accessories (specification No. 30/2). (Reference B.X. 5 827.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 14th.—Supply of ringing motor-generator sets, for automatic telephone exchanges. (Reference B.X. 5 839.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 14th.—Supply of telephone indicators (schedule C. 518). (Reference B.X. 5 822.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 14th.—Two air compressors (capacity not less than 800 cu. ft. of free air per min.), and two electric motors. (Reference A.X. 8 784).

NEW ZEALAND GOVERNMENT RAILWAYS, January 15th.—Supply of automatic telephone exchange equipment for new station at Auckland. (Reference B.X. 5 841.)

VICTORIAN ELECTRICITY COMMISSION, February 3rd.—Electrically-driven mobile coal-trimming machine, for Yallourn power station. (Reference A.X. 8 681.)

VICTORIAN ELECTRICITY COMMISSION, February 10th.—Supply of sine wave generating equipment and accessories (specification No. 30/3). (Reference B.X. 5 844.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Switchgear and controlling equipment. (Reference B.X. 5 798.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 110 kV switchgear, for interconnecting auto-transformers, for Waitaki power scheme, section 76. (Reference B.X. 5 797.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 66 kV switchgear and protective system for Lyttelton, Lake Coleridge power scheme, section 217. (Reference B.X. 5 796.)

VICTORIAN RAILWAY COMMISSION, March 30th.—Supply of d.c. neutral relays for power signalling purposes (contract No. 43 457). (Reference B.X. 5 793.)

Tenders Accepted.

SWALLOWNEST WESLEYAN CHURCH.—H. Stewart, electric light installation.

HULL CORPORATION.—Siemens and Halske, supply of five miles of lead-in cable.

OLDHAM EDUCATION COMMITTEE.—S. Charlesworth and Co., electric lighting of new clinic at Scottfield.

BRIGHTON CORPORATION.—Edison Swan Electric Co., Ltd., supply of lamps for street lighting for 12 months.

SHEFFIELD CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., supply of ten sets of traction motors, £200 each.

HASTINGS CORPORATION.—Ferranti, Ltd., supply of 375 kVA transformer, at Gypsum Mines, Mountfield, £303 10s. (Recommended).

SLEAFORD URBAN DISTRICT COUNCIL.—General Electric Co., Ltd., supply of feeder control panel and switchgear, £113. (Recommended).

GREAT WESTERN RAILWAY.—Crompton Parkinson, Ltd., supply of transformers to nine new 3-ton cranes at South Quay, Newport.

CARDIFF CORPORATION.—Babcock and Wilcox. Ltd., water tube boiler, £5 740; E. Green and Son, 320-tube fuel economiser, £1 554.

HIS MAJESTY'S OFFICE OF WORKS, ETC.—Greenwood and Batley, Ltd., steam driven generating set, etc., for Rampton State Institution.

WARRINGTON CORPORATION.—Mather and Platt, Ltd., pumps, and Electroflo Meter Co., Ltd., measuring appliances for river filtration works.

GENERAL POST OFFICE.—Telephone exchange equipment, Wanstead, Automatic Telephone Mfg. Co., Ltd.; Morecambe, Standard Telephones and Cables, Ltd.

HAMPTON URBAN DISTRICT COUNCIL.—Twickenham and Teddington Electric Supply Co., overhead cable (£72) and wiring and fittings (£55 10s.) for the sewage works.

LONDON COUNTY COUNCIL EDUCATION COMMITTEE.—Coleby and Co., electrical work at Bloomsbury Trade School for Girls, £337. Stegman and Co., electric lighting at Baring Road School, Lewisham, £215.

SHEFFIELD CORPORATION.—T. A. Ashton, Ltd., maintenance of internal telephone system at hospitals for twelve months, £60; Moorwoods, Ltd., supply of lamp pillars for twelve months, £1 17s. 6d. each. (Both recommended.)

LEEDS CORPORATION.—Pickering, Ltd., provision of electric lift at the boiler house, £661; supply of cables, W. T. Henley's Telegraph Works Co., Ltd., £1 296; Macintosh Cable Co., Ltd., £1 849; and Enfield Cable Works, Ltd., £1 325.

GREAT WESTERN RAILWAY. — Metro-Vick Supplies, supply of Cosmos gasfilled and vacuum type ordinary and train lighting lamps (part contract); Siemens Electric Lamps and Supplies, Ltd., 18 months' supply of Siemens gasfilled lamps.

WESTMINSTER CITY COUNCIL.—Gaillard and Robinson and Co., electric light installation on staircases at Marshall Street dwellings, £26; electric time switches at Schomberg House, £40; and time switches at Admiral House, £40. (All recommended.)

CARLISLE CORPORATION.—British Thomson-Houston Co., Ltd., e.h.t. switchgear, £7 691 15s.; J. Spencer, feed-water and blow-down piping, £398; Pratchitt Bros., extension to low pressure c.i. piping, £378; Dewrance and Co., steam and water valves, £953.

LONDON COUNTY COUNCIL.—L. Andrew and Co., Hamnett and Andrew Macinlop, Ltd., Mica Manufacturing Co., Ltd., Mica and Micanite Supplies, Ltd., Pomana Rubber Co., Rubber Industries, Ltd., Rykneld Mills Co., and A. Sample, supply of insulating materials.

MANCHESTER CORPORATION.—Equipment and Engineering Co., Ltd., electric tram rail welding equipment; Rail Welding Co., Ltd., two rail grinding machines; Titan Trackwork Co., Ltd., special trackwork; R. and J. Dempster, Ltd., supply of electric lift for waterless gasholder at Bradford Road gasworks.

OLDHAM EDUCATION COMMITTEE.—W. Caton and Sons, electric wiring work between transformer house at municipal technical college and machines in spinning and weaving rooms. Supply of motors for machines in spinning department of college: English Electric Co., Ltd., British Thomson-Houston Co., Ltd., Metropolitan-Vickers Electrical Co., Ltd., Siemens-Schuckert (Great Britain), Ltd.

THE NATIONAL REGISTER.

Further Fourteen Applications Accepted for Registration.

AT a meeting of the Executive Committee of the National Register of Electrical Installation Contractors on November 8th, the Committee considered twenty-four applications for registration from electrical installation contractors. Of this number fourteen were accepted and ten declined.

The names and addresses of the successful applicants are as follow:—

Boyces, 44, Manchester Road, Nelson, Lancs.

Mortimer and Gall, 57, Basinghall Street, London, E.C.2.

Watkins and Richardson, 1148, London Road, Norbury, London, S.W.16.

Peacock, Robert, Junr., and Co., 1156, Cathcart Road, Mount Florida, Glasgow.

Raistrick, Albert L., Thorp Garth, Idle, Bradford.

Day, George Wm., and Co., 10, Dacre Street, Westminster, London, S.W.1.

Ritchie, Andrew, 120, George Street, Glasgow.

Noble, Herbert, 1, Carshalton Road, Lakenham, Norwich.

Barker and Wilkinson, 1, Cold Bath Road, Harrogate.

Rickards, Charles, Ltd., 12, Spring Street, Paddington, London, W.2.

Hubbard and Williams, 354, Oldham Road, Newton Heath, Manchester.

Ashton, Ernest R., 9, Green Lane, Heaton Moor, Stockport.

Leek, R. W., and Co., 97, Clayton Street, Newcastle-on-Tyne.

Allom Bros., Ltd., 15, George Street, Hanover Square, London, W.1.

ELECTRICITY SUPPLY.

Limerick Harbour Lighting—New Generating Plants in Japan—Supply Inaugurated at Cemmaes—Electrical Progress in North Wales—Extension of Lichfield System—Proposed Transfer of Hereford Undertaking.

ILFORD Electricity Committee is to seek sanction to a further loan of £50 000 for mains and services.

Guildford T.C. has applied for a loan of £50 397 for extensions to Woodbridge power station and plant.

The Macclesfield New Electricity Co. is to erect overhead transmission lines in Bollington urban district.

The Mersey Power Co. is to erect overhead transmission lines to the parishes of Daresbury and Kekewich.

Hornsey Electricity Committee seeks sanction to borrow £20 000 for general main extensions and £10 000 for house services.

The Holywood sub-station is almost completed. A large number of applications have been received for supplies to private consumers.

The South Wales Electrical Power Distribution Co. has extended its supply in the rural areas of Glamorgan by the opening of a service in Coychurch Village.

The Calcutta Electric Supply Corporation, Ltd., has placed with a London firm a contract for the construction of a tunnel to carry cables and mains under the Hugli river at Calcutta.

Leeds Electricity Committee seeks sanction to borrow £175 000 for the estimated expenditure on electricity services to March, 1931, and £50 000 in connection with assisted wiring.

The City Engineer of Bristol is to report upon proposals that gas lamps in the city should be converted to electric lamps and that the public lighting in certain thoroughfares should be improved.

An application by the Cornwall Electric Power Co. for a bulk supply from Plymouth Corporation for certain areas in East Cornwall has been referred to a sub-committee for negotiation and report.

At a recent meeting of Limerick Harbour Board a letter was read from the Electricity Supply Board agreeing to fix the charge for lighting the port at 4d. per kWh, renewals to be charged as heretofore. The present price is 8d.

Ennis Corporation has received a notification from the Irish Electricity Supply Board that electricity for the public lighting of the town will be available on January 1st, 1930, and for other purposes about the middle of January.

The removal of the steam plant at the Lowestoft electricity works has been carried out during the past month, and the installation of the two last convertors is nearly completed. The whole of the supply of current will be taken from Yarmouth.

The Nankai Water Power Co. has been incorporated at Osaka, with a capital stock of 10 million yen, to develop water power by harnessing the Kitayama river at Wakayama prefecture. The power obtainable, at three sites, is estimated at 30 000 kW.

In connection with the proposed supply to Eastdean, Eastbourne Electricity Committee has amended the application for the Fringe Order so as to provide for underground transmission. The committee has authorised street lighting extensions and improvements at a cost of £8 000.

The Ujigawa Electric Co. proposes to construct an additional steam-driven electrical plant at Kitsugawa. The existing one has an output of 60 000 kW from two turbo-generators. The proposed extension will consist of three generators of 35 000 kW each. The site has the advantage of being near the great consuming centre of Osaka.

A supply has been provided for the parish of Cemmaes (Montgomery) by Mr. J. Norman Jones, of Aberandell. Power is obtained from the river Angell by a turbine supplied by W. Warburton and Co., coupled direct to a 60 A dynamo made by the Electric Construction Co. Energy is distributed to the villages of Cemmaes, Aberangell, and Cwmllinan.

A Government inquiry regarding electricity charges in Newcastle-upon-Tyne will be held on December 17th. A conference of 20 local authorities, held in the Newcastle Council Chamber on April 9th last, passed a resolution to demand a public inquiry into the charges of the Newcastle-upon-Tyne Electric Supply Co., Ltd., and the Newcastle and District Electric Lighting Co., Ltd.

Bexhill Electricity Committee has received from the Electrical Engineer a scheme for the provision of a new sub-station, with Hewittic rectifier plant, necessary cable, etc., in the districts north of Broadoak Lane. The estimated cost of the scheme, excluding a site for the building, was £3 825. It is proposed to make further inquiries as to sub-stations in operation in other towns.

Limavady Urban District Council has been informed by Mr. J. T. Irwin, consulting engineer, that Major Ritter, the proprietor of the local Electric Supply Co., would give the undertaking, asked for by the Council, not to raise the existing charge for current, if the Council gave their consent in the matter of his applying for powers as the authorised supplier of electricity in the urban area.

In the supply area controlled by Electricity Distribution of North Wales and District, Ltd., there are 53 towns and villages in which supply is available, and cabling is under construction for sixteen more places. In connection with Anglesey, negotiations are progressing satisfactorily for the construction of a line from Beaumaris to Holyhead, where the railway company would also be supplied.

At a recent meeting of Wicklow County Board of Health Mr. Delargy, of the I.F.S. Electricity Supply Board, attended with a view to arranging a contract for lighting Rathdrum and Baltinglass by electricity. He said the charge would be £2 10s. per lamp until March 31st next. Mr. Henry protested against placing the cost of the lighting of those small towns on the rural people who lived five miles out from them.

The supply of current by Lichfield to Shenstone was inaugurated recently. The supply is taken in bulk from Walsall Corporation. Messrs. Crompton Parkinson, Ltd., supplied the necessary transformer and switchgear, and Messrs. W. T. Henley's Telegraph Works Co., Ltd., the distribution cables. A street lighting scheme has not yet been agreed upon, but there is a growing demand for supplies for private purposes.

The Borough Electrical Engineer of Battersea (London), has prepared a report showing the cost of (*a*) laying electric mains for private services in all streets, or parts of streets in which they are not at present laid; (*b*) laying public lighting mains and converting gas lamps in such streets, and (*c*) providing services for the consumers likely to be obtained during the first year. The estimated cost is: (*a*) £29 973; (*b*) and (*c*) £5 638.

Guildford Electricity Committee is about to extend mains in West Clandon and Burpham, at a cost of £3 336.—A supply is to be given to Gooserye at an initial cost of £4 282.—A supply is also to be provided at Albury Heath, Farley Green, and Little London, at a cost of £1 500.—The Electricity Committee has been asked to consider the advisability of laying electricity mains along the route of the by-pass road during its construction.

Hereford T.C. has applied to the Electricity Commissioners for consent to a transfer of the electricity undertaking to the Shropshire, Worcestershire and Staffs Electric Power Co. It is understood that the company will expend approximately £85 000 on development, and provide about 70 miles of additional power lines in rural areas, lay mains in a number of streets in the city not already served, and change over the system from d.c. to a.c.

The Borough Electrical Engineer of South Shields has proposed that consumers who have prepayment meters should be enabled to purchase lamps or other small electrical apparatus, the payment for them being recovered from the rebate due to the consumer on his meter being read. The record of the goods supplied, and the price to be paid for them, would appear on the back of the meter reading leaflet. The suggestion has been adopted by the Electricity Committee.

The Council for the Preservation of Rural England has been invited by the Minister of Transport to send him a deputation to discuss recommendations made by the Council respecting the electrification of England and Wales. The Council suggests that there should be consultation as to localities where the presence of masts would be particularly incongruous; suggestions are made as to the scheduling of sites to be preserved; open sub-stations to be surrounded by a belt of indigenous trees; power lines should not run over sky lines; importance of architectural designs for transformer houses and harmonious colouring. On the question of new roads the Council will put forward a policy to check "the objectionable riband development of recent years."

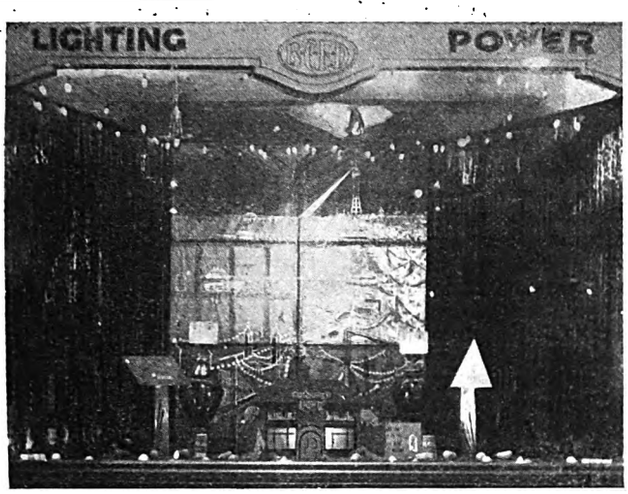
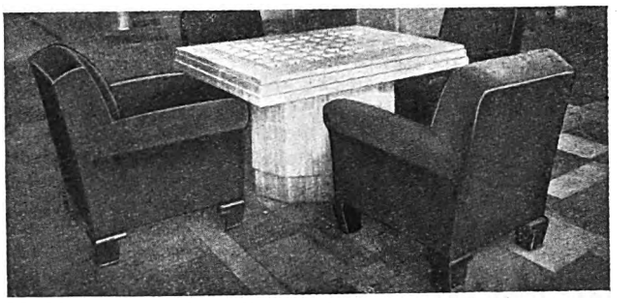
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

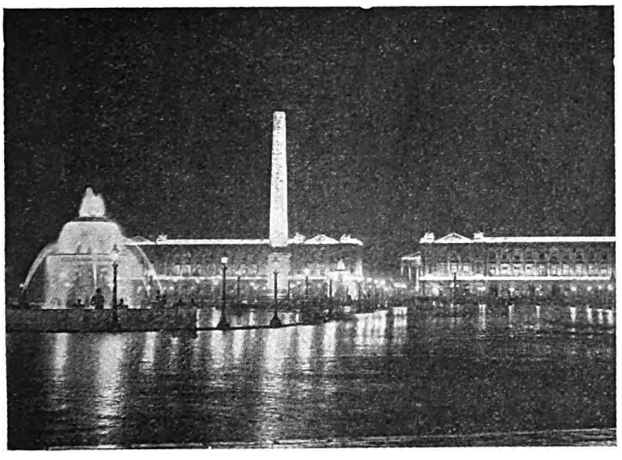


A window display by the Bradford Electricity Department. The background is a complete working model of the Blackpool illuminations recently concluded.



Marble control table for lighting fittings in the showrooms of the A.E.G. From this table the customer can switch in and examine the effect of any fitting. (Photo: "A.E.G. Progress.")

The Electrical Contractors' Association, London, had a happy inspiration when they conceived the idea of organising the ball and cabaret which took place at the Portman Rooms, London, last week, in aid of the E.T.B.I. The festivity was arranged in commemoration of Mr. H. Marryat, one of the past-presidents of the Association, and this year's president of the Institution. The number of tickets sold was about 550, and from 450 to 500 persons were present. The function was very successful, an interesting feature being a distribution of prizes to holders of lucky ticket numbers.



The occasion of the eleventh anniversary of the Armistice was marked in Paris by a number of special illuminations, two of which are shown above. That on the left is of the municipal buildings in the Place de la Concorde, and on the right is the Arc de Triomphe where General Gouraud rekindled the Flame of Remembrance.

Brighton Electricity Committee has approved a scheme by Mr. Christie for providing assisted wiring. Under the scheme the work is to be left open to all local contractors who are prepared to carry it out under the department's supervision and in accordance with the conditions laid down. The material and fittings used will be provided by the department and issued to contractors as required, the contractors to provide labour and small sundries, such as screws, etc., at a priced rate of 7s. per point. Fittings and cables will be standardised. The consumer will be allowed to choose his own contractor. Orders will only be given to contractors whose names appear on the list, and the Corporation reserves the right to strike off the list the name of any contractor whose work is not satisfactory.

ELECTRIC TRACTION.

"Pay-as-You-Enter" Experiment on the Metropolitan Electric Tramways.

THE tramways section of the Underground Group has been experimenting with a number of specimen cars that mark a radical departure from what has long been accepted as the London standard of tramcar practice. In 1926 the Metropolitan Electric Tramways constructed an experimental car, whose salient features were high loading capacity; lightness of construction; low centre of gravity; a one-level floor from end to end of the lower deck; roomy end vestibules, with doors at each side; front exit; and semi-enclosed driving cabs. A second car, embodying most of the features of the first, but differing somewhat in design, was subsequently put into operation on the system of the London United Tramways.

These cars pointed the way to further improvements, with the result that the Union Construction and Finance Co., of Feltham, was commissioned to build two additional cars. These are an all-enclosed, double-deck type, with a streamline body having a slightly turn-under waist punch and tapering sides above the waist-line. The first car, No. 320, a 64-seater, was placed in operation by the M.E.T. a few months ago; and the second, No. 330, a 62-seater, was put into service on the same system on November 6th.

Constructional Details.

The body of car No. 330 is carried on a steel underframe. The framework of the two saloons is one unit, and is riveted to the underframe. The exterior sheets, including those of the roof, are of aluminium. The dash-panels are of high tensile aluminium plate, having a special advantage of lightness. The waist panels, quarter panels, and roof panels are lined with loose-woven canvas, to deaden noise and drumming when the car is in motion. Although the car exceeds the usual length of double-deck bogie cars, its weight is practically the same as the weight of the latter, being only 17 tons. The car is mounted on maximum traction bogies having 28 in. driving wheels. The taper, or sloping in, of the upper part of the car is designed to increase the clearance between the tops of passing cars when rounding curves or swaying through inequalities of track. The exterior width of the lower saloon is 7 ft. 2¼ in., thus enabling double cross seats to be used in that compartment. The car is designed for fare collection on the "pay-as-you-enter" principle, the staircases rise in one flight towards the end of the car, i.e., in the reverse direction to those on car No. 320. The space under the staircase in each vestibule is occupied by a cabinet, in which are disposed the motor resistances, sand-hoppers and air engines operating the exit doors. The doors of these cabinets have a louvred front, and are fitted with electric radiators.

On one side of each vestibule are two double-hinged doors, and on the other side is a sliding door. The former provide two clear openings of 2 ft. 3 in., and are hand operated. Attached to the base are hinged flaps and gas-fillers, which automatically expose or close-in the platform step as the doors are opened or shut. On the rear vestibule of the car, when in service, these doors will be used for both boarding and alighting. The sliding door, which provides an opening 2 ft. 4½ in. wide, is air-operated, and the one in the forward vestibule will be used for egress. It is interlocked with the traction circuit, and the car cannot be started until the door is closed.

The driving-cabs are separate compartments, and partly project from the ends of the car. The total capacity of the car, including standing passengers, is 78.

The motors are B.T.H. 509, 60 H.P., and the controllers are B.T.H. B527B. In conjunction with the controllers, the car is fitted with line-breakers and an overload relay on both poles, as well as with field-shunting contactors operated by an auto-shunt relay, which comes into operation on the last parallel point of the controller. The controllers have five series, four parallel, and seven brake notches. Two trolley booms are provided—one for the up and the other for the down journey. In addition to the usual hand-brake and the magnetic track-brake, the car is fitted with the British Air-Brake Co.'s standard straight air-brake equipment, operated by a 10 in. short stroke cylinder. Compressed air is supplied by a KLL 1 type 2-stage rotary compressor, giving a maximum output of 8·6 c. ft. of air per minute at 100 lb. pressure per sq. in. The compressor is direct-coupled to a 500 V d.c. motor. The compressor governor is a Westinghouse E.S. 16 type. The brake gear is applied to all the eight wheels. The air brake gives a smooth stop up to 4 or 5 ft. per sec. per sec. and the magnetic type up to 8 or 9 ft. per sec. per sec.

BUSINESS ITEMS.

MR. CAWLEY, radio engineer, St. Helens, Lancs, has removed his business to new premises at 66, Liverpool Road, and Baldwin Street.

An agency in Salonika desires to represent British manufacturers of d.c. and a.c. generators, dynamos and electric motors. Further information from the Department of Overseas Trade, reference No. 517.

A Johannesburg firm of engineers desires to represent for the whole of the Union of South Africa a British manufacturer of electric motors up to 50 H.P. Particulars from the Department of Overseas Trade, reference No. 511.

BRUCE PEEBLES AND CO., LTD., Edinburgh, have been granted by BROWN BOVERI AND CO., LTD., Baden, Switzerland, the sole licence for the manufacture and sale in Great Britain of their mercury-arc rectifiers. The correct title of these products is Peebles-Brown Boveri mercury-arc rectifiers.

A manufacturers' agent in Wellington desires to obtain, on a commission basis for the whole of the Dominion, agencies of British manufacturers of electrical goods other than switches, plugs and electrical brassware. Further particulars from the Department of Overseas Trade, reference No. 474.

An agent, established in Bombay, desires to secure the representation of British manufacturers of electric lighting plants for suburbs and hill stations, and electrical and mechanical accessories for electric railways for the whole of India and Bombay Presidency. The Department of Overseas Trade has further details. (Reference No. 465.)

The YORKSHIRE ELECTRIC POWER CO. announces that the Hotel Metropole, Leeds, one of the largest hotels in the city, has recently installed electric radiators in all the bedrooms. The radiators are all "Belling" 2 kW models and are provided with slot meters. The current is taken from the Leeds Corporation supply. This hotel also uses electricity in the laundry and for toasters and grillers, etc.

MR. T. J. ANDERSON, who has been appointed to be H.M. Consul at Maracaibo, Venezuela, will be available at the Department of Overseas Trade until November 30th to interview, by appointment, manufacturers and merchants interested in the export of British goods to Maracaibo or to the Dutch colonies of Curaçao and Aruba, which will be included in Mr. Anderson's consular district. (Reference No. 1 942/29.)

The STERLING TELEPHONE AND ELECTRIC CO., LTD., 15, Alfred Place, Tottenham Court Road, London, W.1, announces that the sole selling agency for "Sterling" telephone supplies, hitherto held by the Marconiphone Co., Ltd., reverts to them. Orders and correspondence relating thereto should be sent to the address above, but remittances, etc., should be sent to the company's accounts department at Marconi House, Strand, London, W.C.2.

The versatility of the range of winding machines made under the registered trade mark "Leesona" by the UNIVERSAL WINDING CO., LTD., is exemplified by some interesting facts that have recently come to light. The whole of the weft used in the fabric of the airship R.101 was re-wound on the "Leesona" No. 90 machine, while in an entirely different class of business small electric coils are being wound on the 'Leesona" No. 102 machine for use in automatic milking machines.

In connection with the exhibitors showing items of electrical interest at the Bradford Engineering Exhibition, which closes at Bradford, to-morrow, Saturday, the following names should be added to those published in our issue of November 1st, page 542: The Airedale Electrical and Manufacturing Co., Ltd.; Allen-Liversidge, Ltd.; Bradford Corporation Electricity Department; James Tate and Co.; the Roto Engineering Co. (Bradford), Ltd.; and the United States Metallic Packing Co., Ltd.

With reference to the recent announcement by the UNDERFEED STOKER CO., LTD., Africa House, Kingsway, London, W.C.2, concerning the rights that they have secured for manufacturing Vibro conveyors under the Schenck-Heymann system at their Derby works, this company has already secured an order for six such conveyors from Imperial Chemical Industries. The conveyors are of special design and are capable of handling fine cement dust at a temperature of approximately 400 deg. C., with capacities up to 30 tons per hour. We also understand that a further conveyor of this type has been ordered for use as a combined conveyor and screen, its capacity being 100 tons of limestone per hour. The Underfeed Stoker Co. announce that a descriptive catalogue is in course of preparation and will shortly be available.

COMPANY NEWS.

Effect of American Slump on British Market—Ferrantis' Increased Profit—Birmingham District Power and Traction's Rearrangement of Capital—Dividend Announcements—New Electrical Companies Registered.

THE renewal of selling on the New York Stock Exchange is having its effect on this side, and electrical securities have shared in the general downward tendency. Hydro-Electric Securities which at the mid-October London settlement "made up" at 62 dollars, and a week ago had fallen to 51 dollars, have further declined to nearly 30 dollars. Associated Electrical ordinary have dropped from 33s. 9d. to 30/-. General Electric ordinary shares have changed hands in large numbers, and at 43s. 9d. are 5s. down.

The ordinary shares of W. T. Henley's Telegraph Works, which are to receive an interim dividend at the same rate as a year ago, have declined 7/6, from 125s. to 117s. 6d. Callender's Cable and Construction ordinary at 72s. 6d. are 2s. 6d. lower, while Johnson and Phillips have receded from £2 apiece to 38s. 9d., and Ever Readies from 19s. to 18s. 9d. Brush Electrical Engineering stock at 127½ is a point up. Cables and Wireless keep fairly steady, the "B" stock is 3 points lower at 47½, and the "A" is almost unchanged at 81½.

In the electricity supply section the ordinary shares of the Metropolitan Company are now dealt in without their rights in the allotment of new capital, and are quoted 17s. 6d. lower, at 38s. 9d. The same remark applies to the shares of the Midland Counties Company, which, at 28s., are 2s. down. North Metropolitan shares at just over 50/7½ are 1s. 3d. lower; Clyde Valley ordinary shares, which have declined from 38s. 9d. to 37s. 6d., show a larger proportionate fall. County of London Electric shares at 50s. 6d. are 2/- to the bad on the week. Bournemouth and Poole at 60s. 7½d., Newcastle Electric at 25s. 7½d., and Yorkshire Power at 33s. 6d., are respectively 1s. 3d., 7½d., and 6d. lower.

In the transportation group, the ordinary shares of the Underground Electric Railways of London, which company controls the London General Omnibus Company, fell 1s. on an abortive local strike. City and South London Consolidated ordinary stock, of which less than £20 000 out of nearly 1½ million of stock is in the hands of the public, has changed hands this week at over 65.

The new ord. shs. will not rank for div. for current financial year.

BIRMINGHAM DISTRICT POWER AND TRACTION CO., LTD.—Mtgs. of 6% cum. participatg. pref. and ord. shhldrs. will be held on Nov. 25 to consider proposed scheme of arrangemt. under which the unissued pref. and ord. shs., with 146 846 issued pref. and 412 934 issued ord. shs., will be consolidated into 700 000 ord. of £1 ea. It is proposed to increase cap. to £1 119 560 by creatg. 419 560 additnl. ord. shs. of £1 ea. Followg. this, £559 780 will be capitalised and applied in distributg. 559 780 ord. shs. to ord. shhldrs. (includg. the converted pref.) in the proportn. of one bonus sh. for each sh. held. Subject to the consent of the Board of Trade, the company's name will be changed to Birmingham and District Investment Trust.

Company Meetings.

BIRMINGHAM ALUMINIUM CASTING (1903) CO., LTD.—Mr. C. C. Maudslay, presiding at the recent general meeting, said the company was breaking new ground in several directions, and a chemical engineering department has been organised. The new metal "Elektron," for which Sterling Metals, Ltd., and the company had the sole right in the British Isles, had before it a considerable future. It was a magnesium alloy 40% lighter than aluminium, having the same physical characteristics as aluminium, and particularly suited for castings where lightness was a consideration. A dividend of 7%, less tax, on the preference shares and a dividend at the rate of 10%, less tax, on the ordinary shares for the year ended July 31st, 1929, were declared, and the report and balance sheet were adopted.

FOUNDATION CO., LTD.—Mr. John Stone, presiding at the meeting on November 5th, said net profit for the year ended June last was £22 655, against £15 281 for the previous year, and the balance brought from 1928 made £40 768 available. It was proposed to place £5 000 to contracts reserve, to pay a dividend on the cumulative preference shares at the rate of 8% per annum, less tax, and to carry forward £26 168. Of the principal contracts at home one was with the Central Electricity Board for what was known as the "North-West Grid"—a high tension transmission line running from Crewe to Carlisle—and one with the London Power Co. for the construction of their new generating station at Battersea. The value of uncompleted work at the end of June last was £1 650 000, this being the balance of contracts still in hand, totalling approximately £3 000 000. The Australian company, registered in January, 1928, as the Foundation Co. (Proprietary), Ltd., had orders on its books amounting to approximately £130 000, of which there was still in hand, uncompleted, about £80 000. The report and accounts were adopted.

New Companies.

G. H. CARTER (EASTERN COUNTIES), LTD.—Cap., £1 200. Electrical engineers, etc. Reg. Office: 69, Green Lanes, London, N.16.

LEYSIAN ELECTRIC LAMP CO., LTD.—Cap., £100. Electrical engineers, manufacturers of electrical accessories, electrical and radio agents, etc. Reg. Office: Leysian Buildings, 114, City Road, London, E.C.

FLEXIBLE WIRES, LTD.—Cap., £3 000. To acquire business carried on by L. A. Gomersall at Astor House, Aldwych, London, W.C.2, and to carry on business of dealers in electric wire, switchgear and electrical appliances. Reg. Office: Astor House, Aldwych, London, W.C.2.

FENBAR SUN-RAY CO., LTD.—Cap., £500. To carry on business of dairymen, producers of milk, cream, butter, cheese and other dairy products, including irradiation of such products with ultra-violet or other electrical rays, etc. Solicitors: Guild and Guild, 5, Rutland Square, Edinburgh.

HARTLEY MAIN POWER CO., LTD.—Cap., £100. To carry on the business of electric power and light company, to generate and supply electricity for all purposes for the use or benefit of the Hartley Main Collieries, Ltd. Secretary: J. T. Roberts, Exchange Buildings, Quayside, Newcastle-on-Tyne.

GREAT NORTHERN TELEGRAPH CO.'S HOLDING CO., LTD.—Cap., Kr. 8 100 000 (£450 000). To acquire and hold, and, if deemed expedient, sell a number of shares in the Great Northern Telegraph Co., Ltd., British address: 5-7, St. Helen's Place, London, E.C. (company incorporated outside United Kingdom).

SALAMAN HANDOLL, LTD.—Cap., £15 000. To acquire from G. E. Handoll goodwill of business known as Handoll Engineering Company, hitherto carried on by him at 23, Broadwall, Stamford Street, London, S.E.1; from R. A. Salaman benefit of business hitherto carried on by him in connection with manufacture of a certain invention relating to the control of theatrical and other lighting known as Salaman Control, and benefit of a contract entered into by him with the Albany Engineering Co., Ltd., for the purchase of the goodwill, etc., of said company; to carry on business of electrical and consulting engineers, etc. Reg. Office: 80, Ossory Road, London, S.E.1.

METAL AND CHEMICAL PRICES.

TUESDAY, November 12th.

		Price.	Inc.	Dec.
Copper—				
Best Selected	per ton	£74 0 0	—	£1 0 0
Electro Wirebars	,,	£83 10 0	—	10s. 0d.
H.C. Wires, basis	per lb.	11 $\frac{9}{16}$d.	—	$\frac{1}{16}$d.
Sheet	,,	11 $\frac{11}{16}$d.	—	—
Phosphor Bronze—				
Wire (Telephone), basis	per lb.	1s. 2 $\frac{8}{16}$d.	—	$\frac{1}{16}$d.
Brass (60/40)—				
Rod, basis	per lb.	9d.	—	—
Sheet ,,	,,	10 $\frac{8}{16}$d.	—	—
Wire ,,	,,	10 $\frac{8}{16}$d.	—	—
Pig Iron—				
Cleveland Warrants	per ton	£3 15 0	—	—
Galvanised Steel Wire, basis 8 S.W.G.	,,	£14 15 0	—	—
Lead Pig—				
English	per ton	£22 15 0	—	£1 5 0
Foreign or Colonial	,,	£21 5 0	—	£1 0 0
Tin—				
Ingot	per ton	£175 15 0	—	£6 5 0
Wire, basis	per lb.	2s. 4½d.	—	1d.
Aluminium Ingots	per ton	£95 0 0	—	—
Spelter	,,	£20 10 0	—	£1 7 6
Mercury	per bottle	£23 2 6	10s. 0d.	—

Sulphur—Flowers, Ton £12 0 0 Roll, ,, £10 10 0 *Copper Sulphate* .. Ton £25 to £25 10 0 *Boric Acid* (Crystals) ,, £20 0 0

Sulphuric Acid (Pyrites, 168°) Ton £6 15 0 *Sodium Chlorate*—Per lb. 2½d. *Sodium Bichromate*—Per lb. 3½d.

Rubber—Para fine, 8½d.; plantation, 1st latex, 7 $\frac{13}{16}$d.

*** The metal prices are supplied by British Insulated Cables Ltd.

THE LEAD MARKET.

In sympathy with the weakness in other metals, the falling price of lead in the United States, and the slump on Wall Street, the lead market, according to James Forster and Co., last week opened with an easier tonea, and fell away until forward lead at one time touched £21 2s. 6d., closing at £21 5s. The American price was cut on November 6th and 7th to 6.25 cents per lb., a fall of about 25s. per ton on the week.

Closing prices on November 8th were £21 12s. 6d. for all positions, 11s. 3d. to 15s. per ton lower on the week.

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

ARTINGSTALL, G., Pentre Howell, Pencoed, electrical engineer. £29 9s. 11d. October 3rd.

ASHTON AND HOLT, 15, Cross Street, Ryde, I.o.W., lighting engineers. £25 17s. October 1st.

BRITISH ELECTRICAL MANUFACTURING CO., Alexandra Works, Brent View Road, N.W., electricians. £20 1s. 5d. October 3rd.

DOWSE, George, 23, Goring Road, New Southgate, electrical engineer. £20 10s. 10d. September 17th.

GARNETT, Arthur John (late trading as A. AND F. GARNETT, now trading as ST. ANNES WORKS), High Road, Hayes, electrical engineer. £21 13s. 5d. October 9th.

MATHEWMAN, A. E., 6, Wednesday Market, Beverley, electrical dealer. £19 2s. 10d. October 8th.

MILLER, Harding, 138, Bedford Road, Rock Ferry, electrical dealer. £15 11s. October 8th.

WARDLEWORTH, L. and V., Bury Old Road, Heaton Park, electrical dealers. £21 11s. 8d. October 8th.

WESTON ELECTRICAL CONTRACTS CO., 17, George Street, Euston, N.W., electrical engineers. £52 3s. 2d. October 2nd.

Bills of Sale.

ATKINSON, Albert, 11, Shuttle Street, Eccles, electrical engineer. Dated November 5th, filed November 7th. £55.

BARKER, Oliver Horace, Aire Vale House, Pollard Lane, Bramley, Leeds, electrical engineer. Dated November 4th, filed November 7th. £60.

HOCKADAY, Dudley John, Betteley, 18A, Blackheath Road, Greenwich, wireless outfitter. Dated October 30th, filed October 31st. £100.

Mortgages.

[NOTE.—*The Companies Act of* 1908 *provides that every Mortgage or Charge, as described therein, shall be registered within* 21 *days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced.*]

BURGOYNE WIRELESS, LTD., London, N.—Registered November 5th, £1 000 debenture to N. G. H. Dey, Aberglaslyn, Amhurst Park, N.; general charge.

BURNDEPT WIRELESS (1928), LTD., London, S.E.—Registered November 1st, Debenture, to bankers; charged on properties in Lewisham, etc., also general charge. *Nil. September 27th, 1929.

"M. P. A." WIRELESS, LTD., London, W.—Registered October 31st, £500 and £5 000 debentures part of £35 000 and bonus of 12½%; general charge.

SUN-RAY ELECTRIC LAMP CO., LTD., London, E.C.—Registered October 18th, £250 debenture, to S. Nicholson, Old Bank, Frinton-on-Sea, solicitor; general charge.

TARR (R. W.) LTD. (late SUPER RADIO, LTD., and LISTENOLA, LTD.), Swansea.—Registered October 31st, £2 500 debenture, to R. W. Tarr, Hazeldene, Newton Road, Mumbles, cabinet maker; general charge. *Nil. September 19th, 1928.

VIOZONE, LTD., London, W.C., electrical engineers.—Registered October 28th, £5 000 debenture, to S. Strauss, 104, Dartmouth Road, N.W.; general charge.

Satisfactions.

BRITISH GENERAL RADIO CO., LTD., Yeovil.—Satisfaction registered October 28th, £100, part of amount registered April 3rd, 1924.

EAST CORNWALL ELECTRICITY SUPPLY CO., LTD. (late TORPOINT ELECTRIC SUPPLY CO., LTD.), London, S.W.—Satisfaction registered October 31st, all moneys, etc., registered March 19th, 1926.

WADEBRIDGE AND DISTRICT ELECTRIC SUPPLY CO., LTD., London S.W.—Satisfaction registered October 31st, £500, registered February 12th, 1923.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

UNIVERSAL AND GENERAL RADIO CO., LTD., Bravington Road, London, W.—The statement of affairs submitted to the statutory meeting of creditors in this voluntary liquidation showed ranking liabilities of £33 152 and assets estimated to realise £7 508, but subject to preferential claims of £795, leaving net assets of £6 713, or a deficiency of £26 439. The assets included book debts £12 226, estimated to realise £7 000. It was stated that the preferential claims were heavy, as they included a substantial amount for rent, and a claim for income tax. No resolutions were passed, and therefore the voluntary liquidation of the company will be continued with the present liquidator, Mr. H. N. Murray of 7/8, Poultry, E.C.

London Gazette, etc.

Company Winding-up Voluntarily.

BUGLASS AND JAMIESON, LTD. By reason of its liabilities, November 6th. H. C. M'Millan, accountant, 13, Dundas Street, Glasgow, C.1, appointed as liquidator.

Bankruptcy Information.

WESTBURY, Leslie William, trading as L. W. WESTBURY AND CO., and also as the WALSALL RADIO CO., at 146, Lichfield Street, Walsall, wireless goods dealer. First meeting, November 20th, 12 noon, Official Receiver's Office, 30, Lichfield Street, Wolverhampton. Public examination, December 12th, 10.15 a.m., Court House, Lichfield Street, Walsall.

Notices of Dividends.

BROCK, Reginald Lewis, trading as R. L. BROCK AND CO., 5, Bedford Row, Tavistock Road, Plymouth, Devon, electrical engineer. First and final dividend, 3s. per £, payable November 11th, Bradley Hole and Co., 240, High Holborn, London, W.C.1.

HORSFALL, Robinson, 24, Commercial Street, Barnsley, Yorkshire, and trading as HARRISON AND HORSFALL, at Midland Street, Barnsley, electrical engineer. First and final dividend, 4s. per £, payable November 16th, Standard Buildings, City Square, Leeds.

LAWRENCE, Louis Haydn, described as HENRY FREDERICK LAWRENCE, 43, Canterbury Road, Margate, Kent, trading as HENRY F. LAWRENCE, electrical engineer. First and final dividend, 2¼d. per £, payable November 22nd, 5, Cecil Square, Margate.

Notice of Intended Dividend.

SKIPPER, Sydney Harold, 35, Broad Bridge Street, Peterborough, Northampton, lately trading as S. H. SKIPPER AND CO., electrical engineer. Last day for receiving proofs, November 21st. Trustee, F. H. Langmaid, 41, Sidney Street, Cambridge, Official Receiver.

Partnerships Dissolved.

ADAMS BROTHERS AND CO. (Percival Stanley ADAMS, Frederick Harold ADAMS, Ernest Herbert BOND and Henry MONK), electrical engineers, 8, Grand Parade, Westbourne, Bournemouth, October 17th, 1929, as regards E. H. Bond and H. Monk. Debts will be received and paid by P. S. Adams and F. H. Adams, who will continue the business under the style of Adams Brothers.

BROWN AND SWAN (James SWAN and James BROWN), electricians, 62, Hamilton Road, Rutherglen, at October 23rd, 1929. J. Brown at that address will collect accounts and discharge liabilities to that date.

H. HOLDEN AND CO. (Hugh HOLDEN and John CAVANAGH), 1, Union Street, Pendleton, Salford, and 270A, City Road, Manchester, motor cycle dealers and electrical engineers, by mutual consent as from November 4th, 1929. Debts received and paid by J. Cavanagh.

JOHN BRYDEN AND SONS (Francis James BRYDEN and Harry Brooke BRYDEN), electricians, bellhangers and window blind makers in Edinburgh and elsewhere. F. J. Bryden retired September 21st, 1929. The business will be carried on by H. B. Bryden at Edinburgh and elsewhere.

LAING AND KERR (George Liddell KERR and Robert Liston LAING), electricians, 178, Morningside Road, Edinburgh, as at November 6th, 1929, by mutual consent, by the retiral of G. L. Kerr. The business will be carried on under the old name by R. L. Laing on his own account.

MIC WIRELESS CO. (Harry BROWN and George Edward HOUGHTON), manufacturers, factors and retailers of wireless and electrical components, Wellingborough, Northampton, by mutual consent as from October 25th, 1929. Debts received and paid by H. Brown, who will continue the business.

RICARDA ELECTRIC CO. (Ada Annie BELL and Richard William MINSHALL), electrical engineers, 16, Holbein Place, Sloane Square, S.W., by mutual consent, as from October 7th, 1929. Debts received and paid by R. W. Minshall, who continues the business.

VUL-K-LEC CO. (Benjamin GRIFFITHS, Herbert de Lisle CRAWFORD and Alexander Bruce COWIE), electric vulcaniser manufacturers, 58, South John Street, Liverpool, by mutual consent as from October 17th, 1929, so far as concerns A. B. Cowie, who retires from the firm. Debts received and paid by B. Griffiths and H. de L. Crawford. The business will be carried on in the future by B. Griffiths and H. de L. Crawford, in partnership with William Henry Fawcett.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

294 875 BRANDES, LTD. Sound-reproducers. (30/7/27.)
292 926 BRITISH THOMSON-HOUSTON CO., LTD. Treating foods and products thereof. (24/6/27.)
317 583 J. GRANT and W. H. GRANT. Devices for removing and replacing electric lamps. (2/7/28.)
293 315 DEMAG AKT.-GES. Electrically operated pulley-block with stationary motor. (2/7/27.)
317 597 J. W. PATRICK. Switch device for electric irons. (6/7/28.)
317 599 ELECTRO-MECHANICAL BRAKE CO., LTD., and S. SMITH. Air-release valves for tramway and other compressed-air brake systems. (6/7/28.)
317 600 IGRANIC ELECTRIC CO., LTD., and W. K. ALFORD. Resistance-capacity coupling-units for use in radio apparatus. (7/7/28.)
293 864 BRITISH THOMSON-HOUSTON CO., LTD. Manufacture of X-ray anodes. (15/7/27.)
317 603 GENERAL ELECTRIC CO., LTD., and J. H. JONES. Shade fitting for electric lamps. (10/7/28.)
317 605 GENERAL ELECTRIC CO., LTD., H. C. TURNER, and A. SHERWIN. Thermally-operated electric switches. (11/7/28.)
317 610 IGRANIC ELECTRIC CO., LTD., and D. SINCLAIR. Radio-receiving apparatus employing tetrode valves. (17/7/28.)
317 611 T. C. CHRISTIANSON and ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Electrical switchgear. (17/7/28.)
317 613 G. W. M. FLETCHER. Devices for actuating the switch-arm of electric light and like switches. (21/7/28.)
317 614 GENERAL ELECTRIC CO., LTD., and T. E. RITCHIE. Mountings for electric light reflectors. (21/7/28.)
317 620 CALLENDER'S CABLE AND CONSTRUCTION CO., LTD., and J. BOWYER. Application of surface markings to vulcanised rubber. (27/7/28.)
317 627 H. H. BERRY. Advertising-signs. (1/8/28.)
295 284 BRITISH THOMSON-HOUSTON CO., LTD. Production of electric signalling-impulses. (8/8/27.)
295 654 BRITISH THOMSON-HOUSTON CO., LTD. Control of dynamo-electric machines. (16/8/27.)
317 641 BRANDES, LTD., and M. S. HOBAN. Electromagnetic sound-reproducing devices. (22/8/28.)
317 642 A. CAMPBELL. Apparatus for the measurement of the capacitance and power factor of electrical condensers. (23/8/28.)
317 647 W. R. EDWARDS. Electric cells. (25/8/28.)
317 655 G. E. HEYL. Means for applying radio-activity for curative purposes. (11/9/28.)
317 661 J. STEELE AND SONS, LTD., and H. STEELE. Trays or stands for use in charging and/or filling electric accumulators or storage batteries. (19/9/28.)
317 666 T. CRACKNELL and E. M. AUSTIN. Electric lamp cap. (5/10/28.)
298 237 H. HALPERIN and K. W. MILLER. Methods of and means for bonding together electric cable sheaths. (6/10/27.)
298 482 BRITISH THOMSON-HOUSTON CO., LTD. Apparatus for the interconversion of sound and electrical impulses. (8/10/27.)
317 667 F. R. FRANCKE. Combined electric switches. (12/10/28.)
298 990 SIEMENS and HALSKE AKT.-GES. Inductances for use in high-frequency circuits, for example, in radio receiving sets. (18/10/27.)
300 511 E. ASCH. Thermionic amplifiers. (10/11/27.)
301 840 BRITISH THOMSON-HOUSTON CO., LTD. Apparatus for the interconversion of sound and electrical impulses. (6/12/27.)
392 729 BRITISH THOMSON-HOUSTON CO., LTD. Electric condensers. (21/12/27.)
306 403 INVENTIA PATENT-VERWERTUNGS-GES. Nozzles for vacuum cleaners. (16/2/28.)
317 531 AUTOMATIC TELEPHONE MANUFACTURING CO., LTD., C. GILLINGS, and C. H. EVANS. Telephone systems. (19/4/28.)
317 532 J. A. CRABTREE. Electric lampholder switches. (16/5/28.) [Divided application on 317 514.]
317 533 J. A. CRABTREE. Cord grips for electric lampholders and the like. (16/5/28.)

Applications for Patents.

August 2nd.

23 736 ASSOCIATED ELECTRICAL INDUSTRIES, LTD., and E. Y. ROBINSON. Vacuum tube device.
23 767 H. ASTBURY and CROMPTON PARKINSON, LTD. Oil break electric switchgear.
23 778 BRITISH POWER RAILWAY SIGNAL CO., LTD., and J. H. GRAHAM. Electric signalling, etc., apparatus. (1/8/28.)
23 770 BRITISH THOMSON-HOUSTON CO., LTD. Electron discharge device. (2/8/28, U.S.)
23 842 P. O. DORER and S. SMITH AND SONS (MOTOR ACCESSORIES), LTD. Clock actuated electric switches.
23 792 J. FISCHER DE TOVAROS. Device for lubricating sliding bows of current collectors of electric vehicles.
23 763 W. H. GRINSTED. Telephone systems.
23 739 L. P. HAUSSAUER. Electric water heaters.
23 740 A. HAMILTON. Electrical warning-device.
23 771 INTERNATIONAL GENERAL ELECTRIC CO., INC. Preventing pulsating in compressors. (3/8/28, Germany.)
23 845 C. LORENZ AKT.GES. Electric signalling installations, etc. (15/4/29, Germany.)
23 766 R. G. MADGE. Electric lamp shades.
23 812 MARCONI'S WIRELESS TELEGRAPH, CO., LTD. Multiplexing, commutating, etc., systems. (29/9/28, U.S.)
23 743 H. A. MOORE. Thermo-electric control.
23 843 MOTORENFABRIK DEUTZ AKT.-GES. Electric starting circuits for Diesel motors. (2/8/28, Germany.)
23 789 L. A. E. NORDFOLK. Feeding discharge tubes with current from supply mains. (2/8/28, Denmark.)
23 724 R. PEARSON. Electric switches.
23 778 RELAY AUTOMATIC TELEPHONE CO., LTD. Electric signalling apparatus. (1/8/28.)
23 762 F. SAVAGE. Wireless signalling apparatus.
23 763 SIEMENS BROS. AND CO., LTD. Telephone systems.
23 735 R. TONKS. Tuning inductances.
23 779 R. E. G. TUGWOOD. Device for translating mechanical vibrations into electrical waves.
23 775 WESTINGHOUSE BRAKE AND SAXBY SIGNAL CO., LTD., and S. A. STEVENS. Alternating current transformers.

August 3rd.

23 871 W. CASSON and H. ROBERTS. Electrically controlled variable speed gear.
23 916 GRAHAM AMPLION, LTD., W. J. RICKETS and D. SINCLAIR. Wireless systems for navigation.
23 895 H. INGHAM. Thermionic amplifiers.
23 934 C. LORENZ AKT.-GES. Control of alternating currents. (6/8/28, Germany.)
23 857 B. E. MACE and A. G. SUTHERLAND, LTD. Electricity, gas, etc., meters
23 932 SELENOPHON LICHT UND TONBILDGES. Damping device for oscillographs. (11/7/29, Austria.)

August 6th.

24 043 AUTOMATIC TELEPHONE MFG. CO., LTD., J. MCGAVIN and H. S. WOODHEAD Electromagnetic relays.
23 988 J. B. BIGNAMY. Current detectors.
23 989 BRITISH THOMSON-HOUSTON CO., LTD. Automatic control systems. (6/8/28, U.S.)
23 969 S. J. BRYCE, and CALLENDER'S CABLE AND CONSTRUCTION CO., LTD. Fittings for electric wiring apparatus.
23 970 CALLENDER'S CABLE AND CONSTRUCTION CO., LTD., and A. E. WILSON. Means for supporting electric cables passing through bulkheads, etc.
24 048 COMPAGNIE DES LAMPES. Light sensitive devices. (10/4/29, France.)
24 042 S. G. S. DICKER (N. V. PHILIPS' GLOEILAMPENFABRIEKEN). Thermionic valves.
23 985 DRAKE AND GORHAM, LTD., O. FABER and P. A. SMITH. Floor boxes for wiring conduits.
23 976 R. EYRE. Telephone mouthpiece disinfector.
23 960 S. GILCHRIST. Cut-out devices.
23 984 GRAHAM AMPLION, LTD. Signalling systems for use in aircraft, etc.
23 943 S. S. GUY. Electrically-driven vehicles.
23 965 HIGHFIELD ELECTRICAL CO., LTD., and F. W. HIGHFIELD. Automatic traffic control apparatus.
23 990 INTERNATIONAL GENERAL ELECTRICAL CO., INC. Oil switches. (7/8/28, Germany.)
24 029 RAYTHEON, INC. Electron discharge device. (15/8/28, U.S.)
24 047 S. RUPPEL. Electrical switches. (6/8/28, Germany.)
24 053 SIEMENS AND HALSKE AKT.-GES. Utilisation of electrical network. (6/8/28, Germany.)
24 014 A. J. STEPHENS (ELEKTROTECHNISCHE FABRIK SCHMIDT AND CO.). Electric lampholder.

August 7th.

24 107 C. F. F. ALLAN. Electric heating element.
24 148 BRITISH THOMSON-HOUSTON CO., LTD. High tension cables. (8/8/28, U.S.)
24 086 S. O. COWPER-COLES. Recording telephone messages.
24 118 P. A. CRAVEN. Telephonic loud speakers, etc.
24 096 W. FAIRWEATHER (SINGER MFG. CO.). Electric motor.
24 155 FERRANTI, LTD., and W. HOLMES. Alternating current measurement devices.
24 160 B. A. and M. H. JARVIS. Thermionic valve amplifiers.
24 161 B. A. and M. H. JARVIS. Electromagnetic telephone instruments.
24 175 J. Y. JOHNSON (I.G. FARBENINDUSTRIE A.G.). Product of acetylene and hydrogen in electric arc.
24 093 F. A. LINDEMANN. Device for preventing arcs in photo-electric cells.
24 094 F. A. LINDEMANN. Photo-electric cells.

COMING EVENTS.

Friday, November 15th (To-day).

INSTITUTION OF MECHANICAL ENGINEERS.—Storey's Gate, St. James's Park, London. Lecture by Mr. Francis Hodgkinson on "Journal Bearing Practice." 6 *p.m.*

ELECTRICAL DEVELOPMENT ASSOCIATION.—Royal Society of Arts, John Street, London, W.C. Lecture by Mr. E. E. Sharp on "Selling Time Switches." 7.30 *p.m.*

JUNIOR INSTITUTION OF ENGINEERS.—39, Victoria Street, London, S.W.1. Lecture by Mr. W. T. Griffiths on "Nickel and its Uses in Engineering." 7.30 *p.m.*

Saturday, November 16th.

INSTITUTION OF ELECTRICAL ENGINEERS (NORTH-EASTERN CENTRE, STUDENTS' SECTION).—Visit to the coal distillation plant of the Newcastle-upon-Tyne Electric Supply Co., Ltd.

ASSOCIATION OF MINING ELECTRICAL ENGINEERS (SOUTH WALES BRANCH).—Cardiff. Paper by Mr. R. H. Morgan on "Electrical Measuring Instruments." 6 *p.m.*

PAISLEY ASSOCIATION OF ELECTRICAL ENGINEERS. Visit to the Bussey Coal Distillation Co., Ltd., Glenboig, Lanarkshire. 3 *p.m.*

Monday, November 18th.

INSTITUTION OF ELECTRICAL ENGINEERS (MERSEY AND NORTH WALES-LIVERPOOL CENTRE).—University, Liverpool. Paper by Dr. N. W. McLachlan on "The Theory and Practice of Modern Loud Speakers." 7 *p.m.*

INSTITUTION OF MECHANICAL ENGINEERS (GRADUATES' SECTION).—Storey's Gate, St. James's Park, London. Paper by Mr. A. G. Brown on "Artificial Lighting of Factories and Public Buildings." 7 *p.m.*

E.L.M.A. LIGHTING SERVICE BUREAU.—15, Savoy Street, Strand, London. Twentieth Illumination Design Course. Lecture (V.) by Mr. H. Lingard on "Electrical Advertising." 7.30 *p.m.*

Tuesday, November 19th.

ASSOCIATION OF SUPERVISING ELECTRICAL ENGINEERS.—Junior Institution of Engineers, 39, Victoria Street, London. Paper by Mr. A. Page on "Development of Generation and Distribution of Electric Power in the British Isles."

INSTITUTION OF ELECTRICAL ENGINEERS (NORTH-WESTERN CENTRE).—Midland Hotel. Annual dinner.

INSTITUTION OF HEATING AND VENTILATING ENGINEERS (ASSOCIATE MEMBERS' AND GRADUATES' SECTION, MANCHESTER AND DISTRICT BRANCH).—Milton Hall, Deansgate, Manchester. Mr. O. Stott on "Fan Standardisation Committee's Report." 7 *p.m.*

PAISLEY ASSOCIATION OF ELECTRICAL ENGINEERS.—39, High Street. Lecture by Mr. H. J. Taylor on "Measurement of Electricity." 7.30 *p.m.*

Wednesday, November 20th.

ELECTRICAL POWER ENGINEERS' ASSOCIATION (MANCHESTER LOCAL TECHNICAL GROUP).—Paper by Mr. D. J. Bolton on "Hire and Hire Purchase of Electrical Apparatus."

ELECTRICAL CONTRACTORS' ASSOCIATION (SUSSEX BRANCH).—Midland Bank Chambers, Brighton. Ordinary meeting.

ELECTRICAL ASSOCIATION FOR WOMEN (SOUTH WALES AND MONMOUTHSHIRE BRANCH).—South Wales Institute of Engineers, Cardiff. Lecture by Mr. T. Catten on "Furnishing your Home with Light."

OVERHEAD LINES ASSOCIATION.—Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London. Lecture by Mr. R. Borlase Matthews on "Standard Intermediate Voltages for Rural Electrification." Cinematograph illustrations. 5.30 *p.m.*

INSTITUTION OF ELECTRICAL ENGINEERS (SHEFFIELD SUB-CENTRE).—Royal Victoria Hotel. Mr. A. Tustin on "Organised Scientific Research and Engineering Progress." 7.30 *p.m.*

BRITISH ELECTRICAL AND ALLIED MANUFACTURERS' ASSOCIATION.—Connaught Rooms, Great Queen Street, London. Annual dinner. 7 for 7.30 *p.m.*

Thursday, November 21st.

INSTITUTION OF ELECTRICAL ENGINEERS.—Institution, Savoy Place, Victoria Embankment, London. Joint meeting with the Institute of Fuel. Discussion on "Low Temperature Carbonisation of Fuel, with special reference to its combination with the Production of Electricity." Introductory papers by Messrs. E. H. Smythe and E. G. Weeks (English Practice); S. McEwen (American Practice); and Prof. Dr. Ing. P. Rosin (German Practice). 6 *p.m.*

INSTITUTION OF ELECTRICAL ENGINEERS (HAMPSHIRE SUB-CENTRE).—University College, Southampton. Paper by Dr. J. W. T. Walsh on "Illuminating Engineering." 7.30 *p.m.*

Friday, November 22nd.

PHYSICAL SOCIETY.—Imperial College of Science, Imperial Institute Road, South Kensington. Papers by Mr. D. P. Dalzell on "Heaviside's Operational Methods," Mr. E. T. Hanson on "The Dynamical Theory of Resonators," and Mr. E. C. Atkinson on "Escapement Errors of Pendulum Clocks." 5 *p.m.*

BIRMINGHAM ELECTRIC CLUB.—Grand Hotel, Colmore Row. Lecture by Mr. J. D. Morgan on "Dust Explosions." 7 *p.m.*

ASCHER'S ICICLE-SHADE

is a selling line that carries liberal discounts

The Icicle Shade is the most up-to-date and effective lighting for the Home, Theatres, Cinemas, Dance Halls, Hotels, etc. There is absolutely nothing to equal it, either in beauty or price.

There is no limit to the wonderful effects that can be obtained by the arrangement of the various sizes of the Icicle Shade, for example, the 24-in. Icicle Shade surrounded by circles of the smaller sizes make a wonderful centre piece for Dance Hall and Theatres, etc., while the Icicle Ceiling Bowl with three or four small Icicle Shades make a very dainty fitting for a drawing room.

Another very effective combination for home use is one large Icicle Shade surrounded with alternate small Icicles and small silk shades.

Made in the following sizes:

ICICLE SHADES, 9½ ins. 14 ins. 18 ins. 24 ins. in length.
ICICLE CEILING BOWLS, 10 ins. 12 ins. 14 ins. diameter.

LONDON SHOWROOMS: **PLOWMAN & BLACKETT, 40-44, Holborn Viaduct, E.C.1**

Electricity Commissioners and Unemployment.

FOLLOWING on the meeting last July of the Lord Privy Seal, the Minister of Transport, and representatives of the electricity supply industry to discuss means by which the number employed in the industry could be increased, so as to assist the Government in dealing with the problem of unemployment, the Electricity Commissioners last week issued a circular letter relating to the suggestions put forward. Briefly stated, these recommend expediting, where possible, all new constructional work on which electrical undertakings are engaged, the extending of distributing networks in built-over areas to meet the demand for domestic supplies, the initiation of assisted wiring schemes and the extension of hire and hire-purchase apparatus. The Commissioners also state that the annual capital investment in transmission and distribution systems has grown from a little less than £8 000 000 in 1922-23 to over £16 000 000 in 1927-28. Providing expenditure continues to increase, the outlay during the next five years should be over £100 000 000, and the Commissioners are of the opinion that a considerable percentage of this could be accelerated so as to fall within the next two years. It will be appreciated that any scheme promoted by the electrical industry with a view to relieving unemployment will help to absorb not only the comparatively few electrical unemployed, but also some of the larger number outside the industry. Extensions of plant, development of the domestic load, increasing distribution networks, etc., not only in themselves reduce unemployment, but cause workshops and factories also to absorb many of the men and women seeking work. The Commissioners' appeal is a good one, and if answered in the right spirit will, besides bringing relief to many, cause our industry to enjoy a prosperity even greater than is its present lot.

Overseas Trade in Agricultural Machinery.

THE Federation of British Industries has communicated details of a scheme which, it is claimed, will not only absorb a large number of unemployed, but will also develop our overseas trade. Seventeen limited companies are co-operating in the manufacture and marketing of agricultural and general engineering implements, including motors and other electrical plant, with a view to securing for Britain a larger share than has so far been enjoyed of the world trade in these products. Five years have been spent in building up the selling organisation, and over £250 000 have already been spent in developing the scheme. Over eighty countries have been visited for the purpose of establishing branches, and the scheme represents a combined offensive on the world market for agricultural machinery. The organisation states that in each of the countries visited an intensive study has been made to ascertain the market conditions and to test in the field the types of machine required. It goes without saying that electrical plant for agricultural purposes will play no inconsiderable part in this scheme, and since, at the moment, Great Britain's share in the world trade in agricultural machinery is only 7% or 8%, the opportunities for improvement are enormous. Electro-farming at home has not progressed as favourably as many would wish, and if, in developing our overseas trade in this direction, it is possible at the same time to better the conditions in the home market, then the success of the scheme will be more than doubly assured.

Royal Institution Exhibition.

As considerable alterations are being made to the buildings of the Royal Institution in Albemarle Street, in order to bring them up to date with respect to safety from fire, the opportunity has been taken to arrange an exhibition of some of the more important pieces in the Science Museum at South Kensington. The apparatus now for the first time publicly displayed owes its interest to the fact that it illustrates many of the most important contributions made by British

Digitized by Google

inventive genius to science and its applications. It has been difficult to display in the allotted space sufficient material to represent the wide range of Michael Faraday's work, but the famous ring with which he discovered in 1831 the laws on which all electrical engineering is built is among the exhibits. The induction coil and the condenser both came from Faraday, and his discoveries of their principles are illustrated by the apparatus of his which is now on view. It was Faraday too who conceived the propagation in space of electric "rays and vibrations." In 1845 he showed that magnetism had a general action in all substances, not in iron merely; he explained diamagnetism, and magne-crystallic action, and found the action of magnetism on polarised light. All these studies are illustrated in the collection and afford an excellent opportunity for all concerned with the industry to familiarise themselves with the earliest stages of electrical development.

Christmas Trade.

THE E.D.A. is to be congratulated on the novelty of its window displays for the December Selling Campaign. No less than five designs have been prepared, each one being sufficiently different to permit of new window dressing for each week of the month, while special literature associated with the windows has also been prepared. We pointed out in our last issue the many opportunities offered by the spending spirit of Christmas, and, fully alive to these increased trading possibilities, the E.D.A. has arranged for advertisements dealing with electrical gifts to be inserted in 19 national newspapers during the month. The Electric Homes (Outlet) Campaign will also receive special attention during December, for it is realised that the electrical gifts campaign is sure to have a favourable influence, in that given a fire one needs an "outlet." Since any success obtained will bring business to the contractor, business to the wholesaler, manufacturer and supply undertaking, the campaign is a very suitable subject for the co-operation of all branches of the industry, and it is hoped that electrical trading during December, 1929, will surpass not only any previous December, but any other month of any other year. Two and a half million domestic users of electricity have been advised to "give electrically" while eight and a half million potential users have been approached with a view to adopting electrical service.

Electrical Development in Mines.

ALTHOUGH the number of working mines using electricity in 1928 was less by 162 than in 1924, the horse-power of motors installed above and below ground increased from 1 481 932 in 1924 to 1 722 322 in 1928. These figures are taken from the report of the electrical inspector of mines, who also records the fact that during 1928 there were 15 fatal accidents at collieries, due in 11 cases to shock and 4 to ignition of fire damp. Reviewing the general progress of electrical development in mines, Mr. HORSLEY points out that while during the years 1907 to 1928 there were only 97 fatalities, the use of electricity below ground, as measured by horse power of motors installed, had increased during this period approximately 70%. These figures show without doubt the rapid strides which have been made in applying "safety first" measures to the electrical equipment specially designed for use below ground and at the same time afford a good sales argument in the selling of coal-cutters and the like. That there are plenty of opportunities for such sales is indicated by the fact that though there were 2 539 mines at work in 1928, no less than 1 072 of them were without electrical plant for mining purposes.

A Timely Settlement.

AFTER many months of litigation and negotiation between members of the Radio Manufacturers' Association and the Marconi Co. with respect to royalties, there at last seems some hope of settled conditions in the trade. This is suggested by a revision of the terms of the agreement proposed last July, and though for the main part the conditions of the new licence are much the same as those proposed four months ago, the chief objection, namely, the free use by the Marconi Co. of certain patents held by licensees, has been removed, by so wording the clause that the licensees shall grant the Marconi organisation licences for such patents. Other substantial changes are that royalties are chargeable on all receiving sets whether they utilise patents subject to the licence or not, and on "kit sets" if patents existing on or after November 14th, 1929, are involved. We have seen a copy of the principal terms of the licence, and these are such that electrical contractors may hope for a settlement of the difficulties by the time Christmas trade starts in earnest. The suspense which has existed in the radio industry during the last few months has left its mark of course, but with all difficulties settled and a reduced royalty into the bargain the future is more hopeful in both the manufacturing and contracting worlds.

Healing Rays?

WITH the firm conviction that the gas industry is fighting a losing battle in the domestic field we are able to disregard most of the pitiful arguments advanced in favour of the methods which it advocates. We do not mind when its representatives claim, as did Mr. C. M. CROFT at the recent B.C.G.A. Conference, that, following the installation of gas fires in a Wandsworth hospital, "the patients are not now being disturbed . . by the clatter of fire irons," for that is obviously true; we also agree that, as a sort of half-way house between coal and electricity, gas fires require no labour and make no smoke. What we do object to is the further claim that these fires are attracting "a great deal of interest in medical circles in view of the healing properties of the rays, particularly in cases of arthritis and similar infirmities." We have yet to hear authoritative medical opinion that gas fires possess any specific curative properties apart from those believed to be the common property of all radiant heating apparatus.

Australia's Policy.

CONFIRMATION of Australia's preference for British goods was forthcoming at the recent Interstate Conference of Australian electrical manufacturers, when the policy of a supply authority was quoted to the effect that they should "Buy Australian first, buy British if you cannot obtain Australian, and if you cannot obtain Australian or British, then do the best you can outside." As we have pointed out on previous occasions, these sentiments are shared by a large proportion of Australian business men, and we should do our best to make it unnecessary for them to go outside the British Empire for their electrical requirements.

METHODS OF MEASURING TEMPERATURE RISE OF ELECTRICAL MACHINERY.

Safe Temperature for Insulation—Three Principal Methods Explained—Limitations of Embedded Detectors—Variation of Resistance Measurements.

By WALLACE FORD, Wh.Sc., A.C.G.I., B.Sc., D.I.C.

THE rating—that is, the statement of the capacity for doing work—of an electrical machine is based upon the temperature rise of the windings of the machine under test conditions. The life of an electric generator, motor or transformer, depends primarily upon the insulating material used in its construction, and the insulation deteriorates in service due to the effects of heat and vibration.

The criterion of the rating of electrical machines, the temperature rise, is the difference between the temperature of the cooling air and the temperature of the hottest spot on the surface of the windings adjacent to the insulation.

The cooling-air temperature can easily be measured by thermometer; for rating purposes, however, some arbitrary ambient temperature is adopted—usually 40 deg. C.—this temperature plus the allowed temperature rise, giving the maximum allowable conductor temperature of the machine. The temperature of 40 deg. C. is higher than the usual air-temperature in temperate climates, but is of the order of the usual temperature in the tropics, and is a temperature which may easily obtain in some sites in cooler countries. The adoption of a 40 deg. C. arbitrary ambient temperature, therefore, allows a margin of safety for machines which work in places where the air temperature is below 40 deg. C.

Conductor Temperature.

The conductor temperature is exceedingly difficult to measure. It must be realised that the highest temperature occurs at a point in the winding where the conductor is entirely surrounded by insulating material, and the insulated conductor is also partially surrounded by the iron of the core of the machine. There is a great difficulty, therefore, in discovering whether the insulation of a machine is at any point in contact with the surface of a conductor the temperature of which exceeds the permissible maximum temperature compatible with safety to the insulation.

It can be discovered by laboratory experiments what is the maximum safe temperature to which the insulation may be subjected, but here again the investigator must bear in mind that the conditions in a test oven are vastly different from those obtaining in a machine in service; insulation in running machinery is subjected to a periodic pounding and grinding action, as well as to heat.

It is not easy to discover, moreover, the relationship which exists between the conductor temperatures as determined by any of the available methods and the temperature at the hottest spot. Only the results of a great deal of observation and research can enable engineers to state that if the conductor temperature measured by a given method does not exceed a prescribed amount, then the temperature of the hottest spot on the conductor is not such as will imperil the life-expectancy of the insulating material.

There are three principal methods of measuring the temperature rise:—

(i) Thermometer method.
(ii) Variation-of-resistance method.
(iii) Embedded temperature detector (thermostat) method.

The thermometer method is undoubtedly the simplest and the most convenient, since the indication of temperature is obtained directly and without any auxiliary apparatus. The thermometer is ideal for measuring the temperature of a bare busbar or switchblade; the bulb is usually placed adjacent to the metal and both insulated from the air and kept in position by some material such as putty or felt. But the conductors in a motor, surrounded as they are by insulation, and embedded in a slot in an iron core, cannot have their temperature so easily ascertained. The only way is to place the bulb of the thermometer on the conductor insulation at a point where the conductor crosses a ventilating duct.

It is therefore usually specified that, when the temperature rise is to be observed by the thermometer method, the bulb of the thermometer shall be applied to the hottest accessible spot in the windings immediately the heat run is completed and the machine is stationary. In practice, several thermometer readings are taken at points likely to be the "hot-spots," and the maximum reading is used to determine the temperature rise.

When thermometers are used in the stators of rotating machines, or in any place where there is liable to be a change in the magnetic field strength, spirit thermometers should have preference over mercury thermometers, as the latter are unreliable under such conditions.

The thermometer method is generally employed for deducing the temperature rise of small and medium sized motors, when any of the other available methods would be inaccurate or inconvenient.

As previously stated the thermometer method can only be used to measure the temperature at the outside of the insulation of an armature or field coil, and will not reach the insides of coils where the highest temperatures occur. The temperature at the surface of an exposed coil depends on the thickness and heat conducting properties of the insulation and the rate at which the cooling air can collect heat from the surface. The temperature of the insulation surrounding an embedded coil is much higher than that round an exposed coil, and the thermometer cannot reach such a coil. Embedded coil temperature depends again upon the thickness and heat conductivity of the insulation and also upon the heat capacity, conductivity and cooling of the core, and on the conduction of heat along the winding to exposed parts where cooling is more rapid.

In small machines the temperature differences due to the fact that some parts of the winding are embedded, while others are exposed directly to the action of the cooling air are small, so that the temperature indicated by applying a thermometer to the hottest accessible spot of the winding fairly represents the temperature on the outside of the insulation throughout the machine. As the machine under consideration becomes larger, however, it is clear that the difference of temperature between various parts of the surface of the coil insulation becomes greater and the temperature of the hottest accessible spot becomes less and less an indication of the greatest temperature to which the insulation is subjected.

Modern engineers tend more and more to accept the principle that the method of measuring temperature rise by variation of resistance is the best method, and should always be employed except where it is impossible, or presents serious difficulties. For small motors with high-resistance windings the variation-of-resistance method is liable to considerable errors and hence the thermometer method is preferred. But as motors increase in size the thermometer is less and less reliable as an indication of the winding temperature and the resistance method becomes less liable to inaccuracy. It is self-evident, therefore, why the resistance method is adopted as the basic method—that it has immense advantages over the embedded-temperature-detector method for general purposes will become clear later.

Resistance Measurements.

When the initial temperature, the initial and final resistances and the temperature coefficient of the resistance of copper are known, a simple calculation only is necessary to compute the temperature rise of a winding. The usual procedure is as follows: the resistance of the windings is measured when the machine is cold and the ambient temperature is noted (by thermometer); at the end of the heat run the resistance of the windings is again measured.

There are one or two complications involved in this method. The cooling-air temperature may not remain constant throughout the test run, and as a run to prove the continuous rating of a machine probably lasts some five or six hours, there is ample scope for some change. If an appreciable change is noted this of course has to be allowed for. The ambient temperature is usually measured by taking the mean of the readings of several thermometers placed about four feet from and spaced round the machine under test, and so screened as not to be affected by radiation or draughts other than those set up by the ventilating system of the machine under test.

The windings of a machine begin to cool almost imme-

Digitized by Google

diately after the power has been shut off. It is impossible to measure the resistance of a rotor before it is stationary, so that the time which elapses between the cutting off of current and the taking of the resistance measurement may amount to upwards of two minutes. The final resistance measurement is not therefore the true resistance of the hot windings at the moment of shut-off. In some cases the difference may not be appreciable, but in a motor where a fan is incorporated in the rotor, the amount of heat removed by the cooling air while the armature is slowing down may be considerable. Any external cooling system should be stopped when the power supply to the machine is cut off. In cases where cooling occurs it is usual to take a series of resistance measurements at close intervals for about five to ten minutes after shut down, and to plot the winding temperatures (or the resistance) against time; then, by extrapolating the curve to zero time, the temperature (or resistance) at the moment of shut-down may be deduced.

There are several available methods of measuring the winding resistance. The Bridge-Megger method can be employed, but is open to the objection that it is difficult to keep the applied voltage steady, and hence inductive effects may make it difficult to obtain a balance. The most usual method is to use some modification of the Wheatstone bridge—the Kelvin double bridge is a convenient choice. There is also the method whereby the drop of voltage across the windings due to a known current is measured.

Good results can only be obtained if the measurements are taken for all readings between the same pair of commutator segments in the case of armatures of d.c. machines, and the brushes must be lifted. The chosen segments should be spaced apart a distance approximately the same as the pitch of the brush arms, and should be marked to ensure ready recognition. When the drop-of-voltage method is adopted, it is better to use an accumulator or battery to supply the current, as this obviates the possibility of fluctuations of supply voltage; it is usual to use a current of about 5 to 10 A. With a current of this magnitude it is better to use separate pairs of contacts for supplying the current and measuring the voltage drop, the voltage being, of course, measured between the pair of segments to which the current is supplied. Some engineers consider it better to choose several pairs of commutator segments, and to take a series of measurements from each pair.

The variation of resistance method of measuring temperature rise gives the average temperature rise of the winding (and the commutator in d.c. armatures). It does not show the temperature rise at the hottest spot of the windings, which is expected to exist where a coil side is completely surrounded—on three sides by the slot lining and the iron forming the core, and on the fourth side by the retaining wedge. The average winding temperature is considerably lower than the maximum temperature, due to the better cooling of the coils over the portions outside the slots.

Commutator Heating.

The heating of the commutator of a d.c. armature is intermittent, and cycles of current are so rapid that little heat variation would take place at individual segments; unless, therefore, the heating due to brush friction and any sparking is large, the commutator temperature would be lower than the embedded-winding temperature, and would tend to reduce the measured average temperature. Only data based on research and extensive experience can assist the decision as to whether a certain measured average winding temperature implies that the insulation is in no part of the machine heated beyond its maximum permissible temperature.

To get over the difficulty of being unable to measure the temperature of the hottest spot when using the thermometer or variation-of-resistance methods, an embedded temperature detector (thermostat) can be employed. This method is useless for rotor windings, and, due to the fact that the detectors (it is usual to fit several in each large machine) have to be built-in to the machine during construction, it is not worth while using this method except for the stators of large machines—turbo generators, large induction motors or large synchronous motors. The most important part of a d.c. machine (or rotary convertor), from the heating point of view, is the rotating armature, hence the E.T.D. method has no application for this class of machine.

It is not generally considered advisable from an economic standpoint to instal embedded detectors in machines of less than 4 000 kVA rating, which practically limits the use of this method to generators (either turbo or slower speed hydraulic types) in large power stations. Further, for generators for voltages under about 5 000 V the method is seldom used, and detectors, unless of a special design, are not used in very high voltage windings; they are not considered suitable for high voltage transformers, although they are suitable for windings for voltages up to the highest voltage for large generators.

Since the limitations of the embedded detector have been pointed out, it will be made clear that the variation-of-resistance method has by far the most wide application.

The British Engineering Standards Association has issued a series of standard specifications for the rating of electrical machinery, each specification dealing with a different type of machine.

Large Machines.

There are three specifications for large electric generators and motors, viz., B.S.S. No. 169—1925, for Large Electric Generators and Motors with Continuous Rating Permitting Overloads; B.S.S. No. 225—1925, for Turbo-Alternators; and B.S.S. No. 226—1925, for Large Electric Generators and Motors with Continuous Maximum Rating. These specifications allow all three methods, with certain qualifications.

For the slot portion of stator windings of machines above a certain limiting capacity (4 000 kVA in B.S.S. Nos. 169 and 226, and 5 000 kVA for turbo generators) the E.T.D. method is specified, but for all other sizes the variation of resistance method is standard, with the provision (in B.S.S. Nos. 169 and 226) that it must not be used for the windings of a.c. machines taking more than five minutes to come to rest—the thermometer method shall then be used. Otherwise the thermometer method can only be used where the other two methods are impracticable. The difficulty of accurately extrapolating a cooling curve to zero time when the first reading is taken after some six minutes will be appreciated: hence the ban on the resistance method.

For Fractional H.P. Motors (B.S.S. No. 170—1926), the thermometer method is standard; this method is also standard for Industrial Motors (B.S.S. No. 168—1926 for motors above those covered by B.S.S. 170 and up to a rating of 2·5 H.P. or 2·5 kW or 2·5 kVA per rev. per min.).

For Transformers for Power and Lighting (B.S.S. No. 171—1927) either the thermometer or the variation-of-resistance method can be used. Since transformer windings are not embedded in slots in the core, the thermometer method is practicable for large transformers. The embedded temperature detector method is not included, because the detectors are not suitable in very high voltage windings.

For Rotary Convertors (B.S.S. No. 172—1927) the thermometer method has preference, probably because constituent parts of a rotary convertor—d.c. exciter, a.c. starting motor, and possibly an a.c. booster and an induction regulator—can all have their temperature rises noted by thermometer at the end of one heat run; for convenience *all* measurements are taken with a thermometer, although the variation-of-resistance method might be better for the armature windings.

The Specification for Traction Motors (No. 173—1928) is a revision of a specification issued in 1923. It is limited to d.c. series-wound motors. The 1923 edition required the temperature rise to be measured by thermometer, whereas the 1928 edition insists that the resistance method shall always be used, except where it "is impossible or presents great technical difficulties, in which case the thermometer method shall be used." This difference in the two editions is probably a reflection of the growing idea among electrical engineers, both in this country and abroad, that the variation-of-resistance method is the method which is most accurate and has the widest application, despite the difficulties which may be imposed—waiting for the armature to stop, for instance.

It may be that in the event of a revision of some of the British Standard Specifications which now call for the thermometer method, we shall find the variation-of-resistance method given first choice. On the face of it, the resistance method seems the better for large motors, especially large d.c. motors, at present included under "Industrial Motors" in B.S.S. No. 168.

As a matter of fact it is quite a usual procedure to measure the temperature rise of fractional horse-power motors by the variation-of-resistance method, although it is essential that expert observers shall take the necessary readings, and that they shall use good instruments. It is claimed by some authorities that for small motors the variation-of-resistance method is quite as accurate as the thermometer method, and under suitable conditions more satisfactory.

Digitized by Google

For induction motors also the variation-of-resistance method is permissible. For small induction motors with solid rotors the maximum temperature rise is in the stator, and this temperature rise can conveniently be measured by the variation-of-resistance method; for squirrel-cage motors the majority of the heating is in the stator, the temperature rise of which can be measured by the resistance method, and for induction motors with wound rotors this method can be used by both stator and rotor.

It would, therefore, seem that the thermometer method is only really preferable where the measurements are to be carried out by comparatively unskilled observers, or where the rather elaborate apparatus necessary for the resistance method is not available.

The above gives a résumé of the principal methods of measuring the temperature rise of electrical machinery, and shows how the methods are applied in standard practice.

BOOK REVIEW.

Overhead Power Lines: Elementary Designs and Calculations.

By Capt. W. Morecombe, R.E. (London: Chapman and Hall.) Pp. xi + 236. 15s.

This work, judging by its contents, is intended to be a handbook for those engaged in the layout and equipment of overhead lines. The book as a whole deals primarily with the mechanical stresses met with in line construction, assuming the factors laid down in the regulations at home.

The first chapter starts off with notes on voltage regulations and the choice of voltage, and then deals with line constants and energy losses, giving some useful curves and data. Regarding the choice of voltage, the author does not stress sufficiently the point that up to the limits of apparatus at reasonable price for village supply, at, say, about 15 000 V, the higher the voltage, not merely the lower the losses, but the better the inherent regulation; for example, it is difficult to understand how anybody could put up nowadays a new line at 3 000 V with a number of transformers on it at 50 or 100 kW. The most recent l.t. regulations, with the increased l.t. distribution radius, tend to favour 11 000 V. Chapter II deals with conductors, their sags and stresses, with tables, and Chapter III. handles line fittings, clearances and spacing; the regulation clearances to earth are now reasonable. Bird guards are briefly mentioned; then spacing, horizontal and vertical, as influenced by swaying and unequal loading. A triangular arrangement of conductors is favoured. In the illustrations given the earth is placed below; in districts where lighting gives trouble, an earth-wire above the conductors has proved to be of material advantage. With the aid of a steel top extension piece and a triangular-sideways arrangement of conductors, this can be managed without increasing the length of the pole. One notes that many British bracket arrangements involve too many coach screws, each hole being a source of weakness; that is why the clip system is going ahead abroad. Low tension construction is dealt with, and also the use of h.t. and l.t. lines on the same post.

Chapter IV deals with insulators and conductor fastenings. It is hardly desirable to standardise insulator forms, as we do not know enough about them yet. A few notes are given regarding chain insulators. The writer states, regarding Hewlett and other interlocked forms, that if the insulator breaks, the wire is still linked mechanically, and therefore does not fall. Recent experience on the Orleans railway, as detailed by M. Parodi at the last Paris E.H.T. Conference, tends to show that arcing is a great factor regarding insulator failure, and that when it takes place the arc may burn through the links. On some comparatively low voltage lines chain insulators are being used at material angles instead of those of the pin type.

The author states that glass (pin) insulators appear to be thoroughly reliable up to 22 000 V; and it is a pity that their manufacture has not been undertaken at home. There are far more glass pin insulators for h.t. work being made in France than those made of porcelain. There are many of the pin type giving satisfaction at 60 000 V, and one line—Argentan to Caen—was comparatively recently equipped with them for 80 000 V. During the war the reviewer tried to get the Sheffield University to take an interest in glass pin-type insulators; so far suspension type glass insulators have not been very successful. Moulded material insulators are used in some parts of South America because "broncho-busters" take pot shots at them; the author states that there is a fortune awaiting the inventor of a material with the electrical advantages of porcelain, but without its fragility.

There is an interesting chapter on cross arms and brackets. The author thinks the elongated insulator bolt type of bracket to be a weak design, only suitable for 6 600 V; yet there must be hundreds of thousands of this general type in operation in France, Germany, and Switzerland giving satisfaction for light lines up to 15 000 or 20 000 V. Even if a stalk does get slightly bent in service, the end of the world does not come. Continental overhead ironwork, regarding cross arms, etc., is tending towards the use of clips rather than through bolts and coach screws. Useful tables are given regarding choice of standard wood poles and the selection of spans to give the best results; as spans get longer, so poles must be higher, to allow for sags, and tables and curves show how, even after allowing pole rent charges, on a high voltage line 3·/·147 copper, with a cross triangle arrangement of conductors, there is but little difference in cost per mile between a span of 200 ft and 400 ft., the increased dimensions, and therefore cost, of the wood pole making up for the bulk of the difference. The author points out that "unless we go to extremes, the length of the span has little effect on the overall economy"; it is also noted that owing to the limited span for increased sag, under the regulations, a larger number of posts must be used on a line with smaller conductors, and therefore the economy of the use of these is diminished. This factor encourages the use of alloy or compound conductors. It is stated that in certain circumstances a movement in the ground may avoid a failure of the pole itself; some ground is little better than a sponge; it is elementary physics that until a pole begins to move, the ground cannot begin to resist. It is admitted, that poles are flexible, and to be so is an advantage. It is stated that owing to the extra foundation costs, Rutter type excepted, the only justification for compound poles in distribution work is the reduction in the number of wayleaves required to be negotiated, rather than the cost of wayleaves.

The Rutter pole is dealt with, but it is difficult to realise the economic advantage of a wood structure requiring twenty-two bolts and ten scarf blocks. Tubular steel, channel steel, and channel lattice poles are discussed. The author calculates an example of a ferro-concrete pole with steel of an ultimate strength of 65 000 lb. or, twenty-nine tons, with a factor of safety of 3½. The regulations state 3½ on the elastic limit, not on the ultimate strength. Assuming, however, that fifty tons steel is used, the calculations come out about right; for their centrifugal posts the Italians use a steel so hard that it is liable to break when falling on a stone floor, but which stands up to test when encased in concrete. Very long bars are now available, and welding is usually only required with transmission posts of 80 to 100 ft.

Angles and Terminals.

A chapter is given on angles and terminals, commencing with stays and struts. In some countries, owing to difficulties regarding cattle and ploughing, stays are strongly objected to. The screw guy-anchor, so much used in America, is not mentioned; it has never taken on here.

A short chapter deals with conductors other than copper; cadmium-copper, bronze, copper clad steel, aluminium, steel cored aluminium, and galvanised steel being dealt with. The ice-loading regulations tend to hamper the use of light section copper. Apparently the author has had some trouble with aluminium conductors. A table is given showing the economy possible with galvanised steel conductors as compared with light copper. This, however, is worked out to the 1923 regulations. Material improvements have been made recently regarding the galvanising of steel wire. It is remarkable that the use of copper-clad steel has not taken on in England; perhaps this is due to the price.

The book concludes with a chapter on safety precautions. Commissioners' and P.O. regulations are given in appendices. In most countries elaborate, snow-catching, money-wasting cradles for Post Office line crossings were abandoned years ago.

The book should be useful to indoor and outdoor power-line engineers, and will provide a much-wanted textbook for technical schools. It is a pity that present-day costs of printing and publishing, mainly the outcome of demands of "friends of progress," must necessarily tend to restrict the circulation of useful technical handbooks.

T. R.

SAG CHART CURVES.

With reference to the Sag Chart Curves shown on page 523 of our November 1st issue, it is interesting to note that the values given agree almost completely with those in Capt. Morecombe's book, though their calculation was entirely independent,

ACHIEVEMENTS IN STEAM GENERATION.

Efficiency and Simplicity Go Hand in Hand—Lively Discussion on Pulverised Fuel—Views on the Grit Problem—Chain Grate Stokers and Large Capacity Boilers—Water Walls.

BEFORE the London Local Technical Group of the Electrical Power Engineers' Association, at the Junior Institution of Engineers, on November 12th, Mr. P. E. Rycroft (Chairman of the Group) presented a paper on modern steam generators, in the course of which he described some of the achievements of modern plants. For purposes of comparison he tabulated the hundred most efficient plants, from the point of view of overall thermal efficiency, of those dealt with in the Electricity Commissioners' returns for the year ended March, 1929, in descending order of efficiency. He added the type of steam generators installed and the system of firing adopted in each case, together with the annual load factor and the yearly output in units. The higher steam pressures were also noted where such were employed.

Looking at the table broadly, the higher pressures were all located near the top, and but for the fact that Padiham—the leading station—operated at only 250 lbs. per sq. in. there would appear to be considerable evidence that the higher pressure plants had the advantage.

In the Padiham station the individual steam-raising units were rated at an evaporative capacity of only 35 000 lbs. of water per hour, whereas its nearest rival (Barton) utilised units evaporating from 100 000 to 160 000 lbs. per hour. It could not be asserted definitely that large steam-raising units made for high efficiency; indeed, it was much safer to say that, beyond units of, say, 20 000 lbs. per hour, if it were assumed that the plant were properly worked, little or no difference in efficiency could be credited or debited on account of the size of unit. As to the types of boilers installed, the table showed a decided weight of evidence in favour of the sectional or header type of water tube boiler with horizontal tubes. Ferrybridge, as a newcomer with vertical bent tube boilers, was an exception to this general rule, and had, of course, the advantage of a super load factor of over 50%, as against 42, 44 and 46% in the case of the first three stations on the list. With regard to the furnaces, the predominance of the travelling or chain grate type of stoker was overwhelming. There was no station in the list completely equipped with pulverised fuel firing except Brimsdown B., which had not yet a full year's working to its credit; of the partially equipped stations, Barking and Lister Drive No. 3 made the best showing, but there was nothing to indicate the relative proportions of load borne by the pulverised fuel sections in either case. Pending the returns from a station completely equipped with pulverised coal burning plant, and operating continuously over a period of 12 months, we were still unable to dogmatise on this question.

An Interesting Observation.

Examining the details of the steam plant at Padiham, he said the outstanding fact was that to all intents and purposes the main design and layout was identical with what was accepted as good practice 20 years ago; simple land type sectional header boilers with horizontal tubes and longitudinal drums, cast iron vertical tube economisers set at the rear of the boilers, integral superheaters raising the final temperature of the steam to only 620 deg. F., the boiler working pressure being 250 lbs. per sq. in., the rated evaporation 35 000 lbs. of water per hour, giving the very modest rating of well under 4 lbs. of water per sq. ft. of heating surface. The units were set in brickwork and fired by means of mechanical chain grate stokers operated for the most part under natural chimney draught conditions with only 0·4 in. draught at the boiler dampers, and equipped with induced draught fans for emergency use only. The keynote of the whole equipment was simplicity and reliability. The result for two years in succession had been an overall thermal efficiency of over 21%.

At the Barton boiler house, the nine original units were of somewhat special design, inasmuch as two sets of horizontal tube sections were placed back to back, and connected into a common steam drum, the furnaces being also double, and fired at both ends. In later units this arrangement had been discontinued in favour of the standard single-ended type. Each complete unit was designed for an evaporation of from 100 000 to 120 000 lbs. of water per hour. Steel tube economisers were superposed above the boilers, and tubular air preheaters were further superposed above the economisers. The complete plant was constructed for a working pressure of 375 lbs. per sq. in., and the furnaces were equipped with chain grate stokers operating with mechanical induced draught only or under combined forced and induced draught when load conditions made this desirable. The overall efficiencies obtained by this plant over a considerable number of years were consistently good, viz., 1924, 20·33%; 1925, 19·83%; 1926, 21·51%; 1927, 21·83%; 1928, 21·07%; and 1929, 21.31%.

The two essential differences between this plant and Padiham were that at Barton air preheaters were installed and forced draught utilised, whereas at Padiham neither of these conditions prevailed.

North Tees Station.

The third example of high efficiency plants was that at North Tees. This operated at the highest steam pressure so far employed by any British power station, i.e., 475 lbs. Secondly, it was designed to function without the aid of economisers, relying entirely on air preheaters for recovering the heat units which passed the boiler. Thirdly, it was the first station to employ steam reheating between the turbine stages by returning the partially expanded steam to the boiler unit. The overall efficiencies obtained from 1924 to 1929 inclusive were respectively 17·69, 18·01, 18·75, 18·33, 20·49 and 21·19%.

The last of the super-efficient plant mentioned was Ferrybridge, and the keynote of this installation, as in the case of the Padiham plant, was simplicity. The boilers were of the vertical tri-drum type with bent tubes, and each unit was complete with integral steel tube economisers placed immediately at the rear of the boiler. The working pressure was 300 lbs. per sq. in., and the normal rated evaporation for each unit was 75 000 lbs. of water per hour. Ferrybridge was a single floor boiler house, with the chimneys erected from ground level, and no air pre-heaters were installed. The furnaces, as in the other 21% stations, were equipped with chain grate stokers arranged to operate with simple induced or induced and forced draught in combination.

Mr. Rycroft emphasised that among the modern steam generating plants of to-day the most efficient was at the same time the simplest in design, and the one which had departed least from well-established practice.

Dealing with super plants which were either just beginning to function or were still under construction, he said the working pressures adopted showed an upward tendency, and the rising evaporative capacity of the individual units was equally marked. Stokers more than held their own against pulverised fuel burning equipment, and in this respect the new Liverpool station was specially interesting, as the stokers were installed to carry the base load, while pulverised fuel burners were to be fitted to the same furnaces for auxiliary purposes. The outstanding features of these new stations was the practically universal adoption of water-cooled furnace walls for all the newer installations. This was one of the definite results of higher furnace temperatures due to more perfect combustion, and there was little doubt that the water-cooled furnace wall would become standard equipment for all the larger plants. Almost equally indisputable was the necessity for fitting all modern steam plants with simple equipment for the systematic removal of soot and fine ash from the heating surfaces, and unless this were done continuously high efficiencies could not possibly be obtained.

Problems of coal supply, ash removal and grit emission were vitally important, and simplicity in coal and ash plants was desirable. The reinforced concrete tank laid down by the London Power Co. at their Deptford West station for coal storage was a good example. Although there were two or three passably good systems available to choose from, he was of the opinion that the ideal method of ash disposal had still to be produced.

The subject of grit emission was so topical that we were in danger of becoming hysterical, but apparatus was available which would readily collect all but the very finest particles, and, by the added refinement of water sprays, even these could could be dealt with satisfactorily Power stations would very soon be able to recover at least 75% of all the sulphur they produced.

With regard to the problem of fuel combustion, there could be no doubt that in this country technical opinion as to the advantages of pulverising coal for firing under steam boilers

Digitized by Google

had undergone a considerable change during the last year or two, and we should make all the more real advance if, while frankly acknowledging that with certain qualities of fuel and under certain conditions of operation it might be advantageous to pulverise coal before we consumed it, it was equally certain that many of our coals could be burned at least as satisfactorily in a solid form by mechanical stokers. Mechanical stoking had undoubtedly made great progress during recent years. The introduction of water-cooled furnace walls had opened a new era in stoker performance. There had been a revival of interest in the retort type of stoker, and it seemed probable that more would be heard of these during the next year or two, but the travelling grate had a long lead, and with the elimination of the furnace arch, which may be safely anticipated in the very near future, the one great objection to this type of stoker would have been disposed of.

DISCUSSION.

The CHAIRMAN (Mr. Wilson) claimed that powdered fuel firing had come to stay. Its success or its failure would not be determined by any report or statistics of the Electricity Commissioners, but it must be studied as a distinctive method of firing. The only reliable figures in this country, if they could be taken as such, were those given by the Derby station, which had been working on powdered fuel for over a year, and if one surrounded the Derby station with the Padiham conditions, Derby would show up to greater advantage than Padiham in the Commissioners' return; or, given the Derby conditions at Padiham, the latter could not achieve the same thermal efficiency as it does to-day. Such statistics as those of the Electricity Commissioners, to which Mr. Rycroft had referred, could not be accepted as indicating the value of the modern steam plant installed. If one were going to use statistics for this purpose, then they should include the average yearly boiler house efficiency. The most important factor of all was commercial efficiency, and Derby was about to publish, if it had not already published, the lowest coal costs in the country, which he believed would be 0·09d. per unit sold. If he were again to take charge of a power station embodying large boilers he would not hesitate to give powdered fuel first consideration, but would consider it in connection with a new boiler design, such as could be seen at Brighton, Derby and Manchester. Why we were content to go on adding excrescences to a boiler which was originally designed for stoker firing he did not know; the obvious thing in modern steam generating practice was to make the boiler the combustion chamber; or make the combustion chamber the boiler, to give an assembly of radiant heating surface which obviously should be more efficient, a simplicity of design which hitherto was never visualised, a compactness of design so that the plant would occupy less area, and at a capital cost certainly not exceeding stoker firing. He predicted that when a station in this country was equipped with boilers built on that principle, Padiham would be considered out-of-date.

Mr. MACGUIRE said he had tried to picture what a station such as Hams Hall would be like if it were built on the Padiham lines; Birmingham would hardly be large enough to carry it. The tendency to-day was in the direction of greater concentration of power in power stations, and he would hesitate even to suggest that with the large boilers having capacities of 200 000 or 250 000 lb. or more, such as would be installed in super power stations, stoker firing would be considered reliable. With regard to water-cooling, he said that the new boiler at Sir John Anderson's works at Milwaukee had completely water-cooled furnaces, and these had been running for, he believed, 12 000 hours without any maintenance costs whatever having been incurred in respect of the furnace. As to dust emission, there were many stations working on pulverised fuel firing, at which 85 or 95% of the grit was being collected, with the aid of washing apparatus in addition to the grit collecting apparatus.

Mr. SAMUELS pointed out that when discussing boiler house efficiency we were apt to forget the excellent results which had been obtained in practice by some of the older power stations. A test carried out in London on a boiler which perhaps is now well on the road towards becoming old-fashioned had shown that the efficiency on the gross calorific value of the fuel was about 88·7%. The power taken by auxiliaries was about 0·6%, so that the overall boiler efficiency was 88 on the gross calorific value of the fuel, or somewhere about 91·5 on the nett. With regard to the chairman's remarks as to the type of plant in which the generator was to be the furnace, he said that in a measure that condition was attained in the new water-cooled furnaces; but we could not afford to take away the tubes of the boiler, because we should be losing an opportunity for heat transfer. It had been suggested that the horizontal tube boiler was designed for the mechanical stoker, but that was not so. The horizontal tube boiler was designed for hand firing, and was later developed and made suitable for the mechanical stoker, though the general principles had remained the same. He believed that it had proved very suitable for pulverised fuel firing. As to the suggested impossibility of using chain grate stokers for boilers having a capacity of 200 000 or 300 000 lb. per hour, he said that no difficulty in that respect had been experienced so far. We had surmounted the refractory difficulty by means of the water wall, and with regard to the quantity of fuel burned there was no question that rates twice as great as those to which we had been accustomed could be obtained per sq. ft. on a stoker in a suitably designed furnace.

Mr. W. J. OSWALD suggested that perhaps we were a little premature in expressing definite opinions or in coming to early decisions as to the merits of different types of plant of large capacity, such as would be used in the future, for we had yet to go through an experimental period in the development of these very large plants. He emphasised that cleanliness in a boiler was the basis of high efficiency, and that was a matter which operating engineers would do well to watch closely. With regard to efficiency, he agreed that the overall thermal efficiency of a station was not necessarily the criterion of the efficiency of the boiler house, because so many factors, as, for instance, the turbine plant, the lay-out of the stations, etc., were included in the overall thermal efficiency.

Mr. BLENKINSOPP, referring to the North Tees station, said that although the engineers and contractors were to be congratulated on the latest efficiencies obtained, it had taken seven years of hard work and experiment to increase the efficiency of the boiler plant to its present standard. He understood that the efficiency of one of the boiler units, as shown by recent tests, was about 89·5% on the low calorific value of the fuel. But even that could be beaten. The boiler efficiency of a pulverised fuel-fired station on the Barking extensions, as shown by a 100-hours test carried out by independent authorities, was 91·7% on the lower calorific value of the fuel. Neither of the two figures he had quoted left very much to be desired. He approached the pulverised fuel firing problem with an open mind, and realised that there was scope for it and for stoker firing. With regard to water cooling of the furnace walls, he urged that the cooling system should be designed as an integral part of the boiler plant instead of an adjunct to it, as had been the case in practically all boilers of that type equipped up to the moment. As to boiler drums, he suggested that, inasmuch as pressures of 600 and 800 lb. per sq. in. had become every day practice, riveted drums were things of the past; we had to face the necessity for providing solid forged drums, or at least welded drums, and we might with advantage carry out propaganda on welded drums.

Cooling Problems.

Mr. WALLIS suggested that in considering boiler efficiencies regard must be had to commercial efficiency, so that the basis of comparison should be the cost per British thermal unit in the steam. With regard to the cooling of the walls of the boiler furnace, he said that in the latest development of the Benson boiler the whole of the tubes formed the walls themselves. It might be said that the bare tubes cooled the gas too much, and therefore it lessened considerably the effective volume of the combustion chamber, and he believed that if they were absolutely cold bare tubes one had to consider that the effective volume of the combustion chamber was considerably less than the actual volume of the chamber.

Mr. NUNN, referring to water walls, asked what power station men were to believe with regard to them, because on the one hand they were told to build boilers with water walls, whereas an engineer from a station in North London had advised them not to adopt water walls, his reason being that they did not contain water at all, but a mixture of steam and water, largely steam.

A SPEAKER agreed that the cost per unit of heat in the steam leaving the boiler house was a useful criterion for comparing the efficiency of boilers. The cost of coal per unit generated was also not a bad basis of comparison.

Mr. NUNN pointed out that in arriving at commercial efficiency it was important to bear in mind the different prices which had to be paid for coal by power stations in different parts of the country.

Mr. RYCROFT made suitable reply.

INTERFERENCE FROM LINE INSULATORS.

Methods of Avoiding Corona and Brush Discharges—Pin and Suspension Insulators Discussed—Moisture and Dirt One of the Worst Causes of Trouble.

By W. JACKSON, M.Sc.

THE expansion of high voltage transmission of electrical energy in this country by overhead lines introduces an important source of radio interference. The extreme sensitiveness of modern radio receivers makes them very susceptible to interference, and the comparatively small amount of energy involved in the electrical discharges likely to occur along high voltage lines is therefore sufficient to produce appreciable disturbance in broadcast receivers.

Different Effects.

These electrical discharges may be of two types—corona discharge and brush discharge. Corona discharge usually occurs at lower voltages than the brush discharge, and appears as a blue glow when viewed in a dark room. Brush discharge occurs after corona and takes the form of fine white streamers. The two produce entirely different interference effects. The corona discharge produces in a broadcast receiver a soft hissing sound which is not ordinarily objectionable. The brush discharge, however, produces a crackling, frying sound which is very annoying.

Corona and brush discharges are liable to occur on high voltage lines, either between metallic surfaces, between insulating surfaces, or between metallic and insulating surfaces. The avoidance of such discharges is a necessity if radio interference is to be prevented, and is therefore one of the problems which must be considered when deciding on insulator designs.

A discussion of the researches recently undertaken in America on this subject are outlined in a recent paper to the American Institute of Electrical Engineers.* In pin type insulators discharge can be avoided by ensuring that all hardware is tight, that adjacent pieces of hardware are either sufficiently well separated or are bonded together, that the conductors and tie-wires make perfect electrical contact with the top of the insulators, and that the pins make perfect electrical contact with the entire surface of the thread in the pinholes. These requirements are readily satisfied, with the exception of the last two. Several methods have been adopted in an attempt to secure good contact between conductors, tie-wires and insulators on existing pin type insulators. Metallic paints have been tried without success, because such paints form a coating of metal particles suspended in varnish, and do not offer a good conducting surface. Partial success has attended the use of metal discs attached to the conductors above the insulators, or by looping the tie-wire so as to form a ring several inches in diameter above the head of the particular insulator.

The best solution at the present time consists of metal gauze placed in the tie-wire groove. For new installations corona and brush discharge on pin type insulators can be eliminated by using metallic threads in the pinholes, by using metal coated or metal capped heads, and in some cases by using a special glaze on the head, or in the pinholes.

The suspension type insulator is a much less difficult problem. Both the spider type and the ball and socket type, while designed primarily for high mechanical strength, and high flashover voltage, rather than for high value of corona and brush discharge voltage, are found to be quite satisfactory from the point of view of radio interference. Clevis type insulators are also satisfactory when the cotter key is designed circular, and with the ends concealed inside the clevis bolt. The link type is satisfactory if sufficient loading is applied to keep the porcelain and links in intimate contact, and the voltage per unit does not exceed 14 000 V.

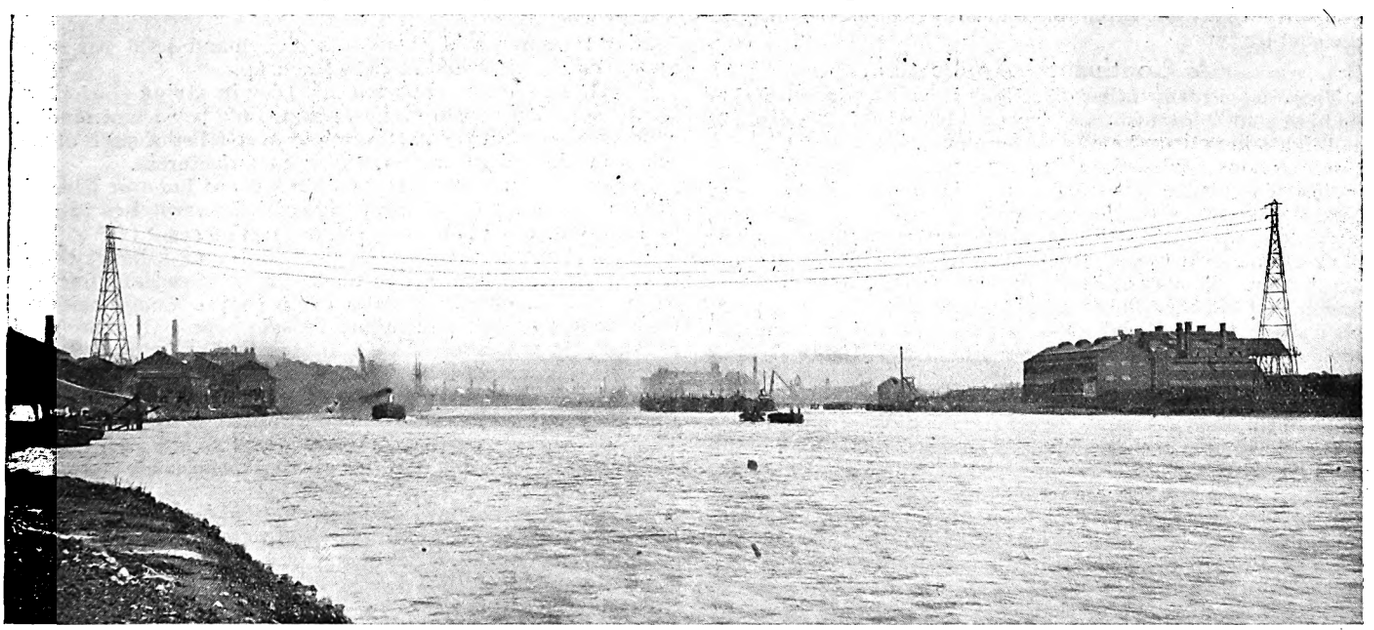
The effect of moisture and dirt in the case of both pin and suspension type insulators is to increase the tendency for discharge and radio interference, while defective, cracked or broken insulators may set up disturbances capable of affecting radio receiving sets many miles away. In either case the remedy is proper inspection and cleaning.

* Van Atta and White. "J.A.I.E.E." September, 1929.

UNDERGROUND LIGHTING FITTINGS.

The Underground Lighting Fittings Specification just issued by the British Engineering Standards Association provides for fittings for use with standard vacuum tungsten filament lamps, with a minimum rating of 60 W, and its main purpose is to ensure interchangeability of such parts as well as glasses that require frequent replacement. The provisions in regard to interchangeability are also extended to cover the attachment of the cables so that with the new standard fittings quick replacement of damaged units will be facilitated.

Copies of the specifications (Nos. 238–1929) can be obtained from the British Engineering Standards Association Publications Department, 28, Victoria Street, London, S.W.1, price 2s. 2d. each, post free.



CROSSING THE TYNE.

AN interesting overhead line feature on the Newcastle Electric Supply Co.'s network is the river crossing seen above. Part of a 66 000 V double circuit line, it crosses the River Tyne from Dunston power station in a single span of 1 000 ft. The crossing towers are 168 ft. high, and the minimum clearance of the line conductors above high water is 114 ft. In the process of reproduction from the original photograph the conductors have run together, thus unduly emphasising their presence.

SELLING TIME SWITCHES.

Applications in the Household—Lack of Enthusiasm in the Electrical Industry—An Example Set by New Zealand—Low Temperature Heating Systems—Views on Salesmanship Schools—Speciality Selling.

AT the E.D.A. Salesmanship Conference on November 15th, Mr. E. E. Sharp, lecturing on the subject of selling time switches, referred to the apathy and lack of enthusiasm for electricity among those engaged in the electrical industry. With regard to the selling of time switches, most of those who were or should be engaged in this class of work—contractors, and supply interests—needed a good deal more courage, initiative, and even common sense, than had hitherto been evinced. One of the commonest uses of the time switch was for controlling shop window lighting, but for the most part the work was bungled. As an instance he mentioned the case of a large stores in the neighbourhood where he himself lives. Hearing that there was trouble with the time switch he made a personal call and found the switch fixed low down in a cupboard where it was almost impossible to get at. The time switch was one of the cheapest type, although the premises were big and important; it was connected without a hand switch in parallel so that the window lights could not be switched on during the day in case of darkness or fog. No instructions had been given as to winding and setting, no key had been given to wind the clock and the switch had been set by the wireman to switch on at 4.15 a.m., and off at 9 a.m. He ascertained that it was the draper himself who had suggested the time switch to the local supply company and eventually he had to explain the whole thing and put matters right himself. Mr. Sharp suggested that many others were similarly placed.

How many of them were aware that there were time switches designed to look after themselves? How many of them were guilty of putting in alarm clock arrangements simply because they were cheap. He and his assistants had spoken to hundreds of shopkeepers all over the country—he was not exaggerating—and the story was nearly always the same. They knew there was some automatic appliance for turning off the lights, but they left it to the supply people or contractors to install what was necessary. There were many tiny shops of a primitive sort where alarm clock switching might be justified, but in the great majority of cases something that would turn on as well as off, and go on doing it for years without attention, was wanted. For those engaged in supply work, it was better to hire out the time switch because a cheap rate could be combined with it for lighting after closing time. But failing to do that, it should be explained to the shopkeeper which apparatus would do the most for him with the least attention and also the shortcomings of the simpler types.

A Continental Application.

There were many other directions in which time switches could be sold. For instance, they could be used for controlling hall lights in private houses. There were more switches sold direct to householders for this purpose than were sold by the trade. Then there was the control of staircases in blocks of flats. Everywhere on the continent a switch was used which, by pressing a button, illuminated the lamps for sufficient time to enable a tenant to travel between his flat and the street door. This was often combined with an ordinary time switch that kept the lights going from dusk till 10 or 11 p.m., when the temporary lighting device came into action. Another device was the programme ringer which would ring bells or buzzers all over a factory or business premises at meal times, and so on. There were numerous other applications which he would not catalogue.

Mr. Sharp stressed severely the danger of salesmen being obsessed with the question of price and mentioned several instances when he had obtained large contracts even when competing against prices 50% lower than his own, simply by being able to show the user the advantages of his own goods or suggesting to his client some better way in which they could be applied.

Finally, Mr. Sharp urged that time switches were important adjuncts to electricity supply, and mentioned that in one town in New Zealand there were about 7 000 in use on off-peak water heating and they were being connected at the rate of 50 per week. As an example of initiative, he mentioned that his firm has a scheme by which a salesman is loaned to electricity supply authorities for a week at a time to canvass for time switches in relation to shop window lighting. The appearance of this salesman in the district is preceded by a series of E.D.A. pamphlets sent to the shopkeepers for three weeks in advance, and then, a week in advance, a letter is sent saying the man will call. No mention of any firm or apparatus is made. The shopkeeper is spoken to and interested in shop window lighting, and in very many cases orders are booked, which means, incidentally, a time switch, wiring, lamps, etc., and so, said Mr. Sharp, the whole industry benefits.

Mr. Sharp expressed his disappointment in salesmanship schools and explained that in no case had he come in contact with a satisfactory student from the selling point of view.

DISCUSSION.

Mr. V. W. DALE (E.D.A.) differed from Mr. Sharp's views as to salesmanship schools and suggested that there were some which did useful work. He called attention, however, to the lack of schools for training girls who might enter the sales side of the electrical industry, and expressed the hope that Mr. Sharp might do something in that direction. Adding that he himself had adopted the practice of adding a new piece of electrical apparatus to his home every Christmas, Mr. Dale pointed out that there were two million people engaged in the electrical industry, and if everybody did that, there would be a tremendous demand both for domestic apparatus and appliances and current.

Mr. HAYES suggested that one of the reasons why time switches were not pushed to the extent they might be was that the ordinary electrical salesman had too many items to deal with and he therefore concentrated on the easiest selling line. There was a tendency towards the development of specialist salesmen, and we would have to come to that if all types of electrical apparatus were to be suitably and adequately dealt with.

Mr. H. W. WATTS (Epsom) said the time switch would help many station engineers during the next few years in regard to their maximum load. At the moment he could do with more plant, but hoped to get a bulk supply in December, when he intended pushing ahead with water heating and using time switches.

Col. W. A. VIGNOLES (E.D.A.) agreed that time switches would be a great help in levelling out peaks in the supply load which were troublesome at times. There was a great need for "gingering up," as Mr. Sharp had said, and the point was how to get at those people who did not attend these conferences.

Miss HASLETT said there was a demand here for such apparatus, but it would have to be cheap.

Mr. H. T. YOUNG supported Mr. Dale in saying that there were some salesmanship schools that could be recommended, and suggested that the E.D.A. might keep a list of such of the schools which might prove useful to manufacturers.

Miss READING mentioned that the City of London Electric Lighting Co. had installed a number of time switches in connection with low temperature heating in offices.

The CHAIRMAN (Sir John Brooke) proposing a hearty vote of thanks to Mr. Sharp, said he had not noticed any lack of enthusiasm among those who came to the Commissioners from time to time. It might be said that only the very enthusiastic ever hoped to get anything out of the Commissioners! There was, however, a tendency on the part of some people to regard the future for electricity as so assured that they had only to sit down and wait for it to come along. That, of course, was all wrong and therefore the point made by Mr. Sharp as to the need for greater enthusiasm than ever was a sound one.

Mr. SHARP, in acknowledging the vote of thanks and replying to the discussion, said he was glad to hear there was some good in salesmanship schools, and perhaps one day he would meet a product of such a school who could convince him. Up to now he had not.

Plans for extensions of the engineering department of Lincoln Technical College are in the hands of Mr. W. S. Watkins. The new buildings which will cost about £11 000 will provide advanced engineering education, and the accommodation will include laboratories for practical and experimental work in mechanics, electrical engineering, etc.

ELECTRIC WARMING.

An Example of Operating Cost.

By R. GRIERSON, A.M.I.E.E., A.M.I. Mech.E.

(*Concluded from page* 601).

THE design of the electric panel system that I have described is such a radical departure from accepted standards that I find that many people regard it with suspicion, and I, therefore, ask you to consider the following details, which relate to the embedded plaster type.

A multiple strand conductor is employed; the conductors operate at a temperature of 130 deg. F. In other forms of electrical apparatus, similar conductors operate entirely satisfactorily for months, and even years, at a temperature of 1 830 deg. F.

In the embedded type the insulating material employed has been tested up to 350 deg. F. without noticeable deterioration, and actually operates at temperatures of the order of 130 deg. F.

I.E.E. Regulations (Table V) permit ordinary house wires to operate normally at 100-120 deg. F., for long periods, and at 130 deg. for short periods.

Short circuits are impossible, because the conductors are rigidly held in hard plaster and a space factor of at least 0·375 in. is maintained between turns and approximately 24 in. between the full voltage points.

The cost of operating an electric warming system is no easy matter to estimate with any degree of precision, for the factors are so variable, accurate measurement is so simple, and the maintenance of the required temperature is so precise. Units are units, but all coke is not good coke, and all stokers are not good stokers. Both coke and stokers can be blamed by hot water engineers. Electrical engineers can only blame the meter or the occupants of the building, or—as a last effort—their own calculations.

To consider only one detail, the animal heat emitted by the occupants of the room exceeds 0·1 Board of Trade units per hour. In our own offices, in two rooms of similar dimensions, one room facing south, occupied by several men, consumes no current on one day, while the other office occupied by one man, may take say 4 or 5 units. Further, heat storage, sunshine, etc., and the temperature maintained in adjoining rooms, all affect the total. On two days in the same month, for the same mean outdoor temperature and with a dead level thermograph chart on the 60 deg. line, the variation may be a difference of anything up to 2 or 3 units per day per room, and the discrepancy is not due to the meters, as these have been carefully calibrated.

From a London cinema equipped with the Dulrae panel system the following figures have been obtained :—

Total load	.. ..	31 500 W, or 107 000 B.Th.U.
Total cube	.. ..	55 000 ft.
Watts per cu. ft.	..	0·586.
Consumption	..	Year ending March 30th, 1928—24 202 units, or 768 units per kW installed.
		Year ending March 30th, 1929—29 627 units, or 940 units per kW installed.

If these totals are figured as to 60% at the 0·75d. rate, and 40% at the 0·5d. rate (which is now available), the annual cost is £60 and £74 respectively. In this case the animal heat of the audience is responsible to a considerable extent for the remarkably low figures obtained.

Figured on a theoretical basis the following results are obtained per kW, installed for a 30 deg. rise :—

One year = 365 days = 8 760 hours, or 8 760 units per kW installed to offset the heat loss.

The heating season can be taken at 212 days or 5 080 hours, or 5 080 units per kW installed to offset the heat loss, e.g., 58% of the year.

The mean outdoor temperature for the heating season is scheduled at 43 deg. F and therefore the average temperature rise required is 17/30 or 56·5% of the maximum of 5 080 units for the seven months, say, 2 875 units per kW installed per annum, to offset the heat loss, which is equal to 32·2% of the maximum possible.

Since the animal heat emitted by the occupants, effect of sunshine, etc., is usually omitted in calculations, the actual consumption will clearly be less than the calculated.

An interesting point is that where thermostatic control is employed and a dozen or more individual thermostats are fixed, it is impossible to conceive that, even in the coldest weather, all the thermostats will be closed simultaneously, e.g., there must be a considerable diversity factor.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Our House in Order."

[To the Editor.]

SIR,—I have to refer to the interesting article by Mr. T. C. Gilbert entitled "Our House in Order" which appeared in your issue dated October 18th, and particularly the reference to the National Register of Electrical Installation Contractors contained in the first paragraph on page 456.

This was brought to the attention of the Executive Committee of the National Register of Electrical Installation Contractors at their last meeting, on November 8th, and I am directed to inform you that this Institution has not at any time expressed any opinion against compulsory wiring rules.—I am, etc.,

A. MONTGOMERY,
For the National Register of Electrical Installation Contractors.

London, November 15th.

Electric Cooking is Cheap.

[To the Editor.]

SIR,—Under the above heading, in your last issue, "Elcook" states that he (or she) has installed an electric cooker and has taken very careful tests on a meter, which have proved that the supposed high cost of electric cooking is a fallacy. While it is gratifying to learn that "Elcook" has come to this conclusion, I think that some details should have been given. It is my belief that there is not a person in existence who would not prefer an electric cooker to a gas or coal cooker—despite the statements made to the contrary by persons having an interest in gas companies' shares—if it can be obtained and operated for an outlay not exceeding, or not greatly exceeding, that involved in the case of the old-fashioned equipment and methods. In some districts the charge for energy puts electric cooking out of the question, except for plutocrats, and before one can be impressed by your correspondent's conclusion it will be necessary for him (or her) to give particulars as to cost of cooker, cost of energy per kWh, and the quantity and class of food cooked per kWh.—I am, etc., DUBIOUS.

November 19th.

Overhead Lines or Underground Cables?

[To the Editor.]

SIR,—I think there are one or two points in the article by Messrs. Crompton and Ekstroem that require a little further explanation.

The relative costs of the overhead line and the cable of £1 000 and £1 300 per mile respectively appear to be a little biased, in so much that it is highly unlikely that the Central Board would use Continental cable, and, since their specifications are based upon the Electricity Commissioners' Regulations, it is unlikely that the cost per mile of even steel tower lines would be £1 000. A sound steel tower line with the tower set in concrete and designed to comply with all conditions, including those of broken wire conditions, can be constructed by direct labour at £500 per mile or less. This line would be suitable for three-phase 33 000 V. I would, therefore, suggest that the item for the cost of line should be £11 000 and the item for the cost of cable should be £40 700. This will, of course, alter the figures very completely.

Could the details of the wayleave costs be amplified a little more fully?

The 1½% allowed for management and upkeep of cable is surely a very low item, especially on 33 000 V cable. I rather think that this figure should be at least equal to the 4% allowed for the overhead line, and probably greater.

In the early part of the article it is mentioned that the major part of the "grid" scheme will be devoted to the development of the urban and rural districts. A development of the rural districts will only be financially successful if the "load on the land" is developed, and the crucial feature of this development is that the supply should be available *at any point on the land*. The use of cables will completely nullify this necessary condition. Personally I do not think that it is as likely that a farmer would allow a cable as it is that he would allow an overhead line, since in the course of the next year or two he will begin to realise the benefit of electricity for power purposes on his land and will come to insist upon an overhead supply being available.—I am, etc. J. A. S.

NEWS IN BRIEF.

Scientific Glassware and Merchandise Marks—The Certification of Electricity Meters—A New Diesel-electric Ship—Rugby and the Hiring of Electric Fires—Chorley and Electric Cooking.

MORECAMBE Electricity Committee has arranged to take a lease of premises in Queen Street for showrooms.

Oldham Health Committee has authorised the purchase of two electric motors and a hauling machine for the sewage works.

Leeds Health Committee has authorised the provision of electricity for heating and lighting at Gateforth sanatorium, at a cost of £544.

The placing of contracts for the erection of sub-stations at Pemberton Road and Greenbank Drive, Liverpool, to cost £769 and £823 respectively, is recommended.

Portland Council is about to adopt electric lighting at Portland Police Station.

Burnley Corporation is to purchase an amplifying apparatus for use at public ceremonies when speeches are delivered to large crowds, at a total cost of £144.

A special sub-committee appointed to consider the reorganisation of Glasgow electricity department has decided to invite the President of the Glasgow Society of Architects to act as adjudicator in the selection of a scheme for the reconstruction of the premises at 75 Waterloo Street, for offices, showrooms, etc.

Warwickshire County Hospitals Committee reports that, owing to the many extensions to the sanatorium and the large number of attendances in the artificial light department, it has been found necessary to consider amplifying the electrical and heating services. A consulting engineer is to report on the work necessary to p ovide efficient services, adaptable for further extension.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *dated November 22nd, 1879 :—*

The shore end of the French transatlantic cable was successfully laid at Cape Cod.

The number of telegrams forwarded by the Great Northern Telegraph Co. in the nine months ended September 30th, was 647 833.

* * *

TWENTY-FIVE years ago THE ELECTRICIAN *recorded that :—*

The number of revenue earning telephones in use in Portsmouth was 2 000.

The total value of electrical exports from November 16th to 22nd, was £13 364.

* * *

FIFTEEN years ago it was stated in THE ELECTRICIAN, *dated November 20th,* 1914, *that :—*

The U.S. Navy Department had decided to make the super-dreadnought "California," the first electrically driven warship.

The Lancashire and Yorkshire and London and North Western Railways proposed electrifying large sections of their lines.

An exhibit at the British China and Glass Exhibition at Chesham House, Regent Street, London, last week was Verta glass, which is said to be an excellent material for electric light fittings.

The British Industries Fair London Exhibitors' Advisory Committee has agreed that, unless special permission is obtained all stands at Olympia made of stock material should have fascias 3 ft. deep on pilasters 8 ft. high. The Fair is to be held February 17th to 28th.

Ripon Electricity Committee has decided to allow the Power Lines Construction Co. to put in skeleton wiring at the new showroom. The question of obtaining electrical appliances, cookers, fires, irons, etc., has been discussed, and the Engineer is to arrange for firms to send appliances on sale or return for the first three months.

A meeting of the Leeds branch of the Electrical Association for Women was held in the Electricity Department Offices, Whitehall Road, Leeds, on November 13th, Mrs. Maxwell Telling presiding. Mr. C. F. Wells, of the Yorkshire Electric Power Co., dealing with the subject "Electricity in the Home," pointed out that in electrifying our homes we were approaching a solution of the domestic servant problem. There were more electric cookers per head of population in this country than in America.

A draft order in Council laid before Parliament provides that certain classes of imported goods, including scientific glassware, implements and tools, etc., when offered for sale in the United Kingdom, should bear an indication of origin. The goods affected by the Order include domestic, fancy and illuminating blown glassware (other than electric lamp bulbs), permanent magnets, vapour bulbs, condensation bulbs, condenser glass, electrolysis tubes, lecture and experimental apparatus, vapour density tubes, condensation tubes and vapour density apparatus.

Accrington Electricity and Tramways Committee is to be divided. The two departments are in future to be separate sections.

London County Council Public Control Committee has had under consideration a letter from Newcastle Corporation urging the need for introduction of legislation requiring the certification and stamping of all electricity meters.

A new laboratory equipped with mining machinery in the mining department of Birmingham University was opened last week by Mr. Evan Williams, president of the Mining Association of Great Britain. Its equipment includes coal cutters, conveyors and electrical and compressed air apparatus.

Amongst orders which the Furness Shipbuilding Co. has in hand is one for a 3 600 ton Diesel-electric driven vessel.

Eston Electricity Committee has asked the Electrical Engineer to report upon a suitable shop site for use as a showroom.

Coulsdon U.D.C. has decided to invite local firms to submit quotations for the lighting installation at the Council offices.

Hull Electricity Committee has agreed to take over a site on the new street from Paragon station, and the Electrical Engineer is to prepare designs for new showrooms and administration buildings.

Rugby U.D.C. has adopted a suggestion by the Electrical Engineer to let out on hire electric fires, at 8s., including 2s. maintenance costs, per annum for 2 kW, and 15s., including 2s. 6d. maintenance costs, for 3 kW fires.

Mr. H. J. H. Webb, district telephone superintendent, Aberdeen, said, in an address to the Arbroath Rotary Club on November 14th, there were now 20 trunk line circuits between London and Paris. He thought the longest call they had dealt with at Aberdeen had been from California to Portlethen call office.

Chorley Education Committee has received an offer from the Lancashire Electric Power Co. to instal and maintain an up-to-date electric cooker, free of charge, provided the Committee agrees to instruction in its use being included in the cookery course. The company states that current for the cooker would be supplied at 1d. per kWh.

The Committee of Management of Londonderry Asylum decided to use the C.T.S. wiring system in the asylum and accepted a tender for the work. The Northern Ireland Ministry of Home Affairs favoured galvanised screwed tubing. The Committee has decided to inform the Ministry that it will adhere to the C.T.S. wiring or consider the abandonment of the whole scheme.

The report of Mr. A. D. Nicholson, who retired recently from the post of inspector of mines for the Lancashire and North Wales Division, states that in that division in 1928, there were 117 coal-cutting machines driven by electricity and 875 worked by compressed air, compared with 120 and 857, respectively, in 1927. The number of coal conveyors in use last year was 219, an increase of 37.

An experiment by the Glasgow Education Authority, in conjunction with the Telephones Department of the Post Office, was commenced last week, when demonstrations of the working of a telephone exchange were given in Dennistoun Public School, Glasgow, to children attending commercial courses. The object of the experiment is to teach children how to use the telephone. Practical demonstrations are given by operators at miniature exchanges representing Douglas and Central Glasgow.

PERSONAL.

M. Ad. Curchod has been appointed editor-in-chief of the "Revue Générale de l'Electricité."

Sir Philip A. M. Nash has been re-elected President of the British Cast Iron Research Association.

Ald. H. J. Goldschmidt is succeeding Ald. Swales as chairman of Manchester Corporation Lighting Committee.

Sir Ernest Benn has been co-opted as a member of the Executive Committee of the Advertising Association for the ensuing year.

We are pleased to learn that Sir Hugo Hirst, who has recently been seriously ill, is improving daily, although he has not yet been able to return to business.

Mr. R. L. Acland is proceeding to India shortly on an extensive tour, during which he will visit all the principal electricity supply undertakings. He expects to be away about four months.

Shoreditch (London) Electricity Committee has appointed Mr. A. F. Cox, outside engineer of the Hewittic Electric Co., Ltd., as electrical maintenance engineer, at a salary of £422 17s. per annum.

Estate of the gross value of £10 459 with net personalty £10 439, was left by the late Mr. Henry Thomas, Vevey, Schiasse, for 34 years contract engineer to Callender's Cable and Construction Co., Ltd.

Estate of the gross value of £3 674, with net personalty £2 396 was left by the late Dr. Richard Vernon Hansford, a member of the research staff of the General Post Office, who died on October 5th.

The marriage of Mr. Rowland Wright, assistant superintendent of the Madras Electric Supply Corporation, Ltd., and Miss Gladys Ethel Stubbs, was solemnised at St. George's Cathedral, Madras, on October 26th.

To Miss W. L. Hackett, of King Edward's High School, Birmingham, belongs the distinction of being the first girl to enter the examination for the Bowen Scholarship for Electrical Engineering at Birmingham University.

Mr. G. R. T. Taylor has resigned his appointment as deputy-chairman of Vickers, Ltd., but retains his seat on the Board. Mr. G. G. Sim has been appointed deputy-chairman in his place. Mr. J. Reid Young has been appointed secretary to the company in place of Mr. Sim.

Bristol Electricity Committee has appointed Mr. S. M. Hill, station superintendent of the Padiham station of the Lancashire Electric Power Co., as station superintendent at Portishead at a salary of £672 per annum, and Mr. T. Wells as boiler house superintendent at a salary of £511 per annum.

The marriage of Mr. Reginald H. Palmer and Miss Muriel Irene Maud Cracknell, the soprano, was solemnised at St. Martin's-in-the-Fields, London, on November 15th. The duties of best man were capably carried out by the bridegroom's brother, Major Clifford H. Palmer, who is also very well known in the trade.

Mr. F. Hayes had resigned his position as deputy engineer and station superintendent at Plymouth electricity works in consequence of continued ill-health. The resignation was accepted with much regret and the Committee placed on record appreciation of the diligent and faithful service rendered by Mr. Hayes over a period of 27 years.

Obituary.

Dr. W. C. Escher, chairman of the Board of the Banque pour Entreprises Electriques and a director of the Cia. Hispano-Americana de Electricidad.

Mr. William Brooks Sayers, on November 17th, aged 68 years. His connection with the industry started with Crompton and Co., at Chelmsford, in 1888, and continued successively with the original Chamberlain and Hookham, Ltd., Mavor and Coulson, Ltd., and afterwards in private practice.

Mr. Ernest Laremont Fleming, on November 15th, aged 75 years. He was the originator of the scheme for the production of electric power from the tidal waters of the river Exe, and acted as honorary secretary of the Exe Power Experimental Association. He was a brother of Sir J. A. Fleming, who was present at the funeral on Monday.

Signor Guido Semenza, on November 7th, aged 61 years, past President of the International Electro-Technical Commission. He was for a time with the original Edison Company in America and was chief engineer of the United Edison Company until 1917. He was awarded the Faraday Medal of the I.E.E. in connection with the leading part he played in electrical development. See page 649.

SOUTHEND'S ELECTRICITY.

Electricity Commissioners' Inquiry Regarding Loan for Diesel Sets.

Southend Corporation's application for sanction to a loan of £66 000 to cover the cost of three 1 200 kW land Diesel generating sets was the subject of a recent inquiry by Col. T. C. Ekin, on behalf of the Electricity Commissioners. Mr. Sydney Turner, on behalf of the Corporation, said the existing plant was overtaxed, and instead of encouraging the use of electricity they were obliged to discourage it. In the year ended March last the Corporation generating plant amounted to 8 250 kW, and during that year the maximum load was 8 182 kW. With reference to the present bulk supply from the County of London Co., the Corporation did not regard £5 10s. per kW, plus 0.3d. per kWh as satisfactory.

Mr. A. C. Johnson, acting borough electrical engineer, gave particulars of his scheme to improve the condition of the undertaking, which was on the lines of using a bulk supply for the base load, modern Diesel plant for the lower peak and the existing plant for the top peak. He said they could not urge the sale of electricity for domestic purposes, because of the inadequate supply. It was hoped to close down the Thorpe Bay station in four years' time, and they wished to concentrate the plant at London Road. If they had the new Diesels there would be a saving of at least £15 000 a year.

Mr. F. Lonsdale, sales manager of Fraser and Chalmers, Ltd., said he was responsible for the offer of the three 1 200 kW land type Diesel sets at the cost of £60 000, and he thought £1 000 was reasonable for the foundation of each engine.

Mr. Harold Hobson, supply engineer to the Central Electricity Board, said they were satisfied that the proposal of the Corporation would involve the Board in unnecessary expense. He did not agree that the installation of the sets for which they were applying would have advantages for Southend. They could bridge the gulf between now and the Central Board supply in 1931 by keeping the present plant in commission. After speeches by Counsel, the inquiry was closed.

A.S.E.E. DINNER.

Successful Gathering of Over 240 Members and Their Friends.

The Association of Supervising Electrical Engineers held a whist drive, dinner and dance at the Mecca Restaurant, London, on November 16th, at which over 240 members and their friends attended. The President of the Association was prevented from attending owing to illness, and in the circumstances Mr. B. C. Garman, the chairman of the Association, presided at the dinner. The function was in every way a success, and during the dinner Mr. F. W. Smith (vice-chairman of the Association), following the loyal toast, proposed "The Ladies," which was replied to by Mrs. B. C. Garman.

Mr. E. E. Gammon (treasurer of the Association) acted as M.C. for the whist drive, and Messrs. E. L. Eastell and F. W. Smith for the dance. The spot-lights, which added to the general success of the function, were kindly loaned through the good offices of Mr. L. E. Buckell. The winners of the whist prizes were: Ladies—1st, Mrs. N. Young; 2nd, Mrs. E. R. Carter; booby, Miss P. Wray. Gents—1st, Mr. E. D. Smith; 2nd, Mr. C. Norriss; booby, Mr. C. H. Taylor.

A photograph taken during dinner is reproduced on page 649.

ELECTRICITY SUPPLY IN GERMANY.

Statistics relating to the generation and sale of electricity in Germany during the first seven months of the current year have been supplied by "Wirtschaft und Statistik" and published by the "Financial Times." It is stated that during the first seven months of the current year generation of electricity showed an advance of 18% on the same period in 1928. At this rate of progress the total supply will reach about 32 000 000 000 kWh this year, compared with 27 800 000 000 in 1928. Since 1925 the annual figure has risen by over 60%. During 1928 there were in existence 7 217 power works, of which 1 417 were owned by public authorities, producing about three times the energy of the 5 800 private works. During 1928 sales amounted to 13 200 000 000 kWh, including imported energy to the extent of 293 000 000 kWh. During 1928 brown coal was used in the production of 37% of the total supply of electricity. Mineral fuel followed with 38%. The output in 1928 was 422 kWh per capita, against 392 kWh in 1927. This compares with 830 kWh in the United States in 1928.

IN PARLIAMENT.

Points from Answers to Questions of Electrical Interest in the House of Commons.

ANGLO-Canadian telephone calls are switched in New York.

The Minister of Transport is not aware that the question of any extension of the Bakerloo tube railway beyond the Elephant and Castle is under consideration at present.

Of the £1 500 000 to be expended this year and next on extensions of the telephone programme, £233 000 is to be expended on improving telephonic communication between Belfast and Glasgow. The cost of the Northern Ireland portion of the work is estimated at £40 000.

Before appointing the Central Electricity Board a large number of associations and individuals representative of the interests of local government, electricity, commerce and industry, transport, agriculture and labour were consulted. The Minister of Transport cannot undertake to give a detailed list of those who were consulted.

A new hand combination telephone instrument is being introduced in the Post Office telephone service as an alternative to the present candlestick pattern, and supplies are expected about the end of the year. The new pattern will be more costly to provide and maintian than the old instrument, and subscribers who desire to have it installed will be asked to pay an additional charge of 4s. a quarter.

The Central Electricity Board has entered into contracts for laying three experimental lengths—totalling about 12 route miles—of main transmission cables in the London area; the estimated cost for double circuit underground cables is £30 000 per mile in round figures and for single circuit underground cables £15 000 per mile; and these amounts are from eight to ten times more than the cost of the erection of double circuit and single circuit overhead lines respectively.

The amount held on deposit at the credit of telephone users was £2 690 717 on September 30th. The Assistant Postmaster-General states that after the subscribers pay their accounts from about five weeks down to the end of each quarter, the Department holds a sum of about £2 500 000 in excess of the proved liabilities of subscribers for the rental and calls. This credit disappears and is replaced by a debit which increases to about £2 500 000 just before the next quarter's accounts are sent out and paid.

In reference to a question whether he will sympathetically consider the granting of free wireless licences to old age pensioners or issuing them at a reduced rate, the Postmaster-General says the Broadcasting Committee, 1925, considered the question of the grant of free wireless licences and recommended that this concession be made to blind persons only. The Postmaster-General does not consider that he would be justified in asking Parliament to grant any similar concession to other classes of the community.

The attention of the Home Secretary having been drawn to the annual Report of the coroner for the City of London and Southwark, and his reference to underground subway explosions in London and the need for an inquiry into the general question of subways of this kind, the Minister says he has been in communication with the other Departments concerned and the London County Council. Replies have not been received from all the Departments which were consulted, and no final decision has yet been reached.

Normally the conversion of a manual to an automatic telephone exchange does not take place until its capacity is exhausted or until the economic life of the plant has expired. The date of complete conversion of the London area to automatic working depends to some extent on the rate of growth of the demand for telephones. About 130 exchanges are expected to be working on an automatic basis by 1940, when about 20 exchanges would remain for conversion. On the basis of present prices the expenditure on buildings and equipment for automatic exchanges up to 1940 will be of the order of £25 000 000.

Statistics issued by the American Telephone and Telegraph Co. show that at the end of the year 1928 the total number of telephones in the world was 30 990 304. Of these, 18 522 767, or 59·8%, were in the United States; in Europe, 8 623 407, or 27·8%, and in the remaining countries, Asia, Africa, Oceania, and the entire western hemisphere outside of the United States, 3 844 130, or 12·4%. Great Britain's share was 1 633 802, or 5·27%. In relative telephone development, as in absolute number of telephones, the United States, with 15·8 telephones for each 100 people, leads the world.

BUSINESS ITEMS.

THE telephone number of the Ipswich branch of the GENERAL ELECTRIC CO., LTD., has been changed from Ipswich 2379 to Ipswich 3771 (two lines).

THE reconstructed showrooms of Rd. Johnson, Clapham, and Morris Ltd., at Manchester.

WALSALL CONDUITS, LTD., announce that the head office organisation and other departments at Walsall have now been transferred to the Excelsior Works, West Bromwich.

EAGLESTON AND SON, LTD., of St. Clement's Street, Oxford, and G. R. COOPER, LTD., of St. Ebbe's Street, Oxford, both electrical engineers, were prize winners in the Oxford window display competition.

The ARROW ELECTRIC DIVISION, of the Arrow-Hart and Hegeman Electric Co., Hartford, Connecticut, has recently moved to new ground floor offices and showrooms at 79, Great Queen Street, Kingsway, London, W.C.2.

The HORSTMANN GEAR CO., LTD., of Newbridge Works, Bath, is showing a full range of "Newbridge" electric time-switches on Stand No. 5, Row B, Gallery, at the Public Works Exhibition, Royal Agricultural Hall, London, which concludes to-morrow, Saturday.

INTERNATIONAL COMBUSTION, LTD., announces that the associated company, International Combustion Engineering Corporation, of America, has secured from the Ford Company an order for two double Ladd boilers 700 000 lb. each actual maximum evaporation, 1 400 lb. pressure, 750 deg. F. superheat, and also a further order for two boilers of 300 000 lb. maximum evaporation at 1 400 lb. pressure and 750 deg. F. superheat for Milwaukee.

West Hartlepool Electricity Department organised an electrical exhibition at premises in Lynn Street, from November 4th to 9th. Special features of the show were an all-electric café and cookery demonstrations. In a temporary lecture theatre coloured lighting effects were produced, illustrating "A Rainbow Curtain." "Joseph's Coat," "Truth in Advertising," "Sunrise in the Desert," etc. Another exhibit took the form of a "bargain counter" where apparatus was "taken in part payment for other appliances."

It is interesting to note that Quin and Axtens, Ltd., have joined a number of other large London stores, amongst which may be mentioned Peter Robinson, Ltd., Arding and Hobbs, Ltd., and John Lewis and Co., Ltd. in the installation of "a special system of 'Marconiphones'" throughout their buildings, prior to the opening of the Christmas bazaars. A number of loud speakers will be placed at convenient points and supplied from a central amplifier driven from the mains. Suitable music will be distributed from gramophone records in conjunction with a new electrical pick-up, and a simple switch will enable an operator to announce any items required by the management. Experience has shown the value of this method of publicity in disposing of any lines which are to be cleared, and in directing the public attention to any special display, etc. Incidentally, where a gramophone department forms part of the stores it has been noted that a marked increase of sales occurs amongst those records which are played through this system.

ELECTRICITY IN MINES.

More Motors being Installed—Nearly 1 500 Mines Use Power.

THE Report for 1928 of Mr. J. A. B. Horsley, H.M. Electrical Inspector of Mines, which has now been published, contains much of interest to electrical engineers, managers and others concerned with electrical equipment at mines. Progress in electrical development at mines under the Coal Mines Act is analysed in detail. The total horse power of motors installed was 1 722 332, or 38 000 H.P. greater than in 1927. Electricity was used at 1 467 mines. The statistical tables include a regional analysis of the H.P. of motors installed, showing the comparative use of direct current and alternating current, and analyses (with comparative figures for 10 years) of fatal accidents, classified according to the type of accident, the employment of the persons killed and the nature of the equipment involved.

The Inspector describes the 15 fatal accidents attributable, either directly or indirectly, to the use of electricity which occurred during the year, and makes suggestions with a view to preventing accidents of a similar nature in future. He also gives particulars of three dangerous occurrences of an unusual nature, and describes 21 recent electrical accidents involving trailing cables and plugs. The Inspector classifies the latter, and discusses the question of design of plugs and trailing cables.

In regard to coal-cutting machines, general analyses of the number and description of machines in use at coal mines during the last ten years are given, together with regional analyses of the quantities of machine-cut coal and other mineral got by electricity and by compressed air. The report states that 25·2% of all coal mined during 1928 was machine cut, and 65·9% of machine-cut coal was got by means of electric coal cutters. The Inspector draws attention to the interest which is being shown in the application of automatic startors (remote control) to coal-cutting machines and to the question of the practicability of the standardisation of trailing cables, which is now being investigated by the B.E.S.A.

Copies of the Report (price 6d., by post 7d.), can be obtained from H.M. Stationery Office, Adastral House, Kingsway, London, W.C.2.

INDIVIDUALIST LUNCHEON.

Sir Ernest Benn and the Liberty to Build.

A FEATURE of the 28th of the series of monthly Individualist luncheons, held on November 13th at the Hotel Cecil, was the return of Sir Hugh Bell to the chair after an absence of many months, occasioned by his long illness. Sir Hugh introduced the principal speaker, Sir John Tudor Walters, M.P.

Sir John Tudor Walters, at one time chairman of the Committee on housing and now President of the Housing and Town-planning Trust, said that he thought it would be a surprise to many people to learn that there was such a thing as private enterprise in housing; many imagined that to-day the only new houses were council houses. The first industrial housing association which was formed for the erection of houses in Yorkshire, Nottingham and Derby, had built 12 000 houses in four years, and simply with the aid of the State loan it was able to build houses without subsidy, and, which was more, had earned and paid the dividends on the loan, and had been left with annual surpluses that were being expended on the provision of public baths, hospitals, welfare centres and other amenities. Some of these houses were parlour and others non-parlour houses, each with a good kitchen-scullery, three bedrooms, central heating, and electric light at ½ of a 1d. per unit, not to mention adequate provision for the perambulator. The rent was in many cases as low as 7s. 6d. per week, The difficulties facing those who set out to provide housing accommodation could be surmounted, without troubling the State, by private enterprise.

Sir Ernest Benn in reply said that there was a great deal more in the housing question than was generally realised. He saw a great nation spending millions a year in educating a great people for whom they had made no adequate provision. He did not believe that their children would be content to live in the houses that many lived in to-day. Sir Tudor's great achievement was the genius that had enabled him to pick his way through over three hundred Acts of Parliament and to overcome the barriers in his path. In voicing the need for individualism in housing, the liberty to build, they could do no better than try to get rid of the restrictions which surrounded the building of a home.

SMOKE ABATEMENT.

A Brief Review of Some of the Outstanding Items Shown at Manchester.

THE electrical industry was well represented at the Smoke Abatement Exhibition held in Manchester under the auspices of the "Daily Dispatch." Perhaps the most striking, and certainly the largest exhibit in the show was that of the E.D.A., which represented in a practical manner the manifold ways in which electricity can be used to provide us with a cleaner atmosphere. The stand was made up of special exhibits by a large number of supply undertakings, contractors, and manufacturers. The centre of the stand was occupied by the various rooms of an all-electric house. Then there was an all-electric bakehouse equipped by the General Electric Co., Ltd., which was representative of a large number of electric bakeries which have been started in various parts of the country. Something new in the way of electric fires, and of which a description will be available shortly, was shown by Ferranti, Ltd., Hollinwood. This is built into the hearth, and preliminary tests indicate a thermal efficiency of over 90%. The ventilation provided changes the air in the average room once in an hour. Electric washers, wringers, and ironers were shown by the Edison Swan Electric Co., Ltd., while W. E. Beardsall and Co., Ltd., of Manchester, were showing the "Two-Twelve" electric boilers. The Siemens-Schuckert (Great Britain), Ltd., demonstrated their electrical precipitators, which are also used for precipitating dust in the manufacture of coal brickettes, and for a large number of other purposes. Briefly, one high voltage electrode charges the carbon or dust particles, which causes them to be attracted by another electrode. They then fall into a container by their own weight. The same firm illustrated an electrical method of measuring carbon dioxide in boiler flues. W. R. Patents, Ltd., were showing their various mine safety devices.

COLONIAL AND FOREIGN IMPORTS.

Amendments to Duties Affecting the Importation of Electrical Goods.

THE following amendments in the Hungarian Customs import duties came into operation on October 6th. The duty on wireless equipment and apparatus, parts and accessories (except receiver and transmitter electron valves) is now 800 gold kr. per 100 kilos, compared with the former duties of 400 or 600 gold kr. The duty on receiver valves is 1·50 gold kr. each, and on transmitter valves 30 gold kr. each (not specified in old tariff); on electric light bulbs the duty is 15 gold kr. per lin. metre (not previously specified). The former duty of 30 gold kr. per 100 kilos on electro-therapeutic apparatus has been superseded by a duty of 60 gold kr. each in the case of X-ray tubes and quartz lamps and a duty of 250 gold kr. per 100 kilos in the case of other electro-therapeutical apparatus. The duty fixed for articles falling under the heading of "electro-therapeutic apparatus" may be levied only on complete apparatus and on X-ray examining (lighting) stands and equipment, X-ray illuminating tables and X-ray stands and electro-therapeutic transformers weighing more than 5 kilos. Other articles under the same heading will pay 10% of the nominal duty.

The following are recent decisions as to the classification of various articles imported into Belgium: Magnets, 10 cm. or more in length, dutiable as "magnets" (No. 1 078), duty, 240 frs. per 100 kilos.; less than 10 cm., to be used as toys, dutiable as "toys" (No. 1 195); duty, 20% *ad. val.*; magnetos, dutiable as "dynamo-electric machines" (No. 1 075), duty according to weight; medium frequency wireless transformers, dutiable as "electrical apparatus, with coils" (No. 1 089*a*), according to weight.

New Zealand imported electrical machinery, etc., during July last valued at £132 782, and the aggregate from January to July, inclusive, was £934 499.

The electrification of the Great Northern Railway of America is the subject of publication No. 1857, issued by the WESTINGHOUSE ELECTRIC AND MANUFACTURING CO., East Pittsburgh, Pa. Other publications received from the same firm are are D.M.F. 5229, dealing with electric tools; L.161 D, describing class 13-125 and class 13-225 magnetic starters for wound rotor induction motors; and L.20382 A, concerning induction frequency changers.

CIRCUIT-BREAKING.

Problems of Line Flashovers—New Switchgear of Outstanding Dimensions.

IN these days of interconnected systems, oil circuit-breakers are being subjected to more and more severe operating conditions. With the increase in size of any electrical system, new switching difficulties arise. Line flashovers become more prevalent as the lengths of the transmission lines are increased. Large amounts of power are lost in these flashovers, and continuity of service may be seriously affected thereby. It is possible to increase the insulation of a transmission line to a point that flashovers will be negligible, but when a surge occurs it will rebound greater distances and greatly endanger the generating or distributing apparatus.

When it is practical to increase the line insulation to a point that line flashovers will be reduced to a minimum, it is also necessary to increase the size of the oil circuit-breakers and other equipment at the sub-station. In this connection it is interesting to note that what is claimed to be the largest oil circuit-breaker has been ordered by the Public Service of New Jersey from the Westinghouse Electric and Manufacturing Co. for the Roseland sub-station. The overall height of the breaker is 25½ ft. The internal diameter of each tank is 10 ft., and the assembled pole units and mechanism extend 45 ft. wide. The tanks hold 22 000 gall. of oil and are insulated for 250 kV. The weight of the complete unit is 141 tons. The circuit-breaker has a continuous current rating of 600 A and a published interrupting rating of 8 000 arc-amperes at 220 kV or 3 000 000 arc kVA. One solenoid mechanism operates the three poles at a high speed. The mechanism is mechanically and electrically trip-free in any position of the closing stroke. The tanks are constructed of boiler-plate steel with riveted and welded seams. They are cylindrical in shape with domed shaped tops and bottoms. Baffled vents for the release of gases are located at the extreme top of the tank. A gauge glass of sufficient length to indicate the oil level over a wide range of temperature changes is provided. The pole unit mechanism is mounted in the top of the tank and is connected with the pull rod through a short shaft. This arrangement is made gastight as the pull rod is mounted in a separate chamber, which makes it impossible for gas or oil to communicate from pole to pole. The lift-rods are of woodbase Micarta. The arcing contents are of the bayonet rotating high-speed type. The moving contacts travel with the lift rod, while the bayonet contacts travel in the opposite direction, making the contact separation at an extremely high speed. Hydraulic bumpers retard the moving contacts after they have travelled 95% of the opening stroke, and prevent rebound. The condenser type of terminal bushings are used, and these are tapped for the condenser bushing potential device that is used in place of a metering transformer. Multi-ratio bushing-type of current transformers are used for metering and relay operation, giving ten ratios from five leads. A semaphore operating indicator readily reveals whether the circuit breaker is in the "open" or "closed" position.

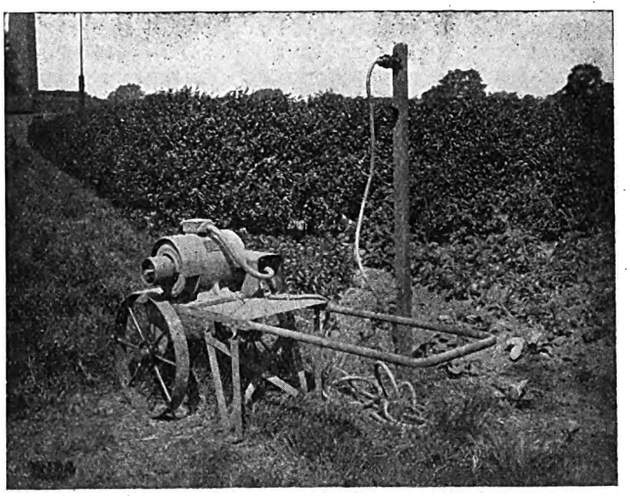
HOLBORN SUBWAY EXPLOSIONS.

Recommendations with Respect to Ventilation, etc.

LONDON County Council General Purposes Committee having considered the recommendations made by the Commission of Inquiry into the Holborn explosions and fires, advises that the Council should express the opinion that effect should be given to the recommendation of the Commission as to the ventilation, etc., of underground cavities only so far as regards the ventilation of cellars and vaults constructed under streets and connected with buildings and that the necessary action should be taken by way of an amendment of the London Building Acts, that the employment of continuous detectors to give warning of the presence of gas is not practicable in the case of sewer manholes, and that in view of the serious objections which exist to the setting up of a new co-ordinating authority, as suggested by the Commission, consideration should be given to the possibility of securing the end in view by some extension of the powers of the Minister of Transport under the London Traffic Act, 1924. Mr. Culpin has given notice of an amendment that the necessary powers and duties, so far as the Administrative County of London is concerned, should, pending the setting up of a new directly elected central authority for an enlarged area, be conferred on the Council.

AGRICULTURAL MOTORS.

WITH the increasing adaptation of agricultural machinery to electric operation certain types of motors are being specially developed by leading firms for the exclusive use of the farmer. Among such agricultural motors may be mentioned the



An example of the B.T.H. 5 H.P. motor equipment designed for agricultural purposes.

two standard models manufactured by THE BRITISH THOMSON-HOUSTON CO., LTD., of Rugby. These motors are rated at 2 H.P. and 5 H.P., respectively, the speed of each being 1 400–1 500 r.p.m. They are suitable for 3-phase a.c. at 220 V (50 cycles) or for d.c. at 220 V. Other sizes, voltage ratings, etc., can be obtained if specially desired. A complete portable unit can be obtained by mounting the 2 H.P. motor, together with the startor, on a steel cradle, or by similarly mounting the 5 H.P. motor on a structural steel wheelbarrow. A 5 H.P. portable outfit is shown in our illustration; the motor is fitted with a pulley 5½ in. dia. by 4 in. face, and starting is effected by a robust Y-delta startor housed under a protecting cover; connection is made to a water-tight socket by a 4-pin plug at the end of a 40 ft. length of 3-core ·01 sq. in. C.T.S. cable with earthed core. It is stated that most farmers who instal one or more electric motors on trial prefer the portable arrangement at first, so that they can test the motor with different machines, at the same time keeping capital outlay at a minimum. Since many agricultural machines run at a comparatively low speed, sufficient reduction often cannot be obtained by belting. This difficulty is obviated by the use of a countershaft, or alternatively by employing a B.T.H. back gear equipment.

The construction of the motors is briefly as follows: The 2 H.P. a.c. motor is of the squirrel cage type, while the 5 H.P. size is a slip-ring motor. The rotor of the 2 H.P. motor has bars and end-rings of aluminium cast in one piece. The motors are equipped with a roller bearing at the pulley end and a ball bearing at the other; the end shields in which the bearings are carried are spigotted into the stator frame.

The d.c. motors, 2 H.P. and 5 H.P., are alike in construction, having commutating poles and the same kinds of bearings and endshields as the a.c. motors. Both a.c. and d.c. types are stated to be able to operate continuously as their rated loads without the temperature rise, exceeding 40 deg. C., except at the slip rings and commutator. On the latter parts the rise will not, it is claimed, exceed 45 deg. C. The overload torques which the motors will sustain without injury are given as 25% for 15 minutes, 50% for one minute, and 100% for 15 seconds.

PHOSPHOR BRONZE BARS.

A specification for phosphor bronze bars or rods has recently been issued by the British Engineering Standards Association. This specification is drawn up on parallel lines to the specifications for brass bars published in 1926, and covers round, square, and rectangular bars from ¼ in. to 2 in., and hexagon bars for standard nuts from No. 3 B.A. to 1¼ in. B.S.W. and 1⅛ in. B.S.F., with specified margins of manufacture. The chemical composition of the material, mechanical tests, and the procedure for selecting samples for these tests are laid down.

Copies of the specification (No. 369—1929) can be obtained from the British Engineering Standards Association, Publications Department, 28, Victoria Street, London, S.W.1, price 2s. 2d., post free.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

AMALGAMATED ANTHRACITE COLLIERIES, LTD.—Six months' supply of electrical goods (form 8). Particulars from the Controller of Stores, Amalgamated Anthracite Collieries, Ltd., Eagle Chambers, Swansea. Stamped, addressed envelope to be sent.

HAMBLE PARISH COUNCIL, November 22nd.—Electric street lighting installation. Specification, etc., from the Clerk of the Council, Elstow, Hamble Lane, Hamble.

WEST DERBY GUARDIANS, November 22nd.—Electric supplies. Forms of tender, etc., from the clerk, Mr. G. O. Holloway, Union Offices, Brougham Terrace, Liverpool.

ALLOA CORPORATION, November 23rd.—Electrical installation work in connection with erection of 36 houses at Ashley Terrace, Alloa. Schedules, etc., from Messrs. J. Melvin and Son, architects, Mar Street, Alloa.

BEXHILL CORPORATION, November 23rd.—Electric light installation at isolation hospital. Particulars from the Borough Electrical Engineer; deposit £1 1s.

EDINBURGH CORPORATION, November 23rd.—Electric lighting and power installation in block of twelve houses and eight shops at Prestonfield Shopping Centre. Specification, etc., from the City Electrical Engineer, Dewar Place, Edinburgh; deposit £1 1s.

MANAGERS OF CENTRAL LONDON SCHOOL DISTRICT, November 23rd.—Electric motor, with reduction gearing, starter, etc. Specification from Mr. G. P. Morrell, clerk to the Managers, Greenford House, Hanwell, London, W.7.

WEST RIDING EDUCATION COMMITTEE, November 23rd.—Electric lighting installation at Mexborough County School. Specification from the Education Officer, County Hall, Wakefield.

HOLYWOOD (CO. DOWN) URBAN DISTRICT COUNCIL, November 25th.—Supply of watt-hour meters. Specification, etc., from the Electrical Engineer and Manager, Sullivan Place, Holywood; deposit £1 1s.

PLYMOUTH CORPORATION, November 25th.—Supply of steel lamp columns. Specification, etc., from the City Electrical Engineer, Electricity Department, Armada Street, Plymouth.

SALFORD CORPORATION, November 25th.—Electric travelling and slewing jib crane (2½ tons capacity). Specification, etc., from the City Electrical Engineer, Frederick Road, Salford.

SALFORD CORPORATION, November 25th.—Alterations to electric light installations in two schools. Particulars from the Secretary of Education, Education Offices, Salford.

STONE (STAFFS) URBAN DISTRICT COUNCIL, November 25th.—Overhead 11 000 V transmission line (2 300 yds.), outdoor sub-stations (2–50 kVA), l.t. overhead distribution (1 400 yds.), services, etc. Specification from Mr. W. M. Selvey, Independent Buildings, Sheffield; deposit £2 2s.

HEMEL HEMPSTED CORPORATION, November 27th.—Supply and fixing two electrically driven high lift turbine pumps, with starters and control gear, at Marloes waterworks. Specification, etc., from the Water Engineer, Market Square, Hemel Hempsted.

Equipment for Government Generating Station.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC., November 28th.—High tension and low tension switchgear, transformer and cables, for H.M. Office of Works' generating station, South Kensington, S.W. Specification, etc., from the Contracts Branch, King Charles Street, London, S.W.1; deposit £1 1s.

EDINBURGH EDUCATION AUTHORITY, December 2nd.—Electric lighting and heating installations in the projected extension of Lochend Road School. Specifications, etc., from Mr. J. M. Johnston, 47, Charlotte Street, Leith.

STOCKPORT CORPORATION, December 2nd.—Supply and erection of 6 600 V switchgear, comprising metal-clad, compound-filled switch units. Specification (No. 3A) from Mr. R. Lee, borough electrical engineer, 23, Tiviot Dale, Stockport; deposit £1 1s.

BIRMINGHAM GUARDIANS, December 4th.—Electrical work at Western House. Specification, etc., from Mr. C. P. Beech, Union Offices, Edmund Street, Birmingham; deposit £2 2s.

NEWBURY CORPORATION, December 5th.—Electric motors, starting gear and centrifugal pumps, with ancillary works, at pumping station. Specification, etc., from Messrs. Howard Humphreys and Sons, 28, Victoria Street, Westminster, S.W.1, on and after November 18th; deposit £3 3s.

STEPNEY (LONDON) BOROUGH COUNCIL, December 5th.—Installation of wireless receiving equipment and apparatus at each of the Council's three hospitals, with l.t. charging machines h.t. generators, motor to drive generators, accumulators, etc. At the three hospitals the requirements include 1 160 pairs of headphones and 24 loud speakers. Specifications, etc., from the clerk, Mr. S. McClelland, Bancroft Road, Mile End, E.1; deposit £1.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, December 10th.—Extra high and medium pressure cable extensions (contract No. 48). Specification, etc., from Mr. R. W. Willis, electrical engineer and manager, 37, High Street, Cheadle, Cheshire; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, December 21st.—Supply and erection of 132 000 V transformers in connection with Mid-East England Electricity Scheme. Specification (No. M.E.E.-F.T.1) and form of tender from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2, on and after November 25th; deposit £2 2s.

HALIFAX CORPORATION, December 21st.—Electrician's work in connection with erection of new Girls' High School at Craven Lodge. Names of intending contractors to be sent by December 21st to Mr. A. C. Tipple, borough engineer, Crossley Street, Halifax; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

SOUTH INDIAN RAILWAY CO., LTD., November 22nd.—Lighting, power and signalling switchgear for stations, in connection with Madras electrification. Specifications, etc., from the company's offices, 91, Petty France, London, S.W.1.

CHRISTCHURCH (N.Z.) MUNICIPALITY, November 23rd.—Supply of pump and electric motor, for Beckenham pumping station. (Reference A.X. 8 737.)

EGYPTIAN MINISTRY OF EDUCATION, November 23rd.—Diesel engines, electric motors, machine tools, etc. (Reference C.X. 3 146.*)

VICTORIAN ELECTRICITY COMMISSION, November 25th.—Watt-hour meters, recording instruments and remote metering equipment, for Metropolitan terminal stations and sub-stations (specification No. 29/92). (Reference B.X. 5 614.)

VICTORIAN ELECTRICITY COMMISSION, November 25th.—Switchgear, for Yallourn power station (specification No. 29/103). (Reference B.X. 5 636.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, November 26th.—Vitreous resistances, each consisting of wire element wound in vitreous spool, for telegraph battery feeds (schedule C. 489). (Reference B.X. 5 696.)

MELBOURNE CITY COUNCIL, November 27th.—Totally-enclosed, metal clad, 6 000 V, three-phase switchgear (specification No. 1 000). (Reference B.X. 5 708.)

MELBOURNE CITY COUNCIL, November 27th.—Supply of 600 V d.c. switchgear (specification No. 1 001). (Reference B.X. 5 734.)

VICTORIAN RAILWAY COMMISSION, November 27th.—Indication transformers for railway signalling (contract No. 43 412). (Reference B.X. 5 737.)

VICTORIAN RAILWAY COMMISSION, November 27th.—Supply of automatic oil switches (contract No. 34 411). (Reference B.X. 5 735.)

WESTERN AUSTRALIA GOVERNMENT, November 29th.—Supply and erection at Perth of (*a*) boiler house equipment, and (*b*) 12 500 kW turbo-generator and condensing plant. Specifications (£1 1s. for each; not returnable) from the Agent-General for Western Australia, Savoy House, Strand, London, W.C.2.

EGYPTIAN MINISTRY OF THE INTERIOR, November 30th.—Diesel engine driven electric lighting installation at Abou-Tig. (Reference B.X. 5 791.)

BLOEMFONTEIN MUNICIPALITY, December 2nd.—Supply of two electrically-driven low lift pumping units and two electrically driven high lift pumping units, with cables, startors, valves, etc. (contract No. 18, 29/30).

BLOEMFONTEIN MUNICIPALITY, December 2nd.—Supply of copper conductors, poles, transformers, switchgear, etc., for electrification of Mazelspoort Waterworks (contract No. 19, 29/30). (Reference B.X. 5 825.)

MADRAS GOVERNMENT, December 3rd.—Electrically-driven hoisting drums, in connection with Pykara hydro-electric scheme. Specification (C.17—part of) can be obtained (on payment of 5s.), from Messrs. Balfour, Beatty and Co., 66, Queen Street, London, E.C.4 (acting on behalf of Power Securities Corporation, Ltd.).

INDIAN STORES DEPARTMENT, December 3rd.—Ceiling and table fans. (Reference B.X. 5 672.)

CAPE TOWN MUNICIPALITY, December 4th.—Supply of 200 c.i. pole bases (specification No. 481/1929). (Reference A.X. 8 771.)

CAPE TOWN MUNICIPALITY, December 4th.—Supply of 50 35 ft. tubular poles (specification No. 479/1929) and 1 500 30 ft. tubular poles (specification No. 480/1929). (Reference A.X. 8 773.)

VICTORIAN ELECTRICITY COMMISSION, December 9th.—Supply of 3 000 kVA transformers and spares (specification No. 29/119). (Reference B.X. 5 775.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 10th.—Switchboard keys and parts (schedule No. C. 496). (Reference B.X. 5 776.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 10th.—Electric lamps, lamp caps and sockets for telephone purposes (schedule C. 497). (Reference B.X. 5 783.)

GATOOMA (SOUTHERN RHODESIA) MUNICIPALITY, December 12th.—Two fire-tube boilers, steam engines, alternators and switchboard, etc. (Reference A.X. 8 749.)

CHRISTCHURCH DRAINAGE BOARD, December 13th.—Supply and installation of four electrically-driven automatically-controlled pumping plants, each consisting of two horizontal centrifugal pumps with direct-coupled electric motor (contract No. 29/420); and two horizontal type, 3 H.P. a.c. motors direct coupled with centrifugal sewage pumps (contract No. 29/421). (Reference A.X. 8 788.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, December 16th.—Supply and erection of electrically-driven pumping plant, with ironwork, crane and gantries, for Junee water supply. (Reference A.X. 8 740.)

VICTORIAN ELECTRICITY COMMISSION, December 16th.—Oscillograph equipment. (Reference B.X. 5 692.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 17th.—Secondary batteries (schedule C. 505). (Reference B.X. 5 777.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 17th.—Telephone fuses, heat coils and protectors (schedule C. 498). (Reference B.X. 5 784.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 17th.—Loading coil pots (schedule C. 499). (Reference B.X. 5 785.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, December 27th.—Telegraph material, including g.i. tubular arms, insulators, upper tubes for poles, etc. (tender No. 175). (Reference A.X. 8 734.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, December 28th.—Supply and erection at site of Mankabad Barracks of three Diesel engine driven electric generators, and sinking of two wells. Specifications (£1 os. 6d., not returnable) from Chief Inspecting Engineer, 41, Tothill Street, Westminster, S.W.1.

EGYPTIAN MINISTRY OF PUBLIC WORKS, JANUARY 4th.—Supply and erection at site of Meadi Barracks, Cairo, of two Diesel engines to drive existing generators. Specifications (£1 os. 6d., not returnable) from Chief Inspecting Engineer, 41, Tothill Street, Westminster, S.W.1.

EGYPTIAN MINISTRY OF PUBLIC WORKS, January 6th.—Supply and erection of plant for supply of filtered and unfiltered water, including pumps, electric motors, etc. (Reference A.X. 8 746.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of testing instruments (schedule C. 504.) (Reference B.X. 5 786.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of timing clocks (schedule No. C. 507). (Reference B.X. 5 762.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of contact pressure testers (schedule No. C. 516). (Reference B.X. 5 821.)

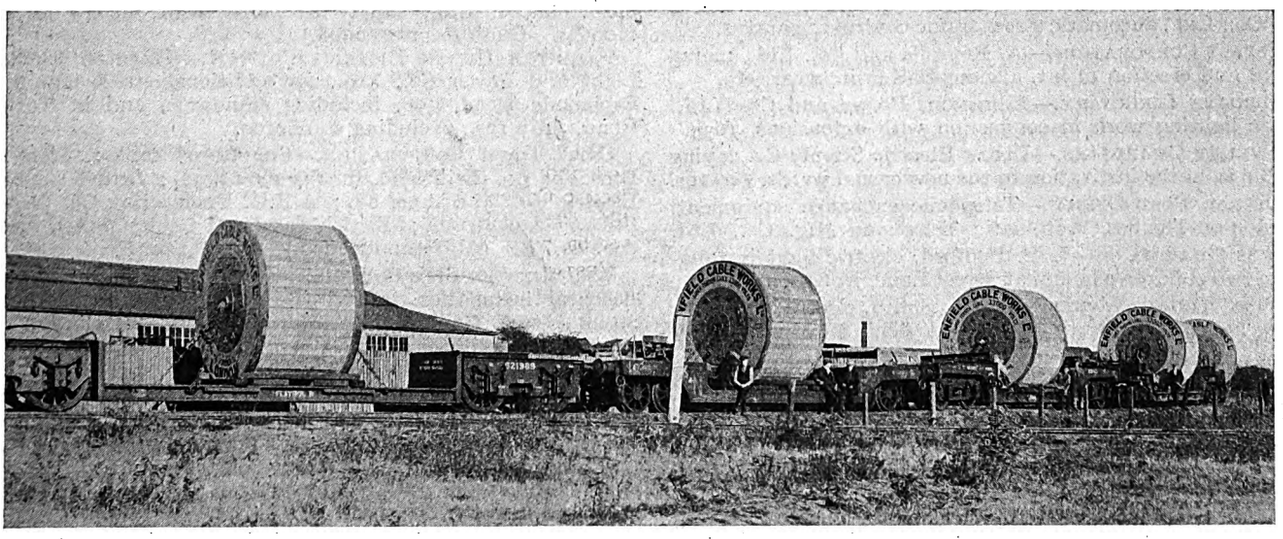
POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of telephone hand sets (schedule C. 526). (Reference B.X. 5 823.)

BLOEMFONTEIN MUNICIPALITY, January 10th.—Supply of automatic electric traffic signals (contract No. 5). (Reference B.X. 5 887.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 13th.—Supply of four-point jacks (P. and T. 151/1897). (Reference B.X. 5 840.)

VICTORIAN ELECTRICITY COMMISSION, January 13th.—Supply of 2 200 V switchgear and accessories (specification No. 30/2). (Reference B.X. 5 827.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 14th.—Supply of ringing motor-generator sets, for automatic telephone exchanges. (Reference B.X. 5 839.)



ON November 3rd, 5 drums were taken from the Enfield Cable Works, Ltd., Brimsdown, by the London and North Eastern Railway to King George Fifth Dock for shipment per s.s. "Ferndale" to Sydney. These drums each contained 700 yards of 3 by 0.25 sq. in. paper-insulated, separately lead-sheathed cables, laid up, double wire armoured and served, of the 33 000 V super-tension type. Each drum weighed over 28 tons and was 11 ft. in diameter. It is claimed that these are the heaviest lengths of cable ever made in Great Britain; they will be laid across Sydney Harbour. The special train, required for the transport by rail of these drums, consisted of 5 trucks, suitable for heavy machinery, an engine and brake van. Traffic on the down line was suspended while the train made the journey from the works at Brimsdown.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 14th.—Supply of telephone indicators (schedule C. 518). (Reference B.X. 5 822.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 14th.—Two air compressors (capacity not less than 800 cu. ft. of free air per min.), and two electric motors. (Reference A.X. 8 784.)

NEW ZEALAND GOVERNMENT RAILWAYS, January 15th.—Supply of automatic telephone exchange equipment for new station at Auckland. (Reference B.X. 5 841.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 16th.—Plug covers for telephone switchboard plugs. (Contract P. and T. 151/1 943.) (Reference B.X. 5 879.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 28th.—Supply of 50 kV oil-immersed circuit breakers, with current transformers and relays (section 299). (Reference B.X. 5 878.)

EGYPTIAN MINISTRY OF THE INTERIOR, February 1st.—Centrifugal well pump and direct coupled electric motor, with piping and accessories. (Reference A.X. 8 811.)

VICTORIAN ELECTRICITY COMMISSION, February 3rd.—Electrically-driven mobile coal-trimming machine, for Yallourn power station. (Reference A.X. 8 681.)

VICTORIAN ELECTRICITY COMMISSION, February 10th.—Supply of sine wave generating equipment and accessories (specification No. 30/3). (Reference B.X. 5 844.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Switchgear and controlling equipment. (Reference B.X. 5 798.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 110 kV switchgear, for interconnecting auto-transformers, for Waitaki power scheme, section 76. (Reference B.X. 5 797.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 66 kV switchgear and protective system for Lyttelton, Lake Coleridge power scheme, section 217. (Reference B.X. 5 796.)

VICTORIAN RAILWAY COMMISSION, March 30th.—Supply of d.c. neutral relays for power signalling purposes (contract No. 43 457). (Reference B.X. 5 793.)

Tenders Accepted.

SOUTHEND CORPORATION.—Waygood-Otis, Ltd., reconstruction of cliff lift, £3 075.

MERSEY DOCKS AND HARBOUR BOARD.—British Insulated Cables, Ltd., electric cable, etc.

COLCHESTER CORPORATION.—Crompton Parkinson, Ltd., supply of spare transformers, £149.

YIEWSLEY-DRAYTON URBAN DISTRICT COUNCIL.—G. Taylor and Co., lighting of Falling Lane, £170 14s. 7d.

GLASGOW CORPORATION.—Belling and Co., 3 800 electric fires; Venner Time Switches, Ltd., 50 time switches.

ROTHERHAM CORPORATION.—A. Reyrolle and Co., Ltd., two pairs of switches, £256 per pair. (Recommended.)

JOHANNESBURG MUNICIPALITY.—Metropolitan-Vickers Electrical Co., Ltd., automatic street traffic control apparatus.

BELFAST CORPORATION.—A. Reyrolle and Co., Ltd., manufacture and erection of h.t. armour-clad switchgear, etc.

ARBROATH INFIRMARY.—Edmiston, Brown and Co., Ltd., electric lighting work in connection with extensions, £635.

NEWBURY GUARDIANS.—Urban Electric Supply Co., laying of cable from the institution to the new casual wards, £20 10s.

GENERAL POST OFFICE.—Telephone exchange equipment, Kingston-on-Thames, Automatic Telephone Mfg. Co., Ltd.

LEEDS GUARDIANS.—J. E. Bedford, electric light installation in two children's homes at Street Lane, Roundhay, Leeds.

HOUSE WIRING, WAKEFIELD.—H. Smith, electrician's work of new house at Horbury Road, Wakefield, for Mrs. F. Hofmann.

STAFFORDSHIRE EDUCATION COMMITTEE.—W. G. France, electric light installation at Wolverhampton schools, £369 6s. 7d.

WEST HAM GUARDIANS.—Andrew Miller, of Plaistow, installation of fire alarms at Whipps Cross Hospital, £246 10s. 6d.

FYLDE GUARDIANS.—Darbyshire, Ltd., electric wiring Children's Homes at Kirkham, £224 10s. (Highest tender was £398 18s.)

FARTOWN CONSERVATIVE CLUB, HUDDERSFIELD.—H. Grant, electrician's work in connection with alterations and additions to premises.

KINCARDINESHIRE EDUCATION AUTHORITY.—Andrew Mc Robb, electric wiring of new Mackie Academy, Stonehaven, £423 14s. 6d.

LONDON COUNTY COUNCIL.—Express Lift Co., Ltd., provision of electric lift at the boiler house of Greenwich power station, £696.

VENTNOR URBAN DISTRICT COUNCIL.—Isle of Wight Electric Light and Power Co., electric light installation in eight houses, eight points each.

HALIFAX CORPORATION.—Gath Electrical Engineering Co., electrician's work in connection with filter house, for waterworks department.

HUDDERSFIELD CORPORATION.—H. C. Stringer, electrical installation in thirty-five new houses on Towngate site, Newsame, Huddersfield.

ISLINGTON (LONDON) BOROUGH COUNCIL.—E. H. Finn, installation work in connection with wiring schemes. (Renewal for twelve months recommended.)

STOKE NEWINGTON (LONDON) BOROUGH COUNCIL.—A. R. Camidge and Co., installations, to be carried out under Council's assisted wiring schemes, 18/3 per point.

CENTRAL ELECTRICITY BOARD.—General Electric Co., Ltd., erection of 132 kV overhead transmission lines in connection with the Mid-East England Scheme.

NEWBURY GUARDIANS.—Urban Electric Supply Co., laying cable from the institution to the new casual wards, £20 10s., Toomer and Co., electric bells, etc., £16 10s. 11d.

WHITBY URBAN DISTRICT COUNCIL.—Sir W. G. Armstrong, Whitworth and Co., Ltd., construction of a lift for the cliff, £12 472 10s. 3d. Highest tender was £20 471 1s. 7d.

MANCHESTER EDUCATION COMMITTEE.—Electrical installations: R. Seddon and Sons, at North Manchester High School for Boys; and Brookes and Co., Ltd., at Birchfields Road school.

GLASGOW CORPORATION.—General Electric Co., Ltd., supply of street lanterns; Metropolitan Electric Cable and Construction Co., Ltd., and British Electrical and Manufacturing Co., supply of cable.

STEPNEY (LONDON) BOROUGH COUNCIL.—W. Lucy and Co., Ltd., distribution boxes, £237. Also tendered: British Insulated Cables Ltd., £262; Universal Electric Manufacturing Co., £275.

CAPE TOWN CORPORATION.—Worthington Simpson, Ltd., supply of steam operated air extraction plant, £140; Allenwest (S.A.), Ltd., for switchgear required for New Alhambra Cinema, £179 10s.

GRIMSBY CORPORATION.—Metropolitan Electric Cable and Construction Co., Ltd., supply of low pressure cables, £5 531; Holmes, Swinburn and Co., Ltd., one year's supply of troughing and lidding, £853.

GENERAL POST OFFICE.—Telephone exchange equipment, Hop (London, S.E.), and Smethwick (Birmingham), Automatic Telephone Mfg. Co., Ltd.; Didsbury (Manchester), General Electric Co., Ltd.

STOKE NEWINGTON (LONDON) BOROUGH COUNCIL.—Messrs. Lucy and Co., Ltd., supply of section pillars, £324 18s.; Measurement, Ltd., supply of prepayment meters for 12 months. (Both recommended.)

PAIGNTON URBAN DISTRICT COUNCIL.—Paignton Electric Light and Power Co., Ltd., for additional street lamps in Esplanade Road, £98, including standards, and in Totnes Road, £161 12s., excluding standards.

CAPE TOWN CORPORATION.—Supply of cable: Siemens Bros. and Co. (British), Ltd., £33 296 6s. 9d.; British General Electric Co., £1 676 9s. 8d.; A.E.G. Engineering Co. (S.A.), Ltd., £5 249 8s. 5d.; British Insulated Cables (S.A.), Ltd., £902 6s. 7d. (All recommended.)

WESTMINSTER CITY COUNCIL.—Gaillard, Robinson and Co., electrical installation to staircase at dwellings in Marshall Street, £26; Gaillard, Robinson and Co., installation of electric time switches at Schomberg House, Esher Street, £40; ditto at Admiral House, Willow Street, £40.

LONDON COUNTY COUNCIL.—Malcolm and Allan (London), Ltd., electric light wiring and fitting at Marvels Lane School (site 2), Twickenham, £179. Also tendered: Stegman and Co., £190; J. Briggs Electrical Contractors, Ltd., £193; H. J. Cash and Co., Ltd., £199; A. Dean and Co., Ltd., £217; Electrical Installations, Ltd., £226.

LONDON COUNTY COUNCIL.—Switchgear and Cowans, Ltd., supply and erection of switchgear at the Greenwich, Limehouse, Tooting and New Cross tramways sub-stations, £10 492; also tendered: Bertram Thomas, £11 972; English Electric Co., Ltd., £12 217; General Electric Co., Ltd., £12 266; Metropolitan-Vickers Electrical Co., Ltd., £12 266; Ferguson, Pailin, Ltd., £12 305; Johnson and Phillips, Ltd., £12 659; New Switchgear Construction Co., Ltd., £23 909.

WORK IN PROSPECT.

ALLOA.—Erection of 36 houses at Ashley Terrace, including electrical installation, for the T.C. Particulars, J. Melvin and Son, architects.

ATTLEBOROUGH.—New church and schools, to cost £7 300. Particulars, Mr. J. T. Hood, architect.

BALLYNARRY.—Reconstruction of church. Particulars, Mr. V. Kelley, 87, Merrion Square, Dublin.

BEDLINGTON.—New Catholic Church, to cost £7 000, at Ridge Terrace. Particulars, Mr. Frank Coyle, architect, Consett.

BIRMINGHAM.—Maternity and child welfare centre at Allen's Cross Farm Estate, Northfield. Particulars, Messrs. Collier and Keyte, architects, 30, Paradise Street.

BLACKBURN.—194 houses on the Whitebirk Road and Hamilton Street sites. Particulars from Borough Engineer.

BLACKPOOL.—Rebuilding lower portion of Trocadero, including alterations to the hotel, restaurant and cinema. Particulars, Mr. H. Best.—Rebuilding shop and café at 31, Church Street. Particulars, Mr. H. Best.

BRIGHTON.—New maids' home at Borough Sanatorium, to cost £7 095. Particulars from Field and Cox, Ltd., contractors, Brighton.

CLEETHORPES.—Erection of building to contain filtration plant and bathing pool. Particulars, Mr. L. W. Pye, engineer.

CRANWELL.—New Air Force Cadet College, to cost £250 000. Tenders to be invited in about six weeks' time for main building. Particulars from Mr. J. G. West, architect to H.M. Office of Works.

CROSBY.—New church at Crosby. Particulars from Mr. Lionel A. C. Prichard, Liverpool.

CROYDON.—50 houses and garages at Hillcote Avenue, etc. Particulars from H. Macintosh, architect.—56 houses at Selsdon Park Road and two new roads. Particulars from T. H. Jones, Alexandra Road, Farnborough.—318 houses, Woodvale Avenue and other roads. Particulars from the Central Estates Co., Ltd., Kenton, Harrow.—Shop and showrooms at Crown Hill. Particulars from Times Furnishing Co., Ltd., High Holborn.—New school at Lodge Road, to cost £28 620. Particulars from Mr. J. G. Gray, contractor, Coventry.

DERBY.—Public baths in Queen's Street. Particulars, Mr. C. H. Aslin, borough architect.

DUDLEY.—Extensions to Guest Hospital and Eye Hospital, to cost £80 000. Particulars from A. T. Butler, Dudley.

EDINBURGH.—Conversion of Huntley House, Canongate, into a museum, to cost £9 000 to £10 000. Particulars, Mr. F. C. Mears and Mr. E. J. MacRae, city architect.—New school at corner of Prestonfield Road, to cost £25 000. Particulars from Education Authority.

EDMONTON.—20 houses in Monmouth and Exeter Roads. Particulars from Messrs. Stanley Parkes and Brown.—26 houses in Circular Road. Particulars from Messrs. Walters and Blake.

FARNBOROUGH.—First portion of new block, for nursing staff, at the Hospital, at Locksbottom. Particulars, Mr. F. Danby Smith, Parliament Mansions, Westminster, S.W.1.

GODALMING.—44 houses. Particulars, Mr. G. B. Hartfree, borough surveyor.

HALTON.—Church and school. Particulars, Messrs. Chorley, Gribbon, and Foggitt, architects, Leeds.

HAMMERSMITH (LONDON).—Extensions to Upper Latymer School. Particulars, Mr. James M. Kellett, architect.

HENDON.—32 houses, Deans Lane. Messrs. H. J. Hook and Sons.—24 houses, Elmsgate Garden Estate. Messrs. H. Boot and Son.—31 houses, Sunny Gardens. Mr. B. R. Evans.—22 houses, Hall Lane. Mr. W. Bagg.—7 shops and flats, Cricklewood Lane. Mr. C. J. Codrington.

HOVE.—New premises at St. Leonard's Gardens, for Messrs. E. J. Chadwick. Particulars from Messrs. Clayton and Black, architects.

HULL.—School at Finton Grove. Particulars from Mr. D. Harvey, city architect.

LLANDOUGH.—New hospital near Penarth Dock. Particulars, Messrs. E. C. Morgan Willmott and T. E. Smith, architects, 27, Park Place, Cardiff.

MORDEN.—200 houses on the St. Helier Estate. Particulars, Mr. G. T. Crouch.

NOTTINGHAM.—Public washhouses, at Noel Street. Particulars, Mr. T. Wallis Gordon, city engineer.

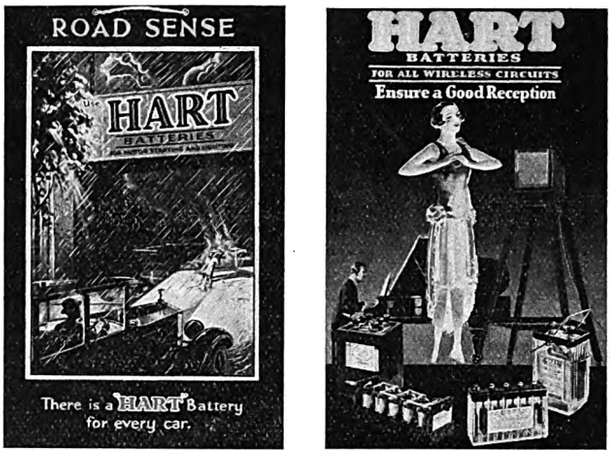
NOTTINGHAM.—School at Wollaton Park, to cost £13 124. Particulars from Mr. R. Hustwayte, Notts.—School at Aspley Lane, to cost £89 993. Particulars from T. Long and Sons, contractors.

TRADE PUBLICATIONS.

THE "Morris" electric lift is the subject of folder F.37, issued by HERBERT MORRIS, LTD., Loughborough.

A new lamp catalogue has been published by CRYSELCO, LTD., Kempston Works, Bedford.

The current stock list has been received from the A.E.G. ELECTRIC, LTD., 131, Victoria Street, London, S.W.1.



Two new showcards issued by the Hart Accumulator Co., Ltd.

L. G. HAWKINS AND CO., LTD., 30/35, Drury Lane, London, W.C.2, have prepared special literature in connection with Christmas gifts.

"Church Lighting" is the subject of publication C.L.510, issued by the EDISON SWAN ELECTRIC CO., LTD., 123, Queen Victoria Street, London, E.C.4.

The WANDSWORTH ELECTRICAL MANUFACTURING CO., LTD., has published a new catalogue relative to electrical accessories. The address of the firm is Imperial Works, Kenyon Street, Birmingham.

The PRITCHETT AND GOLD AND E.P.S. CO., LTD., 50, Grosvenor Gardens, London, S.W.1, has sent us a copy of a new showcard of the closed top type of cell. The card is a very faithful reproduction of the actual cell, and is believed to be the first card of its kind to be issued.

The MULLARD WIRELESS SERVICE CO., LTD., Mullard House, Charing Cross Road, London, W.C.2, has issued leaflet No. V.T.8/1a, describing the VO/150, to replace leaflet V.T.8; V.U.17/1a (V.U.7), to replace V.U.17; V.T.9/1a (VO/250), to replace V.T.9; V.T.10/1a (VO/500), to replace V.T.10; V.U.16/1a (U.8), to replace V.U.16; and V.T.21/1a (T.7A), to replace leaflet V.T.21.

We have received from J. H. TUCKER AND CO., LTD., King's Road, Tyseley, Birmingham, a copy of the company's latest publication G.5, being an abridged price list of popular lines in everyday demand, including tumbler switches (surface, flush and semi-recessed types), lampholders, fuseboards, plugs and sockets, ironclad gear, etc. Only descriptive matter which is absolutely essential is included, enabling the contents of the list to be understood at a glance. Discount is as indicated on a detachable discount slip inside the list.

The MIDLAND ELECTRIC MANUFACTURING CO., LTD., advise us of the building and equipment of a new extension to their works. The new department will be separate from the main works, and will be known as "Specials and Service Department." It is intended to deal with the erection of unit type control panels, variations of M.E.M. gear to suit special requirements, and the many other services which create difficulties and delays in a works specially laid out for standardised large scale production, but which are often essential to the installation engineer. List No. 178 gives full particulars of this new M.E.M. development.

The BRITISH THOMSON-HOUSTON CO., LTD., Rugby, has issued publication A.X. 171C*, which is an index to publications issued by the company for use in the British Isles, other than operating instructions, and cancels index A.G. 171B. Price list No. 5 100D*, dealing with d.c. starting rheostats, has also been published, and this cancels list No. 5 100C. Another new booklet is No. DS. 4 176-1, describing ironclad oil-immersed thermal circuit breakers. Other new issues are No. 2 144A* (squirrel cage motors); a supplement to D.L. 1 225B (air filters); No. 5 281 (auto-transformer starting equipments); No. 1 225B* (air cooling systems for turbo-alternators); and No. 2 420C*, dealing with rotary convertors.

Islington (London) Electricity Committee is to convert street lamps from gas to electricity in Copenhagen Street, Isledon Road and Tollington Road, at a cost of £1 720.

Melton Mowbray R.D.C. has decided to support an application for a Special Order made by the Leicestershire and Warwickshire Electric Power Co. to supply current in the district.

Rugby U.D.C. has decided to carry out mains extensions at an estimated cost of £650, and has applied to the Commissioners for consent to meet the outlay out of revenue during the current year.

Billesdon R.D.C. has approved of an application by the Mid-East Leicestershire Electric Power Co., for an Order for supplying electricity in the area. The company is to carry out a scheme of rural electrification.

Dartford U.D.C. has received an application for a supply of current to Lawson Villas and Burnham Road by the agents for the "Daily Telegraph" paper mills. The Electricity Commissioner has voted £230 for laying the mains.

The Northampton Electric Light and Power Co. has withdrawn its application to the Commissioners for the use of overhead lines in High Street and Market Square, Olney. The use of overhead lines had been opposed by Olney P.C.

Cape Town Electricity Committee recommends that the charges for current to the Table Mountain Aerial Cableway Co., Ltd., be for the first 25 000 kWh per annum, 2½d. per kWh; for the next 75 000 units, 1.2d. per kWh and for all in excess of 100 000, 1d. per kWh.

Durham County Council has raised no objection to the Synthetic Ammonia and Nitrates, Ltd., laying a 6 600 V cable across the Stockton-Port Clarence main road near Eton Terrace, Haverton Hill, and across the Seaton Carew main road near Greatham Creek railway.

The Shawinigan Water and Power Co. is engaged on the preparatory work in connection with the expansion of its hydro-electric power developments on the Upper St. Maurice river in Quebec. The water powers of the upper stretch of this stream—one of the largest tributaries of the St. Lawrence, are believed to be capable of a total power development in excess of 600 000 H.P.

Mr. W. B. Woodhouse, for the promoters of the West Cumberland Electricity Order, has informed Wigton R.D.C. that the promoters are making application for an Extension Order to supply the whole of Cumberland where no other supply is available, and it is proposed to obtain a supply in bulk from the Central Electricity Board, and to utilise the waste heat at the collieries in the Cumberland coalfield.

The municipal electric plant at Melfort, Sask., is to be sold to Canadian Utilities, Ltd., a subsidiary of the International Utilities Corporation, which has recently been active in the purchase and linking-up of small power plants both in Saskatchewan and in Alberta. The company is to be granted a franchise to sell current in the town for 20 years. The price to be paid for the plant is $100 000, and the company proposes to spend an additional $500 000 on extensions.

The Cheshire County Surveyor, reporting to the Highways Committee upon the erection of overhead transmission lines in the parish of Poynton, states that the undertakers have agreed to lay certain lengths of cable underground, provided they are relieved from cost of reinstatement of road surface by the road authorities, involving a cost of £300 for main roads and £250 for district roads. The Committee has agreed that the cost of reinstatement be defrayed by the County Council.

The inhabitants of the Newtown district of Retford are strongly opposed to the overhead electric cables which are being erected in that part of the town. At a recent Council meeting, Ald. W. N. Brackett explained that the system had been adopted purely on account of cost. Underground cables would have cost £1 200, whereas overhead cables would be £360. The cost of service underground would also be considerably higher. Coun. Herrick hoped the Corporation would strongly counsel against the use of overhead lines in other parts of the town.

The Calgary Power Co. has entered into a contract with the City authorities at Edmonton (Calgary) for the supply of electricity from their new developments on the Ghost River. It has been decided to transmit the power to Edmonton over a 132 000 V line. This will be the highest voltage transmission line in Western Canada, and the voltage is exceeded in the Dominion only on the line between the Saguenay River and Quebec (165 000 V) and the new line of the Ontario Hydro-Electric Power Commission connecting the Gatineau River with the City of Toronto (220 000 V).

The Dominion Water Power and Reclamation Service of the Department of the Interior of Canada has recently issued volume 57 of the Water Resources Papers which deal with the surface water supply of Canada. It contains the results of investigations made by the Dominion Hydrometric Survey between October 1st, 1926, and September 30th, 1927, in the provinces of Alberta, Saskatchewan and Manitoba, and the extreme western part of Ontario. The report deals with stream flow and meteorological data. Copies may be obtained from the Director of the Service at Ottawa.

The City Electrical Engineer of York has prepared a scheme to raise the pressure of all new outgoing h.t. feeders from 3 300 V to 6 600 V. He proposes to remove the step-up transformers from individual feeders and place them in a common bank to be added to as circumstances required. To carry out the proposal it will be necessary to erect six feeder panels and to build a small switch house. The estimated cost of the scheme is £2 720. The Electricity Committee recommends approval of the scheme.—The Committee is to seek sanction to borrow £32 000 for mains extensions.

Lindsey (Lincs) County Council has been informed by Mr. R. Borlase Matthews that 28 towns and villages will be given a supply of electricity within the first two years after the making of the Orders by the Electricity Commissioners. These include the urban districts of Alford, Horncastle, Mablethorpe, and Sutton, Skegness, and Woodhall Spa, the parish of Hagworthingham in Horncastle rural district, 21 parishes in Spilsby rural district, and the parish of Burton in the Welton rural district. Mr. Matthews also hopes to be able to supply a number of villages in the neighbourhood of Lincoln within three years of the making of the Orders.

The City Electrical Engineer of Hull has reported that the five new boilers now being erected would be rendered more efficient in operation by the provision of a system of automatic combustion control. He recommends that the "Hagan" system be installed, the cost of which would be £3 189. He also advises that the boilers be equipped with re-heated secondary air to eliminate smoke when the boilers are being forced, at a cost of £900. The recommendations have been adopted.—The City Architect has prepared a preliminary scheme for the supply of electricity to the Tilworth Grange Estate, including the existing buildings, the pavilion in the course of erection, and the four further pavilions, hospital, class-room, working block recreation hall, etc., provided for in the scheme for the future enlargement of the institution, the total cost being £2 210.

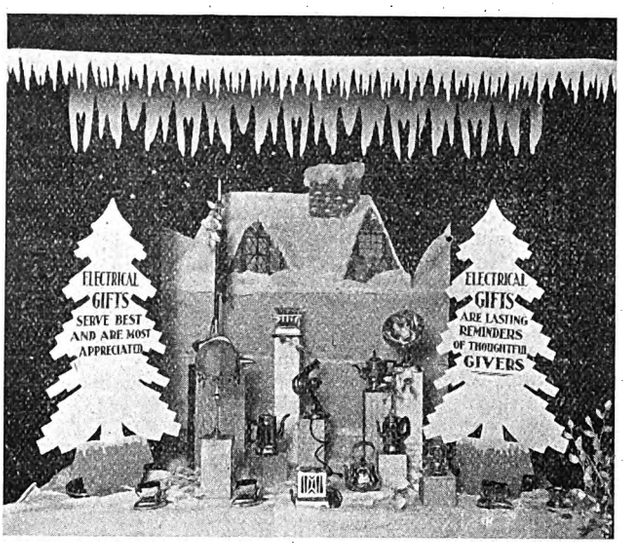
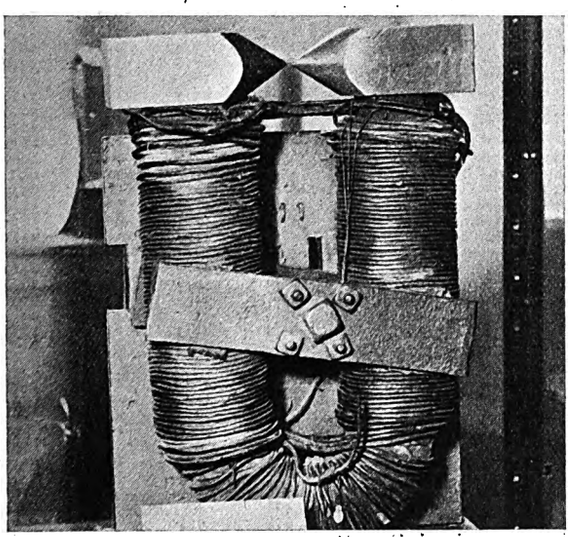
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

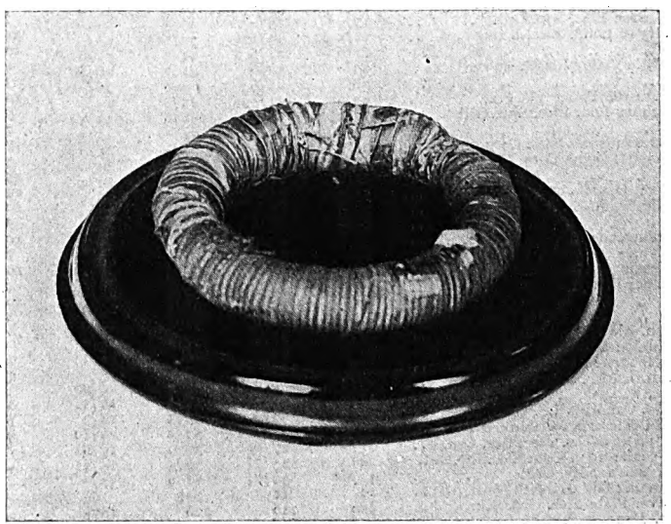
Members of the Association of Supervising Electrical Engineers and their guests at the dinner at the Mecca Restaurant, Ludgate Hill, London, on Saturday, November 16th. The dinner was followed by a whist drive and dance. See page 640.

Signor G. Semenza,. past President of the I.E.C., whose death is referred to on p. 640.



Two special window displays which have been designed by the Electrical Development Association in connection with Christmas selling. All the material necessary for the dressing of the windows can be obtained from the E.D.A., including the silver stars, holly and crêpe paper. Both windows utilise the cubes of other displays, and additional sets, where required, can be supplied.





Included in the apparatus exhibited by the Royal Institution at the Science Museum, South Kensington, are the ring with which Michael Faraday discovered in 1831 the laws governing the theories of electrical engineering. This ring, seen in the right-hand picture, will be the central feature of the international commemoration of Faraday's work which is to take place in London in 1931. The left-hand picture is of another Faraday exhibit and shows an experimental electro-magnet.

COMPANY NEWS.

Electrical Manufacturers and Supply Companies' Shares Sagging—Gramophone Co.'s Radio Policy—Directors' Reports and Dividend Notices—New Companies.

ONCE again the changes shown in our list of electrical share quotations are for the most part downward, and though Hydro-Electrics at 35 are a few points higher, International Holdings have fallen from 7¾ to nearly 5¾. General Electrics, however, have steadied, and at 45s. are 1s. 3d. higher on the week. Other manufacturing shares have been weak, Henley's continuing their decline from 117s. 6d. to 112s. 6d., a fall of 12s. 6d. in a fortnight. Callender's Cable shares are unchanged, but British Insulated Cables and Enfield Cable Works ordinary shares are each half-a-crown down, at 75s. and 95s. respectively. Johnson and Phillips shares have given way 3s. 9d., from 38s. 9d. to 35s., and Associated Electrical Industries are nearly 2s. lower at about 28s. English Electric ordinary shares have changed hands as low as 6s. 3d., as against last week's price of 7s. 6d. Ever Readies are 6d. down at 18s. 3d.

Electricity supply shares have been uniformly depressed. County of London shares are nearly half-a-crown lower at a shade over 48s., and the lower-priced Metropolitans, at 36s. 3d., show the same decline. The ordinary shares of the Electric Supply Corporation have fallen 3s. 9d., to nearly 48s., and Bournemouth and Poole shares are nearly 4s. 6d. down at 56s. 3d. Scotch issues have shared in the general depression, Scottish Power ordinary giving way from 30s. to 28s. 6d., and Clyde Valley from 37s. 6d. to 35s., while Fife Tramway Light and Power issues have dropped, the ordinary from 13s. 9d. to 12s. 6d., and the 6% preference from 17s. 6d. to 15s. Newcastle-upon-Tyne Supply shares at 23s. 9d. show a fall of nearly 2s., Yorkshire Power ordinary at just under 32s., a fall of 1s. 7½d., and Electrical Distribution of Yorkshire at 39s., a decline of nearly 2s.

Midland Counties Supply shares have lost 1s., moving down from 28s. to 27s. Urban Electric Supply ordinary shares have changed hands at 34s. Victoria Falls Power shares have been marked down from £3 to 56s. 3d., and Calcutta Supply ordinary are half-a-crown lower at a shade under 52s.

Cables and wireless issues have weakened slightly; American Telephone and Telegraph stock has risen from 210 to 225; and Indo-European Telegraph stock from 47½ to 52½.

Directors' Reports, etc.

MELBOURNE ELECTRIC SUPPLY CO., LTD.—Usual intm. div. of 10%, tax free, is announced.

HYDRO ELECTRIC SECURITIES CORPORATION.—Qrtrly div. of 50 cents p.sh. on common stk. will be payable on Dec. 14.

INTERNATIONAL POWER SECURITIES CORPORATION.—Div. of $1 p. sh. on common shs. for 1929 will be payable on Dec. 15.

MONTREAL LIGHT, HEAT AND POWER CONSOLIDATED.—Div. of 60 cents p. sh. for qrtr. endg. Dec. 31, less tax, has bn. declared.

MADRAS ELECTRIC SUPPLY CORPORATION, LTD.—Interim div. of 2½% on ord. shares, tax free, will be payable on Nov. 25.

BRITISH THOMSON-HOUSTON CO., LTD.—Div. on 7% pref. cap. for half-year ended June 30, 1929, less tax, will be payable on Dec. 14.

COUNTY OF LONDON ELECTRIC SUPPLY CO., LTD.—Transfer books and register of hldrs. of 5% deb. stk. are closed until Nov. 30 inclusive, preparatory to paymt. of int. due Dec. 2, 1929.

NORTHAMPTON ELECTRIC LIGHT AND POWER CO., LTD.—Directors have decided to increase the 5% deb. stk. from £286 000 to £400 000, redeemable in July, 1964, at par, on or before Dec., 1935, at 105%.

DELAGOA BAY DEVELOPMENT CORPORATION, LTD.—Div. on ord. shs. for year ended June 30 of 3%, agst. 2%, will be payable on Nov. 26, and a further div. of 6¼% on 7% cum. pref. and participatg. shs. is to be paid.

MEXICAN LIGHT AND POWER CO., LTD.—A half-year's int. on 5% 2nd mortgage 50 year bonds will be paid on and after Dec. 2 at the Bank of Scotland, 30, Bishopsgate, London, E.C., against surrender of coupon No. 36, dated Dec. 1. Coupons must be lodged three clear days previous to paymt.

BUENOS AIRES LACROZE TRAMWAYS CO., LTD.—Gross receipts for year to June 30, 1929, £688 816, agst. £696 117, and working exes. £444 953, agst. £453 954, leavg. £243 863, agst. £242 164. Int. charges, etc., £124 526, agst. £135 396; net pfts. £119 337, agst. £106 768. To res. £5 967, agst. £5 338; to directors £5 967, agst. £5 338; divs. £87 301, same to extra-ord. res., £17 460, same; fwd. £5 772, agst. £3 131.;

STOCK EXCHANGE NOTICES.—Official quotations have been granted to £750 000 5% deb. stock of the Atlas Light and Power Co.; 217 050 £1, fully paid, ord. shares of the County of London Electric Supply Co., Ltd., 150 000 £1, fully paid ord. shares, 100 000 £1, fully paid, 7% cum. pref. shares, and £192 700 5½% deb. stock of the Electrical Finance and Securities Co., Ltd.; 7 988 £1, fully paid, ord. shares of the Underground Electric Railways Co. of London, Ltd.

OSLO GAS AND ELECTRICITY CO.—Coupons of Oslo gas and electricity 6% loan 1924 fallg. due on Dec. 1, 1929, will be paid by Messrs. A. Keyser and Co., 31, Throgmorton Street, London, E.C.2, at the exchange of the day. Coupons to be left three clear days for examination. Advice has been received from the company that the reimbursemt. of that portion of the loan due Dec. 1 has taken place by purchase of the bonds.

BAHIA TRAMWAY, LIGHT AND POWER CO.—The receiver (Mr. B. H. Binder, River Plate House, London, E.C.2), is seeking the names of deb. holdrs. in order to assist the Court to decide on the method of procedure to be adopted in respect of a small distributn. to them. In May, 1929, negotiatns. were concluded for the settlemt. of the claim of the co. agst. Bahia Municipality on terms approved by the Court. It was estimated at the time that this settlemt. would result in the paymt. to deb. hldrs. over a period of about three years of about 30% of the nom. value of the debs.

METALS COATING CO., LTD.—Statement, issued for information only and not as invitatn. to subscribe for shs., gives following details: Authorised cap., £150 000; issued £125 000. Company incorporated Sept. 12, 1929. It is intended to acquire factory at Dudley, with plant, etc., and patents and patent rights relatg. to the metals coating process, and the whole of issued sh. cap. of Metallisation Sales, Ltd., giving company benefit for Great Britain, Northern Ireland, Irish Free State and Empire of India of all existg. letters patent covering process whereby any metallic or non-metallic surface can be covered with a coating from 1/20 mm. up to any desired thickness of any metal that can be drawn into wire or obtained in powder form: The process is in use by Siemens-Schuckert, A.E.G., General Electric Co. of New York, Westinghouse Electric and Mfg. Co., and others. The statement also contains a report by Dr. A. L. Mond, testifying to the obvious value of the process.

COMPANIES TO BE STRUCK OFF REGISTER.—The following companies will be struck off the register unless cause to the contrary is shown before Dec. 17: General Battery Co., Midland Radiotelephone Mfrs.; N.S. Battery and Equipment Co., and Winsum Electric Diffusers. The following will be struck off unless cause to the contrary is shown before Dec. 24:—B. Morris (Electrical Radio), Daily Signs, Deansgate Electric Radio (Manchester), Dur-a Electric Lamps, Electric Bulk, Everose Electrical Co., Garter Electrical Mfg. Co., Heath's Auto Electrical Co. The following will be struck off unless cause to the contrary is shown before Jan. 22: Electric Fans, Electro Arts, Eunice Wireless Cabinet Works, Hertz Radio Corporation, Local Electric Supplies Co., Metropolitan Electrical Contractors, Radiolicity, Wessex Power Producers, Westfield Wireless. The following will be struck off unless cause to the contrary is shown before Feb. 12:—Everbright Sign Co.; Light and Shade Co.; Multi Wiring and Instrument Co.; S. L. Electrical Co.

Company Meetings.

LISKEARD (CORNWALL) GAS AND ELECTRICITY CO., LTD.—Mr. W. H. Huddy, chairman, presiding at the annual meeting on November 15th, said, after writing off £1 400 for depreciation and paying for heavy repairs and renovations to plant out of current revenue, a profit had been made on the year of £1 215. The consumption of electricity in Liskeard had increased by 25% during the year, and there was also an increase in the use of gas. The report was adopted and dividends of 7% on the preference and 7½% on the ordinary shares were declared.

DELAGOA BAY DEVELOPMENT CORPORATION, LTD.—Mr. H. K. Heyland, presiding at the meeting on Tuesday, said, due to the new Companies Act, which came into force on 1st of this month, certain details appeared in the accounts for the first time relating to their subsidiary, the French Compagnie Générale d'Eléctricité de Lourenço Marques. The actual capital expenditure by the French Electric Lighting Co. was over £100 000, and provision had to be made, and was being made, for amortisation of the entire capital of this company, by December, 1945, when the property might be taken over by the Portuguese authorities at a valuation. Turning to profit and loss account, the all-important item was "Profit in Lourenço Marques," amounted to £51 449, showing a small increase on the previous year. The volume of business done, however, in water and electric light and power supplies showed a quite normal increase, which in net revenue would represent approximately a money value of over £3 000. On the other hand, the increase in loss on working the tramways and motor-buses, due to competition, was nearly £2 000 more, so that the trading profit was practicly the same as last year. The corporation had at present six motor-buses in operation, and its competitors have three, so that at present nine buses were running in competition with the electric tramways. Negotiations with the authorities were proceeding for closing down the tramways altogether and adopting in their place a modern up-to-date motor-bus service. The report and accounts were adopted.

GRAMOPHONE CO., LTD.—Mr. E. Trevor L. Williams, presiding at the meeting on November 13th, said since the last general meeting Mr. David Sarnoff and the Marchese Marconi had been added to the board. The trading profit for the year was £1 200 912, the highest figure yet attained. After provision for debenture service, directors' fees, interest on preference shares, etc., a net figure of £1 146 508 remained, or £2 105 155 after adding balance from last account. An interim dividend of 10% was paid in May, and a final dividend of 50% was now recommended. The Marconi contract was not yet completed, but would be shortly. In the meantime, they had been working in conjunction with the Marconi Company, so as, on completion, to take over their acquisition with the factories and business well forward upon their own lines. Many of the inventions which had made broadcasting possible had also been found to be useful in the gramophone field. The directors considered, therefore, that the company should become actively interested in radio. In March last, the directors acquired all the rights which the Marconi Co. possessed in the field of home entertainment, with their factories and sales depots and the whole of their interest in the M.O. Valve Co. In May of this year it was decided that the company utilise its experience and technique in sound reproduction by co-operating with others in the production of talking and sound films. The company arranged to co-operate with the British and Dominion Film Corporation in the taking of a number of new talking films. Four of these had now been completed and would be exhibited to the public shortly. The report and accounts were adopted.

RADIOVISOR PARENT, LTD.

A New Industry—Promising Developments—Inquiries from Manufacturers Invited.

THE first annual general meeting of Radiovisor Parent, Ltd., was held on November 14th at the Hotel Victoria, Northumberland Avenue, London.

Lt.-Col. the Hon. A. C. Murray, C.M.G., D.S.O., chairman, who presided, said that the company was in a strong financial position, with cash resources amounting to £113 800.

One of the most remarkable technical developments of recent years had been the use of light-sensitive processes for various applications, especially in connection with talking films. The advent of the Radiovisor light sensitive bridge had placed the selenium cell in the forefront of light-sensitive devices. Having such a selenium bridge, a large field of activity was opened up, and the possible applications were numerous. To mention a few: the automatic switching on and off of street lights; the "invisible ray" burglar alarm; marine smoke alarm; control of water level in boilers and of smoke of factory chimneys, etc. The bridge should prove of use in many industries, and manufacturers and others were invited to communicate with the company.

It was not the board's policy to go in for manufacturing apparatus on a large scale other than the Radiovisor light-sensitive bridge, and they were prepared to co-operate with manufacturers and make arrangements with them to take over the manufacture and sale of appropriate applications. In cases where firms or individuals wished to make use of the bridge for some particular purpose or application of their own it was the policy to lend bridges and to assist them in developing their ideas.

The patent rights and trade marks for the world, excepting Great Britain, Northern Ireland, Isle of Man, and the Irish Free State, had been sold to Radiovisor Foreign and Colonial Ltd., in which the Parent company held a substantial interest. The "foreign company" had already made considerable progress, having concluded an agreement with the well-known firm of Siemens and Halske A.G. of Berlin for the exclusive rights to manufacture and sell throughout Europe. Intensive development work was already being carried out in their laboratories and workshops, which should lead to active business.

In conclusion, the chairman said that the company was financially strong, and, with the foundation already laid and the work that had been and was being carried out, they could look forward with confidence to the future.

The report and accounts were unanimously adopted.

THE LEAD MARKET.

The lead market, according to James Forster and Co., last week recovered 15s. per ton. The American price is unchanged at 6.25 cents.

Closing prices on November 15th were £22 for November, £21 18s. 9d. for December and January, and £21 17s. 6d. for February, 7s. 6d. to 5s. higher on the week.

NEW COMPANIES.

LOUTH ELECTRIC SERVICE, LTD.—Cap., £500. Electricians, electrical and mechanical engineers, etc. Solicitors: Falkner, Son and Roberts, Louth, Lincs.

W. H. BAKER (WALLINGFORD), LTD.—Cap., £1 500. Mechanical, electrical, wireless and general engineers, etc. Governing Director: W. H. Baker, Warborough, Oxford.

TELLUS ELECTRIC CLEANER CO. (SCOTLAND), LTD.—Cap., £10 000. To acquire the business formerly carried on by F. Smart and now by J. L. Smart, as Tellus Electric Cleaner Co. Reg. office: 33A, Gordon Street, Glasgow, C.1.

GUARANTEED ACCUMULATOR SERVICES, LTD.—Cap., £500. Manufacturers' agents and distributors of accumulators, mechanical, radio and musical apparatus and accessories, etc. Reg. Office: 7, Station Road, Wealdstone.

DEAN AND GOSLING, LTD.—Cap., £1 000. To acquire business of electrical and mechanical engineers and contractors, etc., carried on by A. P. Dean, A. R. Gosling and F. T. Gosling, at Colchester. Reg. office: 14A, Hospital Road, Colchester.

ACOUSTOPHONE, LTD.—Cap., £1 000. Manufacturers, erectors, installers, maintainers and repairers of and dealers in wireless, radio gramophones, radio receivers, radio wire, etc. Reg. Office: 82, Pelham Street, South Kensington, London, S.W.7.

MOTOR INVENTIONS, LTD.—Cap., £1 000. Motor, electrical and general engineers, manufacturers of, agents for and dealers in motor and other vehicles, lamps, batteries, accumulators, dynamos, magnetos, etc. Reg. office: 2, South John Street, Liverpool.

INTERNATIONAL TRADE AND INDUSTRIES, LTD.—Cap., £7 800. To adopt agreement with George Evans and Co., Ltd., and to carry on business of manufacturers of and agents for scientific instruments, electrical accessories, etc. Reg. Office: 35, Waterloo Road, London, S.E.1.

RESONANT FAST DRILLING CORPORATION, LTD.—Cap., £200. To acquire licence from W. R. Macdonald, and to carry on business of designers, inventors and manufacturers of and dealers in illuminated, mechanical, revolving, and other signs and apparatus and process for internal and external lighting, direction and other indicators, etc. Reg. office: 66, Finsbury Pavement, London, E.C.

DULRAE PATENTS, LTD.—Cap., £100. To acquire and turn to account inventions, processes or apparatus relating to electric panel warming of buildings, and other inventions, processes or apparatus relating to warming, ventilation or cooling of buildings, to carry on business of heating, ventilating, cooking and electrical engineers and contractors, etc. Reg. office: 4, Bloomsbury Place, London, W.C.1.

ALFOL INSULATION, LTD.—Cap., £1 000. To acquire business of dealers in insulating material sold under a trade mark incorporating word "Alfol" carried on at 3, Bramham Gardens, London, S.W.5, by N.V. Internationale Alfol Maatschappij of Amsterdam, by its agent L. G. Wilkening, and to adopt an agreement with the said company and Dr. E. Dyckerhoff. Solicitors: Slaughter and May, 18, Austin Friars, London, E.C.

METALS COATING CO., LTD.—Cap., £150 000. To acquire assets of Metallisation, Ltd., Dudley, and Metallisation (Sales), London. Company holds six months' option to acquire 91% of issued ord. sh. cap. of Metals Coating Co. of America, Inc., which controls Metallisator A. G. of Berlin and Metallisator A-G. of Hamburg, three companies which, with the British firms now being acquired, between them control the world rights for the manufacture, sales, and contracting licences of a metal-spraying pistol. The principal uses of the process are for coating metals against corrosion and erosion.

ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by GEE AND CO., Patent and Trade Marks Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.

JUNILOG.—505 775. Class 8. Electric condensers for use in wireless telegraphy and telephony. Sydney Sam Bird, Cyldon Works, Sarnesfield Road, Enfield Town, Middlesex; manufacturing electrical engineer. September 3rd, 1929.

TORNADO.—500 356. Class 13. Electric incandescent lamps (ordinary). L. Benn and Co., Ltd., 8, Colonial Avenue, Minories, London, E.1; merchants. February 25th, 1929.

PREMAG.—505 396. Class 13. Filler rods and electrodes, being metal goods not included in other classes, for use in electric arc and acetylene welding. The Premier Electric Welding Co., Ltd., Harrow Manorway, Abbey Wood, London, S.E.2; manufacturers. August 19th, 1929. To be associated with No. 505 395 (2 687) i.

DEMON.—502 867. Class 6. Electric vacuum cleaning machines. L. Benn and Co., Ltd., 8, Colonial Avenue, Minories, London, E.1; merchants. May 17th, 1929.

SILOVIM.—505 145. Class 6. Electric vacuum cleaning machines. C.C.A. (Vacuum Cleaners), Ltd., Swinton House, 324, Gray's Inn Road, London, W.C.1; merchants. August 8th, 1929. To be associated with No. B505 143 and another (not yet advertised).

LE MIROIR DE LA VOIX (sign).—501 543. Class 8. Wireless telephonic and television apparatus and parts thereof, sound recording and amplifying machines and parts thereof. Compagnie Generale des Machines Parlantes Pathe Freres, 30, Boulevard des Italiens, Paris; manufacturers. April 5th, 1929.

HEART.—504 200. Class 8. Thermionic valves, battery eliminators, battery chargers, accumulators, dials, transformers, valve holders, and condensers, all for use in connection with wireless telephony. Adolf Knopf, trading as the Wholesale Guarantee Incandescent Supply Stores, 25, Waterloo Road, London, S.E.1; wireless dealer. July 4th, 1929. To be associated with No. 350 756 (1 839) and others.

TWIN CONE (sign).—504 679. Class 8. Philosophical and scientific instruments. Arthur Green, Wilga, Warwick Avenue, Coventry; engineer. July 22nd, 1929. Registration of this trade mark shall give no right to the exclusive use of the words "Twin Cone."

ORGOLA.—505 267. Class 8. Instruments and apparatus for radio signalling, thermionic valves, thermionic amplifiers and sound reproducers, gramophones, gramophone pick-ups and parts. The Mullard Radio Valve Co., Ltd., 45, Nightingale Lane, London, S.W.12; manufacturers. August 13th, 1929.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

CAPLIN, Mr. F., 40, Downs Park Road, Dalston (trading as FRANKS), wireless dealer. £11 10s. 2d. October 2nd.

CASTLE RADIO CO., 161, Westminster Bridge Road, S.E., wireless dealers. £20 5s. 6d. October 2nd.

ENGLAND AND SON, Eynsham, electrical engineers. £17 18s. 1d. October 14th.

LUEN, A. E., Lanthorne House, 98/100, Queen Street (trading as LUEN ELECTRICAL SUPPLIES), Cardiff, agents and merchants. £20 13s. 4d. October 5th.

MAYFAIR ELECTRIC GRAMOPHONES, LTD., Friars House, New Broad Street, E.C., electrical engineers. £16 15s. 4d. October 12th.

SQUIRES AND CO., High Street, Billericay, electrical engineers. £15 15s. 6d. October 7th.

UNDERHILL, G., 8, Summer Street, Barbourne, electrical contractor. £13 18s. 7d. October 1st.

Deed of Arrangement.

BRICE, Mrs. Mary Ann Charlotte, trading as STEGMAN AND CO., Brighton Railway Approach, Clapham Junction, electrical engineer. Dated November 7th, filed November 14th. Trustee, W. A. J. Osborne, Balfour House, Finsbury Pavement, E.C., Certified Accountant. Liabilities unsecured, £3 526; assets, less secured claims, £1 500.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced.*]

HOUGH BROS., LTD., Nottingham, gramophone and wireless dealers.—Registered November 9th, £2 500 debentures; general charge. *Nil. December 10th, 1928.

TRUPHONIC RADIO LTD., London, S.E.—Registered October 31st. £15 000 debenture to Branch Nominees, Ltd., 15, Bishopsgate, E.C.; charged on land in London, also general charge.

WOLF AND MORGAN, LTD. (late WAGNER ELECTRIC SUPPLIES, LTD., London, E.C.—Registered November 7th, series of £2 000 debentures present issue £1 000; general charge. *—. September 28th, 1928.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

ABBOTT, James William, trading as ELECTRICAL ENGINEERING AND SUPPLY CO., 26, The Bank, Barnard Castle, Durham, electrical engineer. The creditors were called together recently when a statement of affairs was submitted which showed liabilities of £580, of which £388 was due to the trade and £192 to the bank, the latter holding a third party guarantee to the extent of £100. The assets consisted of cash in hand, £6; stock, £60; book debts, £63, valued at £50; furniture, £5; plant, £200; and equity in freehold shop and house, £8, making a total of £329. After allowing £6 for preferential claims, the net assets were £323, or a deficiency of £257. It was stated that the debtor had recently suffered from ill-health, and a deed of assignment had already been executed in favour of Mr. H. Wood, C.A., of Newgate, Barnard Castle. The creditors decided to confirm the deed, and expressed the opinion that the trustee should continue the business for a period of six months, which would cover the busy season, and would also give him an opportunity of selling as a going concern.

BRITISH ELECTRICAL REPRODUCTION CO., LTD., Lee Valley Road, Ponders End, Middlesex. In pursuance of the provisions of the Companies (Consolidation) Act, 1908, a meeting of the creditors in this voluntary winding up was held on November 12th at the offices of Winney Smith and Winney, C.A., 4B, Frederick's Place, E.C., when Mr. R. L. Latimer, the liquidator of the company, submitted a statement of affairs which disclosed liabilities of £4,367, of which £2,803 was due to the trade, and there was a sum of £1,285 due to the directors for advances. In addition there were debentures and interest amounting to £538. The debenture holders held a floating charge on the assets of the company which were estimated to realise £260, leaving the debenture holders unsecured creditors for £276. There was a deficiency as regarded the unsecured creditors of £4,367. According to a trading and profit and loss account from July 17th, 1928, which was the date of the incorporation of the company, to September 6th, 1929, the purchases amounted to £3 710 and the sales were £1 412. After allowing for the expenses in carrying on the business there was a trading loss of £3 183. The liquidator said that there had been two preliminary meetings of creditors prior to the liquidation of the company. The debenture holder was willing to distribute to the trade creditors any proceeds he might receive under his debenture. The voluntary liquidation of the company was confirmed, and a vote of thanks passed to the debenture holder.

London Gazette, etc.

Bankruptcy Information.

BATES, Victor Harold, High Street, Linton, trading as THE LINTON RADIO SERVICE, wireless engineer. Receiving order, November 11th. Debtor's petition. First meeting, November 23rd, 11 a.m., Official Receiver's Office, 41, Sidney Street, Cambridge, Public examination, December 4th, 11 a.m., Guildhall, Cambridge.

PEACE, Ernest Everitt, 230, High Street, Erdington, Birmingham, trading as PEACE AND CO., manufacturing electrical engineer. Receiving order, November 12th. Debtor's petition.

Notice of Dividend.

[M] BRAYSHAW, Dunwell, 78, Granby Street, Liverpool, electrician First and final dividend, 4s. 7¼d. per £, payable November 21st. Office of the Official Receiver, Government Buildings, Victoria Street, Liverpool.

Notices of Intended Dividends.

HUNT, Sydney Everest, 8A, Torwood Street, Torquay, electrical engineer and contractor. Last day for receiving proofs, November 29th. Trustee, E. H. Hawkins, 4, Charterhouse Square, London, E.C.1.

PRICE, Frederick, and TARVER, Charles Reekes, 15, Working Street, Cardiff, electrical engineers, trading as FRED PRICE, TARVER AND CO. Last day for receiving proofs, December 4th. Trustee, E. Owen, 34, Park Place, Cardiff, official receiver.

RADCLIFFE, Harold Howe Delme, and HADDLETON, Frank, 51, Islington Row, Birmingham, trading as CITY ELECTRIC SERVICES, electrical engineers. Last day for receiving proofs, December 4th. Trustee, C. Hoult, 191, Corporation Street, Birmingham, official receiver.

Application for Discharge.

COHEN, George, 49, Newman Street, Oxford Street, London, W., electrical engineer. Hearing, December 11th, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

Order Made on Application for Discharge.

WHEELER, Frederick George, Wynchwood, Broadlands Avenue, Shepperton-on-Thames, Middlesex, electrical engineer. Discharge suspended October 18th, for 18 months.

Partnership Dissolved.

VAN RAALTE AND MURREY (Harry Alexander John Hoddesdon MURREY and Leonard VAN RAALTE), dealers in antiques, crystal fittings, and electrical sundries, 1, Gilbert House, Princeton Street, Holborn, W.C., by mutual consent as from July 1, 1929. Debts received and paid by H. A. J. H. Murrey.

Bankruptcy Proceedings.

CAMEROFF, Joseph, 147, Spencer Place, Leeds, electrical engineer. The public examination of this debtor was held last week at the County Court House, Albion Place, Leeds. A statement of affairs was returned showing liabilities of £351 and a deficiency of £335. The debtor ascribed his failure to lack of capital and loss on contracts.

GRAHAM, Frederick Henry, 14, Hilltop Avenue, Harehills, Leeds, electrician. The public examination of this debtor was held on November 12that the County Court House, Albion Place, Leeds, when the failure was attributed to ill-health and lack of capital. The debtor produced a statement of affairs showing liabilities of £245 and a deficiency of £205.

WILLIAMS AND GILL, 1, Station Road, Church End, Finchley, Middlesex, electricians. The public examination was held on November 14th at the Court House, Barnet. There was a statement of affairs returned showing liabilities of £1 132, against assets estimated to produce £14, a deficiency of £1 118. The separate estate of debtor P. J. Gill showed liabilities of £44 and assets of the estimated value of £3. The debtor P. M. Davidson had liabilities of £207 and no assets. It would seem that the debtors formerly traded together in partnership as WILLIAMS AND GILL, the business being started in 1914 by the debtor Gill and another. Davidson became a partner some years later and subsequently the other partner retired. In July, 1928, the debtor Davidson left the business. The debtors were closely questioned regarding their household furniture, both claiming that it belonged to their wives; and the examination was closed.

OVERHEAD LINE EQUIPMENT

IN "Empire" overhead line equipment, manufactured by Electric Control Ltd., the highest standard of design and construction are maintained.

The illustration shows a horizontal disconnecting switch, which has many special features.

Each single-phase unit is specially arranged for self-alignment, with fixed and moving insulators and rocker bearings.

This considerably facilitates erection, since each unit is erected independently, the three single-phase units being connected by inserting a coupling rod after erection.

THE INSULATORS ARE BEST BRITISH PORCELAIN, THE CAPS AND PINS BEING JIG-FITTED AND CEMENTED UNDER STEAM-SET PROCESS.

ALL CURRENT CARRYING PARTS ARE SURFACE PLATED, AND ALL STEEL PARTS HOT GALVANISED AFTER ALL MACHINING AND DRILLING PROCESSES ARE COMPLETE.

25 115 C. S. Franklin. Thermionic valves.
25 070 Graham Amplion, Ltd., and W. J. Rickets. Radiogoniometers.
25 093 H. H. Mactaggart, Mactaggart Scott and Co., Ltd., and R. G. Scott. Air loaded accumulators.
25 120 Marconi's Wireless Telegraph Co., Ltd. Pyro recording paper, etc., for pictures, etc., telegraph receivers. (20/8/23, U.S.)

COMING EVENTS.

Friday, November 22nd.

Physical Society.—Imperial College of Science, Imperial Institute Road, South Kensington. Papers by Mr. D. P. Dalzell on "Heaviside's Operational Methods," Mr. E. T. Hanson on "The Dynamical Theory of Resonators," and Mr. E. C. Atkinson on "Escapement Errors of Pendulum Clocks." 5 *p.m.*

Birmingham Electric Club.—Grand Hotel, Colmore Row. Lecture by Mr. J. D. Morgan on "Dust Explosions." 7 *p.m.*

Monday, November 25th.

Electrical Contractors' Association (Ealing Sub-Branch).—Ordinary meeting.

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Informal meeting. Discussion on "Wooden Poles for Overhead Transmission Lines, and their Preservation." (Opened by Mr. C. Wade.) 7 *p.m.*

E.L.M.A. Lighting Service Bureau.—15, Savoy Street, Strand, London. Twentieth Illumination Design Course. Lecture VI by Mr. R. W. Maitland on "Architectural Lighting." 7.30 *p.m.*

Tuesday, November 26th.

Electrical Trades Benevolent Institution.—Savoy Hotel, Strand, London. Annual festival. Dinner followed by dance.

Electrical Contractors' Association (Chesterfield Sub-Branch).—Falcon Café. Ordinary meeting.

Institution of Electrical Engineers (Scottish Centre).—Grosvenor Restaurant, Gordon Street, Glasgow. Annual dinner. 6.30 for 7 *p.m.*

Institution of Electrical Engineers (East Midland Sub-Centre).—University, Nottingham. Paper by Messrs. E. H. Smythe and E. G. Weeks, on "Low-Temperature Carbonisation of Fuel, with special reference to its combination with the production of Electricity." 6.45 *p.m.*

Institution of Electrical Engineers (North-Eastern Centre).—Armstrong College, Newcastle-on-Tyne. Faraday Lecture on "Broadcasting by Electric Waves." 7 *p.m.*

Institution of Electrical Engineers (North Midland Centre).—Hotel Metropole, Leeds. Lecture by Dr. H. Norringer on "Surges and Over-voltage Phenomena on Transmission Lines Due to Lightning and Switching Disturbances." 7 *p.m.*

Institution of Electrical Engineers (North-Western Centre).—Engineers Club, 17, Albert Square, Manchester. Joint meeting with the Manchester Association of Engineers. Paper by Lt.-Col. S. E. Monkhouse and Mr. L. C. Grant on "The Heating of Buildings Electrically by Means of Thermal Storage." 7 *p.m.*

Electrical Power Engineers' Association.—Junior Institution of Engineers, 39, Victoria Street, London. Paper by Mr. P. E. Rycroft on "Protective Apparatus." 7.15 *p.m.*

Wednesday, November 27th.

Institution of Electrical Engineers (Mersey and North Wales, Liverpool, Centre).—University Club. Annual dinner.

Electrical Contractors' Association (Croydon Branch).—Ordinary meeting.

Electrical Association for Women.—46, Kensington Court, London. Lecture by Mr. E. E. Sharp on "Some Electrical Experiences in Australasia." 3 *p.m.*

Electrical Contractors' Association (Belfast Branch).—3, Bedford Street. Ordinary meeting. 3.30 *p.m.*

Royal Society of Arts.—John Street, Adelphi, London. Dr. Mann Lecture by Mr. C. Norman Kemp on "The Examination of Coal and Coke by X-Rays." 8 *p.m.*

Thursday, November 28th.

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Paper by Mr. H. W. Taylor on "Voltage Control of Large Alternators." 6 *p.m.*

Friday, November 29th.

Institution of Electrical Engineers (South Midland Centre).—Grand Hotel, Birmingham. Annual dinner.

Institution of Mechanical Engineers.—Storey's Gate, St. James's Park, London. Open debate on "The Registration of Reliable Tests of Power-Plant Machinery." 6 *p.m.*

Junior Institution of Engineers.—39, Victoria Street, London. Informal meeting. Lecture by Mr. W. C. Freeman on "Modern Welding Systems and Applications." 7.30 *p.m.*

Saturday, November 30th.

Association of Mining Electrical Engineers (South Wales Branch).—Official visit to Engineering Exhibition. 3.30 *p.m.*

Raw Materials.

EXACTLY a year ago THE ELECTRICIAN announced its intention, in the first of a series of specialised issues, to undertake a thorough survey of the raw materials of the electrical industry. The issue in which this policy was first inaugurated was rapidly sold out, and keen interest has been shown during the past twelve months in the many interesting aspects of the raw materials field—most of them based on original research—that have been explored in our monthly raw materials section. The scope for further inquiry and discovery is immense, for few industries come near to the electrical industry in the catholicity of its demands upon the world's resources of materials. It may also be noted that many of the electrical raw materials are the finished or semi-finished products of another industry, a factor which adds to the range of our investigations, and complicates the costs side of electrical manufacturing.

Already we have dealt with such insulating materials as papers, fabrics, pressboards, and varnishes, and an important contribution on insulating oils is presented on a later page of this issue. Other subjects which have received attention include the electrical uses of iron, steel, and ferrous alloys, non-ferrous metals, insulated magnet wires, laminated synthetic resin products, bakelised asbestos and vitreous products.

Our second annual Raw Materials issue contains, in addition to the article on Insulating Oils, a variety of articles concerning materials and processes of direct interest to electrical manufacturers. In forthcoming issues special attention will be paid to such materials as bitumens, cellulose products, fibre, mica, timbers, moulded compositions, porcelain, glass and earthenware, slate, marble and soapstone, and arc-resisting non-ignitable and self-extinguishing materials.

Insidious Propaganda?

THE work of the Electrical Association for Women has always commanded our admiring support, but it has now been found by one of the gas journals to be indulging in "an insidious form of propaganda" and "a cunning attempt to prostitute the national education system for the benefit of a commercial ideal." Seeking the reason for these epithets we find that the E.A.W. scheme for the teaching of electricity in schools has aroused the ire of the gas interests, who consider it most unfair. All we can say is the gas people should be good practical judges, as they have for years past supplied gas apparatus for the use of cookery classes in educational establishments and have not found occasion to condemn their efforts in this direction as insidious propaganda. We could also remind them of the ingenious tactics employed to obtain Harley Street's approbation of the gas fire. Leaving aside such obvious *tu quoques* we fail to see anything insidious in the E.A.W. plan. The generation now at school will use electricity to an extent which only those in the electrical industry itself can at present visualise. It is quite legitimate for a non-trading organisation to offer, and the educational authorities to accept, assistance in teaching children something that will be of real use in after life.

Proposed Telephone Reform.

WHATEVER may be felt about the propriety of the recent attack on the Post Office by the late Assistant Postmaster-General, there is undoubtedly a growing body of opinion in favour of Lord WOLMER'S latest suggestion that the telephone service should be taken out of the hands of the Civil Service and treated purely as a business proposition and public utility service. Within limitations which they are powerless to break down, our telephone engineers and administrators are performing splendid work, but the impression is abroad that they would do far better if their activities could be removed beyond the dictates of Treasury finance. The only real attempt to develop the use of

Digitized by Google

telephones in this country is at present being made by an association representing manufacturing interests, and not by the Post Office, which seems to find difficulty in reconciling the growing demand with the limited capital resources placed at its disposal. Special interest therefore attaches to the decision of the London Chamber of Commerce to ask the Government to institute an inquiry into the advisability of establishing an independent statutory authority to administer the internal telephone and telegraph services of the country. Such an inquiry would be favoured by telephone manufacturers, who would doubtless be willing to place before the Government the conclusions reached in the recently concluded investigation undertaken by the Telephone Development Association.

Standardised Page Sizes.

THE advantages of standardising the page sizes of technical journals have been fully debated in our correspondence columns in recent months, and as the result of these and other discussions definite means for putting the proposals into effect are now being considered by the Incorporated Society of British Advertisers. The main considerations upon which these suggestions are based are set out in a letter in our correspondence columns this week. As, however, these views are solely those of I.S.B.A. members we shall be glad to hear the opinions of advertisers who are not members of this Society.

A Broadcasting Defect.

FIVE chords played on a pianoforte. And then a voice: "I have just played 'Humoreske'" by someone or other. This was heard by every "broadcatcher" receiving the 2LO radio programme just after the second news bulletin last Saturday night. It was not an isolated example. The same sort of thing happens most nights. Surely it is time the B.B.C. programme experts called in some of the engineering staff to devise means for warning the interludial pianiste of the conclusion of the announcements, and of the necessity to start playing. There are many possible ways of doing this, the simplest of which would be a light signal at the piano which could be operated by a switch at the announcer's desk in the other studio. Trivial as it may seem, this defect can at times be distinctly irritating to listeners, and as it is technically inexcusable, we hope better synchronisation will be provided in the future.

Faraday's Diaries.

OF the diaries of MICHAEL FARADAY, which are expected to be published in about eighteen months' time, Sir WILLIAM BRAGG gave some interesting preliminary glimpses in a lecture the other day at the University of Manchester. "I do not believe," Sir William said, "speaking of them collectively, that there is in the scientific world a diary quite like it in its fullness and completeness." Most of the work FARADAY did has, of course, been described in his "Experimental Researches," but the attraction of this, as of most other diaries, is that it reveals something of the man himself, the workings of his mind, his directive ideas, and his attitude towards the great problems of physical science which he set out to investigate. The notes cover about six volumes of foolscap, each of several hundred pages, all written in FARADAY'S very neat, small hand. They are to Sir WILLIAM BRAGG, as they will be to others, so human and interesting, because "all the time you see what he is trying to do." One innocent remark recorded when the diarist was nearing his sixtieth birthday, and when he had spent a lifetime in the most fruitful observation and experiment, might well be the first rule of every electrical man—"I must learn to observe."

The Prime Minister and the Downs.

IN his reception of the deputation of "anti-pylonists" on Monday, the PRIME MINISTER gave an excellent exhibition of tact and good sense. He very properly acknowledged the duty which is incumbent on every one of us to avoid causing preventible disfigurement of the amenities of the countryside, but he also gave to these reactionaries who decline to see any sort of compensating feature in the electrical scheme a clear and unequivocal ruling on the matter. He told them that as regards Sussex "the proposal which has been sanctioned must, of course, go on." With the Premier's definite confirmation of a decision that is obviously for the common good, we hope that the Sussex "martyrs" will now turn their attention to the hideous bungalows and other similar blots on their landscape.

Treatment of Sulphur Fumes.

THE two interim reports dealing with the treatment of sulphur fumes in connection with the proposed new Battersea power station, extracts from which are given on a later page of this issue, go very far towards confirmation of the hope that concentrated effort on the problem would very quickly indicate a practicable solution. As will be seen from the extracts which we give, the Power Co.'s advisers take an unreservedly optimistic view of the large-scale possibilities of the process which has been tried for some months on an experimental scale. As was only to be expected, the Government Chemists' Committee is a little more guarded in its opinions, though, on the whole, its report may be taken as encouraging. The economic side of the question does not seem to have been considered by either of the reporting bodies, but as the remedy must be applied whatever the cost, this aspect is not of prime importance at the moment.

The E.T.B.I. Festival.

THE Festival Dinner of the Electrical Trades Benevolent Institution on Tuesday night was a real record-breaker, for which all concerned—and notably the president, Mr. HOWARD MARRYAT—deserve cordial congratulations. In the first place the amount raised for the Institution's fund reached a new peak at £9 000, a sum £2 000 greater than has ever previously been raised in one year. Then the attractiveness of the programme was enhanced by a dance, which, though the first of its kind, seems likely to become a regular feature. We were very glad to see the practical recognition which was given to Mr. F. B. O. HAWES for his many years' work as honorary secretary of the Institution. It is, of course, no reflection on the honorary secretary that the ever-growing work of the Institution necessitated the appointment of a full time secretary, a departure which has, we think, been fully justified by results. Faced last year with the task of arranging the second Festival Dinner in that year—the 1927 event being held in February, 1928—Capt. KEEPING was largely instrumental in producing results which were second only to the record set up during SIR HUGO HIRST'S presidency, while this year the collection is by far the largest yet made.

THE PROPERTIES OF SHEET MAGNETIC MATERIALS.

Essential Knowledge for the Designer—Permeability of Steels—Effect of Silicon Content—Hysteresis Loss Under Alternating Magnetisation.

By B. G. CHURCHER, M.I.E.E.

THE fundamental importance of high-grade magnetic materials in electrical engineering is well recognised at the present time. Such materials are required in the manufacture of almost all classes of electrical apparatus, although their influence on the performance of the apparatus varies considerably from one class to another. Many years of experience in the design of generating and transforming apparatus, coupled, in recent years, with systematic research by modern technical methods, have brought the art of design to a state approaching finality. This is especially true of transformers, in which the properties of the materials at present available for the construction of the magnetic circuits form a limit to progress in the improvement of such apparatus. A complete and accurate knowledge of the properties of such materials is therefore necessary to the designer in order that the materials may be used to their utmost advantage.

In discussing the magnetic materials in general use in the construction of modern electrical engineering apparatus, it is convenient to group the materials according to whether they are intended for use with alternating or static fluxes. With materials for alternating fluxes, the need for lamination gives rise to an important class of material, namely, the magnetic sheet steels. In this article we shall confine our attention to sheet materials.

In designing an electrical machine or apparatus the designer desires, in general, to set up the required alternating flux in the smallest possible space with the minimum expenditure of excitation and energy loss. Thus the two most important properties are the permeability and the energy loss. The permeability of a material or the ratio of B, the static flux

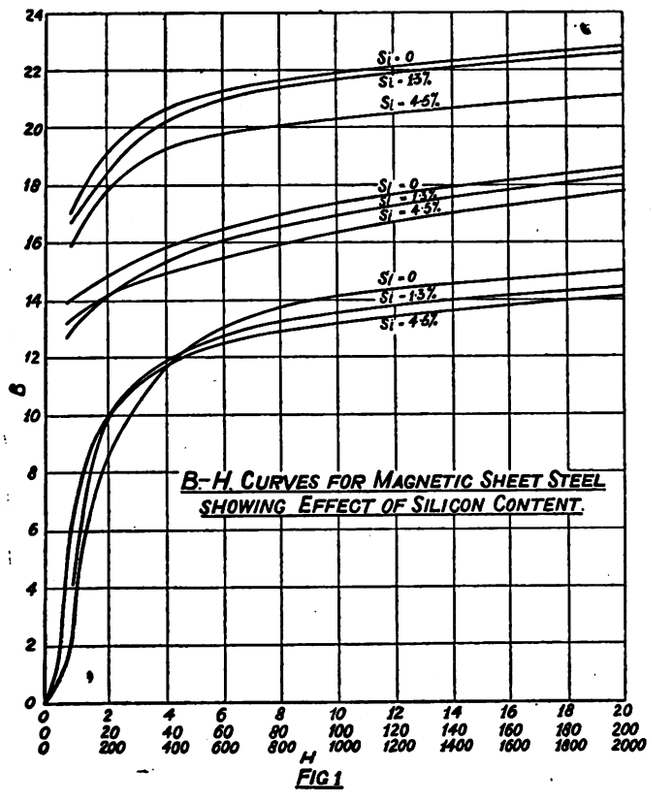

FIG 1

Relative permeability curves of steel.

density to H, the static magnetising field, requires some qualification before its value for engineering purposes can be judged. Thus a material may have a very high maximum permeability, but it is clear that the lower the value of B at which this occurs, the more limited will be the use of the material on account of the greater volume required to set up a given flux. Thus the designing engineer is more interested in the values of H required to produce certain values of B than in the ratio B/H. Instances of this will be given later. It may here be noted that the alternating fluxes involved in the operation of electromagnetic apparatus are not necessarily set up by alternating magnetising forces. In d.c. generators and motors, a.c. synchronous generators and motors and rotary convertors the alternations of the flux are produced by the relative mechanical motion of the laminated core and the field magnet, and the magnetising

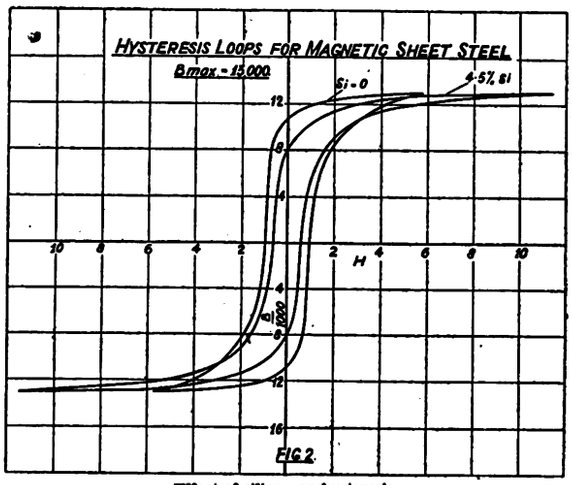

FIG 2

Effect of silicon on hysteresis.

force is supplied by windings carrying direct current. No material error is introduced by using a static B-H curve for calculating the magnetising force for the core in such machines. In the case of transformers, where the magnetising force is supplied by an alternating current, the magnetising current required for the core can still be calculated approximately from a static B-H curve, but the process is very laborious. The r.m.s. magnetising force, determined under alternating magnetisation, is more convenient for magnetising current calculations. Nevertheless, the static B-H curve is very convenient for use in making a general comparison of the merits of different grades of sheet steel.

In the design of certain classes of electromagnetic apparatus, especially rotating machines, an important quantity associated with the B-H curve is the saturation value, which is a measure of the maximum flux that can be contributed by the material, given a sufficiently high value of H. If I is the intensity of magnetisation, then $B=H+4\pi I$. As H is generally increased, I increases, first rapidly and then at a decreasing rate, until it finally becomes constant for very high values of H. Thus B may be considered to consist of two parts: the "air flux" density, which is equal to H, and the flux density contributed by the material, which is equal to $4\pi I$. When the limiting values of $4\pi I$, or the saturation value, is reached, any further increase in B is due to increase in "air flux." As $4\pi I=B-H$, we have a ready means of estimating the magnetising field required to produce high values of B. Thus, if the saturation value of a material is equal to 20 000 c.g.s. lines per sq. cm., the magnetising field necessary to produce $B=25\,000$ is equal to $H=5\,000$.

Although the permeability and saturation value of a material may be satisfactory, the amount of alternating flux that can be set up in a given cross section, or the flux density, may be limited by the expenditure of energy necessary to maintain that density. This energy loss consists, as is well known, of two parts, hysteresis loss and eddy current loss. The factors upon which the loss depends are best indicated by the following expression for W, the loss in watts per kilogram of steel, which holds for power frequencies where the skin effect is unimportant.

$$W=\frac{k\,B^n f+1.33\,t^2 f^2 F^2 B^2\times 10^{-4}}{\rho}$$

In the first term, which represents the hysteresis loss, k is a constant depending mainly on two magnetic properties of the steel—viz., the remanent flux density after magnetising

Digitized by Google

to a given maximum density and removing the magnetising force and the magnetising force required to remove the remanent magnetism. These properties in turn depend upon the composition of the material and on its physical condition. B is the maximum flux density during the cycle of magnetisation and f the frequency. The second term represents the

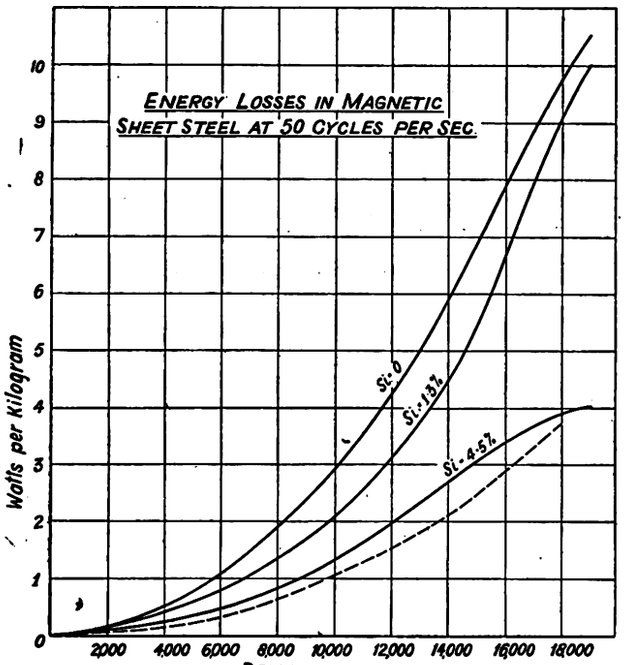

FIG.3.

Illustrating the total energy losses with increasing silicon content.

loss of energy due to the circulation of eddy currents in the sheets. The thickness of the sheets is denoted by t, ρ is the resistivity of the material and F the form factor of the applied voltage wave form. The form factor is equal to the ratio of r.m.s. to the mean value of the voltage, which for a sine wave form is equal to 1.111. The amount by which the form factor departs from this value is a measure of the wave form distortion present, which in testing work is always kept as small as possible. These will be discussed later.

Some General Considerations.

There are a few general points which must always be borne in mind when considering the properties of sheet magnetic materials and when testing them. The quantity B is equal to the total flux divided by the net cross sectional area of the core, the flux density being uniform over each section and equal at every section of the portion of the magnetic circuit formed by the specimen. If this condition is fulfilled, then, as far as this factor is concerned, the permeability and energy loss have only one value for a given value of B, whereas if the flux density is not uniform, the total flux divided by the net section gives only the average density and the permeability or energy loss deduced from the tests will depend upon the degree of non-uniformity of the flux distribution, which gives rise to undesirable complications. Hence magnetic leakage in permeability and energy loss apparatus must be kept to a negligible amount. It has already been mentioned that the hysteresis loss is influenced by the physical condition of the material. The permeability is influenced thereby to an even greater extent. In preparing sheet specimens for test, the cutting of the strips hardens the material at the cut edge. This reduces the permeability and increases the hysteresis in the neighbourhood of the edge of the strips. Hence, the narrower the strips, the greater will be the proportion of material affected by the cutting. Since the object of the test is, in general, to ascertain the properties of the material in bulk, the effect of a narrow test specimen will be to make the permeability appear lower than it is and the hysteresis higher. The effect on permeability is very great. Strips 1 in. wide cut with ordinary care may give results 30% in error in the region of maximum permeability. The effect on the total energy loss is much smaller, being of the order of 2% for a 1 in. strip. However, in the purchase of sheet steel for engineering purposes, the energy loss is usually the factor which determines the price of the steel, and is therefore subject to a much closer scrutiny than the permeability. Therefore tests which have any pretensions to accuracy must be carried out on reasonably wide strips. A satisfactory compromise for commercial purposes is to use strips 4 in. wide. Another effect which must not be overlooked is that any constraint caused by the clamping of the specimen in a testing apparatus affects the permeability considerably and the hysteresis to a smaller extent.

Early Troubles.

In the early days of electrical engineering, the only material available for the cores of transformers and rotating machines was sheet iron—that is, iron in which other constituents were present in small quantities only as impurities. The permeability of this material was reasonably good, but the energy loss was large. The most unsatisfactory feature was that a progressive increase in the energy loss with time, or "ageing," took place. This was specially evident in transformers. A progressive increase in the core temperature took place, resulting in extreme cases, in the burn-out of the transformer. In 1906 Hadfield and Barrett produced silicon sheet steel and drew attention to its many advantages over sheet iron. In the intervening years the use of silicon steel extended widely until at the present day almost all transformer cores are constructed of this material and also the cores of many types of rotating machines.

The introduction of a small percentage of silicon (up to 5%) has a marked effect on the properties of steel. The permeability is increased at low densities and decreased at high densities; the hysteresis loss is reduced; the resistivity is increased, thereby inducing the eddy current loss; ageing is virtually eliminated. Fig. 1 shows the relative permeabilities of steels containing zero, 1·3 and 4·5% silicon. Other materials—viz., carbon, sulphur and phosphorus, are present as impurities, and, in general, should be kept as low as possible. This is especially the case with carbon, small amounts of which have a very deleterious effect. It is desirable that the amount of carbon present should not exceed 0·08%. Manganese is added intentionally in small quantities as the mechanical properties of the steel are unsatisfactory without it. Referring to the curves, it will be seen that at moderate and high flux densities, the effect of the introduction of silicon is to decrease the permeability, while at low densities the addition

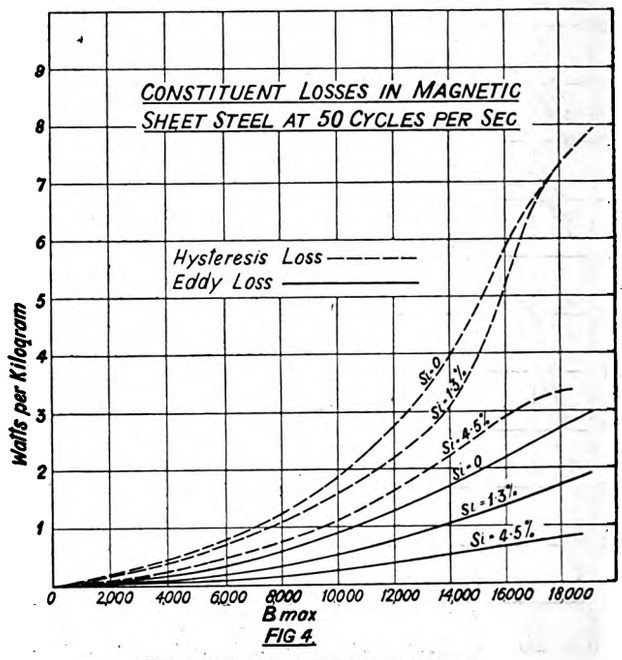

FIG 4.

Effect of silicon content on constituent losses.

of silicon increases the permeability. The saturation values obtained from the curves are as follows:—Si = 0, B-H = 20 950, Si = 1·3% B-H = 20 700, Si = 4·5, B-H = 19 200. Thus the reduction in saturation value from Si = 0 is approximately proportional to the silicon content. The saturation value of pure iron is 21 650. The difference between this and the value 20 950 for Si = 0 is to be ascribed to the other constituents present as impurities. If these impurities were absent, the proportionality of silicon content and reduction in saturation value would be much closer. The maximum permeabilities of these steels, which occur in the region of

Digitized by Google

B 4000 to B 7000, are Si=0, μmax.=4 400, Si=1·3%, μmax. =5 800, Si=4·5%, μmax.=7 100. In considering these saturation values and maximum permeabilities, it should be borne in mind that they are typical values only. In a given grade of steel the permeability at high densities and the saturation value vary with the exact amount of silicon present, which is not always strictly of the nominal amount, and with the amount of the impurities. The permeability at moderate and low densities is even more variable, and is influenced not only by the constitution of the steel, but by its physical condition—i.e., by its hardness, which is increased by cutting and bending. In measuring permeability at low densities the effect of any mechanical constraint on the specimen caused by clamping it to a test yoke, is very large.

Fig. 2 shows the effect on the hysteresis of the introduction of silicon. It is seen that the remanent flux density is reduced from B 10 400 to B 8 000, and the coercivity from H 0·95 to H 0·6. The hysteresis loss under alternating magnetisation depends on the amount of work that has to be expended in taking 1 cu. cm. of the material through a cycle of magnetisation. The amount of work is proportional to the areas of the loops. For S=0 and a maximum flux density of B 13 000, we obtain 4 770 ergs per cu. cm. per cycle, and for Si=4·5% and the same density, 3 060. For Si=1·5% the figure is approximately 3 900.

Fig. 3 shows the total energy losses of the same three steels. The reduction in total loss with increasing silicon content is very marked, especially in the region of flux density in which transformers operate, viz., B 11 000 to 14 000. The full-line curves represent steel of average quality. Recent improvements in the manufacturing process have enabled steel of the quality shown by the dotted curve to be produced commercially in this country. The effect of the silicon content on the constituent losses is shown in Fig. 4, in which the hysteresis and eddy current losses are shown separately. If the hysteresis loss is represented by the equation $Wh = k f B^n$, it can be seen from the shape of the curves that as the flux density increases, n at first increases and then decreases. At densities below B 10 000, n has a value of between 1·4 and 1·6 for all three grades of steel. The fact that 1·6 is a common value was pointed out by Steinmetz many years ago, but from this there seems to have arisen an erroneous idea that 1·6 is an universally applicable constant. Actually, n varies considerably with density, a sample of 4·5% silicon steel giving 1·6 at B 5 000, 1·8 at B 10 000, 2·1 at B 15 000, and 0·7 at B 19 000. A sample of 1·3% silicon steel gave a value as high as 3·7 for B 15 000, falling to 1·2 at B 19 000. That n must decrease at high densities is evident from the following considerations. As the flux density is raised to high values, the material becomes saturated and the area of the hysteresis loop, i.e., the hysteresis loss, becomes constant. Hence, if the above equation is to hold for the condition where Wh is constant and B is increasing, it is clear that n must continually decrease. The resistivities of the three grades of steel are approximately 14 $\mu\Omega$ per cm. cube for o Si content, 28 for 1·3% Si, and 60 for 4·5% Si. The eddy current losses are seen to be approximately inversely as the resistivities. The silicon content also affects the temperature coefficients of resistance, the values being 0·0042 per deg. C. for o Si, 0·0019 for 1·3% Si, and 0·00055 for 4·5% Si. In combination with the fact that the hysteresis loss has a positive temperature coefficient, the resistance temperature coefficients cause the total loss to vary with temperature according to whether the increase in hysteresis loss or the decrease in eddy loss preponderates. Thus, for o Si the coefficient of total loss is −0·0013, for 1·3% Si −0·00043, and for 4·5% Si +0·0005.

Mechanical Properties.

From an engineering standpoint, the mechanical properties of sheet steels are of the very greatest importance, as they often limit the application of certain grades of steel. The introduction of silicon has the effect of increasing the tensile strength, but it also reduces the ductility. In general, the higher the silicon content, the less easy it is to shear or punch the material satisfactorily. It might be thought profitable to increase the silicon content above 4·5%, and so reduce the losses still further. However, apart from the further decrease in permeability which would take place at high densities, mechanical deficiencies would become apparent. Too high silicon content leads to hardness and brittleness, which gives rise to difficulty in shearing and punching the sheets. The wear on the shears and dies is increased, and in extreme cases the material may shear with a ragged edge or may break at narrow sections, such as at the roots of the teeth of armature punchings.

Uniformity in thickness in different parts of a sheet is of the greatest manufacturing importance. If the sheet varies in thickness in different parts, especially if it tapers from one end to the other, it is impossible to obtain a uniform core and a sufficiently high space factor. The space-factor is the

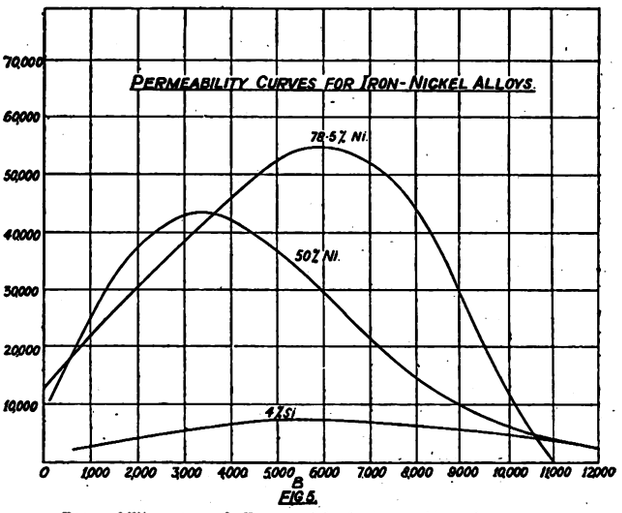

FIG 6.

Permeability curves of alloys used for instrument transformers.

ratio of the net steel cross-section to the gross core section. It is obvious that a low space factor offsets the advantage gained by using a high grade steel, since if a core is made to given dimensions the real flux density in the steel will be higher than the nominal density, and hence the energy loss will be higher than it would otherwise be. Want of flatness in the sheets also causes difficulty, especially in the manufacture of the cores of rotating machines.

We can now consider briefly the uses to which the different grades of steel are put. Where the iron loss is not of great importance, the high saturation value, good mechanical properties, and low cost of o Si material are points in favour of its use. Thus in low frequency alternators or low speed d.c. machines, where the iron loss would not be large in any case, this material can be used with advantage. It is also used in induction motors, where it is necessary to keep the no load current low. On account of the need for a high efficiency and due to the large output of the machine in proportion to its dimensions, a low iron loss is necessary in large turbo alternators. On this account a medium grade of steel, such as the 1·3% Si, is used, and occasionally the 4·5% grade. These grades are also used on totally enclosed motors where it is necessary to keep the amount of heat generated in the machine to a minimum.

Transformer Cores.

In the case of power transformers, two important considerations arise. First, the sheets can be sheared instead of being punched, except for the small amount of punching required for core bolt holes. Secondly, the demand for extremely high efficiencies in transformers and the fact that the only losses are the copper and iron losses makes it necessary to keep the latter at the lowest possible value. As a result, power transformer cores are made almost exclusively of steel containing about 4% Si. In the manufacture of current transformers, the highest permeability is required in order that the magnetising ampere-turns, and hence the phase angle of the transformer, shall be kept within the desired limits with a core of moderate dimensions. Referring to Fig. 1, it will be seen that 4·5% Si steel has a considerably higher permeability at low densities than the other two grades, and this makes it suitable for constructing the cores of current transformers. While energy loss, as such, does not enter into the performance of the transformer, the component of magnetomotive force which is associated with the energy loss affects the ratio error of the transformer. The low energy loss of 4·5% steel is therefore an additional advantage.

Silicon sheet steel is also used in the manufacture of a.c. watt-hour meters. A medium grade is found most suitable for such work, as a punching operation is involved.

We have seen that the hysteresis loss varies as the first power of the frequency, whereas the eddy loss varies as the square of the frequency. In the construction of high frequency apparatus, it is therefore necessary not only to use magnetic

Digitized by Google

material of high resistivity, but to use thin sheets in order that the eddy loss may not be excessive. This has led to the production of very thin silicon steel ribbon only one or two thousandths of an inch thick for the manufacture of transformers for use in wireless sets. Thin sheets are also required in the manufacture of high frequency alternators. It is of the greatest importance that sheets used for such work should be as smooth and flat as possible, and the thinnest insulation should be used between sheets, otherwise a poor space factor will be obtained, which will largely nullify the advantage gained by using thin sheets.

We now turn to the consideration of magnetic sheets made from other alloys. The addition of moderate amounts of nickel to iron renders it much less magnetic. As the percentage of nickel is increased, a progressive reduction in permeability takes place until at 30% nickel the alloy is almost non-magnetic. As the nickel content is further increased, the magnetic properties gradually increase again until at 78·5% nickel, an alloy of exceptional properties is obtained. This is the material known as "Permalloy." Its maximum permeability, which occurs at about B 6 000, is of the order of 60 000, that is, eight times that of 4% silicon steel. The permeability in low magnetising fields is such that the material is practically saturated in the earth's field. In testing Permalloy, means have, therefore, to be employed to neutralise the earth's field at the region in which the specimen is placed.

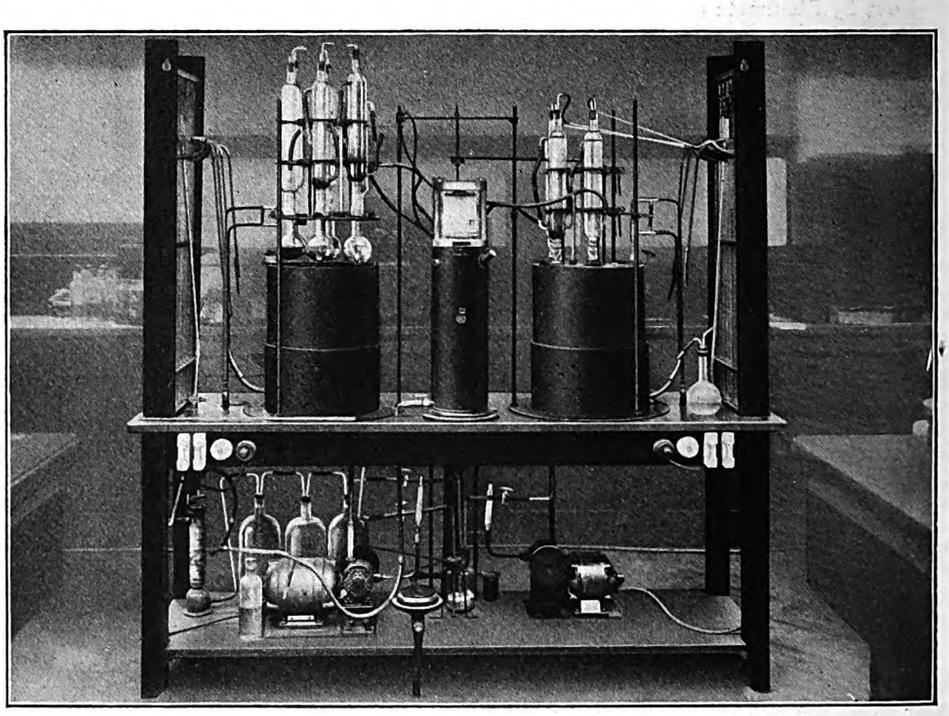
In Fig. 4 are plotted curves of permeability at various flux densities, which are more convenient for studying such alloys than B-H curves. A curve for 4% Si steel is given for comparison. It will be seen that in the 78·5 Ni alloy, a remarkably high permeability is maintained over a wide range of flux density. The material has a saturation value of about 10 500 lines per sq. cm. The hysteresis loss is remarkably small. The resistivity is about 16·5 $\mu\Omega$ per cm. cube. The total energy loss with a thickness of 0·0062 in., is as low as 0·29W per kg. at B 10 000 and 50 cycles, compared with about 1·1W per kg. for the best silicon steel. However, the alloy is very susceptible to mechanical treatment, the permeability being greatly reduced by what would be considered reasonably careful handling for ordinary materials. The mere winding of a magnetising coil on to a ring specimen is sufficient to cause a considerable alteration in its properties. On the other hand, a tensile stress has the curious property of largely increasing the permeability, provided the stress is not too large. Permeability values of 280 000 have been obtained experimentally. An alloy which is used increasingly is one appearing under various trade names and containing 50% iron and 50% nickel. The permeability is shown in Fig. 4. It will be seen that while the maximum permeability is not as high as that of the 78·5% Ni alloy, a figure about six times that of 4% Si steel is reached. The saturation value is approximately 15 000 lines per sq. cm. The resistivity is 45 $\mu\Omega$ per cm. cube, and this, together with a low hysteresis loss, gives a total energy loss of about 0·72W per kg. for a thickness of 0·014 in. The material is not unduly sensitive to handling. This combination of qualities makes it very suitable for the construction of instrument transformers in which excellence of performance is important. It is also used for audio frequency transformers for wireless work and in the construction of choke coils where a large inductance is required in a small space. Both the 78·5% and the 50% Ni alloys have been used in ribbon form in connection with the loading of long distance submarine cables, enabling greatly increased operating speeds to be attained.

Several other sheet materials, such as those having a constant permeability over a wide range of magnetisation, have been developed, but with these we have not space to deal. There is a great need for better magnetic materials in the electrical industry. There is also every reason to suppose that such materials will be available in due course, since out of all the alloys that are possible, only a small fraction have been studied for their magnetic properties.

SLUDGE TESTING APPARATUS FOR INSULATING OILS.

THE greater or less tendency of insulating oils to form sludge under service conditions is a most important consideration with regard to these materials, since any sludge which is formed not only reduces the insulating value of the oil but also, by silting up the circulating ducts, seriously interferes with its function of cooling the apparatus.

An important development in this connection is that of special apparatus devised by the Metropolitan-Vickers Electrical Co., Ltd., for determining the relative sludge-forming tendencies of various classes of insulating oils under conditions designed to represent, so far as is compatible with testing requirements, those obtaining in service in transformers and switchgear. This piece of apparatus is now being regularly employed in the carrying out of routine tests in accordance with the British Engineering Standards Association requirements. The equipment is the outcome of several years development and investigation into the relative influences of the several factors which combine to cause the sludging of insulating oils.



The test consists in submitting a measured quantity of oil for a standard time to the combined influences of heat, contact with air and a catalyst. Accurate control of the details of the test is essential to precision and accurate repetition. For example, the control of the air supply is a very important factor, it being imperative that the same specified volume of pure air shall be supplied at an equal and constant rate to each of the oils under test. The method of air-flow control and measurement now employed for testing essentially consists of a calibrated capillary tube which is so arranged that the pressure drop across its ends when air is passing through it can be readily measured by a manometer, and adjusted. The same close attention has been given to the control of other factors which may influence the result of the test.

ASBESTOS.

Manufacturing Process of Asbestos Papers—Tests for Electric Strength—Loss in Weight by Ignition.

By A. R. DUNTON, A.M.I.E.E., and A. W. MUIR, D.S.O., M.C., B.Sc.

ASBESTOS has long exercised a fascination over the human mind because though it can easily be fashioned to resemble the common fabrics of cotton and wool it is practically unaffected by fire.

In spite of its familiarity in various manufactured forms, probably few users of the material would recognise it in its natural form, as illustrated in Figs. 1 and 2. Asbestos is a mineral, probably the only fibrous mineral, and in its various forms it is a decomposition product of amphibole (hornblende) or serpentine, two minerals common in igneous rocks and consisting largely of silicate of magnesia. The original minerals contain no water, but the different varieties of asbestos contain combined water in varying proportions and the suitability of the varieties for electrical purposes is largely determined by the amount of water content and also by the amount of iron oxides present. The ordinary white asbestos of commerce is a serpentine asbestos called "chrysotile." Its chemical composition may be considered as $3MgO$, $2SiO_2$, $2H_2O$ and its average composition is given as: Magnesia, 41%; silica, 40%; combined water, 14%; metallic oxides, chiefly of iron and aluminium, 5%. The crystals of chrysotile are usually silky, long (1–4 in.), flexible and strong, and lend themselves readily to the weaving of fabrics.

Blue asbestos, technically known in different varieties as "crocidolite," "tremolite," etc., is a hornblende asbestos.

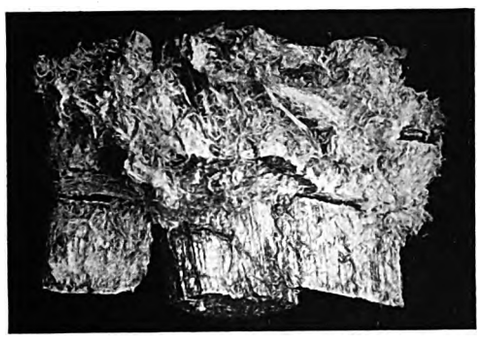

Fig. 1.—Rock chrysotile asbestos in its natural form.

Apart from colour it is similar in general appearance to white asbestos, but its fibres tend to be harsh and wiry, and in chemical composition and properties it is very different from chrysotile. The chemical composition of crocidolite is given as $Na\ Fe\ (SiO_3)_2$, $Fe\ SiO_3$, H_2O and its average composition as: Silica, 51%; iron oxides, 37%; sodium oxide, 6%; magnesia, 2%; other metallic oxides, 1%; combined water, 3%.

It will be noted that the proportion of iron oxides is high. This results in poor electrical insulating properties. On the other hand, the water content is low, and this results in good heat resistance. Blue asbestos finds extensive application where harsh, springy fibres can be employed, and, apart from the electrical industry, where it is required to resist strong mineral acids. It may be noted also that it has a lower actual fusing point than white asbestos, and it is used as a fluxing agent in oxy-acetylene welding.

Table I sets out the chief varieties of asbestos with their principal places of origin and some of their properties and uses.

TABLE I.—VARIETIES OF ASBESTOS.

Derivation	Serpentine		Amphibole			
	White Asbestos		Blue Asbestos			
Varieties	Chrysotile	Crocidolite	Tremolite	Anthophyllite	Antinolite	
Source	Canada, Russia, South Africa	South Africa	Italy, Russia	U.S.A.		
Colour	White, brown or blue	Blue	White		Green	
Fibres	Soft and fine	Harsh and springy				
Uses	Long fibres—woven fabrics; Medium fibres—millboards	Asbestos Cement Boards				
Temperature Limit	300 to 500° C.	1 000–1 200° C.				
Critical Temperature	400° C.	300° C.				
	Non-Acid Resisting	Acid-resisting				

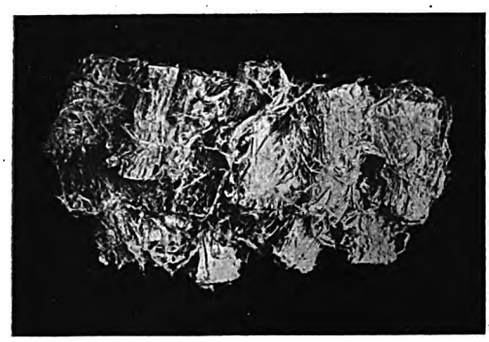

Fig. 2.—Another formation of natural asbestos, this being rock crocidolite.

For electrical purposes, the main forms and uses of asbestos may be summarised as follows: (1) Asbestos papers for insulation between copper strip field coils and for the build up of laminated synthetic resin products, bakelite asbestos boards, tubes and cylinders; (2) woven asbestos fabrics in the form of tape for wrapping conductors and coils or in large sheets for building bakelised asbestos blocks such as are used for supporting the end windings of turbo-alternator rotors; (3) fine asbestos yarns for insulating magnet wires and for insulating cables and the asbestos-protected wires used on switchboards to reduce the fire risks of clustered connections; (4) asbestos fibres and powders used as fillers or binders in bakelite or bitumen compound mouldings and as fillers for arc-resisting paints; (5) asbestos in various fibre forms for bonding with portland cement to form arc-resisting or self-extinguishing boards or mouldings.

The manufacturing process for asbestos papers is very similar to that for ordinary papers. Asbestos fibre can be used alone but vegetable fibres are usually added to give strength. One of the main difficulties in making good asbestos paper is to eliminate metallic impurities, chiefly the oxides of iron contained in the mineral. Attempts are made to eliminate these impurities by the use of magnetic separators and by "sand-traps" inserted in the flow channels down which the pulp passes on its way from the beaters to the paper-making machine

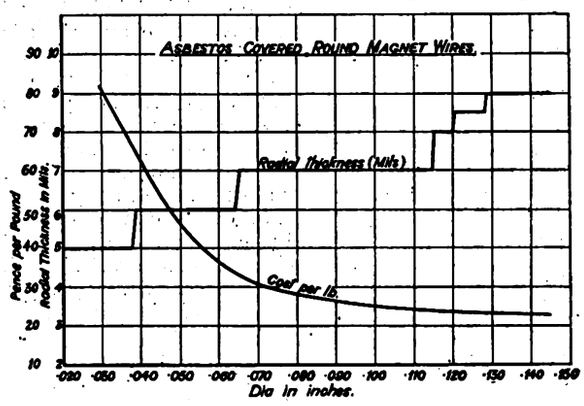

Fig. 3.—Indicating the cost and insulation thickness of asbestos-covered magnet wires.

felts. Another method is to treat the fibres with oxalic acid, but while this is effective in improving the insulating value, it has the disadvantage of weakening the mechanical strength of the fibres.

The usual thicknesses of paper employed for electrical purposes range from 5 to 25 mils. The general characteristics of the papers and of the millboards built up from them are shown in Table II.

Due to the affinity of asbestos for moisture, the tests for

Digitized by Google

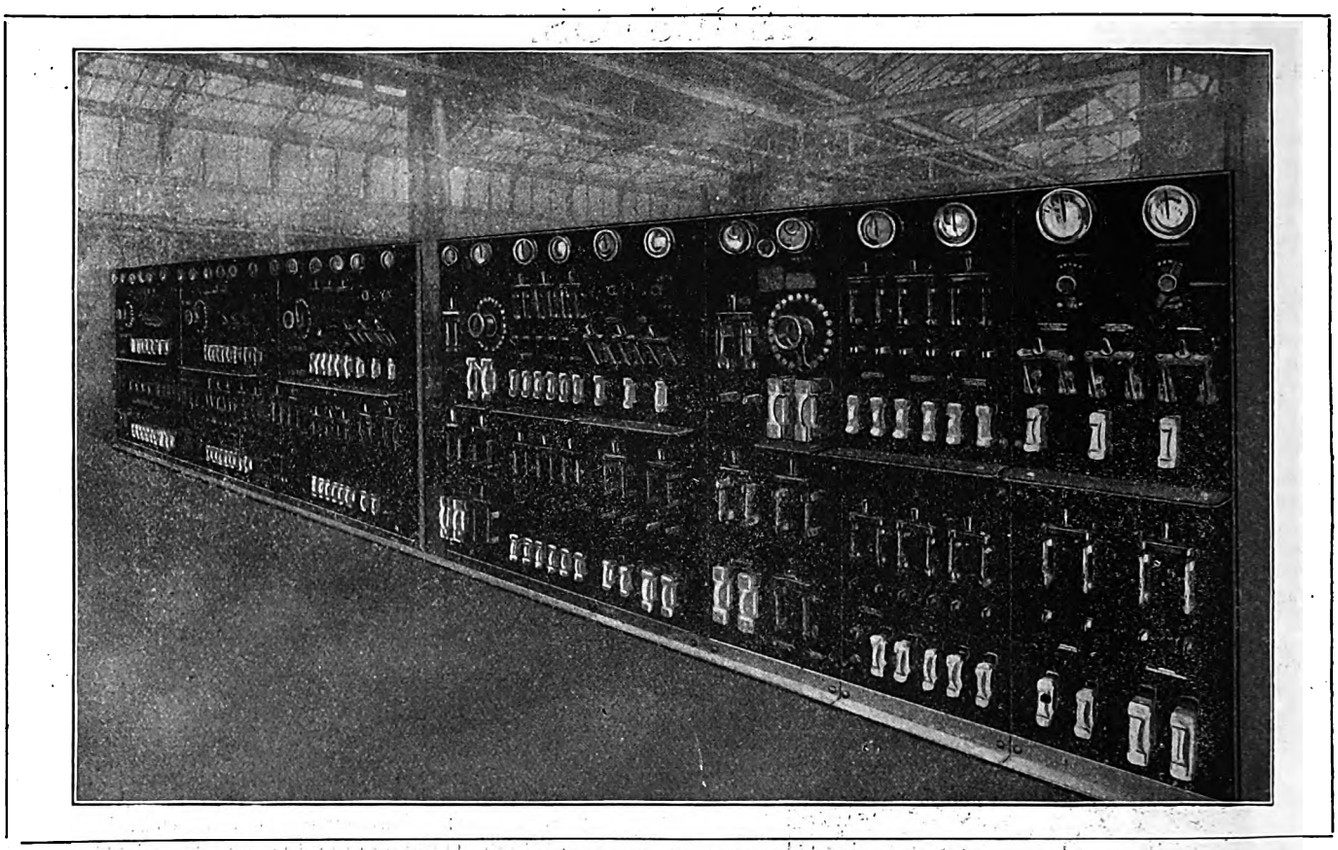

Fig. 4.—View of switchboard with panels of "Ebony Syndanyo."

electric strength are usually made after drying out at a temperature of 105–110 deg. C. The loss in weight by ignition of asbestos papers is generally about 18–20% but may in some instances be as great as 30%, the amount being determined by the greater or less proportion of cotton fibre present in the mixture.

TABLE II.—PROPERTIES OF ASBESTOS PAPERS AND MILLBOARDS.

Test.	Thickness (inch) 0·007	0·010	0·015	0·020	0·025	1/16	1/8
Tolerance in thickness—mils ..	±1	±1	±2	±3	±3	±5	±10

Bursting strength before and after ageing at 110° C. for 24 hours* (Ashcroft)	3	5	9	13	18	—	—
Elec. strength, volts/mil—							
At 20° C.	150	125	100	75	50	60	40
„ 80° C.	200	165	125	105	95	100	70
„ 180° C.	180	150	120	90	80	90	60

* Bursting strength should not be affected by a temperature of 110° C.

It is not yet fully realised in the electrical industry what excellent asbestos fabrics are now available and that it is possible to obtain asbestos cloth in almost any thickness ranging from superfine varieties of approximately 10 mils thickness to heavy materials, resembling canvas, of 40 mils or more. The fabrics are all woven from finely spun long fibred asbestos, to which a small percentage of cotton is added to facilitate manufacture. The proportion of cotton should not exceed 15% and when specially selected long, silky fibres of asbestos are used, the proportion of cotton can be reduced as low as 7%. For good electrical strength it is important that the fibres used should be specially selected, with the iron content reduced to an absolute minimum. A few years ago, before the special selection of fibres was insisted upon it was almost impossible to use asbestos tapes for electrical purposes owing to their high content of conducting impurities and it was common practice to ascertain roughly the suitability of a tape by observing if it could be influenced or even picked up by a magnet.

Electrical Tapes and Cloths.

The asbestos tapes and cloth commonly used for electrical purposes are shown with their tensile strengths in Table III. It should be noted that the reduction in tensile strength after ageing is influenced by the percentage of cotton present.

Where electric strength is important the presence of conducting particles can be rapidly detected by subjecting a 3-in. sample of the tape or fabric to a stress of 1 000 V a.c. 50 cycles, applied by electrodes on the surface at the ends of the sample. Even at this low voltage considerable sparking will be detected in materials of poor quality.

A considerable use is now made of the superfine variety of asbestos tape for insulating the conductors of large turbo-alternators, and a more extensive use would immediately result if it were possible to obtain his material in a thickness of not more than 7 mils. Asbestos cloths are commonly used for the manufacture of hard thick synthetic resin varnish laminated boards, which are produced by subjecting fabric impregnated with a varnish similar to bakelite to pressure between steam or electrically heated plates inserted between the platens of heavy hydraulic presses. This produces an exceptionally hard, heat-resisting material which is extensively used for spacing and supporting the end windings of turbo-alternator rotors.

Insulating Windings.

Improvements in the art of insulating both round and ribbon conductors have resulted in the extended use of this material for windings which have to withstand high temperatures. Typical instances in which the adoption of this material has resulted in improved service include welding transformers, tramway and railway motors and arc-lamp solenoids.

TABLE III.—ASBESTOS TAPES AND FABRICS.

	Thickness (inch)	Width (inch)	Tensile strength before and after ageing at 330° C. lb./inch width.	
Superfine Woven Tape	.. 0·010	½ to 6	30	25
Ordinary Woven Tape	.. 0·015	½ to 6	33	20
Asbestos Fabric ..	.. 0·062	36, 40, 42	60	40

An interesting example is given in the "Electrical World," January 29th, 1927, which describes how a motor for 50 H.P. rating was built in the frame ordinarily used for a 20 H.P. motor, with the exception of bearings and shaft, which were strengthened. With asbestos insulation the motor proved satisfactory for 50 H.P. rating and actually carried a load of 70 H.P. successfully. Temperatures as high as 260 deg. C. with a 50 H.P. load, and 350 deg. C. with a 70 H.P. load were reached, with no apparent damage to the insulation. The stator winding was of the bar type with asbestos insulation, and the rotor was of the indestructible cast-aluminium type. As first built the motor was equipped with bakelised wedges, but, these proving unsatisfactory, wedges of slate were adopted. It is quite possible that bakelised asbestos would have been equally as good. At the time of the report the motor had been in actual service for two years, operating at very nearly

Digitized by Google

its 50 H.P. rating. The example suggests interesting possibilities, especially for motors for service involving heavy overloads or high ambient temperatures.

The limitation on the use of asbestos-insulated conductors is largely one of costs, the price being from 33 to 50% higher than for d.c.c. In the construction of tramway motors, for instance, it has been proved that the use of asbestos insulated magnet wire gives a better life, but competitive prices have greatly restricted its adoption. It is a hopeful sign, however, that the engineers of some of the largest systems now tend to favour this material, recognising that the saving in upkeep and the greater reliability justify the somewhat higher initial cost.

With regard to space considerations, it is important to note that asbestos-insulated wires can now be obtained with a radial thickness of insulation equal to or only slightly exceeding that of ordinary d.c.c. The electric strengths at normal temperatures are equal to those of cotton, but at 180 deg. C. they are far superior. Recent test results have shown that round wires of 0·036 in. diameter insulated with asbestos of 4·5 mils radial thickness are capable of withstanding more than 400 V between conductors. Some typical results are given in Table IV. Fig. 3 shows the radial thickness of insulation and the cost per lb. of asbestos covered wires.

TABLE IV.—TYPICAL ELECTRIC STRENGTH TEST RESULTS ON ASBESTOS-INSULATED WIRES.

Conductor diam. (inch)	Radial thickness of wall (inch)	Electric strength between twisted conductors*—(volts)	
		at 20° C.	at 180° C.
0·081	0·004	780	750
0·081	0·0065	1 400	1 200
0·036	0·0051	580	560
0·036	0·0053	670	820

* Tested between two 12-in. lengths twisted tightly together.

As a rule the comparison between d.c.c. and asbestos-insulated conductors shows the following relationship: (1) Under normal conditions the electrical strength is almost similar for similar radial walls; (2) under humid conditions some impregnated asbestos-insulated conductors are less affected than natural d.c.c.; (3) under hot conditions where the temperature reaches 160 deg. C. or 180 deg. C. the asbestos-insulated conductors are much superior.

Apparently the minimum size of conductor which can be commercially insulated with asbestos is 0·036 in. Where small radial thicknesses are desired the asbestos insulation consists of a mass of fibres mixed with a suitable bonding agent, the resulting felt being smeared on the conductor and smoothed to a uniform coating by drawing through dies. The insulation is usually black or white according to the bonding agent used, and is often reinforced by a spaced winding of single cotton strand. In cases where heat resistance is important and thickness of insulation not necessarily reduced to a minimum, a more reliable insulation can be obtained by an overlapped wrapping of asbestos paper. Since, however, it seems impossible to obtain good asbestos paper less than 5 mils thick, such a winding with one-third overlap necessarily approximates to a thickness of 10 mils.

Examples of superfine asbestos tape.

Arc resisting boards, although essentially intended for electrical purposes, cannot be regarded as good electrical insulators, especially in the natural condition, although considerably improved electrical properties exist in the black varieties. There are a large number of different makes on the market known under a variety of different names, such as Syndanyo, Ebony Syndanyo, Siluminite, Arcovite, etc. These have all been classified by the E.R.A. under the term "non-ignitable" or "self-extinguishing," and most likely will be eventually more clearly classified under various grades. They are virtually all asbestos cement in which the cement is reinforced in a very effective manner by an intricate network of asbestos fibres.

The black varieties now becoming popular in switchboard design represent in many cases the natural asbestos cement board which has been subjected to a thorough impregnation with asphalts, and, in its final form, makes an excellent substitute for slate or marble. Fig. 4 shows a large switchboard, installed by the Metropolitan-Vickers Electrical Company, the panels being of Ebony Syndanyo supplied by Messrs. Turner Brothers' Asbestos Co., Ltd.

By virtue of the impregnation, the electrical properties of the ebony variety is greatly superior to those of the natural, especially under humid conditions.

Table V. shows a comparison between a "natural" asbestos cement board and an "Ebony" grade, and serves to emphasise the good electrical properties of the impregnated variety and the good arc-resisting properties of the natural grade.

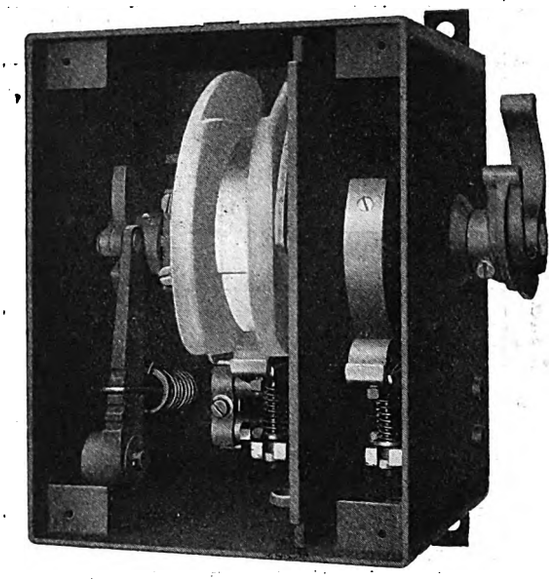

Fig. 5.—A limit switch with moulded asbestos arc chute.

TABLE V.—COMPARATIVE PROPERTIES OF EBONY AND NATURAL ASBESTOS CEMENT BOARDS.

Test	Ebony	Natural (Grey)
Elec. strength minute Values volts/mil.		
Normal conditions	36	4
Tropical conditions	26	conducting
Hot (180° C.)	35	20
Surface breakdown over 1½ in.-kV—		
Normal	19	10
Tropical	24	6
Hot	20	12
Tensile strength, lb./sq. in.	1 500/1 700	2 000/3 000
Shearing strength, lb./sq. in.	4 700/6 000	4 000/4 500
Water absorption (per cent)—		
24 hours	0·41/0·42	18
6 days	0·90/0·92	25
Arc resistance	Fair	Very good
Fuse Wire explosions	Poor	Good

For arc chutes and similar applications asbestos is sometimes moulded with cement to form special shapes. An example is illustrated in Fig. 5. A more extensive use is made, however, of the arc-resisting and non-ignitable boards already referred to. It is hoped to deal specially with the development and characteristics of these materials in a later article.

The authors are indebted to Messrs. Turner Brothers' Asbestos Co., Ltd., for Figs. 1, 2 and 4, to Mr. R. E. Forbester, of that company, for technical information regarding the raw materials, and to the Metropolitan-Vickers Electrical Co. for Fig. 5 and for permission to publish information obtained by research.

The British Engineerings Standards Association has issued a Standard Specification for Solid and Split Taper Pins.

The specification embodies requirements for the quality of material and appropriate tests, and gives a table of standard sizes for both solid and split taper pins.

INSULATING OILS.

Origin of Mineral Oils—Manufacture of Transformer Oils—Asphaltic and Soap Sludges—Gas Formation in Oil Switches.

By ALLAN MONKHOUSE, M.I.E.E., M.Amer.I.E.E., A.M.I.Mech.E.

THE oils used as insulating oils in commercial work are almost exclusively refined from crude mineral petroleum. The origin of mineral oils is still obscure. Two eminent theories may be quoted—one organic and the other inorganic. The organic theory is the one now most generally accepted, particularly since recent discoveries, referred to below, have revealed the process of metamorphism in all its stages, from

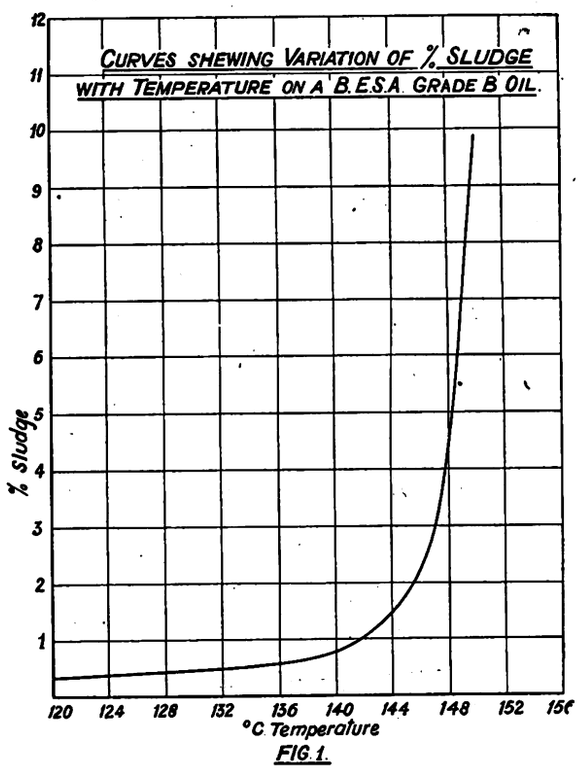

Fig. 1.—Results of sludge tests on oil which has shown good results in 115 000 V transformers.

animal and vegetable matter to the oil-bearing sludges. According to this theory the slime produced in stagnant waters by the putrification of elementary animal and vegetable life is the first stage in the formation of mineral oil. During putrification the non-fatty constituents (albumens and cellulose) disappear and grey-green purulent slime is deposited, which becomes buried under subsequent deposits and forms a polymerous bitumen, which in turn decomposes under the influence of pressure and heat and produces petroleum.

Recent researches made under the Soviet Government in Russia have shown every step in the above transformation, from the living vegetable plant Botrycoccus Browni, a very elementary water vegetable growth of the green pond slime order—containing a considerably greater proportion of fat than is associated with higher forms of vegetable life—to oil-bearing (bituminous) shale deposits.

Recent slime from the bottom of certain lakes including Balkash in Turkestan has been "refined" to produce the majority of the products usually distilled from crude petroleum.

The inorganic theory of the origin of petroleum was first put forward by Mendeleieff, and assumes that metallic carbides (formed by the action of carbon with iron and other metals) have been decomposed under water at high pressures and temperatures, resulting in the production of hydrocarbons. A subsequent rearrangement of the molecules of these hydrocarbons has been shown by various experimenters to be capable of producing hydrocarbons homologous to those found in petroleum.

It may be emphasised that the optical activity of mineral oils is not compatible with an inorganic origin.

It is not necessary here to enumerate the ever increasing number of oil producing centres of the world, but in considering transformer oils it should be borne in mind that broadly the crude oils can be classified into two general groups. The first comprises crudes which are largely paraffinoid hydrocarbons with certain smaller amounts of benzol hydrocarbons (cyclic compounds). Pennsylvanian oils and the oil from the Grosni district of the Caucasus can be cited as examples of such crudes. The second group may be typified by the majority of the oils obtained from the oil fields of Azerbajian (Baku District) which are chiefly cyclic combinations such as naphthenes (C_nH_{2n}), cyclo-paraffine, etc., which are derived from cyclo-pentane) and aromatic hydro-carbons of composition C_nH_{2n-6}. Insulating oils produced from the crudes of the former group can only with difficulty be made into transformer oils which are free from the tendency to form sludge at high temperatures. On the other hand, transformer oils made from crudes of the second group, such as the so-called Russian oils from Baku, have been proved by thirty years' experience to be singularly free from any tendency to form sludge.

The processes employed in the preparation of transformer oils and other products from crude mineral oils differ, largely depending on the nature of the oil, and on which of the various products obtainable is regarded by the refiner as of the greatest importance. In general, however, the crude is "cracked" on the oilfields. Cracking consists of heating in a cracking still, and separating the distillate which comes off at different temperatures. Under the influence of heat the complex hydrocarbons constituting the mineral oil are broken down into less complex volatile and aromatic hydro-carbons, which become liberated at various temperatures, according to their boiling points.

Baku crude oil, for instance, when subjected to this process produces (1) Up to 150 deg. C.—Crude benzines or petroleum naphthas, specific gravity 0.75 to 0.77, which is capable of being further distilled into gasolene (specific gravity, 0.655), benzoline (specific gravity 0.705), and benzine (specific gravity 0.737); (2) 150 deg. C. to 300 deg. C.—Kerosenes or illuminating oils (specific gravity 0.87); and (3) Above 300 deg. C.—Residium (Russian ostatki) remaining in the still. This product forms the base from which lubricating and transformer oils are distilled by blowing superheated steam through the mass in the stills and collecting the distillate at various temperatures, as instanced in the following figures (applying to Russian ostatki)—

Name of Oil.	Distilling at deg. C.	Sp. Gr.	Colour.
Solar Oils	150–170	0.840–0.860	Pale yellow
Insulating Oil or Light Spindle Oils ..	170–200	0.870–0.880	Yellow
Heavy Spindle and Light Machine Oil ..	200–250	0.895–0.900	,,
Engine Oil	250–300	0.908–0.912	Reddish Brown
Cylinder Oil	300–320	0.915–0.920	Red
Fuel Residue	—	0.950	Black

From the above, it will be seen the fraction, from which insulating oils are made, comes off between 170 and 200 deg. C.

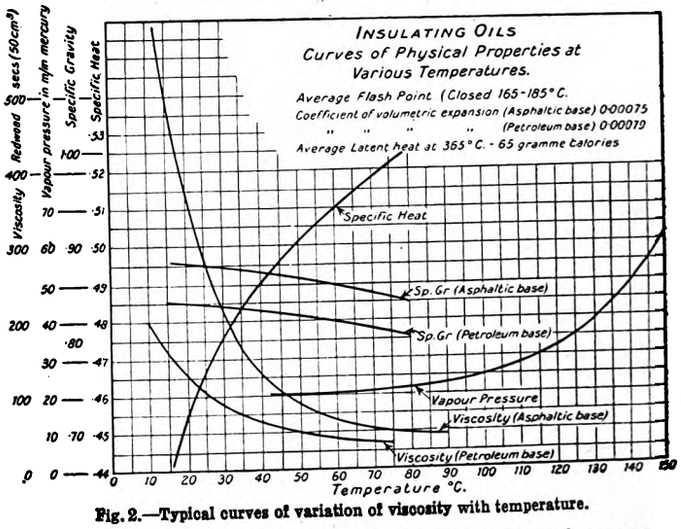

Fig. 2.—Typical curves of variation of viscosity with temperature.

This distillate is then "washed" by passing through concentrated sulphuric acid (66% H_2SO_4) to remove unsaturated hydrocarbons and bases, followed by caustic alkali to remove traces of the acid; and also litharge to remove all traces of sulphur. It is then carefully dried and filtered, either by passing through blotting-paper type filter presses or centrifugal separators.

The rapid increases in the size of transformers and in the rupturing capacities of oil circuit-breakers has made necessary the enforcement of the strictest supervision over the production and use of insulating oils. Specifications of the properties of which such oils should be possessed, have been drawn up by the B.E.S.A. and similar bodies in other countries; and Table I represents an effort to compare the requirements of a number of such specifications which have been issued in recent years. The most undesirable property, which unfortunately characterises many insulating oils, is their tendency to form sludge under working conditions and, therefore, the specification of the minimum permissible amount of sludge in insulating oils when tested, and the method of determining sludging characteristic occupies the first place in Table I. Sludging in insulating oils may be due to a number of causes, and it is necessary to differentiate between three different types of sludge.

Asphaltic sludge is the most common sludge found in transformers in which poor quality oil has been used, and is an oxidation product forming primarily on the hot parts of the windings and core. This sludge is not a bad dielectric, but is a poor conductor of heat, so that its presence gives rise to hot spots and not infrequently so "sludges up" transformers as almost completely to prevent oil circulation; with the result that insulation failures occur. Sludge of this type can be washed off the affected parts of a transformer with petroleum spirit, etc.

Researches made by the A.S.E.A. of Vesteras, Sweden, and others, have shown that the formation of sludge of this kind is, particularly pronounced where the oil is in contact with parts of apparatus, and transformers, which are under dielectric stress. One series of tests made by the A.S.E.A. showed that after a test of six months' duration at 90 deg C. an oil which had been during that period subjected to a stress approximately that obtaining in e.h.t. transformers showed 100% more sludge and 33% more acidity than oil of the same sample similarly tested, but without a dielectric field.

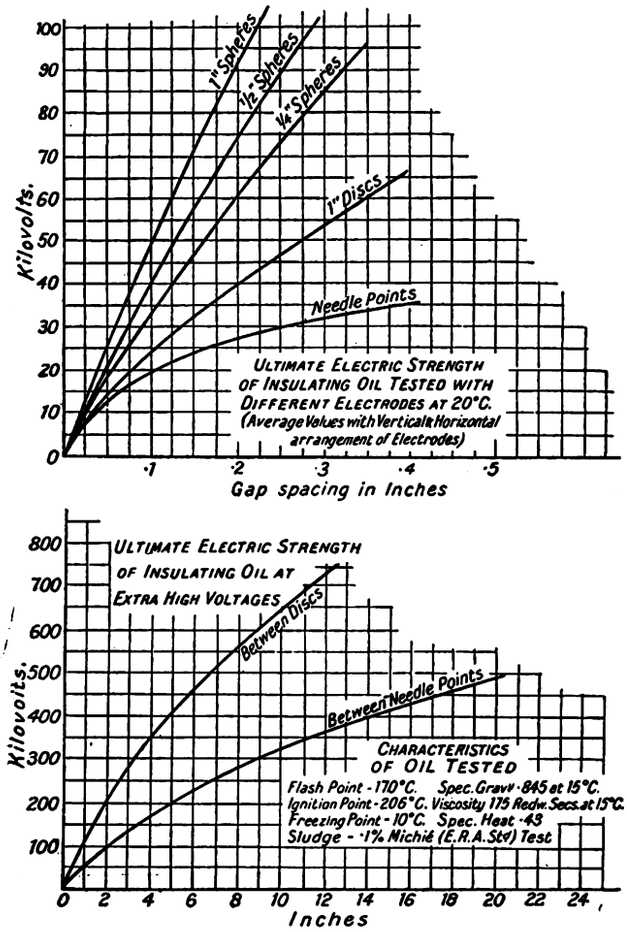

Fig. 3.—Average electric strengths of commercial transformer oils at 20 deg. C.

Soap type sludges take the form of a yellowish, sometimes dark brown, flakey precipitate which floats in the oil and settles on the surfaces of cooling pipes, tank sides, etc., as a slime. It is a "soap" and is probably formed due to impurities introduced into oil with the transformer core and windings. This sludge has a very low dielectric strength and its danger lies in its great affinity for moisture which it absorbs from the transformer oil. Bare copper conductors appear to accelerate the formation of this particular sludge.

Carbonaceous sludges are the result of an electric arc having been formed in the oil. The carbon particles formed by an extra high tension are very fine, and are almost pure amorphous carbon, and differ from the flakey deposit of more nearly graphitic carbon which occurs as the result of a low tension arc being formed in the oil. This form of sludge is a frequent cause of trouble in e.h.t. oil switches, because after such switches have interrupted a number of heavy short

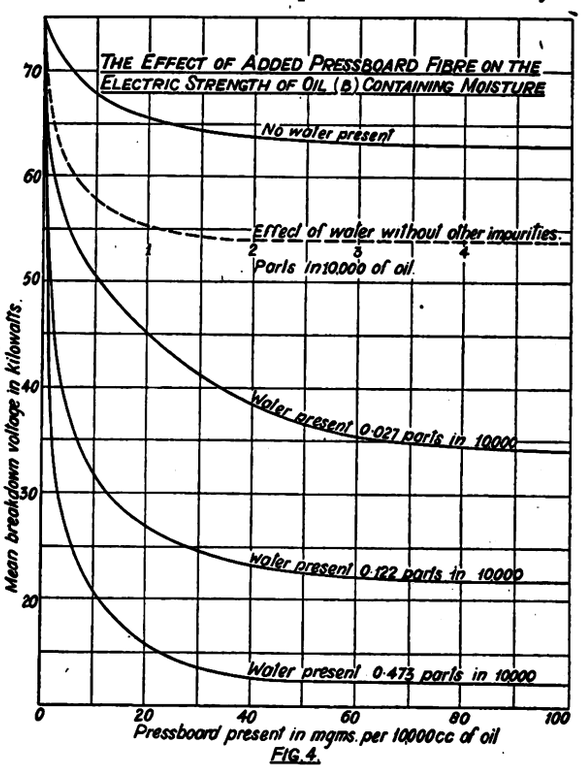

FIG. 4.

Illustrating the effect of impurities on the electric strength of insulating oil.

circuit faults, the amount of finely-divided carbon present in the oil may be sufficient to make itself dangerous, by reason of the fact that it is drawn into the dielectric field and becomes a conducting deposit on bushings and other insulation surfaces.

The first-named sludge, i.e., asphaltic sludge, is by far the most serious, because it is a characteristic of the oil which cannot be removed by filtering and cleaning. The International Electrotechnical Commission has endeavoured to coordinate the efforts of research workers in various countries, and prepare a common specification for determining the sludging characteristics of insulating oil. The reports of a number of investigating sub-committees were presented at the Bellagio meeting of the I.E.C. in October, 1927, but opinions were at that date so diverse that no agreement could be reached as to what form a suitable standard test should take. The Michie sludge test adopted by the B.E.S.A. undoubtedly gives an indication of how any given oil is likely to behave with regard to sludging when used in transformers, but it is liable to criticism, in that the high temperature of 150 deg. C. lies too near to the critical sludge-forming temperature of many oils (including the oils made from Azerbajanian crude) to allow consistent results to be obtained. The curves in Fig. 1 show what is meant by this statement, and are the results of tests made on oil which has shown the most excellent results in large 115 000 V transformers. It will be seen that at 150 deg. C., a difference of half a degree in the average temperature at which the oil was maintained during test may result in a 25 to 30% increase in sludge content. This critical temperature varies for different oils.

The quantity and temperature of the air passed through the sample during the Michie test also play a most important rôle, and should be most accurately controlled. It would almost seem reasonable to preheat the air by circulating it through tubes in the heating bath before passing it through the sample. Irregular results are obtained by the oil of the heating bath forming a heat insulating coating over the test flask. For this reason the temperature should, it has been suggested, be recorded inside the test flasks.

The sludge test equipment made by the A.S.E.A., of Sweden, includes provision for subjecting the oil to dielectric stress of 10 000 V per cm. during test, and also including as catalysers mild steel and transformer iron, in addition to copper as specified in the B.E.S.A. specification. This company recommends the test being made at a temperature of 100 deg. C., using one

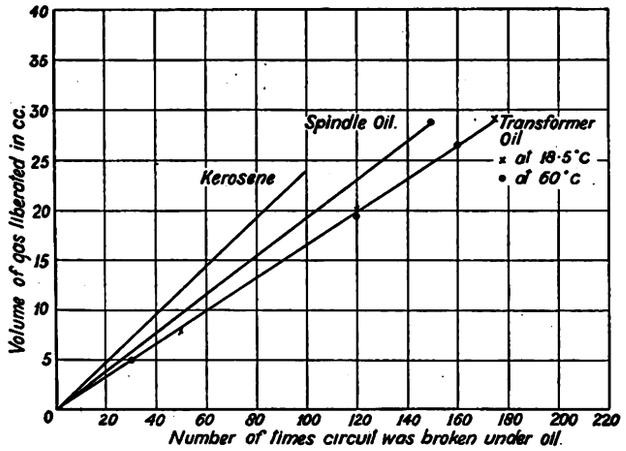

FIG. 5.

Indicating the little difference in gas formed with different oils under test.

litre per hour of oxygen instead of air. Messrs. Brown, Boveri and Co.* have employed a sludge test worthy of note, since it takes into consideration the colour of the oil in contact with the copper after prolonged periods of heating.

The main disadvantage of all these tests is the time and laboratory accuracy which they require. Many large power systems are situated in parts of the world where such tests are not feasible, and much time is lost in transferring samples to testing authorities. It may therefore be of interest to repeat here a quick test, which has been suggested by Mr. W. H. Nuttall, of the Ioco Rubber and Waterproofing Co.† This short test depends in principle on the fact that oils containing large amounts of unsaturated hydrocarbons (and therefore having a strong tendency to sludge) exhibit a much stronger interfacial tension towards water than that shown by oils which contain no unsaturated hydrocarbons. This is due to the affinity unsaturated hydrocarbons possess for water. The test consists of allowing a known quantity of oil to rise in " drops " through distilled water from a standard orifice, The " drops " are expelled from the orifices under a definite head of oil. Oil which contains large amounts of unsaturated hydro-carbons will rise through the water in small " drops." The number of " drops " per unit volume of oil is claimed to afford a direct measure of the sludge properties of the same.

The figures in the following table, quoted from Mr. Nuttall's results, indicate the wide difference between various oils which only differ within comparatively small limits when the sludge value is expressed in accordance with the B.E.S.A. specification. In these tests a 40% solution of sulphuric acid was used instead of water, in order to produce a wider difference in the results obtained with good and bad oils.

Oil No.	Drops per 100 cc. of oil.	Drop Volume in cc.	Sludge Value by Ordinary Test No. 36.
1	802	0·1247	nil
2	731	0·1368	0·05%
3	752	0·1329	0·05%
4	798	0·1253	0·08%
5	1 616	0·0619	0·70%
6	1 733	0·0699	0·86%
7	1 790	0·0558	0·97%
8	1 742	0·0574	1·10%

An even quicker and more practical test based on the same idea can be made by allowing one drop of the oil under test to fall gently from the end of a clean glass rod on to the surface of distilled water in a breaker. The drop should remain on the surface of the water as a slightly flattened drop not more than approximately 5 to 8 millimetres diameter. If it spreads over the surface of the distilled water, it indicates an oil which should most certainly be subject to laboratory tests before use.

Table 1 indicates the range of viscosities which various authorities have considered it necessary to specify for insulating oils. Unfortunately, the figures given in the specification are not easily comparable, due to the fact that different methods of determining and expressing viscosity are employed. For this reason equivalent figures at 15·5 deg. C. have been inserted in making up the Table 1. Fig. 2 includes some typical curves of variation of viscosity with temperature.

The curves in Fig. 3 show the average electric strengths which it is reasonable to expect in commercial transformer oils at 20 deg. C. Much has been published from time to time in dealing with the methods of determining the electric strength of insulating oils and the relative advantages of various forms of electrodes and arrangements of test cups. It is the author's personal opinion that the half-inch diameter spherical electrodes standardised by the B.E.S.A. and spaced 4 m/m apart, form as good a method of commercially comparing insulating oils as there exists. Whether the electrodes are arranged vertically or horizontally appears to make comparatively little difference, so long as spherical electrodes are employed, and the oil is reasonably dry and of good quality. With flat disc electrodes and a small spacing the breakdown figures would appear slightly lower with the electrodes arranged vertically than with horizontally arranged electrodes.

The electric strength of insulating oils is almost entirely a question of moisture and impurities being present in the oil. At the recent International Conference on Large Electrical Systems, in Paris, a paper was presented by Mr. J. E. T. Cogle showing the effect of various measured quantities of impurities (including moisture, vegetable fibres, atmospheric dust, carbon, etc.) on the electric strength of oil. The curves shown in Fig. 4 have been prepared from the information in Mr. Cogle's paper, and may be taken as typical of the effect of impurities on the electric strength of insulating oil.

Impurities having a specific inductive capacity greater than that of oil, will naturally become drawn into the space between the electrodes where the dielectric field is most intense. As vegetable fibres, when perfectly free from moisture, have a high dielectric strength, their presence, even though drawn into the gap, does not greatly lower the break-down strength. On the other hand, when particles of water are similarly drawn into the gap, considerations of relative specific gravities and surface tensions of the water and the oil present difficulties to the water particles lining up between the electrodes, so that their presence, although seriously affecting the electric strength of the oil, does not result in the extremely low breakdown which occurs when both moisture and vegetable fibres are present.

In testing oil for electric strength the B.E.S.A. specification states that " the oil shall be passed if two out of three tests, each on a separate filling, give results not lower than the limit fixed (30 kV)." This clause is of importance, because repeated tests on the same sample often result in an improvement in electric strength being shown after five or six tests have been made consecutively. This is due to the heat of the arc actually drying the oil in the neighbourhood of the electrodes.

Disastrous fires in the early days of transformer work resulted in insurance authorities demanding the use of transformer oils having very high flash points. Since high flash point can only be obtained in oils of proportionately greater viscosity resulting in poorer circulation and cooling, it has been appreciated that such a demand was not technically sound, and the tendency of recent years has been to decrease flash point values, and secure less viscous oils. The development of open air sub-stations calling for oils which will withstand a cold test at —30 deg. C. has itself necessitated a lowering of viscosity, and hence of flash point.

It is a significant feature of oil switch failures that the serious results which not infrequently occur during such failures are not due to the explosion which occurs when the initial arc is broken, but are due to secondary explosions of liberated gases. Dr. Bauer* and other investigators have developed formulæ for the quantities of gases formed in relation to the " breaking energy " of oil switches. The question immediately arises as to how far different oils differ from one another in the quantity of gas they may liberate under such conditions. The curves in Fig. 5 show the results of numerous tests, and indicate a surprisingly little difference in the amount of gas formed with different oils, even including kerosene, when a controlled electric circuit is broken under the oil.

ANTI-VIBRATORY PROPERTIES OF RUBBER.

Report on an Investigation for the Rubber Growers' Association.

WE have received from the Rubber Growers' Association a report on the anti-vibratory properties of rubber. While the investigation was primarily undertaken in connection with the use of rubber for isolating wireless sets, the results are applicable in a wider field, and will appeal not only to wireless manufacturers but to consulting engineers, manufacturers of scientific instruments, gramophone manufacturers, dynamo manufacturers and others interested in the elimination of vibration and noise.

The purpose of the investigation was to determine under various conditions the ability of rubber cushions placed under broadcast receiving sets to isolate them from vibration.

This research was carried out on behalf of the Association by Messrs. Digby and Fairthorne, consulting engineers, Queen Anne's Gate, London.

Five different types of rubber were submitted for examination, as follows:—

Sample "A," sponge rubber; "B," special compound containing 95% pure rubber (unreinforced); "C," sole crepe rubber; "D," cellular or expanded rubber (gas filled); "E," special compound containing 95% pure rubber (reinforced with fibre core).

The pads were placed in turn on a special platform that could be made to oscillate at any required frequency and used to support a base 11½ in. by 8½ in., on which was mounted the instrument which recorded the movements of the base. The weight of the base and instrument together was 21½ lb. As a result of inquiries previously addressed to the makers of various receiving sets, it was found that 21½ lb. was a good average for the weight of the usual set, and 11½ in. by 8½ in. for the size of the base. When undergoing test, the pads were placed beneath the corners of the base, and therefore supported it in the same manner as they would a wireless set. The conditions were, therefore, as close an approximation to actual working conditions as it was possible to get.

The method employed in testing a set of pads was first to keep the platform oscillating at a known frequency, and place on it the base and instrument, without the pads. The instrument then recorded in a greatly amplified form the actual movement of the base by means of a spot of light moving to and fro on a ground-glass screen.

The pads were then inserted beneath the base, and the movement of the spot of light again observed at the same known frequency. The difference in amplitude of the movement of the spot of light before and after the insertion of the pads was a direct measure of the amount of movement absorbed by the pads. Permanent records were obtained by substituting a piece of gaslight paper for the ground-glass screen, and records capable of photographic reproduction by using specially rapid orthochromatic plates which give negatives from which any number of positives may be obtained.

Recording Shock Absorption.

The absorption of shocks was also obtained by arranging for a weight to fall from a given height on to the bench carrying the special platform, and records were taken in the same manner as in the previous experiments, except that the gaslight paper records were impossible owing to the intermittent nature of the vibration.

Tests were carried out at a speed of 550 cycles per minute adopting different sizes and thicknesses of samples. The sizes of the samples were as follows, 2 in. square, 2 in. by 1 in. and 1 in. square, and the thicknesses varied from ¼ in. to 1 in. Experiments were also carried out with perforated samples by which the area of the pad was reduced by 20%. The result of all these tests indicated that the absorption increases as the size of the pad is reduced in area and increased in thickness.

Further tests were then taken at 720 cycles per minute with different amplitudes. It was found that the absorption was greater for vibrations of small amplitude than for large, and, as in the previous set of experiments, the absorption increased as the size of the pad was reduced and the thickness increased.

Experiments to test the phenomenon of resonance were carried out. In every case the amplitude of the movement was increased by inserting the rubber pads. Those that gave the greatest absorption at higher frequencies gave the greatest increase in amplitude.

In the impact experiments the results showed very clearly that the rubber pads absorbed intermittent jars and shocks to the same extent and with the same facility as they did steady vibrations. The intrinsic value of rubber pads in absorbing sudden shocks would appear to be even greater than that indicated by the results, as a steep-fronted wave is transformed into a wave with a sloping front, thus converting an impact into a gentle movement. The risk of injury therefore to any apparatus receiving the shock is reduced.

The appearance of the vibration is similar to the vibration obtained in any house when fast, heavy traffic passes over a bad patch of road surface in front of the house.

Tables are given of results of tests at 550 and 720 cycles per minute.

The Theory Outlined.

The theory of the action of a rubber pad absorbing horizontal vibration is outlined as follows:—

The forces exerted on the pads when absorbing vibration in a horizontal plane are shear forces, as the under surface of the pads has to move to and fro while the upper surface remains stationary. The strain to which the rubber is subjected depends entirely on the amplitude of the oscillations of the vibrating support, and the greater the stress produced by this strain, the greater will be the horziontal force exerted by the pads on the base of the wireless set they support, and the greater will be the amount of vibration transmitted.

It will be clear, also, that this stress can be measured in so many pounds per sq. in. of the surface of the material, so that reducing the area of support decreases the amount of movement transmitted through the pads. Also, doubling the thickness of the material doubles the strain required to produce the same shear stress. The above reasoning indicates that the best results are to be expected with pads of soft flexible rubber, in pieces which are small in area and relatively thick. This is verified by the experiments carried out.

The best results were obtained with the following materials: (*a*) Pads, 1 in. thick, of sample "C" in pieces 1 in. square perforated with small holes; (*b*) pads, ½ in. thick, of sample "D" in pieces 1 in. square; (*c*) pads, ⅝ in. thick, of sample "B" in pieces 1 in. square.

The sample "C" was the only material perforated and built up to a thickness of 1 in.; the other materials were used only in thicknesses up to ⅝ in. From their nature, however, they would show increased absorption if perforated and the number of layers increased.

The various features incidental to the absorption of vibration in the case under consideration are summarised in the report as follows:—

(*a*) That the material must be elastic.

(*b*) That it must be soft and flexible and used in the form of relatively thick pieces of small area. Annular rings of rubber will probably be the best form to employ in these cases.

(*c*) That the pads being made as small as possible will be heavily loaded, and the best results are to be expected when the load is made as heavy as the material will bear. It is suggested that the *yield point* of the rubber under compression should be obtained, and the pads designed so that when in use the compression stress will be about half the stress at the yield point. This would necessitate pads of various sizes for sets of different weights.

(*d*) That rubber pads absorb vibrations of small amplitude much more readily than large movements.

(*e*) That they absorb vibrations of high frequency to a greater extent than those of low frequency.

(*f*) Following from (*d*) and (*e*) the pads are effective in absorbing jars and shocks of a normal character, but tend to magnify slow movements when resonance occurs.

(*g*) That when resonance occurs the pads tend to magnify movements. In this respect, the pads share the properties of any other intervening medium of a non-rigid character.

(*h*) That for the purpose of this investigation, the best all-round absorption was that given by ½ in. thick pads of sample "D"; perforated samples of material "C" ranking next.

(*i*) That for general utility purposes perforated samples of material "C" are to be recommended on the score of cheapness. The proportioning of the diameter and spacing of the perforated holes to the thickness of the material will require investigation.

HARDNESS TESTING.

Features of the Constant Size Impression Method.

OF the various machines developed for the testing of hardness by the indentation method, the Brinell machine is perhaps the most popular and the most widely used, for it allows of the test being quickly and conveniently carried out, and the values obtained can be related in some measure to tensile strength. Various forms of the machine are in use, and it is customary to use hardened steel balls of 1 to 10 mm. diameter as indenter elements, machines using the 1 mm. ball having been designed for testing the hardness of small specimens and thin material. One of the chief limitations of this method of hardness testing arises from the deformation of the ball when testing hard materials.

For measuring the hardness of hardened steels and heat-treated tool steels, the Rockwell machine, where a constant load is used and the depth of penetration measured, is now quite commonly employed. With the development of extremely hard materials for use in the form of tools and dies (such as the tungsten carbide alloys, for example), the need for a satisfactory method of effecting hardness measurements is becoming more necessary. The difficulty of deformation of the indenting tool when measuring high hardness values is overcome by the use of diamond indenters in place of steel, and in various machines this material has been used.

In a recent paper by A. F. Shore read before the American Society for Steel Treating, and printed in "Heat Treating and Forging" for May, 1929, the desirability, in hardness determinations, of reading pressures required to produce a standard impression is dealt with, and the author has designed a machine known as the Monotron hardness indicator in which this principle is employed. This principle overcomes the objection which is sometimes raised against the constant load method, that with soft metals the degree of penetration is relatively large as compared with harder metals, that is, the amount of deformation which the soft metal undergoes is greater, and the result is thereby affected.

The Monotron Method.

Even with the constant size impression method the degree of penetration adopted is of importance, for it is possible that metals having similar elastic limit hardnesses will give very different results with greater penetration if they behave differently under extreme cold working. The errors in measuring high hardness values, due to deformation of the steel ball, as in the Brinell machine, are overcome to some extent by the use of a diamond pointed indenter in the Monotron machine.

With a machine embodying the constant size and varying pressure principle, one of the chief difficulties in the way of obtaining accurate measurements of the depth of penetration is due to the elastic shortening of the penetrator element when under load. It is not practicable to make allowances for this factor for different hardness values, and in the Monotron machine the depth micrometer is held in a compensator, and so given a retractile movement equal to the elastic shortening of the diamond point when under pressure. The load required to produce a standard penetration, and the depth of the penetration, are read off on two dials which form part of the instrument. For universal application a 0·75 mm. diamond ball point is used, the standard depth of penetration being 0·0018 in., which is 6 % of the ball diameter. With this penetrator the entire hardness range encountered in metals from lead to tungsten carbide alloys can be satisfactorily measured.

No special difficulty attaches to the carrying out of the test, irregular shaped pieces of metal being satisfactorily accommodated by a tilting table which can be replaced by a V-block for cylindrical specimens. The values read off on the dial recording pressure are in kilograms and pounds, but other scales can be substituted such as are giving diamond ball Brinell values direct. The modulus of elasticity of the material under test does not affect the result, since the depth of the penetration, or hardness value, is read while the load is applied. A protecting cap for the diamond point acts as a contact for operating the depth gauge, and, since the latter moves relative to the position of the cap, it has the advantage that any yielding (say of a hollow piece under test) does not affect the result. The depth scale is divided into nine divisions each representing 0·0002 in. or 0·005 mm.

As already indicated, the development of extremely hard metallurgical products has led to increasingly exacting demands being made on hardness testing machines. Of these, surfaces hardened by the nitriding process and tungsten carbide alloys may be cited, the hardness of some of the alloys in this class being twice as much as that of quenched high-carbon steels. Such materials are well beyond the range of hardness which can be satisfactorily determined by hardened steel balls or indenters, and only carefully selected diamonds can be used. Even these must be used with caution on the harder grades of tungsten carbide alloys. The Monotron instrument with its spherical diamond indenter, which gives a straight increment line, can be used to advantage in determining the hardness of these extremely hard products.

Depth of Penetration.

In testing materials of this kind, it is advisable to use a depth of penetration corresponding to three divisions only, which does not impose an unduly severe strain on the diamond and yet is quite satisfactory for the purpose. With hardened steel a penetration equal to three divisions requires a pressure of from 35 to 38 kilograms, which when multiplied by three gives the value needed for the standard penetration of nine divisions or 0·0018 in. With superhard steels this value to yield the standard penetration might be as high as 120. With nitrided steel it is of the order of 117, or 39 kilograms for a penetration equal to three divisions.

Values on tungsten carbide alloys vary considerably, one of the softer but tough grades recording 45 kilograms with a depth of three divisions, or 135 when calculated to the standard, a harder and more brittle sample yielding corresponding figures of 65 to 75 and 195 to 225 kilograms. On hardened steel, the diamond will last for thousands of tests taken to the full depth of nine divisions, but is not capable of being used on tungsten carbide to this depth.—M. C.

CHROME PLATING.

Growing Applications in the Electrical Manufacturing Industry.

THE next few years will in all probability see something like a revolution in domestic and indoor appointments and fittings.

Polished brass, so loved by the industrious housewife, has long ago disappeared from most houses, and "labour-saving" is the slogan of the new generation. Oxidised silver, and other finishes, more or less successfully simulating the effects of age and wear, have had a brief interregnum, but undoubtedly the modern house (and office) will soon be dependent almost exclusively on chrome-plated metallic fittings.

Chrome-plated taps and bathroom fittings attracted the public notice some time ago, and their cleanliness, durability and beauty have led to a steadily increasing demand for this delightful and serviceable finish in every department of the house.

The supreme virtue of chrome-plating (after its appearance) is undoubtedly its property of keeping clean. Not only does it resist tarnish indefinitely, but it seems to have an uncanny habit of actually repelling dirt, so that a chrome-plated switch cover, for example, shines up resplendent in even a neglected and dusty room.

Electric fires, irons, toasters, kettles and other domestic appliances are now commercially produced in this finish, and, as many architects are now embodying the finish as standard for the modern home, manufacturers of electrical appliances and fittings will need to prepare themselves to meet this demand.

The technical applications of chrome-plating are many and important, but it is outside the scope of this article to mention more than a few. One of the most striking is its use in the machinery and apparatus of the modern power station. Switchboards are particularly striking when plated with a metal that eliminates practically all cleaning. Whenever scientific instruments are exposed to dirt or bad weather conditions they may with advantage be protected by the chrome process.

There are a few misconceptions about chrome-plating still lingering in some manufacturers' minds. The process is not costly, and, apart from the initial outlay on the plant, does not compare unfavourably with other plating processes.

The process is not difficult, and if the equipment is purchased from a first-class house, it includes a short course of training in the correct technique to be employed.

Digitized by Google

The modern plant has totally eliminated any obnoxious gases and fumes, and the whole process can now be operated as surely and as safely as any other plating process.

The only way in which the chrome plant differs from the more orthodox plating plants is in the exhaust apparatus which carries away the fumes. This apparatus is claimed to be so efficient that no trace of any gases can be detected immediately over the vat, or, indeed, within a few inches of the top of the solution.

ELECTRO-DEPOSITED CHROMIUM.

Effect of Current Density on Hardness.

AN investigation of the effect of current density upon the hardness of electro-deposited chromium was described to the fifty-sixth general meeting of the American Electro Chemical Society at Pittsburgh, by Mr. Robt. J. Piersol. The author found that using various current densities, from 1 to 7 A/sq. in. (16 to 109 A/sq. dm.), chromium has a maximum hardness when plated at about 4 A/sq. in. (62 A/sq. dm.). The value of this is approximately forty-three times as great as that obtained at a normal plating current density of 1 A/sq. in. (16 A/sq. dm.) as shown by abrasion tests.

MELTING POINT OF CHROMIUM.

Attempts to Secure More Accurate Determinations.

IN a recent communication to "Nature," Messrs. C. J. Smithells and S. V. Williams, of Wembley research laboratories of the G.E.C., state that no accurate determination of the melting point of chromium has been published recently, so far as they are aware, and the accepted value of 1 550 deg. C. usually quoted appears to be based on measurements made in 1907–8.

Various properties of metallic chromium appeared to the writers to be inconsistent with such a low value, particularly the very slow rate of diffusion of chromium into iron and nickel. They found ("J. Inst. Metals., 40, 273; 1928) that even in pressed bars of nickel and chromium powders heated to just below the melting point of nickel (1 450 deg. C.) very little diffusion takes place, whereas under the same conditions nickel and iron rapidly form solid solutions.

An attempt was made to melt electrolytic chromium in an atmosphere of hydrogen in an electric furnace, but at the maximum temperature of 1 700 deg. C. there was no sign of fusion. Rods of both electrolytic and thermit chromium were therefore prepared and heated by passing a current through them *in vacuo*.

A small hole drilled in the side of the rod enabled the true (black body) temperature of the axis of the rod, as well as the brightness temperature of the surface, to be determined (cf. Pirani and Alterthum, "Z. Elektrochem," 29, 5; 1923) by means of a disappearing filament pyrometer calibrated at the melting points of tungsten, molybdenum, platinum, and iron. The difference between these two temperatures at 1 600 deg. and 1 700 deg. C. was found to be 160 deg. C. A number of determinations of surface brightness at fusion gave a value of 1 760 deg. C., giving a value of 1 920 deg. C. for the melting point of chromium. The experimental errors all tended to make this a low value. More accurate determinations will be made when larger rods of chromium are available.

METAL "SPOTTING."

Research Indicates Methods for Minimising its Effects in Plated Finishes.

AN investigation recently carried out by the American Electroplaters' Society has established the fact that the "spotting" of plated finishes on domestic and other appliances may be of two quite distinct kinds, i.e., crystal and stain spotting.

The crystal spots consist of dendritic crystals which appear only on metals having an oxidised surface; that is, one coloured with copper sulphide or other sulphides, and subsequently lacquered. The stain spots appear especially on cast metals, either plain or lacquered, in the form of discoloured areas of irregular shape, usually with a small dark spot near the centre.

The crystal spots have been found by X-ray examination to consist of cuprous sulphide (Cu_2S or chalcocite) growing usually between the layer of cuprous sulphide on the metal and the lacquer film. Their formation is caused or accelerated by sulphur in even minute amounts, such as may be derived from sulphur or hydrogen sulphide in the atmosphere, or from rubber bands or wrapping paper or cardboard cartons. It was impossible to determine whether these traces of sulphur cause the slow formation of new cuprous sulphide in coarse crystals or the recrystallisation of the very fine-grained cuprous sulphide already present.

The only promising remedies are (*a*) exclusion of sulphur from the surroundings, (*b*) the use of lacquers found to retard spotting, (*c*) the application of a thin film of a grease, such as petrolatum, to the lacquered surface, and (*d*) the use of wax paper for wrapping.

The stain spots are caused by the absorption in pores in the metal of acid or alkaline compounds during the plating process. Upon subsequent exposure to a high humidity such substances absorb moisture and exude upon and stain the surface. It was found that alkaline substances are especially difficult to remove from capillary pores. It is not practicable, however, to eliminate alkaline substances from the cleaning and plating solutions.

In some cases the porosity of the metal may be reduced by a change in pattern or in casting conditions. No method of rinsing or neutralising was entirely effective in removing the compounds. Baking at high temperatures before lacquering is sometimes helpful.

The two most effective remedies are: (*a*) permitting the chemicals to exude or spot out by exposing the articles to a high humidity before the final finishing, and (*b*) the application of a lacquer which has been found to retard this type of spotting.

In general, phenol-condensation lacquers, which are less permeable to moisture than nitro-cellulose lacquers, are also more effective in retarding stain spotting.

Permeability to moisture is, however, not the only factor. Tests on many commercial lacquers of both types show that it is possible to develop lacquers which are much more effective for this purpose than the average nitro-cellulose lacquers previously employed.

"PANALUMIN."

Anti-Corrosion Process for Aluminium and Aluminium Alloys.

THE Panalumin process (known on the Continent as the "Jirotka" process), for the protection of aluminium and aluminium alloys against corrosion, is extensively used in many industries where aluminium and aluminium alloys are utilised, especially by motor-car manufacturers, aeroplane builders, constructional and machinery engineers, optical instrument makers, etc.

The chief aim of the process is the protection of light metals against corrosion, but there are other advantages to be obtained, namely, that paint and lacquer will permanently adhere to metal which has been treated. It is also possible to nickel-plate and to produce various colours on the metal, as well as to render it non-corrosive.

The treatment is very inexpensive and is obtained by immersing the articles in chemical baths prepared in accordance with the chemical and metallurgical characteristics of the particular aluminous metal, the only plant necessary consisting of enamel vats large enough to hold the articles undergoing treatment, no electrical energy or highly technical knowledge being needed. In certain cases it is possible to treat metal *in situ*.

H.T. INDICATOR.

Portable Apparatus for Cable Testing up to 15 000 V.

A CONVENIENT and reliable means of testing h.t. cables and apparatus up to 15 000 V, is provided by the Philips portable h.t. indicator, type 4 048.

The instrument consists of a Neon tube enclosed in an insulated cover of convenient dimensions. This is provided with a case of similar insulating material, which serves as a handle when the instrument is in use, fitting over the end in the manner of a fountain-pen cap. When in use, an earth connection is made to the terminal provided, and the hook at the end of the instrument is brought into contact with the wire or apparatus to be tested. Should the circuit be alive, the Neon tube will glow, the light being seen through a slot in the insulated cover. Absolute safety in using the instrument is assured, there is no danger of a short circuit, and the Neon tube will not fail to give a correct indication.

SPRAY FINISHING FUNDAMENTALS.

Treating the Surface—Rust Removal—Cleaning Solutions and Methods Outlined—The Application of Coating Materials.

THE various types of spray finishing apparatus have already been described in these pages, and the following hints taken from an article by Mr. Paul W. Collins in " Electrical Manufacturing " should prove useful to the growing number of manufacturers using spray finishing processes.

Many a poor finish is unfairly attributed to the manufacturer of the coating material. While this is sometimes true, the real cause is usually found in : (1) lack of proper foundation (unclean surface) ; (2) improper method of application (improper drying time, insufficient sanding, etc.) ; (3) inadequate or improper equipment.

Removing Surface Impurities.

Proper cleaning is necessary before a permanent coating can be assured. Finishing an unclean article is like building a house on the shifting sands. By " clean " is meant the removal of dirt, rust, grease, oil, paint, acid, alkali and any of the other undesirable elements that may endanger the life of the coating to be applied. Even in the case of dip finishes with cheap materials and low priced products, the failure to remove the impurities from the surface to be coated frequently destroys the coating material for further use after a few submersions of unclean articles have been made.

Cast iron, steel, brass, aluminium, zinc, die castings, forgings, screw machine products : all should receive cleaning treatment according to the nature of the metal, the type of cutting aid used in machining, whether the surface is rusted, scaled or deeply pitted, the type of finishing materials to be applied, and many of the similar elements that enter into the manufacturing processes.

Castings sometimes need only a brisk scrubbing and dusting with a stiff brittle duster. This old method is fast giving way to the sand-blast machine which leaves a clean and highly desirable surface for coating.

Small castings are frequently " tumbled " in a rotating barrel or cylinder partly filled with steel polishing balls. This process saves a great deal of labour and handling, if there are no machined threads or particular planes or corners that might become damaged in the tumbling process.

Grease and dirt are sometimes " baked out " by subjecting the metal to a heat treatment of from 400 to 700 deg. F. for about one hour. By this method the dirt and grease is forced out of the pores of the metal and crystallised on the surface. The surface is then gone over with emery cloth, steel wool or sand paper, and afterwards brushed off with a stiff bristle brush or an air duster.

Die castings that are to be japanned must be given a preliminary heat treatment to drive out internal gases. The heat treatment should not run higher nor lower than when the coatings are baked on. Heat treatment will cause the surface to blister with small round balls. These are to be sanded off. Zinc becomes brittle at above 170 deg. F. and aluminium becomes injured internally at above 350 deg. F. Grease and dirt should be removed from die castings by brushing with a chemical solution and dried immediately.

A patented solution is obtainable for the removal of rust. It not only eliminates this undesirable feature from the surface but at the same time impregnates the metal against further action of the same sort for some little time. It is a combination of phosphoric acid and alcohol. The solution is simple to apply, and is becoming more and more popular as a rust inhibitive coating for steel and sand-blasted surfaces. Rust is undesirable beneath a finish because it soon causes the finish to crack and chip.

Cleaning solutions are divided into solvent cleaners (benzine, petrol, etc.) and chemicals (alkalis, acids, etc.). All are used separately and in varying percentage combinations to clean surfaces for the finishing coat depending on the metal and the substance to be removed.

Because benzine is cheap many think it is a very excellent cleaner to use in removing grease. It is primarily inexpensive, but soon loses its strength through dilution and quick evaporation. Many factories are giving it up in preference to chemical compounds because of the high flash point of benzine and petrol and their consequent fire hazard.

There are a number of reliable cleaner and remover compounds marketed by reputable chemical firms who employ large staffs of chemists and men capable of diagnosing the cleaning compound best suited to the individual needs.

Methods of cleaning are changing too. Not long ago articles were put into wire baskets and plunged up and down or whirled in the boiling cleaning solution. Modern plants of to-day are equipped with hooded tanks through which passes an endless conveyor belt or chain. The articles when placed on the chain pass under a steady spray of cleaning solution directed at the proper angle to clean them thoroughly. From there (if necessary) they pass under a shower of clean water or neutraliser and thence through a heated enclosure for drying, and on directly to the spray room or dipping tank.

Chemical solutions are usually kept at a temperature slightly under boiling. This prevents an excess of steam and helps to keep the solution at its full strength as long as possible. To get the best results, the solution must be kept at uniform strength. As an accurate test cannot be made in the boiling solution, frequent samplings should be taken out, cooled and tested with an hydrometer. The reading should be close to 8 deg. Baumé, indicating an average solution of one pound of cleaner to the gallon of water.

In selecting coating materials, one should consider the surface to be covered, the kind of use and abuse it will receive after having been sold, whether it is intended for use inside or out of doors, and who is going to buy the article. Then there are different quality finishes for the sliding price range of the " full line." The manufacturers of paints, varnishes and lacquers can best assist one in this respect, as they can match up their materials to the particular requirements. The general basic observations for finishing any piece are, however, the primer, the surfacer, and the finish coating.

The primer is applied for the main purpose of causing the finishing coats that follow to adhere to the surface. It is the " tooth " of the coating and is one of the most important steps in painting. The primer should be applied in one thin coat and must be perfectly dry before any other material is applied over it. The drying time ranges from 4 to 12 hours for oil base primers (depending on whether it is oven dried or air dried) and from 20 to 30 minutes for lacquer base primers. There are some surfaces that do not lend themselves well to a lacquer base primer and it is believed that this fact occasioned the early feeling that lacquer base primers were not much good.

Putty and glazing mixtures are next applied to a surface containing pits or depressions that should be levelled up to uniform surface. These materials are applied with a broad flexible putty knife, the action of which is to force the putty into the depressions and scrape off all surplus material. Deeply pitted castings and large depressions frequently need more than one application of surfacing with putty. Too heavy a layer cannot be applied at one time as it will take too long for the material to dry and the putty of glaze (which is a stiff putty) might crack open. Drying time for each application of putty should be approximately 12 hours. Lacquer base putties are rather faster.

Levelling-out Depressions.

Some finishers prefer to reserve the putty or glazing application until after one or two coats of surfacer have been put on. While it seems to be more common usage to follow the sequence offered here, there can be no possible harm in knifing in the putty after a coat or two of surfacer has been sprayed on and sanded to smoothness. It is contended that sometimes slight depressions will level out with the application of the surfacer coat, and this is frequently the case if the operator knows how to handle his spray gun.

The surfacer coats may be applied in one or several coats, allowing proper drying time between each coat. One heavy coat is not as good as three or four light coats.

The spray gun is practically universal in the application of surfacer coats as the saving of sanding labour alone would make its use indispensable. The spray gun leaves a highly atomised surface free from brush marks and streaks, all of which would be present and have to be removed if a hand brush were used in applying the surfaces. The usual method is to apply a coat of surfacer, dry it (often hastening this process by the use of ovens), and then sand this coat down to smoothness. The subsequent coats are applied in like manner. Care must be taken that all moisture is out of the surface before the succeeding coat is applied.

BRIGHT-ANNEALING.*

Some Details of the Grünewald Method—How Oxidation is Prevented—Economic Advantages Claimed—Use of Thin-Walled Annealing Pots.

DURING the present century big improvements have been made in every branch of the metal industry. Only the intermediate and final stages in the two processes of rolling and drawing, viz., annealing, have not kept pace with the general development. More than 90% of all the products in the metal industry are still annealed by the clumsy and inaccurate methods that were in general use over fifty years ago.

The advent of the electric furnace opened the way to new possibilities, particularly as regards the maintenance of a more uniform temperature, but the problem of preventing the oxidation of the goods to be annealed still proved insoluble.

With the old methods of bright-annealing, such as filling the annealing pot with cast-iron chips, the cost of electrical heating proved prohibitive; and filling the muffle or furnace with inert, though, nevertheless, generally explosive gas, introduced so much inconvenience and additional cost that a wider use of this latter method was out of the question.

Protection Against Oxidation.

Comparatively early on it was found by experience that in order to obtain a bright surface of the annealed goods it is actually only necessary to provide protection against oxidation while the charge is cooling down. The Vitry method, for instance, depends on this fact, but since it involves the use of an inert gas, it has not been adopted very extensively.

The Grünewald method of bright-annealing also depends on this fact. Instead, however, of using inert gas to prevent air from reaching the goods, the annealing pot is rendered air-tight when the maximum temperature is reached, the principle being similar to that in preserving foodstuffs.

Constructionally, the Grünewald pot differs from all previously used types in that it does not stand on the bottom of the furnace but is suspended inside it from the rim at the top. Also, the charge is not laid directly in the pot but on a special tray suspended from the cover by means of rods, the cover also serving to close the furnace.

The economic advantages are obvious. Instead of making the pots 20 to 30 mm. thick out of cast steel or special plates, for temperatures up to 750 deg. C., the casings can be made of 6 to 8-mm. boiler plate. The reduction in the dead weight to be heated, alone enables a saving in the current consumption of 15 to 20% to be effected. The thin walls also offer much less resistance to the passage of heat; so that the productive capacity of the furnace is very appreciably increased. In general, the annealing pots used in electric furnaces have a longer average life than those used in other types of furnaces; the life of the Grünewald pot is still further increased, due to the fact that it can be used until it becomes so thin as to be no longer air-tight (three to four millimetres). Even then it is only necessary to replace that part of the casing which is exposed to the heat of the furnace (and therefore subject to oxidation), while the cover lasts indefinitely, so that the cost of repairing a Grünewald pot is barely one quarter of the cost of repairing a cast-steel pot which is placed wholly inside the heating chamber.

As already mentioned, Grünewald annealing pots with very thin walls can be used. This enables the part of the pot exposed to the heat to be made of special heat-resisting alloy steel, without rendering the cost too high. The thin walls, low weight, and the fact that the surfaces of the annealing pot are always free from oxide, allow the charge to be heated up and also cooled down in a much shorter time. Thus the number of annealing pots required for a given production is much smaller. Fewer furnaces are also required, so that, neglecting the saving in floor space, the total cost of the furnace plant, complete with annealing pots, is less than that of any other annealing plant for the same production, even if the walls of the former are made of the more expensive non-oxidisable metal.

The annealing pots themselves are sealed similarly to preserving glasses for fruit, by means of a rubber ring placed between the rim of the pot and the cover. The rubber ring is cooled by water circulated in a groove, and is thus prevented from becoming too hot.

The process of bright-annealing wire is as follows:—

The goods are first laid on the supporting tray. The cover with suspension rods is brought over the supporting tray by the crane, and the rods are attached to the tray. The cover is now lifted, together with the charged tray, carried to the pot, and lowered into it. Before bringing the pot together with the cover to the furnace, the cover is tightly clamped

A charge of wire coils on the supporting tray. The operator is seen fixing the suspension rods.

to the pot. By this means a uniform pressure is exerted on the whole of the rubber ring, and an air-tight joint made between pot and cover. The cooling-water groove is filled up with water before bringing the pot to the furnace. The pot can now be lowered into the furnace and heated up.

A large part of the air is expelled through the valve, due to the expansion caused by the rise in temperature and also due to the vaporisation of oil and grease which has adhered to the charge. The oxygen in the remaining air is used up in burning part of the oil vapour, so that the annealing pot is entirely free from oxygen long before the oxidation temperature of the charge is reached. The pressure in the pot drops towards the end of the process and the valve then closes automatically.

The Cooling Process.

When the desired annealing temperature has been reached, the pot is lifted out of the furnace by the crane and hung in a cooling pit, where it cools in 12 to 20 hours. The good fit of the cover and of the valve prevents any air from entering during the cooling process, so that a vacuum up to 400 mm. of mercury can be attained inside the pot. The valve is opened at the end of the cooling process, *i.e.*, when the temperature has dropped to the value required for bright, blue or black dull annealing, whichever is desired, and the charge, suspended from the cover, is lifted out of the annealing pot. The supporting tray is now placed on the floor and the suspension rods are removed and immediately fitted to another tray, ready loaded with a fresh charge.

ALUMINIUM.

Some Methods of Affording Protection Against Corrosion.

DEALING, in his Autumn lecture to the Institute of Metals, with methods of protection against corrosion in aluminium, Dr. A. G. C. Gwyer said he considered that a very marked advance had been made by the recognition of the important part played by surface films, both in promoting and in retarding corrosive action. "Passification" of metals had been recognised for some time, although there was still some difference of opinion as to whether it was brought about by the formation of gaseous or solid films at the metal surface. Evans had recently succeeded in proving the presence of solid films, and had been able to give methods for their isolation and examination, and Callendar had shown that the local corrosion of metals in normal waters was governed very largely by the presence of boundary films of either a solid, liquid, or gaseous character on the metal surface.

Present Methods Unsatisfactory.

In the case of aluminium, what was still wanted was a satisfactory method or methods for measuring the extent of corrosion, as such comparatively simple methods as the "loss in weight," or "loss in tensile strength" methods had been of little real service, as they failed to distinguish between general and local corrosion or "pitting."

Two tests, both due to Mylius, must, however, be mentioned. The first consisted in immersing the specimen in hydrochloric acid contained in a flask under standard conditions, and in measuring the rise in temperature of the acid, it being assumed, that the reaction velocity in such circumstances may be taken as a measure of the corrodibility. In the second test, a sample of standard area was immersed in a solution of sodium chloride of given concentration, to which a definite amount of hydrogen peroxide had been added. After twenty-four hours the aluminium hydroxide which had been precipitated was filtered off, ignited and weighed, but it was questionable how far this test gave a measure of the total action, since it appeared to take account solely of the non-adherent deposit or scale.

It was much to be hoped that the valuable researches of Bengough upon zinc would be extended to aluminium, as they were of a highly fundamental character. Bengough and his colleagues had devised an ingenious and special form of apparatus in which the corrosion was allowed to proceed under accurately controlled conditions, so that the quantity of oxygen absorbed could be determined quantitatively.

With regard to methods of protection, very remarkable progress had been made. There were now a variety of paints, collodion lacquers, varnishes and cellulose mixtures which gave highly satisfactory results, always provided that care was taken to produce a thin and closely adherent coating free from pinholes. It was interesting to note that aluminium paint, which had long been in use for painting iron objects, such as lamp posts, tramway standards, etc., afforded excellent protection when sprayed on aluminium castings. It had also been found that the practice of dipping either in water-glass (sodium silicate solution) or lanoline, formed a useful precursor to painting proper. When the former process, which was developed in America by Zimmerman and Daniels, was followed, the castings or other objects must subsequently be baked for a couple of hours at 150 deg.

"Anodic Oxidation."

One of the most successful and important methods of protection was based upon the principle of causing the metal to build up its own protective film, as, for example, in the case the so-called "anodic oxidation process," devised and patented by Bengough and his colleagues. The process consisted in making the finished article the anode in a bath of chromic acid, the voltage being raised slowly to 50 V, whereby an extremely thin and tenacious coating of oxide was produced, which was extraordinarily resistant to the action of sea water. Another and rather similar process had been patented by Jiortka; here a protective film was formed by simple immersion in a heated solution of carbonates and other salts, no electromotive force being applied, but the films so produced were much thinner and rather less resistant under severe conditions.

In America the most recent development made use of the fact that very high purity aluminium was practically non-corrodible. A composite metal was produced, the outer layer consisting of very high purity aluminium, and one of the principal advantages claimed for this procedure was that the protective action of the coating extended over any portion of the metal base, which might have become exposed by abrasion or cutting.

The possibility of alloying with some element in order to raise the resistance to corrosion had been and was being also actively investigated. For example, in Germany the addition of antimony in comparatively small amount had been found to give rise to a highly protective film, which was rapidly reformed after abrasion, etc. The modern high-silicon alloys were also good from the standpoint of corrosion.

"TEMPORARY EXPEDIENTS."

Some Noteworthy Examples in Electrical Manufacturing.

AT an informal meeting of the Institution of Electrical Engineers on November 11th, with Mr. W. E. Lang in the chair, Mr. W. E. Highfield opened a discussion on "Temporary Expedients in Engineering." He said he felt that the modern trend towards specialisation in one branch of electrical engineering, at an early age, necessarily limited the range of practical experience. "Temporary expedients" might be simple or elaborate, they might be thought of in a moment or they might have been very carefully considered and elaborated. There was equal merit in all of them, and he hoped that the audience would not shrink from giving their experiences of ingenious expedients used by them merely on account of apparent simplicity. He next described some remarkable repairs in a variety of situations. Many of the extemporisations had that merit of simplicity which made one wonder that they had not been thought of before, but some of his instances of repairs to vessels at sea were epics of resource and resolution.

Among the electrical instances was a scene on the Bulgarian front during the war. The artillery required a military telephone board to link together their signalling system. There was no possibility of getting the board except by making it. The panel was easily made from a packing case lid. The plug receptacles were empty cartridge cases sawn in two vertically and screwed to the board. The plugs were "full" cartridges. It was simple and effective and for all practical purposes as good as the actual article.

The commutators of d.c. machines broke down sometimes, and if such a fault occurred to an essential machine something had to be done. The most frequent failure that occurred was a puncture of one of the mica cones, which entailed unsweating all the armature connections and removing the commutator. To remove the commutator intact a commutator jig was required. This was, of course, never available, but as a temporary expedient the commutator could be held together by binding it firmly round with a layer of wire. The failure in the mica cone was usually a small puncture, and this should be cleaned out and, if necessary, enlarged and filled with a hard-setting insulating cement. If no known cement was available quite a good one could be made by mixing water glass with precipitated chalk or even tooth powder. Another way of making a good insulating glue was to mix the frosting used on Christmas trees with Durofix, and this would set as hard as cement. When dry it was hard enough to file, and such a repair would enable a vital machine to be run again within a few hours of its breakdown.

Messrs. G. C. Allingham, G. F. Bedford, T. H. Dennis, W. A. Erlebach, L. J. Gooch, A. F. Harmer, S. B. Jackson, A. J. N. Kennett, A. N. D. Kerr, W. E. Lang, A. Morgan, W. J. Minton, N. Prentice, E. S. Ritter, J. F. Shipley, D. J. Watkin, and M. Whitgift also spoke.

TREATMENT OF SULPHUR FUMES.

Points from Two Interim Reports in Connection with the Working of the Proposed Battersea Power Station.

INTERIM reports prepared by the advisers to the London Power Co., and by the special committee appointed by the Government Chemist, on the question of the treatment of sulphur fumes in connection with the working of the London Power Co.'s proposed new power station at Battersea, have just been issued [in Cmd. 3442: H.M. Stationery Office 6d. net].

Messrs. E. Ardern and R. V. Wheeler, the London Power Co.'s advisers, refer to experiments at the Grove Road power station between April and August this year, and state that the theoretical considerations on which the proposed treatment of the flue gases for the removal of sulphur gases were based were as follows:—

From the data available, it appeared that when the Battersea power station was in commission each boiler would yield a maximum of about 170 000 cu. ft. of flue gases per minute, the combustion control being such that the gases would contain 10% of carbon dioxide. The proposed lay-out of the plant arranged for three boilers to deliver to one chimney, so that about 510 000 cu. ft. of flue gases would pass up each chimney per minute. This quantity of gases would be derived from 1 ton of coal per minute (burnt at the three boilers working together).

To provide a working basis, it was assumed that the flue gases from a coal containing 1·5% of sulphur would contain about 0·03% SO_2 and 0·05% SO_3 by volume, such figures having been obtained in several analyses. It was recognised that these figures might be subject to considerable variation (dependent on several factors) but they sufficed for the purposes of calculation.

In small scale experiments on the washing of flue gases with water at St. Pancras power station, 0·328 gram of SO_3 had been removed per litre of water, or 0·328 oz.

Calculations set out in detail in the report gave an indication of the character of the problem, approached as one of "gas-scrubbing," the main practical consideration being: could the chimneys (and perhaps the flues) of the proposed plant provide sufficient scrubber capacity?

Two facts were evident, having regard to the obvious desirability of reducing to a minimum the amount of water to be used: (1) The time of contact between the flue gases and the water was all-important and required to be determined experimentally; and (2) The proportions of SO_2 and SO_3 in the flue gases required to be accurately known, for SO_3 can be more easily removed than SO_2. It was conceivable that, either by treatment of the coal on the grate or by treatment of the gases in the flues, the formation of SO_3 could be encouraged.

With these two main points in mind, experiments on a reasonable working scale were put in hand at Grove Road power station. The plant used is shown diagrammatically in the drawing reproduced below. It consisted essentially of a cylindrical absorption tower, 27 ft. high and 40 in. in diameter, with attachments for the delivery of flue gases and water in contra-flow.

The flue gases could be drawn by a fan from one of the chimney stacks (No. 2) of the Grove Road power station through a 12 in. pipe delivering at the base of the absorption tower, the rate of flow being controlled by a butterfly valve at the point of entry and measured by a Pitot tube. A short

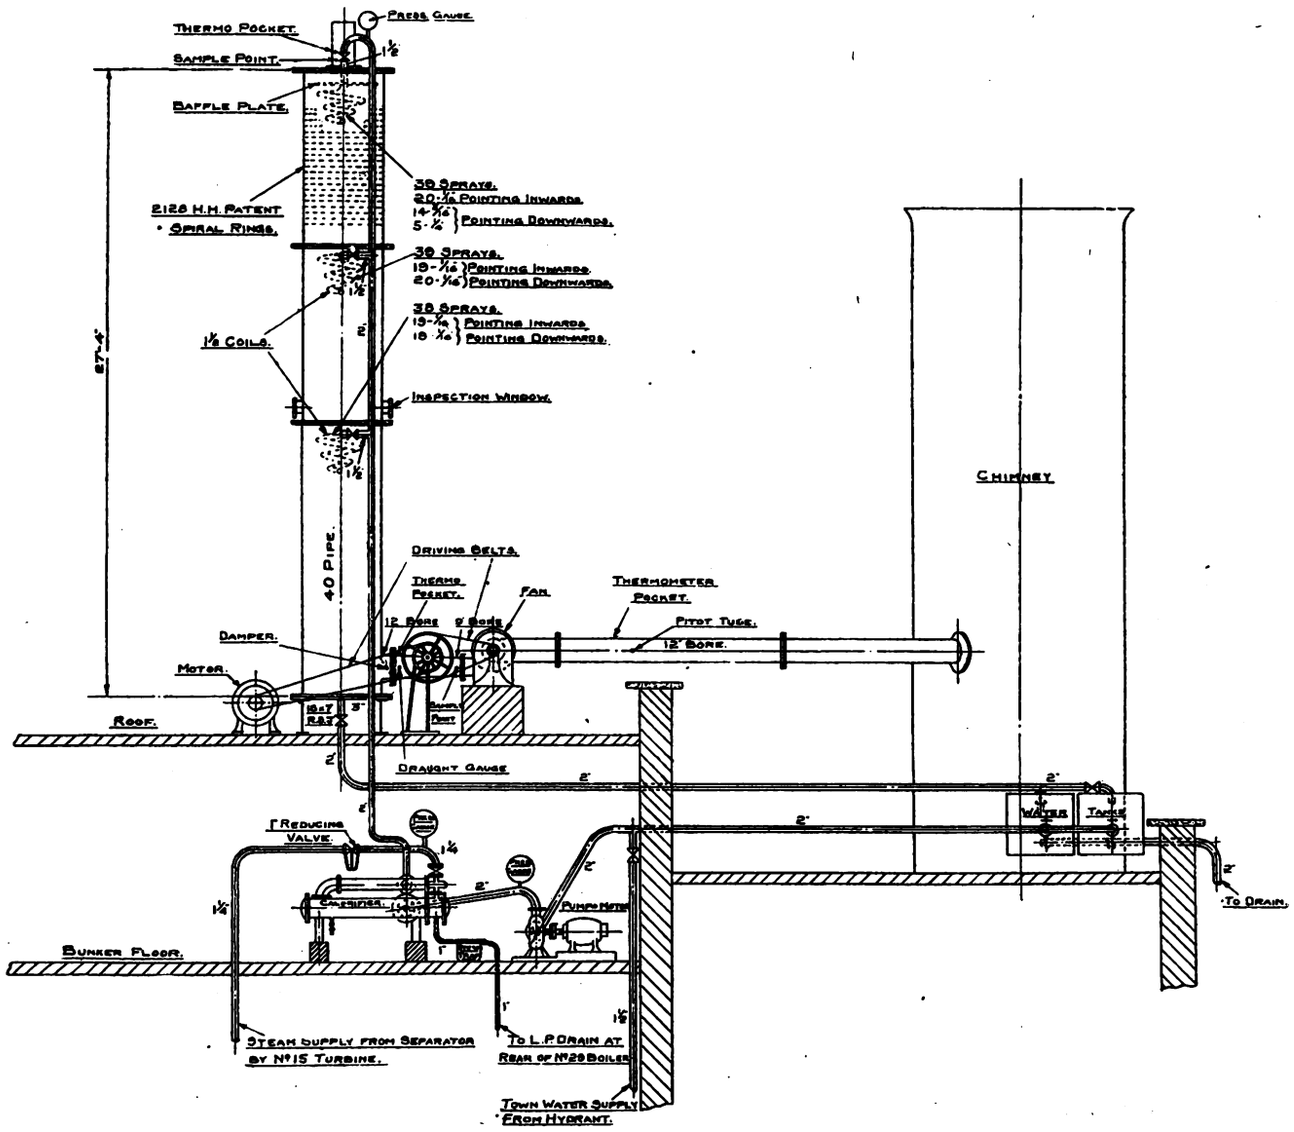

Diagram of the arrangement of the experimental gas washing plant on the roof of the west boiler house at the Grove Road power station.

Digitized by Google

exit pipe, 12 in. in diameter, on the top of the tower carried the treated gases to the atmosphere. At both the inlet and the outlet pipes, draught and temperature measurements could be made and samples of the gases could be taken.

Water from the town main was used for scrubbing the gases, delivered through a centrifugal pump to spraying devices. After passing through the tower, the water could be collected in either of two 300-gallon galvanised iron tanks which in turn communicated with a drain. If desired, the wash-water could be re-circulated through the tower.

For the more important series of experiments, the water was delivered to three spirals, each carrying about 40 nozzle sprays, at heights within the tower of about 10, 17 and 24 ft. respectively. In the principal series of experiments described in this report, the portion of the tower lying between the two upper spray-spirals was packed with spiral absorption rings. Other experiments have tested the efficiency of water sprays alone, without packing.

From experiments, using cold water, it can be concluded that, when the time of contact of the flue gases with the wash-water is over 12 secs., there is complete removal of the sulphur gases, even when their original concentration is high, if sufficient water is used. As the velocity of the flue gases increases, the efficiency of removal of the sulphur gases decreases, but it is still high (90%) with times of contact as low as 7 seconds.

Comparative experiments (details of which are not recorded in the report) with the absorption tower (1) empty save for the spray-spirals and (2) packed, as to its upper portion, with absorption rings, showed that the efficiency of removal of the sulphur gases was as good with the unpacked as with the packed tower, provided that sufficient water was used. Rather more water was required with the unpacked tower.

A striking feature of the tests with hot water was the absence of any smell of SO_2 in the wash-water. When using cold water this smell was always noticeable and analysis showed the wash-water to contain sulphites. On analysing the hot wash-water, it was found that sulphites and thio-sulphates were entirely absent. All but about 2 or 3% of the total sulphur they contained could be accounted for as sulphate.

It thus appears that, by the use of hot water, the desired transformation of the SO_2 of the flue gases into SO_3 has been effected. The efficiency of removal of the sulphur gases by comparatively small quantities of hot water is thus explained.

It having been found that the amount of water required effectively to remove the sulphur gases from flue gases, even when their concentration is high, is not excessive, a scheme for the treatment of the gases at the Battersea power station was drawn up.

Requirements Amply Met.

This is shown diagrammatically in the report. It more than fulfils the requirements (as regards, for example, the time of contact of the flue gases with the wash-water) indicated by the Grove Road experiments, and allows for an additional treatment, a final washing with a slightly alkaline solution, which the advisers do not consider will be necessary. Provision has been made for the insertion of packing material (rough-sawn boards on edge) both in the downtakes from the main flue and in the uptakes to the chimney-stacks. The Grove Road experiments indicate that but little packing material will be required, the sprays in the main flue alone, with perhaps some packing in the downtakes, being sufficiently effective.

To guard against the emission from the chimney-stacks of gases saturated with water-vapour, with consequent condensation in cold weather, arrangements are provided for delivering hot and dry air to the stacks either just above the "eliminator plates" (which will entrap entrained moisture) or at any point higher up the stacks.

As regards the neutralisation of the wash-water, this will be effected by mingling with the "condenser" water, the volume of which will be about 40 times that of the wash-water.

The only alteration in the character of the river water would be a slight diminution in the carbonate content and a corresponding increase in the amount of sulphate present. Should the necessity arise for further treatment—for example, to remove suspended matter or to oxidise any sulphites that may occasionally be present—provision is made for settling tanks of adequate capacity.

The interim report of the committee presided over by the Government Chemist states that generally they consider the experimental work so far reported indicates that by the use of water sprays in the experimental apparatus it is possible to eliminate from the gases of combustion nearly the whole of the sulphur gases present.

In addition to seeing the interim report of the advisers to the Power Co., they had the opportunity of inspecting the experimental arrangements while in operation at Grove Road on July 8th, 1929, when neither acid taste nor objectionable odour could be detected by breathing the undiluted treated gases coming from the exit flue.

The analytical results as regards acidity of ingoing and outgoing gases during an experimental run at Grove Road were checked by a representative of the Government Laboratory and the absorption of about 95% of the sulphur acids in the flue gases was confirmed.

"Promising Results."

From what they have seen of the process in its small experimental stage, while they consider that it has afforded results that are promising, they consider that there are features in the experimental apparatus and process which are still obscure, so that, while they think there is no inherent reason why similar results should not be obtained from the larger experimental plant now being erected on the lines of a projected installation at Battersea, they prefer to await the results afforded by this larger experiment. They think it necessary that a more definite explanation of the mechanism of the oxidation of sulphurous to sulphuric acid in the experimental process should be forthcoming before they can report on the practicability of the process.

The committee points out that: "In connection with this power station very large quantities of condenser water are to be used, as much as 500 tons, we were informed, for every ton of coal burned. A portion only of this quantity should be required for washing the gases. We have ascertained that the alkalinity of Thames tidal water near Battersea is about 20 parts per 100 000. Five hundred tons of such water would have twice as much alkalinity as is necessary to neutralise the sulphur acids derived from one ton of coal containing 1·5% of total sulphur, even assuming that no sulphur remains in the clinker. Under these conditions there is no chance of an acid effluent going into the river if all the condenser water is systematically utilised for neutralisation, and this condenser water before being withdrawn maintains the required alkalinity, but there is a chance of some calcium sulphite remaining in solution. This, although a neutral salt, might be objected to, on account of its property of further depleting the river of oxygen. From the ready oxidisability of sulphurous acid and sulphites, their total conversion into sulphuric acid and sulphates should be easy, in which case the effluent water at Battersea would still retain a certain alkalinity, and would be altered only in the sense of having in solution a small quantity of innocuous calcium sulphate.

"We understand that mechanical separators are to be used for eliminating the bulk of the dust; the washing process which the gases undergo for removal of sulphur acids should prevent the escape of most of the residual dust particles, but we have no experimental data on this aspect of the question."

OVERHEAD OR UNDERGROUND.

The Ministry of Transport inspector, Mr. Gordon Tucker, held an inquiry at Poynton, on November 20th, into the application of the Electricity Co. of Macclesfield for permission to erect overhead lines for the supply of electricity in Poynton. Mr. Arthur Garner, land agent, Stockport, stated that building development in Poynton was being delayed by the absence of a supply of electricity. Mr. Pittfield, owner of land at Butley, said the advantages of electricity would outweigh the loss of amenities through the pylons. Mr. W. Lionel Howard, chief engineer to the company, said the cost of overhead line was less than one-third of the cost of underground cables, and the latter would not be justified in view of the small class of property in the district. There was opposition by the County Council and the Parish Council, but the inspector said the Ministry would have to be satisfied that the overhead cables interfered with the amenities of the district or were a public danger before being justified in refusing the application.

MIDLAND ELECTRICAL ENGINEERS' BALL.

The Midland Electrical Engineers' Annual Ball took place at the Grand Hotel, Birmingham, on November 15th. About 450 persons sat down to supper and spent a most enjoyable time. During the evening a presentation was made by Mr. W. H. Heaton, Chairman of the Engineers' Ball Committee, to Mr. and Mrs. R. A. Chattock to show appreciation of the former's valuable services as President of the Engineers' Ball Committee from its inception. The gift took the form of an antique silver cream jug and sugar basin, together with an old oak linen chest.

THE ELECTRICAL INDUSTRY OF GREAT BRITAIN.

Important Survey Issued by the British Electrical and Allied Manufacturers' Association—Production Data—Greater Activity but Smaller Profits.

"THE Electrical Industry of Great Britain," published yesterday (Thursday) by the British Electrical and Allied Manufacturers' Association (pp. 233, £2 2s. net), is a notable production which should be studied carefully by every member of the electrical industry. It is a survey of the organisation, productive efficiency and world competitive position of the British electrical industry, and it attempts to give at once a retrospective view and a forecast. It explains in relation to the general industrial conditions of the country the way in which co-operation and marketing enterprise have saved the industry from trade depression. It also deals with the expansion of electrical exports in the leading markets of the world, the growth of electrical power consumption at home and overseas, and discusses the importance of the power industries in the public economic organisation of Great Britain.

Its length and the nature of its contents—including many facts and statistics which we have not seen elsewhere—preclude the usual form of review in the limited space available, so we must confine this notice to a selection of extracts which may serve as a sample of the remainder.

Emphasising the slow rate of capital depreciation in electricity supply, the survey points out that this means that renewals and replacements do not constitute an important factor as such in the market for power equipment, so that the electrical manufacturing industry is dependent on extensions and on new installations, and, above all, on its capacity to produce new types of plant sufficiently economical in operation to justify the retiral of existing plant before it is normally due.

The capital increase in the industry is very much less than that recorded in electricity supply, and is sufficient indication of the fact that the profit-earning capacity of this branch of the industry has not been such as to attract capital continuously in a volume relatively the same as that of electricity supply.

The capital expenditure on power equipment in this country since the conclusion of the war is, measured on a kilowatt basis, almost the lowest in the world, and it is interesting to find that more than 90 % of such expenditure has been met by home production.

The balance of the manufacturing industry is changing. Only a few years ago the weight of production lay undoubtedly in heavy generating plant, large industrial motors, main transmission cables, and overhead lines, but now production is becoming much more important in small transformers and switchgear and in consumers' apparatus generally. This means a new alignment of forces within the industry, which is not calculated to render difficult the work of co-operation on a horizontal basis.

Peculiar Market Reaction.

The industry is peculiar through the fact that it has the greatest potential market in front of it of any in the world, and this market reacts at once to a reduction in the selling-price of electricity. A reduction in price, as experience has shown, almost invariably means such a growth in demand that the net revenue accruing to the supply undertaking within the limits imposed by essential capital expenditure is increased. There is an optimum return on capital expenditure beyond which it is difficult for a supply undertaking to go, and the very existence of such an optimum return should be an incentive to such undertakings to bring their prices down to an economic minimum. There is a point where demand can be stimulated so greatly as a result of proper price adjustment that an optimum return is reached almost at once and the undertaking can expand its capital expenditure almost indefinitely, with the sure knowledge that a satisfactory return will be made on it. There is room for a very close examination of the electricity supply industry from this aspect.

Development expenditure has not been adequate in electricity supply, owing to the prevalence of the conception that a high price per unit is justified merely on the basis of return on capital expenditure. If supply undertakings adhered instead to the conception that their system should have a definite revenue-earning capacity, and if they set out to increase to the very maximum their distribution system and their demand complex, the position of Britain electrically would be enormously improved. Load-building can justify a very heavy capital expenditure, even in agricultural areas, and the growth of electricity in the future must depend on a policy of load-building with carefully reasoned and accurately detailed schemes. This whole subject merits the most minute investigation, since the issues involved are important, and there is need for some form of theory which will not only guide policy, but serve to concentrate effort along broad lines.

Chapter II deals with electrical manufacture, examines production, and points out that since 1907 output in Great Britain has increased by 404%, and in the United States by 540% ; but it is significant that generators, transformers, and other power plant equipment should only have increased by 300% in Great Britain and 283% in the United States—a fairly clear indication that the change in balance of production in the industry had begun before 1924.

Leeway Made Good.

Statistics are given which show that the industry has moved upwards very rapidly in fifteen years, but, during the last three years especially, owing to circumstances which together have retarded progress, the curve of increase has shown a tendency to straighten out, and the industry has not, as a consequence, fulfilled the expectations of those who assumed at the conclusion of the war that the rapidity of electrification would be so marked that the power industries would be fully occupied for a considerable number of years. During 1929, however, much of this leeway has been made good as a result of developments in connection with the national electrification scheme.

The statement has been made recently that the industry is now so fully employed that it cannot add easily to its existing industrial capacity. According to the survey, the industry is now in a position to increase its production by at least 40%. In one section, devoted to electric motors, there is undoubtedly excess productive capacity, owing entirely to the state of depression which has ruled in the industry since 1921. The natural expansion of this branch has been seriously checked, with the result that there is a high percentage of reserve plant not yet brought into full use. On the whole, the productive capacity of the industry in excess of its present output is placed at rather more than 40%, so that it can undertake any work of widespread industrial or national railway electrification which economic conditions may cause.

It is quite clear that the industry has gone through two cycles of prosperity and depression since the conclusion of the war. The year of greatest prosperity was 1921, following the trade boom of 1920. The engineering lockout and trade depression generally caused a very heavy slump in 1922. This slump affected more directly electrical than mechanical plant, while meters and instruments survived it with much less difficulty than any other section, due possibly to the fact that they are less affected by trade and more by the general growth of electricity.

Recovery was very rapid from this period of slump, with a point of maximum output in 1926. Since 1926 a period of fairly steady output has intervened, accompanied by falling prices and a definite increase in volume, as measured in horse-power. This increase in volume has had its effect in the absorption of more labour, on the one hand, and in a serious reduction of profits on the other.

A further observation may be made to the effect that general trade conditions, either of depression or prosperity, are reflected in electrical manufacture with the lag of one year. Thus the collapse of 1921 resulting from the coal strike affected electrical manufacture in 1922. Similarly, the crisis of 1926, which was less severe owing to the fact that it was not accompanied by deflation in prices, interrupted the expansion of the industry in 1927, and still had a certain effect in 1928.

The one section which had moved upwards practically in a straight line since 1922 has been control and switchgear, and it is rapidly becoming one of the most important sections of the engineering branch of the industry. The development of the national scheme must serve to make it still more important, with the result that one would expect the productive capacity of the industry to increase much more rapidly there than in any other branch, with the possible exception of transformers.

THE ELECTRICAL INDUSTRY AND COMPETITION.

The Annual Dinner of the B.E.A.M.A.—Export Orders in 1929 Higher than Any Year Except 1927—Minister of Transport on Development in Rural Areas.

OVER 700 persons attended the annual dinner of the B.E.A.M.A. at the Connaught Rooms, London, on November 20th, presided over by Lord Derby, the president of the Association, and among those present were Sir Andrew Duncan, Sir Philip A. M. Nash, Mr. W. L. Hitchens, Lt.-Col. R. K. Morcom, Sir T. F. Purves, Sir John Brooke, Dr. S. Z. de Ferranti, Mr. A. Page, Col. R. E. Crompton, and Sir Duncan Watson.

Mr. J. H. THOMAS, proposing the toast of "Electricity in Industry and Transport," said that the prosperity of the electrical industry was a good answer to those who doubted whether we could compete against the world. The volume of exports of electrical goods and apparatus had risen since 1924 by 15%. The index of production showed that export orders in 1929 were the highest of any year except the abnormal year of 1927, following the hold-up caused by the coal dispute.

Demand for Heavy Electrical Plant.

In the past seven months orders for heavy electrical plant to the value of £7 000 000 had been obtained from abroad, in the face of foreign competition. During the same period orders for £12 500 000 of heavy plant for home use had been placed. The first necessity for selling abroad was that we should make the right article at the right price. It was the buyer who decided what he wanted, and we should make up our minds to give it to him. In price, we were up against it. We were trying to maintain our standard of living against the formidable competition of other countries with a lower standard. Our standard could be maintained only by fully using our heritage of industrial skill, both of employers and workpeople, by a vigorous cutting of unnecessary on-costs and by the highest technical efficiency.

We were told that this was an age of big business. Big business cannot be done by small isolated units, however efficient. For big business, research and experiment were needed, and it was a truism of all research that it could only be successful in the long run if effort and results were pooled. For big business, big financial resources were required, and these would readily be forthcoming for any well-organised plans of concerted action in any industry, whether for export trade or for internal equipment and home development. There were certain matters in which it was thought the Government could help, and ought to help, but for industrial difficulties as a whole it was true to-day that self-help should come before Government help. The electrical industry was one which, in the main, had helped itself. That was one reason why it was properous, and it was also a reason why it would always command sympathetic attention from the Lord Privy Seal.

Sir FELIX POLE, replying, said that as a newcomer to the electrical industry he was astonished at the fierce competition and alarming price-cutting which took place. The popular notion was that, through combination and co-operative action, electrical manufacturers had been able to secure high prices for their products and were in a position to obtain a satisfactory margin of profit over production costs. That was not the fact. Not only was there strong domestic competition, but there was a form of foreign competition which was not apparent on the surface. He referred to the tendency in some quarters to invite tenders from foreign firms, and then to bargain with British companies to force them to reduce their considered quotations as an alternative to placing orders out of this country. In the long run, that procedure was not calculated to obtain the best results, either in equipment or service.

Protection of Home Markets.

As to foreign competition, he looked hopefully to the present Government. As he understood it, they were helping—indeed forcing—the coal industry to bring into effect a comprehensive scheme of protection of home markets. In the electrical industry they were in need of similar protection. They lived in the most highly taxed country in the world—hours and wages were more onerous here than in many competing countries, and the cost of social services was increasing. They were prepared to exert themselves to the utmost to get business at home and abroad. They were prepared to cut prices to get export business, but he asked them not to force down prices to the level of those quoted by foreign competitors. The English market was the foreigner's excursion traffic, and electrical manufacturers could no more live on the basis of foreign prices than could English railways live by carrying all their passengers at excursion rates. He asked railway companies, municipal corporations, statutory supply undertakings, etc., to patronise home industries at fair prices, having regard to conditions at home, and he wished the Government would seriously bear this in mind when considering the question of safeguarding of essential industries. He would also ask Mr. Thomas to help them to increase their trade by reviving and extending the Trade Facilities Act, which would help the electrical industries by affording facilities for the financing of large contracts at home and abroad.

Mr. HERBERT MORRISON, M.P., Minister of Transport, congratulated British manufacturers on their achievements in the supply of electrical equipment overseas, but progress in the home market was not as good as it should be. The industry ought to pursue a really aggressive policy in achieving the almost universal use of electrical power. There were a large number of areas where electricity was not yet available, in some cases even in towns. That was an indefensible state of affairs, and he urged everybody to go ahead with the ideal of having electricity available throughout Great Britain. There were hundreds of thousands of private houses equipped with electricity for lighting only. The electricity undertaking that was content with such a state of affairs in the houses it supplied was not doing its job.

The sales of electricity to consumers had already advanced from 3 645 million kWh in 1922 to 7 603 million in 1928, showing an increase of 108%. No less than 500 applications for consent to overhead lines had come before the Commissioners and the Ministry in the last seven months, consent having been given in the majority of cases. Since April the Electricity Commissioners had issued loan sanctions to local authorities to the extent of £10 000 000 for electrical purposes, and he, the Electricity Commissioners, and the Central Electricity Board were giving special attention to the supply of current in rural areas, in the light of the valuable reports drawn up by the Conference on Electricity Supply in Rural Areas.

Work of the Central Board.

The work of the Central Board was proceeding. Six regional schemes had been transmitted to the Board by the Commissioners covering nearly half of Great Britain, and including about 80% of the population. These schemes provided for the establishment of 1 870 miles of 132 000 V line, it being estimated that during the next 10 years over 4¼ million kW of plant would be required. The work of building the "grid" was proceeding satisfactorily. He, as Minister of Transport, had consented to the erection of 144 miles of overhead lines, forming part of the system, and the Electricity Commissioners had consented to a number of important underground main transmission lines in the London area. About two-thirds of the lines of the Central Scotland area had already been erected. The "grid" lines were alive between Bonnybridge and Dalmarnock; Dalmarnock and Yoker; Stockport and Macclesfield; Bedford and Little Barford. In the near future the Board would be giving supplies to Greenock, Kettering, Luton, Aylesbury, Epsom and Worthing.

It was a misfortune that the electricity supply industry had not been developed as a co-ordinated national enterprise. Only since the war was some reasonable degree of national control being secured. Even so the industry was afflicted by a mix-up of authorities, sometimes getting in each others' way, but the Commissioners and the Board, together with the Ministry of Transport, were trying to evolve order out of chaos. He hoped that at some time he would be able to take a hand in the further national development of electrical generation and distribution. If he did, the manufacturers would be able to look forward to a big expansion of demand in the home market.

E.T.B.I. DINNER.

Gratifying Response to President's Appeal for Funds.

MR. HOWARD MARRYAT presided over a gathering of some 260 members of the electrical industry assembled at the Savoy Hotel, London, on Tuesday evening for the annual festival dinner and dance of the Electrical Trades Benevolent Institution.

Proposing the toast of the E.T.B.I., Mr. Marryat said he had never undertaken a task which had given him such real pleasure as the presidency of the E.T.B.I. His task had been greatly simplified by the generosity of the contributors, and he was glad to announce that he had received no fewer than eight gifts of not less than £500, and a number of other large sums. He was personally delighted at the wonderful support he had received from his colleagues amongst the electrical installation contractors.

Mr. Marryat said he had noticed that electrical people generally had developed the distressing habit of telling each other that business was bad, although official figures conclusively proved that the bright spot in the industrial firmament was the progressive and prosperous electrical industry. This habit had led us to think of the E.T.B.I. on too low a scale; in pence when it should be pounds, and in pounds when it should be tens. The income needed to meet the cases of distress inseparable from any great industry, could only be provided by a very substantial increase in the capital fund of the E.T.B.I., which, at the start of this year, amounted only to £37 000, a sum less than the yearly disbursements to beneficiaries in some other industries.

Only the committee which dealt with the claims on the E.T.B.I. knew the appalling destitution of some of the industry's pioneers, who were too proud to air their distress in public. It was unthinkable that we should allow these old people to end their days under conditions of dire necessity. They had ploughed the rough ground which was now yielding ample reward, and but for some accident depriving them of their health, would now be enjoying their share of the harvest which was coming to those now in the industry.

Tactful Administration.

From personal knowledge he could say that great care was taken in investigating the *bona fides* of claimants for help, and that the fund was administered with remarkable sympathy, tact and patience. Help was given in a way which could not offend the self-respect of any individual, and it was gratifying to note that many of those who had thus been helped through times of difficulty, had been able to take their places again in positions of responsibility.

It was the proud claim of the E.T.B.I. that it had never yet failed to aid anyone who had a proper claim to assistance. The time had now come when the normal income was inadequate to meet the needs of cases of incurable disease which should be pensioned.

Great efforts were being made to place the finance of the Institution on a basis of small contributions from those likely to benefit from them. It would be a long time before the additional income from this source could satisfy requirements, and it was essential to raise the fund to at least £50 000, in order to start the New Year with any degree of security. There were still two vacancies for vice-presidencies, positions for which anyone might qualify by making a donation of £500. Others willing to give £100 could become life governors, and to those who could not afford this, he recommended a life membership at £10.

Mr. Justus Eck then made a presentation on behalf of all the committees of the E.T.B.I. to Mr. F. B. O. Hawes, who, after 19 years, was now retiring from the position of honorary secretary, to which he had devoted so much of his leisure. The presentation took the form of a seven-valve all-mains wireless receiving set bearing an inscribed tablet, a piece of silverware for Mrs. Hawes, and a leather envelope containing a series of letters commenting on the value of Mr. Hawes's services to the Institution.

A Record Collection.

Mr. Hawes, after acknowledging the gifts, said he desired to emphasise the necessity for keeping the finance of the Institution on a voluntary basis. The danger of the fixed contribution plan was that the Institution might come to be regarded as a friendly society.

The health of The President was proposed by Mr. L. B. Atkinson, seconded by Mr. W. R. Rawlings, and briefly acknowledged by Mr. Marryat, who announced that the totals of the collectors' lists amounted to £8 009 10s., which, with the collection during the dinner of £925, brought the total to £8 934. This sum was later raised up to £9 000, the difference being partly accounted for by 25 guineas received for a framed water colour painting presented by Mr. Marryat, auctioned by Mr. Justus Eck, and "knocked down" to Mr. C. L. Arnold. This collection makes history by exceeding the previous record collection of £6 912 by a very considerable amount.

A novel feature of this year's Festival was the dance, which was held after the dinner, and continued until 2 a.m., at which hour quite a number of couples still held the floor.

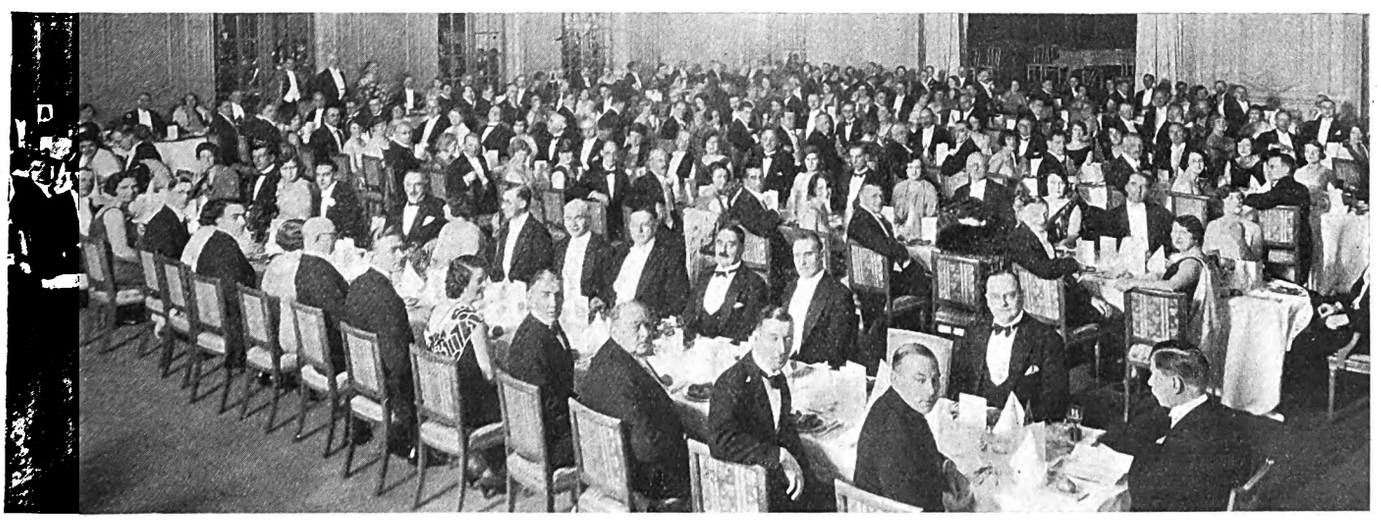
The totals of the collectors' lists are as follows:—

President's List:—Personal, £5 286 2s., per Mr. L. C. Penwill, £72 1s. 11d.; per E.C.A., £624 10s. 3d., total, £5 982 14s. 2d.

"Distribution" £79 9s. 6d.; Messrs. A. G. Beaver, £16 16s.; C. H. Cox, £81 15s.; J. Y. Fletcher, £546 2s. 9d.; H. Howitt, £280 15s. 6d.; W. R. Rawlings, £158 2s. 6d.; Major W. Roberts, £17 13s. 4d.; E. E. Sharp, £11 0s. 6d.; J. M. Sim, £40 14s.; J. N. Stephens, £218 16s. 9d.; L. Thurner, £128 16s. 6d.; C. Wilson, £184 19s. 6d.; E. Wilson, £243 8s. 6d.; Miss C. Haslett, £18 5s. 6d. Total, £8 009 10s.

Some of the large individual donations made to the Institution during the year are specially noteworthy. They include the following:—

Mr. Dane Sinclair, £602; Mr. N. Frankenburg, £500; Messrs. Merz and McLellan, £500; Sir George Sutton, £500; Sir Hugo Hirst, £500; Mr. J. A. Crabtree, £500; Sir Tom Callender, £500; Sir Harry Renwick, £250; Electrical Contractors' Association, £200; the Electric Lamp Manufacturers' Association, £105; Whitehall Securities, £100; Mr. H. Alabaster, £100; the Mullard Wireless Service Co., £100; Holophane, Ltd, £100; Mr. W. R. Rawlings, £75; and Mr. R. S. Whipple, £50.



Some of the company assembled for the annual festival dinner and dance of the Electrical Trades Benevolent Institution at the Savoy Hotel, London, on Tuesday. Mr. H. Marryat, the president, who is seen standing, announced a record collection of £9 000 for the capital fund of the Institution.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Our House in Order."

[To the Editor.]

Sir,—I notice under the above heading a communication from Mr. A. Montgomery, for the N.R.E.I.C., stating that that institution has not at any time expressed any opinion against compulsory wiring rules.

I do not think that the extract from the Executive's report that I quoted could be construed to mean exactly that, as I gave the context stating that the Executive could not recommend the adoption of compulsory wiring rules, the time not being ripe. This indicates rather, I think, that at the moment the idea is not practicable.

In any case, this need not really be gone into at length, as the whole object of my article now seems to have been achieved, the E.C.A Council, at their last meeting on October 29th, having agreed to the appointment of a sub-committee to formulate a definite policy with regard to compulsory wiring rules, compulsory registration, and like matters. The findings of this committee will doubtless be reported to the Council, and may eventually become the E.C.A. policy.

This news will delight the hearts of all sincere E.C.A. members, and I think the thanks of the whole industry are due to the editor of this journal for the valuable opportunity afforded for the ventilation and discussion of these most important questions.

The names of the individuals appointed to this important committee will be awaited with great interest, but I think that it will be possible to promise beforehand that, whatever the finally decided policy of the E.C.A. may be with regard to these vitally important matters, all members will support it with all the influence at their command. Personal opinions will fade into the background; in fact they would never have flourished for so long but for the often-deplored absence of a clear-cut lead, now, happily, a thing of the past.

May one obscure E.C.A. member wish this committee every success in its labours, and express the hope that from them will emerge a policy that will represent the greatest step forward that the Association has ever achieved?—I am, etc.,

T. C. Gilbert.

Folkestone,
November 25th.

Standardisation of Page Sizes.

[To the Editor.]

Sir,—The variety of page sizes in British trade and technical journals is the cause of much waste of money by advertising through the multiplication of designs and blocks. An advertiser using the same advertisement in three journals having page sizes of, say (1) 8 in. by 5 in., (2) 9 in. by 6¼ in., and (3) 11 in. by 7½ in., must necessarily have three sets of blocks, and in the case of journal No. (3) whose page differs in proportions from those of Nos. (1) and (2), he must also have a new layout. It might be thought that the unnecessary expenditure under this heading is small, but in actual fact it is a serious item for all advertisers, and in the case of one engineering firm in the North of England is estimated to represent no less than 15% of the money spent on designs and blocks.

As in the design and production of commodities, so also in the design and production of advertisements it is essential to eliminate waste and make for greater efficiency and economy by the adoption of standards. The Engineering Section of the Incorporated Society of British Advertisers, Ltd., has therefore initiated a movement towards standardisation of page size in British trade and technical journals, and this letter sets forth the proposals, so that the opinions of advertisers other than those who are members of the Society may be obtained.

Since any money which is wasted by the advertiser on unnecessary designs and blocks cannot be spent on the purchase of advertising space, such money is lost to the publisher, and it is quite as much to his interest as to that of the advertiser to assist in preventing this waste. The Incorporated Society of British Advertisers, Ltd., has therefore invited the co-operation of the publishers in considering the problem and the practical steps to be taken in adopting standards. The Society desires to thank a large number of publishers for their practical assistance in the formation of a joint committee representing the Incorporated Society of British Advertisers, Ltd., the Periodical, Trade Press and Weekly Newspaper Proprietors' Association, Ltd., and independent publishers. This Committee now propose the following:—

"That a standard type space size of 10 in. by 7 in. be adopted for advertisement pages by trade and technical journals in Great Britain, and that if a larger or smaller page be considered to be absolutely necessary this should be in the same ratio—and either 11½ in. by 8 in. or 9 in. by 6¼ in."

Note.—The proposals affect only the area occupied by the advertisement, and do not affect the gross page size.

The standards have been proposed for the following reasons:—

(1) 10 in. by 7 in. is already the printed page size of a large number of British trade and technical journals, and has been adopted as standard in Canada and the United States. It further approximates so closely to the page size of many other British trade and technical journals that the change to the standard can be made without undue inconvenience on the part of the publisher.

(2) While it is desirable to have one standard only, this is not practicable at present, and it is therefore proposed that two other sizes should be considered. These, however, are in the same proportion as that 10 in. by 7 in. page, so that the same drawings and designs may be used without alteration.

Although publisher and advertiser will both share the ultimate benefit of standardisation, we realise that the change from over 135 page sizes to three for British trade and technical journals will involve a certain amount of expense for the publishers of those journals whose pages do not at present correspond with the standards proposed. It is only reasonable, therefore, that we as advertisers should recognise this fact and should be prepared to meet the convenience of publishers in making the change. We propose, therefore, that any change of size should be made at a time convenient to the publisher of any journal concerned, preferably at the end of a volume, and we also propose that where a page size of a journal is slightly reduced, no demand is to be made for a reduction in rate, although the advertiser will lose a small percentage of space.

Many publishers are keenly interested in the proposed standardisation, and are anxious to put our proposals into effect. Before they take such an important step, however, they wish to ascertain the views of their advertisers as a whole. This is a reasonable standpoint to adopt and we invite you, therefore, to write, giving your opinions on the proposals regarding standardisation made by the Joint Committee, to the Secretary, Incorporated Society of British Advertisers, Ltd., Aldwych House, Aldwych, W.C.2, with a copy of the letter to the editor of this journal.—We are, etc.,

Thomas Bell,
Chairman, I.S.B.A.
J. Taffs,
Chairman, Engineering Section, I.S.B.A.

"Overhead Lines or Underground Cables?"

[To the Editor.]

Sir,—In answer to Mr. Fennell's remarks in your issue of November 15th, and to those made by "J.A.S." in your issue of November 22nd, we would point out the following:—

(1) Mr. Fennell states that we have under-estimated the cost of laying 33 kV cables.

The cable-laying costs which we gave were taken from a *definite quotation*, from a responsible Continental firm, for the laying down of cables in a large area in England, and include the cost for the use of machinery, etc. We clearly indicated in our article that these costs refer to work carried out in districts where the soil is suitable.

(2) Mr. Fennell states that wayleaves for underground cables would be greater than those for overhead lines. It may be possible that the initial cost of compensation to the farmer, for the damage done to his land at the time of laying the

Digitized by Google

cable, would be greater than that for the building of an overhead line. We contend, however, that the farmer will suffer so much less interference in his farming operations from the uninterrupted surface which the underground cables form, and that he will appreciate the fact that his land will not be traversed by those responsible for the upkeep and supervision of the overhead line, that the total capitalised cost of wayleaves will be considerably lower in the case of underground cables than in that of overhead lines.

This is also an answer to the question asked by "J.A.S."

(3) Mr. Fennell remarks that there is no reason why we can calculate on a shorter route for underground cables than for overhead lines. On account of Mr. Fennell's considerable experience in this direction, we are very grateful to him for the information, which we shall duly take into consideration in future calculations, although this item is not important.

(4) "J.A.S." remarks that 33 kV overhead lines could be built for a price of £500 per mile. We calculated on a price of £1 000, which appears to comply with the figure given in the Electricity Commission's preliminary estimate of these feeders. If, however, we take "J.A.S.'s" figure, by means of which the cost of an underground cable line would be almost two-and-a-half times that of an overhead line, the actual cost per unit calculated on a supply of 8 600 kVA for 2 000 hours per annum, for a supply by underground cable, would exceed the cost of a supply by overhead line construction by about 0·015d. per unit. We leave it to your readers to say whether this difference would be justified by the more efficient service given by the underground cable.

(5) We leave "J.A.S.'s" statement that the maintenance of underground cables would probably be greater than that of overhead lines to the judgment of your readers. We have experience of underground lines laid 30 years ago which have cost nothing for maintenance, and which are in as good condition now as when first laid down.

(6) "J.A.S." says that the grid supply should be available *at any point in the land*, and that the use of cables would completely nullify this condition, etc. We think that this is a misunderstanding on "J.A.S.'s" part. The 33 kV lines which we have under consideration are to radiate from selected stations to certain points in a district and are not to be tapped, but the distribution is to take place from these points.

(7) "J.A.S." thinks it very unlikely that the Central Board would use Continental cables. This is quite possible, but the English cable industry has developed so greatly that we are convinced that it can manufacture cables of as good a quality as those now obtainable from the cable makers on the Continent, and at the same price.

Finally, in our article on 33 kV underground cables we calculated on losses greater than we believe will be incurred in general practice, but we intend to correct this in an article on 11 kV lines, which we hope will shortly appear.—We are, etc.,

R. E. CROMPTON.
ALFRED EKSTRÖM.

"Where *is* that Battery?"

[TO THE EDITOR.]

SIR,—Mr. Raymond Mitchell's suggestion for a big prize as an inducement to the invention of an epoch-making storage battery will not, I fear, bear the test of analysis.

Let us look at it for a moment. What individual or what organisation can or will offer a minimum of £50 000 as a reward for the invention of a light, cheap, durable, compact storage battery? A famous daily paper made both a name and capital for itself by not only offering but paying large money prizes encouraging the development of practical aeroplanes. No newspaper to-day would think of offending its huge advertising clientele representing the petrol, oil, tyre, car, vehicle and accessories industries by offering a large prize for a traction battery, the invention of which would rob it of hundreds of thousands of pounds in annual revenue.

This fact prompts us to turn elsewhere. Will some cigarette, soap, pill, pork or powder king come to the rescue with one eye on publicity and the other on profit? I think not.

I think that the electrical industry has the money for a big prize, but with 25 years' work "on its plate" at the present time, in co-ordinating electricity supply and in catching up with the domestic demand, it is much too busy to worry itself about a traction battery.

I have already pointed out that the battery makers to-day are finding good enough profits in existing types, and therefore do not need to concern themselves with a "posterity battery" which is very hypothetical in any case.

Having now run the gamut of plutocratic prize possibles, we are left with the prospect of State intervention; need we bother to examine this in view of the pioneer work now being carried out by the Irish Free State? The prize idea is a good one, but will Mr. Mitchell tell who shall offer the prize?—I am, etc.,

"BATTERY ELECTRIC."

London,
November 26th.

THERMAL STORAGE.

Some Advantages of the Constant Pressure System —Dr. Kiesselbach's Method Described.

DURING the last few years attention has been consistently directed to methods of steam-heat accumulation, in which the surplus steam generated during periods of normal operation on light load is condensed to water in order to conserve the heat. In this system, when the demand for steam is greater than the normal steaming rate of the plant, the pressure is allowed to fall and the water evaporates and is used as steam at lower pressure to augment the steam generated by the boilers.

Since, however, the water in which the heat is thus accumulated cannot be evaporated except by reducing the pressure imposed upon it, the system is only readily adapted to works requiring two or more processes. It will be appreciated that in this method the accumulator shells must necessarily be large, as they must hold sufficient water to condense all the surplus incoming steam.

Distinct from this system of falling or variable-pressure accumulation is the constant-pressure system, which appears to possess distinct advantages in many industries where single pressures as well as more than one pressure are used. Under this heading comes the system devised by Dr. Kiesselbach, which consists primarily of a storage tank in which water is accumulated and maintained at both boiler temperature and pressure.

Water Level and Circulation.

The accumulator is in direct contact with water in the boiler by means of an overflow pipe from the boiler which maintains constant water level, and the water is circulated from the boiler to the accumulator and from this storage-vessel back to the boiler, by means of a circulating pump. The normal feed-water pump is controlled by a pressure-operated regulator connecting the feed-pump and the live steam delivery line, and the feed-pump then operates in accordance with the rise in boiler pressure. A pressure equilibrium pipe admits steam from the boiler on to the top of the water in the accumulator, and ensures that the accumulated water is maintained at boiler pressure and temperature.

Under conditions of normal operation of the boiler the circulating pump runs normally, the feed-pump passing the same quantity of water as is being evaporated. In the event of a decreased demand on the steam line, the pressure tends to rise and the automatic regulator between the live steam line and the feed-pump supplying the boiler opens, admitting more steam to the feed-pump and increasing its speed and the quantity delivered. The consequent rise of water level in the boiler causes an overflow of water to the accumulator, and the low-temperature water admitted to the boiler tends to lower the pressure. As the demand for steam increases, the pressure tends to fall, with the result that the boiler feed-pump is slowed down, while evaporation in the boiler continues. At the same time, water which is at full boiler temperature and pressure is circulated from the accumulator, flowing to the boiler and back to the accumulator.

In this way the water level in the accumulator continues to fall at the exact rate at which it is being evaporated, but during this period of excessive evaporation the boiler is fed with water at boiler temperature and pressure, and consequently only the latent heat to convert this water to steam at the same temperature has to be added. When the period of excessive steam demand is passed, evaporation again becomes normal, the pressure regulator admitting water from the feed-pump, restoring the water level in both the boiler and accumulator.

NEWS IN BRIEF.

School Lighting—Progress of Burnley Hiring Department—Appointments Vacant—Electricity in Manchester Baths—Electrical Development in France.

BARROW Corporation's new showroom, offices, demonstration and lecture room, etc., in Duke Street, which have cost about £10 000, were opened on November 15th.

Seaham Harbour Electricity Committee has decided to equip Emily Street School with large cooking equipment for about 200 scholars, in addition to lighting the school by electricity.

It is understood that the Tribunal of the German Patent Office in Berlin has upheld the claim of the Western Electric Co. against the Klangfilm-Tobis Co. regarding a certain patent, and has declared it null and void.

Burnley Electricity Department in October fixed 859 prepayment meters, 589 meters on rateable value system, and 206 appliances, including radiators and cookers, on hire or hire purchase.

An experimental installation of five electrically operated fans at Blackwall Tunnel having improved the ventilation, the London County Council Highways Committee recommends the installation of further plant at a cost of £8 000.

Bexhill Electricity Committee has considered the provision of further lighting on the parade and the lighting of parade shelters, and a full report on the subject is to be presented. The basement at the showrooms is to be adapted as a model kitchen.

Applications are invited for the following appointments: Lecturer in electrical engineering at the Government Technical Institute, Insein, Burma; test-room supervisor and test-room assistant in the Hull electricity department; electrical showroom salesman and lady demonstrator of electric cooking and domestic apparatus at Barrow-in-Furness; assistant engineers in Sunderland electricity department.

Manchester Corporation Baths Committee reports that the use of electricity for driving purposes has proved far more economical and cleaner than by steam power, and, consequently, all the later establishments are being driven by electric power and all new schemes will be on similar lines. The machinery in two of the establishment laundries, a large number of pumps connected with filtration aeration, and a large proportion of the machinery in the washhouses have been converted to electric driving.

Mr. B. Waite, district manager, Post Office Telephones, addressed, last week, a meeting of the South Wales and Monmouthshire branch of the Chartered Institute of Secretaries on "The Telephone Service." Mr. Waite said at present the total capital account of the telephone system amounted to £109 766 608, and of this not less than £74 000 000 had been sanctioned since 1920. Expressed in terms of telephones per 100 of the population, London headed the list with 10·2, Bournemouth being second with 7·6, and Cardiff followed with 6·3.

Mr. F. W. Goodenough, president of the Incorporated Sales Managers' Association, said in a recent address, we had to learn that recognition of the vital importance of scientific salesmanship was essential to progress. That was why the Committee on Education for Salesmanship, whose interim report would soon be published, were so anxious to arouse the interest of manufacturers in the problem. We needed a better appreciation of the importance of salesmanship in the high places of the industrial world; and an appreciation of the importance of education and training.

The direct telephone communication which has been established between ships in the Tyne and the shore is found to be a complete success.

Hull Corporation Aerodrome Committee has authorised the Town Clerk to negotiate with National Flying Services, Ltd., terms for the installation of an oil engine and generator for the purposes of electricity supply at the aerodrome.

The Magistrates of Glasgow recommend that automatic signals be erected at the corner of Queen Street and George Square as a further experiment on similar lines to the signals already set up at the corner of Hope Street and Sauchiehall Street.

The French Prime Minister has laid on the table in both Houses of the French Parliament the portion of the National Equipment Bill asking for an immediate vote of £1 600 000 for developing the electrical power industry.

A fire which occurred recently in the tower of St. Andrew's Church, North Berwick, was apparently due to a leak in the by-pass of the gas lighting equipment for lighting the clock. At last week's meeting the T.C. decided to light the clock electrically in future.

Engineering employers last week declined to concede the demand of the trade unions for an increased wage or to make any offer, and the unions decided to report the deadlock to their executives, with a view to calling a meeting in January of next year. The employers supported their decision by facts showing that the financial commitments of the Government would impose greater additional burdens upon industry.

The Western Union Telegraph Co. announces that the effect of the recent earthquake upon its cable service between Great Britain and North America is considerably less than was at first anticipated. The service via Western Union between this country and the American Continent is now practically normal.

Swanscombe U.D.C. has received a report from the Surveyor that the Northfleet Gas Co.'s successors have offered to provide and instal service pipes in the Council houses now being or to be built, free of charge, so that the tenants or purchasers can have a supply of gas for use with cookers, coppers or fires. The houses are to be wired for electric lighting.

Mr. W. M. Rankin, principal of Burnley Municipal College states in his annual report that during the session engineering students, numbering over 400, were in excess of any previous year. Twenty students—a record—obtained national certificates in mechanical and electrical engineering, and 10 others were placed in merits lists of Union of Lancashire and Cheshire Institutes. For the first time an honours engineering degree of London University was obtained by part time study, by Mr. Gilbert H. Jackson, of Todmorden.

The exhibition and annual meeting of the British Institute of Radiology, incorporated with the Röntgen Society, will take place from December 4th to 6th, inclusive, at the Central Hall, Westminster. A number of interesting papers will be read, including two by Dr. A. Orliansky and Mr. W. R. Gray, on "Output of Transformers under different methods of High Tension Rectification" and "A Hot Cathode Tube with Rotating Anode," respectively, and the annual dinner will take place on December 6th at the Trocadero Restaurant, London. Tickets (15s. each) from Major D. B. McGrigor, 32, Welbeck Street, London, W.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *dated November 29th, 1879:—*

The P.S.N.C. successfully tried electric lighting in the new steamer "Mendoza."

The "Scotia" and "Kangaroo" were on their way to Aden to lay the last portion of the Cape cable.

As a result of damage by gas lighting to frescoes in the Paris Opera House, electric lighting was to be installed.

* * *

FIFTEEN years ago THE ELECTRICIAN *recorded that:—*

The Germans had installed electric street lighting in the badly-damaged town of Malines.

The Bank rate prevailing at that time was 5%.

* * *

TEN years ago it was stated in THE ELECTRICIAN *dated November 28th, 1919, that:—*

The Lyric Theatre, Hammersmith, London, had installed electric heating throughout.

Stepney (London) B.C. had decided to become a member of the E.D.A.

Sir John Snell, Rear-Admiral F. L. Field, Prof. J. E. Petavel, Dr. W. H. Eccles, and Messrs. F. J. Brown, James Swinburne and L. B. Turner were appointed members of an International Communications Committee, under the chairmanship of Sir Henry Norman.

Digitized by Google

PERSONAL.

MR. P. W. Bancroft has been appointed, subject to confirmation, tramways manager to Derby Corporation

Sir Harry Hatt, deputy Mayor of Bath, has been elected Chairman of the Electricity Committee for the 28th time.

Mr. Bernard D. F. Dudley Docker and Sir Edmund Wyldbore-Smith have resigned from the Board of Associated Electrical Industries, Ltd.

Dr. Yasujiro Niwa, chief engineer of the Nippon Electric Co., Ltd., has been awarded the Asano Prize of the Institute of Electrical Engineers of Japan.

Louth Corporation has ratified the appointment of Mr. Edgar Marsden, of Huddersfield, as electrical engineer, at a salary of £300 per annum.

Mr. E. Morgan, general manager of the Sheffield Electricity Department, announces that his permanent address is now "Glensone," 23, Thornsett Road, Sharrow, Sheffield.

In connection with our reference last week to the late Mr. W. R. Sayers, we are given to understand that he joined the staff of Messrs. Cromptons in 1882, and not 1888 as stated.

The marriage of Mr. Eric R. Knight, of the Leicestershire and Warwickshire Electric Power Co.'s staff, and Miss Dorothy Edith Southorn was solemnised at Leamington Spa on November 12th.

Hammersmith (London) Establishment Committee recommends the payment of £168 15s. 4d. to Mr. R. H. Paterson, borough electrical engineer, in respect of his services as acting borough electrical engineer from February 13th to July 17th last.

Mr. T. R. Martin announces that, having resigned his position as joint managing director of J. H. Tucker and Co., Ltd., correspondence of a personal nature should be addressed to him at "Highland Lodge," Wellington Road, Edgbaston, Birmingham.

In the Sheffield Tramway offices on November 21st, Mr. Rowland C. Moore, who is shortly leaving to take up the position of traffic superintendent to the Stockton Corporation Motor Bus Department, was presented, on behalf of his colleagues, with a clock and barometer.

Dr. W. E. Sumpner, principal and head of the physics department of Birmingham Central Technical College, is retiring at the end of the present year. He has held the position of principal for 35 years. Dr. A. H. Railing, who distributed the prizes at the College last week, expressed the appreciation by the industrial community of Dr. Sumpner's work.

With reference to the resident engineer required for the Kirkstall power station, Leeds Electricity Committee, after interviewing Messrs. E. C. Harris (Barking), Frank H. Pooles (Hams Hall), J. F. Sarvent (Hammersmith), Ronald Dickinson (Ribble), John Mullin (Brimsdown), recommended Mr. J. F. Sarvent, power station superintendent at Hammersmith (London), for the appointment.

Barking Electricity Committee received a letter last week from the electrical engineer, Mr. W. Holmes, stating that the specialist whom he had consulted in connection with his illness had reported that he was not at present, and would not in future be, fit to take charge of his department. In the circumstances he placed his resignation in the hands of the Council. The committee received the news with regret and appointed Mr. W. E. Kidner, the present acting electrical engineer, as electrical engineer at a salary of £725 per annum.

Members of the staff of the Yorkshire Electric Power Co. assembled at the Leeds Liberal Club on Monday evening for the joint purpose of bidding farewell to Mr. R. H. Harral, and congratulating Mr. Oldroyd and Miss Crowther on the occasion of their marriage. Mr. R. H. Harral, who has been a mains engineer on the staff of the company for 11 years, is leaving to take up an appointment as mains superintendent in the Blackburn Electricity Department. He was the recipient of a handsome clock, a loud speaker, and an illuminated address. Mr. Oldroyd and Miss Crowther have served on the company's staff for 17 and 14 years respectively, and were presented with a pewter tea-service, a canteen of cutlery, a case of fish-eaters and an illuminated address.

Obituary.

Mr. JOHN W. LIEB, on November 1st, aged 69 years. He was a past-president of the American Institute of Electrical Engineers and senior vice-president of the New York Edison Company.

BUSINESS ITEMS.

MESSRS. MAXIMS, radio engineers, of Locksbrook Post Office, Lower Weston, and Brougham Hayes, have opened additional premises at 33, Broad Street, Bath.

We have received an inquiry for the name and address of the makers of the "Eclipse" electric kettle. Will any reader able to supply this information please communicate with the Editor.

A general view of the new showrooms of Metro-Vick Supplies which have been opened at Newcastle.

FERRANTI, LTD., Hollinwood, Lancs., announce that with the coils now being supplied in the company's h.f kit for the "Screened Grid 3," it is necessary to use 0·0005 μF. tuning condensers in place of the 0·00035 condensers originally specified. This alteration has become necessary owing to the changes in wavelength that have taken place since the receiver was first made available to the public.

Following the satisfactory operation of the "Alton" batteries installed at the Foochow, Changchow, Changeu and Nanking telephone exchanges, the ALTON BATTERY CO., LTD., of Alton, Hants, advises us that an order has been received covering three batteries which are required for the Shanghai automatic telephone network. This contract now brings the total number of Alton batteries shipped for the automatic telephone systems being installed in China and Manchuria to 23.

In connection with the new building recently opened as a furniture emporium by Messrs. Bradley's, at Fore Street, Edmonton, SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., advise us that the furniture window displays are floodlighted by means of Siemens' lamps and shop window reflectors. For the lighting of the various floors "Ultralite" fittings are used. The NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO., Sales Department, were responsible for the wiring and lighting schemes.

The BRITISH THOMSON-HOUSTON CO., LTD., is showing electric lighting equipments for motor cycles and motor-cycle combinations at the Motor Cycle Exhibition, at Olympia, London. Types P.B.17, P.B.K., P.A. and C.A. are exhibited. B.T.H. magnetos also occupy a position of prominence, all the well-known types for single, twin (V or flat) cylinder motor-cycle engines being shown, while attention should also be drawn to the B.T.H. impulse startor. Among the other exhibits reference may be made to Fabroil silent timing and pump gears, electric horns and "Mazda" motor-cycle electric lamp bulbs.

In our issue of July 26th, page 116, we reproduced a photograph of the new premises built for the Newcastle offices of METRO VICK SUPPLIES, and pointed out that at that time the showrooms were not completed. We are now advised that this section has been opened and the reproduction above gives some idea of the department's extent and scope. The picture, however, does not show the model rooms that have been equipped—drawing room, bedroom, bathroom, kitchen, etc., with a view to demonstrating the advantages of electrical domestic appliances both from the artistic, utility and economy points of view. It will be appreciated from the illustration that every endeavour has been made to avoid the unpleasant effect of a "jungle" of fittings, and owing to the imposing size of the room this can be done without in any way sacrificing the variety of the display. The general decorative scheme for the showroom is blue and silver.

LEGAL INTELLIGENCE.

Dispute Concerning Re-wiring of Old Lighting Installation.

ALLEGATIONS of bad workmanship were made in the High Court, on November 18th, in an action brought against Messrs. George Thomas (Dover), Ltd., engineers, of Dover, in regard to a contract carried out by them for overhauling the electric lighting installation at Kearsney Court, near Dover. The plaintiffs, Messrs. A. H. and H. G. Stocker, who had acquired Kearsney Court as a convalescent home, alleged that in 1927 they employed the defendants to overhaul the electric lighting installation, for which they paid £156, but afterwards found that the work had been done so badly that they had to have it re-done. They accordingly claimed £151.

The defendants denied negligence, and pleaded that the work was done under the personal supervision of the plaintiffs' foreman of works and approved by him.

Mr. Carthew, for the plaintiffs, detailed some of the defects complained of and said that the joints in the cables were made simply by twisting the wires and re-insulating them but without soldering. The cables were cramped and tightly pressed together without sufficient insulation. The extensions were contrary to regulations, and wires had been passed down through ceilings without any protection. The defendants did not do the work themselves, but sub-contracted with a Mr. Mason, of Dover. It was after complaints had been made by the Borough Electrical Engineer of Dover that the plaintiffs employed an expert to examine the work and then found that it had been badly done.

Mr. James Douglas Allen, of Foundations, Ltd., said the work was exceptionally bad, and material used was unsuitable for the purpose.

Mr. Clery, of Messrs Drake and Gorham, Ltd., who reviewed the work executed by the defendants, said the re-wiring should have been done on the looping-in system. The work as done by his firm would have cost £345.

Mr. David Connors, foreman to Messrs. Drake and Gorham, said a good deal of the work was left in a dangerous condition, for the junctions were not soldered.

Mr. Clery recalled, said he had cut out and kept a number of the defendants' junctions to add to his museum.

Mr. Craig Henderson, for the defendants, said they quite agreed that the job ought to have been done on the looping-in system, but they were compelled to do it on exactly the same system as they found it, as time did not permit of adopting any other. They did exactly what they were employed to do, and were not allowed to adopt the looping-in system. As to the joints, they were done exactly as the old ones had been done. It was impossible in repairing an old system to work in accordance with modern regulations, and it was significant that nothing ever went wrong with the work.

Mr. E. W. Hansell, K.C., Official Referee, giving judgment, said that though it might have been better to adopt the looping-in system and to solder instead of adopting the tie joint, there was no obligation on the defendants under the contract to change the system they found existing, especially as no danger resulted. The plaintiffs had failed to prove that what the defendants did was not enough to make the work sufficient and safe, and therefore there would be judgment for defendants with costs.

Valve Holder Patents.

Judgment was given in the Chancery Division on November 19th in the action in which Benjamin Electric, Ltd., and the Igranic Electric Co., Ltd., sought an injunction to restrain Garnet, Whiteley and Co., Ltd., from infringing the plaintiffs' patents for improvements in thermionic valve holders.

Mr. Justice Clauson said the action concerned two patents belonging to the plaintiffs—the Benjamin and the Burndept. It was obvious that they had been infringed, and the questions for the court were whether prior publication and prior user amounted to anticipation, and whether the plaintiffs' inventions contained subject matter for a patent. In both cases the valve holders were carried on springs, the springs serving to carry the holder and to conduct the current to the valve.

Describing the various alleged anticipating inventions and prior user, his Lordship said there was some evidence that in December, 1923, the Sterling Telephone and Electric Co., Ltd., made and published a form of holder, but it was not a true anticipation.

It was said that the plaintiffs' device was merely a combination of several old features, but it appeared to him that the combination was not a mere juxtaposition of old features but a new and useful article. In his opinion the selection and co-ordination of old features in this instance involved a new invention. He held that both the patents were valid and had been infringed, and therefore there would be judgment for the plaintiffs.

A stay of execution was granted with a view to an appeal.

Pending Electricity Suit.

On the application of Mr. Tyldesley Jones, K.C., on behalf of the plaintiffs, Mr. Justice Bennett, in the Chancery Division, on November 22nd fixed December 11th, subject to anything part heard, for the hearing of the action, Oxford Corporation *v.* Oxford Electricity Co., Ltd.

He said the action related to the construction of an Act of Parliament under which the Corporation had served notice on the company requiring them to sell to the Corporation the electricity undertaking. Evidence would probably not be called on the claim, but there would be some on the counter-claim, chiefly by experts on the question of construction.

Imported Cable.

A summons under the Merchandise Marks Act, against Messrs. Walter James Edwards, Arthur Norman Edwards, and Thomas Daniel Edwards, trading as Edwards Brothers, 20, Blackfriars Road, London, S.E.1, was heard at Tower Bridge Police Court, before Mr. Oulton on Tuesday. Defendants were summoned for advertising cable for sale without indicating the country of its origin.

Mr. St. John Hutchinson supported the summons on behalf of the Cable Makers' Association; Mr. A. H. Osmond, solicitor, defended.

Mr. Hutchinson said he understood defendants would plead guilty. Under the Act of 1887 defendants were entitled to go for trial, the offence was actually under that Act although proceedings had been taken under the Act of 1926.

Mr. Osmond said defendants would ask the Court to deal with the case.

Mr. Hutchinson said the prosecution was under the Merchandise Marks Act of 1926, sec. 5, sub-sec. 2, which laid down that if any person offered for sale any imported goods of any class or description without indicating the place of origin they were guilty of an offence. By an Order in Council made in 1928 insulated cable was brought under the Act, and defendants should have shown in their advertisements either the place of manufacture or the word "foreign." They advertised as Edwards Bros., and one of the items advertised was "Grey Cable," as a cable passed by the Cable Makers' Association. These particular cables were advertised as "Siemens Schuckert (Great Britain)," and people reading that description would come to the conclusion that the cable was made by a British firm. The Cable Makers' Association had inserted advertisements in all the trade papers, pointing out that the place of origin of such goods must be mentioned under the Act. In pursuance of their objects the Cable Makers' Association bought a length of this cable, which bore a ticket showing that it was manufactured by Messrs. Siemens Schuckert, Ltd., Berlin, and it also bore the words "Made in Germany." If the cable had been purchased in smaller quantities there would have been nothing to show where it had been made.

Mr. Osmond said his clients acted in ignorance. The goods were labelled according to the Act, and also bore the words "German Manufacture." They had advertised only in trade papers.

Defendants were fined £2 each, and ordered to pay £5 each as costs.

THE INDUSTRIAL SOUTH.

The Ministry of Labour's annual survey of the distribution of the working population, industrially and geographically, shows that the shift of industry to the south is continuing. Over Great Britain and Northern Ireland, as a whole, the insured population has grown by 8% since 1923. In London the increase has been 13·6%, in the south-eastern division 22%, in the south-western 13%, and in the Midlands 9·7%. In the other divisions the increase has been less than 5·2%, while in Wales there has been a decline of 2·4%. Among the industries which show increases of a fifth or more since 1923 are: heating and ventilating apparatus 61·1%; electrical wiring and contracting 44·4%; electric cables, wires and lamps 33·1%; iron and steel tubes 20·1%.

PLASTICS ASSOCIATION.

Formation of Trade Association—Election of Committee.

A REPRESENTATIVE meeting of firms engaged in the plastic trade was held in London, on October 16th, with a view to discussing the formation of an association. The meeting was presided over by Mr. James Macfarlane, who pointed out that the purpose of such an Association would be to protect the interests of the plastics industry and to promote its development.

Some discussion followed the Chairman's opening remarks, the chief point at issue being whether one or two associations should be formed, for manufacturers in the one case and for moulders in the other. A decision in favour of one association was finally made.

During the course of the discussion it was revealed that the moulding industry in Germany, although not any older than the moulding trade in this country, primarily started in the electrical industry. The Verband Deutscher Elektrotechniker formulated rules with regard to the supply of mouldings to the electrical and allied trades, and at the same time indicated the physical, chemical, electrical and allied properties of the materials required for mouldings. Every manufacturer engaged in the electrical and wireless moulding trades was given a monogram of the association, and each member was allotted a number, which, when used with the monogram, indicated the grade of material from which the moulding was made. The grading of materials and classification of mouldings were of some importance, particularly to those members of the plastics trade who supplied the electrical industry with mouldings and raw material.

The formation of an Association committee was discussed, and after considering all the views expressed, the following were proposed and seconded :—Messrs. C. C. Last (Bakelite, Ltd.), R. R. Todd (Birkbys, Ltd.), A. S. Welch (Jas. Ferguson and Sons, Ltd.), A. V. Keller (Kelacoma, Ltd.), A. Fraser (Rissik Fraser and Co., Ltd.), H. E. Ashdown (H. E. Ashdown, Birmingham), J. W. Barber (Brownie Wireless Co., Ltd.), B. Weaver (Ebenestos Insulators, Ltd.), W. C. Waghorn (Insulators, Ltd.), S. A. Goode (Streetly Manufacturing Co., Ltd.), C. T. O'Callaghan, C. S. Dingley and F. C. Higgins. The committee will select its own chairman.

The following firms were among those represented at the meeting: A.E.G. Electric Co., Ltd., H. E. Ashdown (Birmingham), Ltd., Bakelite, Ltd., Beatl Sales, Ltd., Bell Moulding Co., Birkbys, Ltd., British Celanese, Ltd., British General Mfg. Co., Ltd., Brownie Wireless Co., J. A. Crabtree and Co., Ltd., Thos. De La Rue and Co., Ltd., Ebonestos Insulators, Ltd., Erinoid, Ltd., Jas. Ferguson and Sons, Ltd., Graesser-Monsanto Chemical Works, Ltd., H. C. S. Hicks and Co. (Galalith), F. A. Hughes and Co., Ltd., Rockhard Resins, Ltd., Insulators, Ltd., Kelacoma, Ltd., Lorival Mfg. Co., Ltd., the M.L. Magneto Syndicate, McLeod and McLeod, Ltd., Mica Mfg. Co., Ltd., Plastic Moulding Co., Ltd., Ranton, Ltd., Rissik Fraser and Co., Ltd., St. Albans Moulding Co., Ltd., Solidite and Synthetic Mouldings, Ltd., J. M. Steel and Co., Ltd., Streetly Manufacturing Co., Ltd., Synthetic Resins, Ltd., United Ebonite Mfrs., Ltd., Messrs. H. Courtney Bryson, F. C. Higgins, Rex Jones, H. McL. Melville Smith, C. T. O'Callaghan, and A. Titmuss also attended.

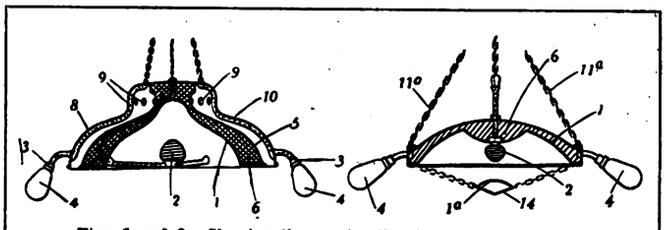
MODERN SHOP LIGHTING.

In the course of an address to members of the West of England Display Association at Exeter on Monday, Mr. T. Catten, of the Electric Lamp Manufacturers' Association, said the whole subject of display had been revolutionised, and the art of selling had become positive. In the early days of electric lighting, window displays were of little importance, and interior displays were entirely absent. For a long time the sole outlook on lighting was its ability to permit vision, but the modern store had a different outlook. The intensities of the light employed both in the windows and the interiors was well in excess of the limits which permitted clear vision. It was realised that a well-lighted window or interior possessed a sales force which was second to none in its appeal and effectiveness. The advertising value of such display or a cheerful and bright interior was of such importance that no progressive shop-keeper could afford to be without it. Mr. Catten demonstrated the difference between old and modern systems of window lighting, and referred to the "new art" system which was being adopted for facia lighting.

A NEW HEATING DEVICE.

WE have received from Mr. James Dorman, 24, Lower Leeson Street, Dublin, particulars of a new combined heating and lighting unit which he has patented. The number of the specification is 314 567 and a brief description of the arrangement is as follows :—

A heating and lighting unit adapted to be supported from a wall or ceiling comprises a heating device consisting of a



Figs. 1 and 2. Showing the constructional arrangement of the combination fitting.

resistance wire carried by an insulating former, a reflector, and one or more electric incandescent lamp sockets disposed outside the reflector. A part or the whole of the heating device constitutes a permanent fixed part of the unit. In Fig. 1 the heating device 2 is arranged in an inverted bowl reflector 1, separated by insulation 6 from an outer bowl 5. A surrounding shroud 10 carries lamp sockets 3. Air passes upwards between the shroud and bowl and through perforations 9 at the top of the former. In Fig. 2 the heating device is arranged centrally of a reflector carrying lamp sockets on its periphery. An auxiliary reflector 1*a* and a guard 14 are arranged below the heating device. The heating and lighting circuits are controlled by separate switches. Modifications referred to in the full specification comprise concentric heating and lighting devices and heating devices grouped about a central lighting device.

IN PARLIAMENT.

Electricity Special Orders Approved by the House of Commons.

THE House of Commons has approved Electricity Special Orders in respect of (1) the urban districts of Crewkerne and Ilminster, and parts of the rural districts of Chard and Yeovil; (2) the borough of Honiton, the urban district of Ottery St. Mary, and parts of the rural districts of Axminster, Honiton and St. Thomas.

Replies to Questions.

The following are points from answers to questions in the House of Commons :

The works on which the Postmaster-General has arranged to spend an additional £750 000 in telephone construction are in connection with the development of trunk telephone traffic. They comprise a number of duct and cable schemes which were originally contained in programmes not scheduled to be put in hand this year.

Proposals in regard to the future of the Indo-European Telegraph Department are under consideration which may necessitate reductions in various grades of personnel employed by the Department, in which case the question of compensation for the retrenched officers for the loss of employment will be carefully considered.

The financial position of the telephone service does not at present permit of a reduction in rental charges.

The latest available figures as to the British Broadcasting Corporation's income and expenditure are for the year 1928, and are shown in the Corporation's report for that year. Its total expenditure during 1928, including provision for depreciation, was £879 324 6s. 2d., and its total income was £1 002 505 10s. 3d., of which £871 763 16s. 9d. was in respect of wireless licences.

The Minister of Transport has recently been in communication with the London and North Eastern Railway Co. with respect to the possibility of electrifying the railway between Newcastle and South Shields, and has been informed by them that the question of the electrification of the section of line concerned has been considered, and that in their view there are a number of other schemes for improvements to their system which should be given precedence.

WATER HEATING.

First of the E.D.A. Sales Conferences at Manchester.

"DOMESTIC Electric Water Heating" was the title of a paper given by Mr. R. J. Hebbert, of Ferranti, Ltd., at the first of the series of E.D.A. Sales Conferences to be held at Manchester during the present season.

Mr. Hebbert said that much thought had been given lately to the framing of tariffs to attract the load, and many supply authorities were now offering exceedingly low prices for this purpose. Because so much had been done to improve load factors by the development of water heating, however, it should not be concluded that all types of equipment were good from the load-building point of view. They used to feel that for the purpose of central heating of buildings electricity could not compete, on grounds of economy, with coke and other low grade fuels, but with current available at less than a farthing a unit this was no longer the case. Domestic water heating was of greater concern, however, and this involved the widest possible use of storage principles. In most modern houses hot water could be supplied from one heater, and it was preferable to place it in the scullery, as close as possible to the sink. In larger houses it was generally possible to divide hot water points into conveniently centred groups, and thus instal two or more large heaters, each feeding its own separate group of taps. It could not be too strongly emphasised that anything in the nature of a circulating pipe to give instant hot water at the taps was prohibitive.

He could assure those present that, at ½d. per kWh, the electric heating of water for an average small household did satisfactorily bear comparison with the cost of equal service obtainable by any other means. They had in Great Britain at the present time over 40 electricity undertakings whose domestic tariffs incorporated a kWh charge of ½d. or less, and the population which they served represented one fourth the total population of the country. In general, where the kWh rate incorporated in the ordinary domestic tariff was more than ½d. per kWh it would be wise to consider the possibility of offering a reduced rate for storage heaters, under some special control to restrict its loading to off-peak conditions of supply. He considered that at ½d. per kWh the service was one which paid the average consumer, and if the load could not be generally attracted at this rate, he suspected it was due to some other obstacle.

Interesting comment was made by several speakers in the discussion which followed, and the initial cost of the necessary installations was apparently one of the main difficulties which were put forward. Mr. Barrett, of the North Wales Power Co., said that he would like to see a greater understanding between the manufacturers of the appliances and the supply undertakings. He felt that reductions in both cost of apparatus and tariff rates would be possible if there was more working together. Mr. Burton, of the Liverpool Corporation, mentioned the success which had attended the adaptation of electrical heating units to existing cylinders.

SWISS RAILWAYS.

Over 1 600 Kilometres of Lines now operated by Electricity.

THE report of the Swiss Federal Railways for 1928 states that expenditure included 9 302 464 frs. for coal (decrease 3 356 783 frs.) and 17 198 223 frs. for electric power (increase 2 332 475 frs.). The distance covered by electric locomotives was 29 290 502 km., and by steam locomotives 17 103 419 km. The price of electric power worked out at 4·85 centimes per kWh, compared with 5·32 in 1927. Expenditure on constructional work was 87 826 391 frs., including 24 404 343 frs. on rolling stock. Expenditure on electrification was 27 449 902 frs., against 60 335 428 frs. in 1927, exclusive of the fourth and fifth instalments—10 million frs. in each case—of the Federal subsidy of 60 million frs. for railway electrification. The end of 1928 witnessed the completion of the first stage of the electrification of the Federal Railway system, of which 1 666 kilos. are now operated by electricity. The electrified lines, representing 56·6% of the Federal Railways system, carry approximately 85% of its total traffic. At the end of 1928 the railways had expended 650 441 255 frs. on the electrification of their system. In 1928 the railways acquired 22 electric express locomotives and 16 electric shunting locomotives, at a total cost of 13 758 168 frs., in addition to 16 motor coaches, at a cost of 4 747 327 frs. They also added 28 passenger coaches for fast trains and 97 goods vans to their rolling stock. At the end of the year they owned 345 electric locomotives for main-line traffic, 20 electric shunting locomotives, 45 motor coaches operating under 15 000 V, 10 motor coaches operating under 5 500 V, 17 tractors and other vehicles working with batteries.

THE SOCIAL SIDE.

The first G.E.C. dance of the season was held at Magnet House, on November 8th, when there was a good attendance. The arrangements being in the capable hands of Miss Harbour and Mr. Nash, a very successful evening was the outcome. On November 9th a social evening was held at Magnet House, when the "Wilson" and "Byng" tennis challenge cups were presented to the winning teams by Mrs. F. P. Driver, in the unavoidable absence of the donors, Mr. C. Wilson and Mr. E. G. Byng. These trophies, the former for gentlemen and the latter for ladies, were competed for by the whole of the London Establishments of the G.E.C., and won by the Osram Lamp Works gent's team and the Magnet House (London) ladies' team. Singing and dancing, interspersed with conjuring and ventriloquial entertainments by various G.E.C. "stars," contributed towards a very pleasant evening. The fortnightly debate provided some keen discussion, the motion "That the tendency of the cinema in England is to undermine English character" being lost by a large majority. Football, hockey, netball and Badminton sections of the G.E.C. Social Club have heavy programmes and are meeting with pronounced success, while the Choral Society is rehearsing ambitious numbers.

A CHRISTMAS lamp display at the trade counter of the General Electric Co., Ltd., at Magnet House, Kingsway, London, W.C.2. Christmas tree lighting sets and colour-sprayed lamps are interspersed among holly and other leaves.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

CLYDEBANK CORPORATION.—Electric lighting work in connection with erection of about 320 houses at Parkhall housing site, No. 2 development. Intending contractors apply to Mr. J. W. Johnston, town clerk; deposit £1 1s.

STROUD JOINT HOSPITAL BOARD, November 29th.—Electric light wiring of administrative block of Stroud Isolation Hospital. Particulars from the Clerk to the Guardians, John Street, Stroud.

BELFAST CORPORATION, December 2nd.—Manufacture, supply, and erection of (*a*) h.t. armour-clad switchgear (specification W. 99); (*b*) transformer kiosks (W. 100); three-phase star neutral earthing compensator (W. 101); and cable testing equipment (W. 102). Specifications, etc., from Mr. F. H. Whysall, city electrical engineer and manager, East Bridge Street, Belfast; deposit £2 2s.

EDINBURGH EDUCATION AUTHORITY, December 2nd.—Electric lighting and heating installations in the projected extension of Lochend Road School. Specifications, etc., from Mr. J. M. Johnston, 47, Charlotte Street, Leith.

STOCKPORT CORPORATION, December 2nd.—Supply and erection of 6 600 V switchgear, comprising metal-clad, compound-filled switch units. Specification (No. 3A) from Mr. R. Lee, borough electrical engineer, 23, Tiviot Dale, Stockport; deposit £1 1s.

ROCHDALE CORPORATION, December 3rd.—Electric lighting and power installations in 104 houses on Spotland estate. Particulars from the Borough Surveyor, Town Hall, Rochdale.

BIRMINGHAM GUARDIANS, December 4th.—Electrical work at Western House. Specification, etc., can be obtained from Mr. C. P. Beech, Union Offices, Edmund Street, Birmingham; deposit £2 2s.

NEWBURY CORPORATION, December 5th.—Electric motors, starting gear and centrifugal pumps, with ancillary works, at pumping station. Specification, etc., from Messrs. Howard Humphreys and Sons, 28, Victoria Street, Westminster, S.W.1, on and after November 18th; deposit £3 3s.

STEPNEY (LONDON) BOROUGH COUNCIL, December 5th.—Installation of wireless receiving equipment and apparatus at each of the Council's three hospitals, with l.t. charging machines, h.t. generators, motor to drive generators, accumulators, etc. At the three hospitals the requirements include 1 160 pairs of headphones and 24 loud speakers. Specifications, etc., from the clerk, Mr. S. McClelland, Bancroft Road, Mile End, E.1; deposit £1.

GLASGOW CORPORATION, December 7th.—Electrical work in connection with erection of observation ward at Belvidere Hospital. Specifications, etc., from the Office of Public Works, 64, Cochrane Street, Glasgow; deposit £3 3s.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, December 10th.—Extra high and medium pressure cable extensions (contract No. 48). Specification, etc., from Mr. R. W. Willis, electrical engineer and manager, 37, High Street, Cheadle, Cheshire; deposit £2 2s.

Transformers, Switchgear, etc., for Manchester.

MANCHESTER CORPORATION, December 10th. and December 17th.—(*a*) Delivery and placing into position, at Barton power station, of twelve single-phase feeder reactors (specification No. B. 71); (*b*) supply and erection, within Manchester area of supply, of one 6 600 V sheet steel type transformer kiosk and switchgear (specification No. 259); (*c*) supply and placing in position, within Manchester area of supply of 125–250–500–750–1 000 kVA, 6 400/400 V, three-phase, oil immersed, self-cooled transformers (specification No. 260). Specifications, etc., from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s. for each. Tenders for (*a*) and (*c*) by December 10th, and for (*b*) by December 17th.

MANCHESTER CORPORATION, December 13th.—Supply of electrically propelled tower ladder vehicles. Specification, etc., from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester.

HULL CORPORATION, December 19th.—Supply of electricity meters (contract No. 148). Forms of tender, etc., from Mr. J. N. Waite, city electrical engineer, Electricity Works, Sulcoates Lane, Hull; deposit £2.

MILLOM URBAN DISTRICT COUNCIL, December 20th.—Haverigg extension scheme, comprising e.h.t. and l.t. cables, pillar box, etc. (section A); and e.h.t. and l.t. switchgear, transformers, etc. (section B). Specification, etc., from Mr. A. Lawrence, solicitor, clerk to the Council.

CENTRAL ELECTRICITY BOARD, December 21st.—Supply and erection of 132 000 V transformers in connection with Mid-East England Electricity Scheme. Specification (No. M.E.E.-F.T.1) and form of tender from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

HALIFAX CORPORATION, December 21st.—Electrician's work in connection with erection of new Girls' High School at Craven Lodge. Names of intending contractors to be sent by December 21st to Mr. A. C. Tipple, borough engineer, Crossley Street, Halifax; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, January 6th.—Supply and erection of 132 kV overhead transmission lines (special crossings and high spans), in connection with North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.—P.L. 2) and form of tender from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note:—An asterisk denotes that local representation is, in practice, essential.*

WESTERN AUSTRALIA GOVERNMENT, November 29th.—Supply and erection at Perth of (*a*) boiler house equipment, and (*b*) 12 500 kW turbo-generator and condensing plant. Specifications (£1 1s. for each; not returnable) from the Agent-General for Western Australia, Savoy House, Strand, London, W.C.2.

EGYPTIAN MINISTRY OF THE INTERIOR, November 30th.—Diesel engine driven electric lighting installation at Abou-Tig. (Reference B.X. 5 791.)

BLOEMFONTEIN MUNICIPALITY, December 2nd.—Supply of two electrically-driven low lift pumping units and two electrically driven high lift pumping units, with cables, startors, valves, etc. (contract No. 18, 29/30).

BLOEMFONTEIN MUNICIPALITY, December 2nd.—Supply of copper conductors, poles, transformers, switchgear, etc., for electrification of Mazelspoort Waterworks (contract No. 19, 29/30). (Reference B.X. 5 825).

MADRAS GOVERNMENT, December 3rd.—Electrically-driven hoisting drums, in connection with Pykara hydro-electric scheme. Specification (C. 17—part of) can be obtained (on payment of 5s.), from Messrs. Balfour, Beatty and Co., 66, Queen Street, London, E.C.4 (acting on behalf of Power Securities Corporation, Ltd.).

INDIAN STORES DEPARTMENT, December 3rd.—Ceiling and table fans. (Reference B.X. 5 672.)

CAPE TOWN MUNICIPALITY, December 4th.—Supply of 200 c.i. pole bases (specification No. 481/1929). (Reference A.X. 8 771.)

CAPE TOWN MUNICIPALITY, December 4th.—Supply of 50 35 ft. tubular poles (specification No. 479/1929) and 1 500 30 ft. tubular poles (specification No. 480/1929). (Reference A.X. 8 773.)

VICTORIAN ELECTRICITY COMMISSION, December 9th.—Supply of 3 000 kVA transformers and spares (specification No. 29/119). (Reference B.X. 5 775.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 10th.—Switchboard keys and parts (schedule No. C. 496). (Reference B.X. 5 776.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 10th.—Supply of electric lamps, lamp caps and sockets for the Government telephone service (schedule C. 497). (Reference B.X. 5 783.)

ROUMANIAN POSTS, TELEGRAPHS AND TELEPHONES, December 10th.—Bronze wire, hard and soft copper wire and copper sleeves. (Reference A.X. 8 809.)

Digitized by Google

GATOOMA (SOUTHERN RHODESIA) MUNICIPALITY, December 12th.—Two fire-tube boilers, steam engines, alternators and switchboard, etc. (Reference A.X. 8 749.)

CHRISTCHURCH DRAINAGE BOARD, December 13th.—Supply and installation of four electrically-driven automatically-controlled pumping plants, each consisting of two horizontal centrifugal pumps with direct-coupled electric motor (contract No. 29/420); and two horizontal type, 3 H.P. a.c. motors direct coupled with centrifugal sewage pumps (contract No. 29/421). (Reference A.X. 8 788.)

Electric Pumping Plant for N.S.W.

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, December 16th.—Supply and erection of electrically-driven pumping plant, with ironwork, crane and gantries, for Junee water supply. (Reference A.X. 8 740.)

VICTORIAN ELECTRICITY COMMISSION, December 16th.—Oscillograph equipment. (Reference B.X. 5 692.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 17th.—Secondary batteries (schedule C. 505). (Reference B.X. 5 777.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 17th.—Telephone fuses, heat coils and protectors (schedule C. 498). (Reference B.X. 5 784.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 17th.—Loading coil pots (schedule C. 499). (Reference B.X. 5 785.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, December 27th.—Telegraph material, including g.i. tubular arms, insulators, upper tubes for poles, etc. (tender No. 175). (Reference A.X. 8 734.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, December 28th.—Supply and erection at site of Mankabad Barracks of three Diesel engine driven electric generators, and sinking of two wells. Specifications (£1 os. 6d., not returnable) from Chief Inspecting Engineer, 41, Tothill Street, Westminster, S.W.1.

EGYPTIAN MINISTRY OF PUBLIC WORKS, January 4th.—Supply and erection at site of Meadi Barracks, Cairo, of two Diesel engines to drive existing generators. Specifications (£1 os. 6d., not returnable) from Chief Inspecting Engineer, 41, Tothill Street, Westminster, S.W.1.

EGYPTIAN MINISTRY OF PUBLIC WORKS, January 6th.—Supply and erection of plant for supply of filtered and unfiltered water, including pumps, electric motors, etc. (Reference A.X. 8 746.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of testing instruments (schedule C. 504). (Reference B.X. 5 786.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of timing clocks (schedule No. C. 507). (Reference B.X. 5 762.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of contact pressure testers (schedule No. C. 516). (Reference B.X. 5 821.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of telephone hand sets (schedule C. 526). (Reference B.X. 5 823.)

BLOEMFONTEIN MUNICIPALITY, January 10th.—Supply of automatic electric traffic signals (contract No. 5). (Reference B.X. 5 887.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 13th.—Supply of four-point jacks (P. and T. 151/1897). (Reference B.X. 5 840.)

Australian Switchgear Contract.

VICTORIAN ELECTRICITY COMMISSION, January 13th.—Supply of 2 200 V switchgear and accessories (specification No. 30/2). (Reference B.X. 5 827.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 14th.—Supply of ringing motor-generator sets, for automatic telephone exchanges. (Reference B.X. 5 839.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 14th.—Supply of telephone indicators (schedule C. 518). (Reference B.X. 5 822.)

CAPE TOWN MUNICIPALITY, January 15th.—Supply of direct-coupled, electric motor driven, centrifugal pump for sewage works (specification No. 475/1 829). (Reference A.X. 8 836.)

NEW ZEALAND GOVERNMENT RAILWAYS, January 15th.—Supply of automatic telephone exchange equipment for new station at Auckland. (Reference B.X. 5 841.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 16th.—Plug covers for telephone switchboard plugs. (Contract P. and T. 151/1 943.) (Reference B.X. 5 879.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 28th.—Supply of 50 kV oil-immersed circuit breakers, with current transformers and relays (section 299). (Reference B.X. 5 878.)

POSTMASTER-GENERAL'S DEPARTMENT, January 28th.—Supply of telephone cycle signalling equipment. (Reference B.X. 5 906.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 28th.—Supply of induction coils and regulator plates (schedule No. C. 533). (Reference B.X. 5 899.)

EGYPTIAN MINISTRY OF THE INTERIOR, February 1st.—Centrifugal well pump and direct coupled electric motor, with piping and accessories. (Reference A.X. 8 811.)

VICTORIAN ELECTRICITY COMMISSION, February 3rd.—Electrically-driven mobile coal-trimming machine, for Yallourn power station. (Reference A.X. 8 681.)

VICTORIAN ELECTRICITY COMMISSION, February 10th.—Supply of sine wave generating equipment and accessories (specification No. 30/3). (Reference B.X. 5 844.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, February 27th.—Supply and erection of h.t. three-phase, overhead transmission lines in the Northern Delta of the Nile. Specifications, etc., from the Chief Inspecting Engineer, Egyptian Government, 41, Tothill Street, London, S.W.1 (£10 5s., not returnable).

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Switchgear and controlling equipment. (Reference B.X. 5 798.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 110 kV switchgear, for interconnecting auto-transformers, for Waitaki power scheme, section 76. (Reference B.X. 5 797.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 66 kV switchgear and protective system for Lyttelton, Lake Coleridge power scheme, section 217. (Reference B.X. 5 796.)

VICTORIAN RAILWAY COMMISSION, March 30th.—Supply of d.c. neutral relays for power signalling purposes (contract No. 43 457). (Reference B.X. 5 793.)

Tenders Accepted.

HEMEL HEMPSTEAD GUARDIANS.—Gibbons, electric light installation in laundry and kitchen, £24 3s.

CARLISLE EDUCATION COMMITTEE.—R. M. Hill and Sons, electric light installation at Newtown School.

CANTERBURY CORPORATION.—Electricars, Ltd., supply of electric vehicle for refuse collection, £470. (Recommended.)

BOMBAY CORPORATION.—Chloride Electrical Storage Co., Ltd., supply of battery for lighting set at Tansa, Rs. 2 495.

TENTERDEN RURAL DISTRICT COUNCIL.—C. Milsted and Sons, electric light installation at Gate Field Cottages, Rolvenden, £7 18s. 6d.

GLASGOW CORPORATION.—John Thompson (Water Tube Boilers), Ltd., six boilers, for Pinkston tramways power station, £90 327. (Recommended.)

UPTON-ON-SEVERN RURAL DISTRICT COUNCIL.—Addyman, of Worcester, electric light installation in Council houses, parlour type, £6 3s. each; non-parlour type, £4 12s. each.

CROYDON CORPORATION.—Works auxiliary switchboard: Ferguson, Pailin, Ltd., ironclad £3 051, cubicle, £1 728 (recommended). Also tendered: Metropolitan-Vickers Electrical Co., Ltd., £3 306 and £1 870; English Electric Co., Ltd., £3 342 and £1 889; British Thomson-Houston Co., Ltd., £3 394 and £1 950; Switchgear and Cowans, Ltd., cubicle, £1 871; A. Reyrolle and Co., Ltd., ironclad, £3 388.

CROYDON CORPORATION.—Equipment for connecting up new switchhouse to existing switchrooms, English Electric Co., switchroom A—modification to existing No. 4 10 000 kW generator switchgear cell and control panel, £280; modification to existing No. 5 10 000 kW generator switchgear cell and control panel, £117; new split conductor feeder switchgear cell and control panel 300 A, £711. Metropolitan-Vickers Electrical Co., Ltd., switchroom B—2 400 A group feeder equipment, £1 763; modifications to auxiliary transformer cubicle, £480; busbars, troughing, etc., £346; tank raising and lowering devices, £120; two split conductor feeder equipments, £902; erection, etc., £1 500; potential transformers, £500; current transformers, £150. Metropolitan-Vickers Electrical Co., Ltd., switchroom C—2 400 A group feeder equipment, £2 521; 1 000 kVA auxiliary transformer unit and control panel, £1 243; split conductor feeder equipment, £1 212; split conductor feeder equipment, for Addiscombe No. 3 unit, £1 360; 1 800 A interconnector unit, £1 254; two split conductor feeders, £2 721; busbar cross-overs, £1 940; contingencies, cabling, etc., £1 000 (All recommended.)

WORK IN PROSPECT.

BIRMINGHAM.—286 houses. Particulars, Mr. A. F. Underhill, Housing Director, Council House, Coventry.

BOLTON.—Erection of baths and wash-houses. Particulars, Borough Engineer, Town Hall.

BOURNEMOUTH.—Motor-bus and coach station. Particulars, Messrs. Jackson and Greenen, architects, Bournemouth.

BOSTON.—Three new blocks at the Fever Hospital. Particulars, Borough Engineer.

BRADFORD.—Rebuilding of Central Area as a shopping centre. Particulars, Mr. E. Cowles-Voysey, architect, Gray's Inn Square, London, W.C.

BRIGG.—Alterations and additions to Brigg Grammar School. Particulars, Mr. H. G. Gamble, architect, Lincoln.

BROUGHTON.—New club house and billiard room. Particulars, Messrs. Gotch and Saunders, architects, London.

BURY.—New Music Pavilion. Particulars, Borough Engineer.

COVENTRY.—New branch of Lloyds Bank. Particulars, Messrs. H. T. Buckland and W. Haywood, architects.

EDINBURGH.—New school. Particulars, Mr. J. M. Johnston, 47, Charlotte Street, Leith.

GREAT YARMOUTH.—Additions to Girls' High School. Particulars, Messrs. Olley and Howard, architects, Great Yarmouth.

HENDON.—Welfare centre and school clinic. Particulars, Mr. A. O. Knight, engineer, Town Hall, Hendon, N.W.4.

KETTLESING.—New Wesleyan chapel. Particulars, Mr. J. Ward Knowles, architect, Accrington.

KIRKCALDY.—Slaughter house, to cost £20 000 to £25 000. Particulars, Borough Surveyor.

LEEDS.—Extension at Rawdon Baptist College, to cost £5 000. Particulars, Mr. Herbert Illingworth.

LLANDOVERY.—New casual wards. Particulars, Mr. J. Owen Parry, Ammanford, S. Wales.

LONDON.—New cinema to accommodate 3 500. Particulars, Mr. George Coles, architect, Craven Street, Strand.

LINTHWAITE.—Extensions to Cotton Waste Mills, for W. E. Cotton and Sons, Ltd. Particulars from John Kirk and Sons, architects, Huddersfield.

MANSFIELD.—Two picture palaces, one near post office and one at High Stree , Edwinstowe, to cost £13 000 and £8 000 respectively. Particulars from Mr. Beyan Dean, architect.

MANCHESTER.—Reconstruction of the "Three Arrows," Barry Road, Ainsworth. Particulars from Messrs. Graves and Ellerton, architects, Manchester.

MARYLEBONE (LONDON).—Large block of flats in Seymour Place. Particulars, Messrs. Joseph, architects, 2, Paul's Bakehouse Court, E.C.4.

NORFOLK.—New offices for C.C. Particulars from Boardman and Sons, architects, Norwich.

PADDINGTON.—New buildings for St. Mary's Hospital, to cost £500 000. Particulars, Sir Edwin Cooper.

PLYMOUTH.—New school to accommodate 800, and clinic. Particulars, Mr. J. Wibberley, city engineer.

ROTHWELL.—New Conservative club. Particulars, Mr. J. Brown, Chartered architect, Northampton.

ROTHERHAM.—340 houses on the Herringthorpe Estate. Particulars, Borough Engineer.

SCARBOROUGH.—Enlargement and reconstruction of "Red Lion," Longwestgate. Particulars, Mr. F. Baker.

SOUTHWELL.—New church school and reconstruction of existing buildings. Particulars, Mr. Cyril E. W. Haseldine.

SUNDERLAND.—300 houses, at Bainbridge Holme. Particulars, S. T. Brown and Son, architects, 51 Fawcett Street.

TWICKENHAM.—51 houses between Fifth and Sixth Cross Roads. Particulars, Messrs. White and Moyes. — 28 houses on north side of Nelson Road. Particulars, P. Chase Gardener and Co., Ltd., architects, Hounslow.—29 houses Hampton Road. Particulars, Mr. G. T. Crouch.

WESTMINSTER (LONDON).—Adaptation of Nos. 8, 9 and 10, Great George Street. Particulars, County Architect, 89-91, Tufton Street, S.W.1.

WEYBRIDGE.—Erection of a new ward at Hospital. Particulars, Mr. E. C. Hughes, contractor, Wokingham.

WHITBURN (DURHAM).—New Council school. Particulars, Mr. F. Willey, architect, 34, Old Elvet, Durham.

WINDLESHAM.—New fire station, for U.D.C. Particulars, Council's Surveyor.

WORTHING.—Office and oil depot, at the West Worthing ods yard. Particulars, British Petroleum Co.

TRADE PUBLICATIONS.

THE DRAYTON REGULATOR AND INSTRUMENT CO., LTD., West Drayton, Middlesex, has issued list No. 128, relative to the "Dial Set" temperature regulator.

The "Reliability Wireless Guide" No. 296, with electrical supplement, has been published by J. H. TAYLOR AND CO., Macaulay Street, Huddersfield.

MAVOR AND COULSON, LTD., 47, Broad Street, Glasgow, S.E., have issued a new leaflet dealing with the latest "M and C" troughed belt gate-end loader.

Publications recently received from B.E.N. PATENTS, LTD., 92, Tottenham Court Road, London, W.C., include leaflets dealing with the company's mechanical polisher and air units.

FALK STADELMANN AND CO., LTD., 83/93, Farringdon Road, London, E.C., has published booklet P1363, concerning electric fires, and a special catalogue dealing with the same subject.

A new showcard just issued by Siemens Electric Lamps and Supplies, Ltd.

The latest publication of SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., 38/39, Upper Thames Street, London, E.C.4, is catalogue No. 405, devoted to "Xcel" domestic electrical appliances.

The IGRANIC ELECTRIC CO., LTD., 149, Queen Victoria Street, London, E.C., has published leaflet No. 6612, dealing with dual wave coils, and No. 6626, describing the "Megastat" volume control.

List No. 11029, containing a full description and several illustrations of mercury switch tubes has been sent to us by the SAXONIA ELECTRICAL WIRE CO., LTD., Roan Works, Greenwich, London, S.E.10.

We have received from the REDFERN RUBBER WORKS, LTD., of Hyde, near Manchester, a copy of a new brochure entitled "Rubber: The Story of a Famous Manufacturing Firm." The issue is extensively illustrated.

"You are Losing Money" is the striking title given to a new publication by OWENS BOILER CIRCULATOR, LTD., 22, Surrey Street, Strand, London, W.C.2. The subject dealt with is the economic generation of steam.

The London agents for "Gee Gee" electric water heating apparatus, E. R. MORTON, LTD., 22, Bartlett's Buildings, Holborn Circus, London, E.C.4, have sent us a copy of a new catalogue dealing with the apparatus offered.

The HENDON LAMP AND ACCESSORIES CO., LTD., 104, Southampton Row, London, W.C.1, has published special lists for overprinting, concerning the "Hendon" British-made lamps and the "Popular" continental lamps.

"Nonpareil Sheet Cork for Land Type Cold Stores" is the title given to a new folder by NEWALLS INSULATION CO., LTD., Washington, co. Durham. The same firm has published a booklet dealing with insulating bricks and other forms of insulation.

A well-produced brochure describing and illustrating the various types of "Sisson" engines, has been sent to us by W. SISSON AND CO., LTD., Elmridge Road, Gloucester. The publication is well illustrated, and includes details of the employees' social and welfare activities.

BRITISH INSULATED CABLES, LTD., Prescot, Lancs, have replaced folder P.243 with P.F.60, the subject being single-phase meters. H.96 has also been replaced with P.F.61, ebonite sheathed cables being the subject matter. The "Mistake-Proof" switch cut-out is dealt with in a new publication, P.183.

ELECTRICITY SUPPLY.

Hay Electricity Undertaking and the Builth Wells Electricity Supply Co. Acquired by the S.W.S. Electric Power Co.—Shannon Scheme News—Supply for Abertillery—Electrical Development in New Zealand.

DOVER T.C. has applied for a loan of £2 000 for electric mains.

Croydon Electricity Committee is to lay a distributor in the Wellesley Road district, at a cost of £500.

Batley T.C. is to seek sanction to borrow £2 800 for e.h.t extensions and £5 000 for mains and services.

Wandsworth (London) Highways Committee is to improve street lighting in Clapham, at a cost of £1 143.

The County of London Electric Supply Co.'s sub-station at Broadwater Road, Tooting, is to be extended.

St. Helens T.C. has applied for a Special Order to cover the parish of Bold, and a portion of the township of Burtonwood.

Winchester Council has received sanction to a loan of £8 567, part of the cost of supplying electricity to the parishes of Twyford and Compton.

The Wessex Electricity Supply Co. is to supply current to the village of Chieveley by overhead lines. Energy will be available early next month.

St. Pancras (London) Electricity Committee proposes that the standing charge under the "one-meter" system should be reduced from £16 to £12 per kW.

Eston Electricity Committee seeks sanction to borrow £1 000 for hired wiring; £1 000 for services; £1 500 for meters and £250 for domestic apparatus.

The undertaking of the Builth Wells Electricity Supply Co., Ltd., has been acquired by the Shropshire, Worcestershire and Staffordshire Electric Power Co.

A supply of current provided by the West Wilts Electric Light and Power Co. has been inaugurated in the village of Box. For street lighting there are twenty-nine lamps.

The Clyde Valley Electrical Power Co. has offered to provide a cable to supply electricity to Biggar and district provided a sufficient number of guarantors can be obtained.

The Central Electricity Board has informed the Featherstone Urban Council that wires in the Council's area cannot be placed underground owing to the cost. The Council is approaching the Minister of Transport on the question.

A 7 000 kW turbo-alternator installed by the Metropolitan-Vickers Electrical Co., as sub-contractors to Vickers-Armstrong, was formally started by the Mayoress at the Barrow electricity works on November 15th. The new plant cost £60 000.

The Shropshire, Worcestershire, and Staffordshire Electric Power Co. has acquired from Mr. W. Lilwall the Hay electricity undertaking, which has served Hay since 1911.

West Lancashire Council is making application to the Commissioners for sanction to a loan of £22 625 in connection with development in the parishes of Aughton, Maghull and Lydiate.

Birtley P.C. has received sanction to a loan of £2 600 for converting the public lighting from gas to electricity. Energy will be supplied by the County of Durham Electrical Power Distribution Co., Ltd.

Porthcawl U.D.C. is to hold a special meeting to consider a proposal to apply to the Electricity Commissioners for authority to transfer the Council's electricity undertaking to the General Electric Co., Ltd.

Ashford Electricity Committee has reported on the offer of the Kent Power Co. for a bulk supply, but the U.D.C. has agreed to proceed with the necessary negotiations with the Electricity Commissioners for plant extensions.

Ballyboy (Co. Managhan) T.C. has passed a resolution calling on the Electricity Supply Board to hasten with the supply from the Shannon scheme, as the Electric Light Co. has increased its charges from 1s. to 1s. 2d. per kWh.

Burnley Electricity Committee has received approval of an electricity scheme for the relief of unemployment. It provides for the extension of a h.t. feeder from Brunshaw to Plumbe Street; the laying of an e.h.t. feeder from Every Street, to Rosehill; and the renewal of various mains.

It is proposed that with the coming of the Shannon scheme the Dundalk power station, which has been under municipal control for 18 years, should be scrapped. The U.D.C. asks the Electricity Board to inquire whether expediency does not outweigh considerations of strict economy in this particular case.

In view of the circumstances disclosed by the negotiations carried on with the several bodies concerned, Islington (London) Electricity Committee recommends that the Council approve generally of the scheme of the London and Home Counties Joint Electricity Authority regarding a bulk supply for the borough.

At a public meeting in Carrick-on-Suir Town Hall last week, it was agreed to sign a petition and send it to the Electricity Supply Board protesting against the increased charges. It was stated that charges that had been fixed at 1s. 6d. a week were raised to 2s. 3d. and 2s. 6d., and charges of 3s. 6d. per week had been raised to 5s. At least 200 houses in the town have been wired.

Portland Electricity Committee has arranged that two-rate meters be installed for shop lighting, provided a maximum of 120 W be connected on the shop lighting circuit. The Committee has arranged to supply current to the premises of the National Omnibus and Transport Co., Ltd., at Victoria Square. The U.D.C. has decided that underground cables be used in the whole of the compulsory area.

Mr. Frank Hodges switched on the current on November 22nd at the new sub-station from which a supply of electricity is given in Abertillery, and Mr. J. Hillier, chairman of the Electricity Committee of the U.D.C., switched on the l.t. gear. A supply is taken in bulk from the Ebbw Vale Co. and the equipment of the sub-station was provided by the Electric Construction Co., Ltd., and A. Reyrolle and Co., Ltd.

An l.t. cable to distribute current to Islip's Manor and the Northolt Housing Estate is to be laid by the Uxbridge and District Electricity Supply Co. The cost of the house services, to be paid by the Ealing T.C., is £3 3s. 10d. per house. Tenders are to be invited for the house wiring.—The Council has agreed to offer no objection to the placing by the Metropolitan Electric Supply Co. of overhead lines to the Sewage Works.

At a meeting of Hull Electricity Council last week Mr. J. N. Waite, city electrical engineer, reported on the scheme for supplying electricity to Willerby and Kirkella, and stated that the Rural and Parish Councils had sanctioned the overhead lines, but objection had been taken by the residents in Victoria Avenue. The Council decided to support the Engineer, and authorised him to apply for compulsory powers, if necessary.

In reply to a request for lower charges for current supplied by the T.C., Hastings R.D.C. has been informed by the Electricity Commissioners that from figures supplied by the Borough Accountant there was a deficiency in the extended area of £1 241 for the year ending March 31st last, and that it was estimated that there would also be a deficiency for the current financial year. A reduction in the charges would depend entirely on the income.

Carnarvon T.C. has decided to terminate its agreement with the National Electric Construction Co., and to carry on the electricity undertaking as a municipal concern. The company offered to provide a supply at a maximum charge of 6d. per kWh for lighting, 2d. for heating and cooking, and 2½d. for small power; and to pay to the Corporation 25% of the net profit made in any year, but the Council decided not to renew the agreement.

The Calcutta Electric Supply Corporation has issued to the share and debenture holders a statement relating to the project to tunnel under the river Hooghli, to enable all necessary cables to be carried across to the right bank. A contract has been let for the construction of the tunnel and the contractors are John Cochrane and Sons, Ltd., of London. It is estimated that the work should be completed by mid-summer, 1931, if no unforeseen complications are encountered.

The official opening of the first generating station under the Waikaremoana hydro-electric power plant, the last of the three major power schemes of the North Island of New Zealand, took place last week. There are to be three generating stations which will derive their power from the Waikaremoana Lake, and the part of the equipment of the first station which has now been put into operation will supply power to the Gisborne, Napier, and Wellington districts. It will eventually be linked up with the Arapuni scheme, near Auckland, and with Wellington's station, Mangahao, to form the complete scheme for North Island. The new installation provides 40 000 H.P., and the potential capacity is 190 000 H.P. That from the Arapuni plant is 96 000 H.P., and of Mangahao 24 000 H.P.

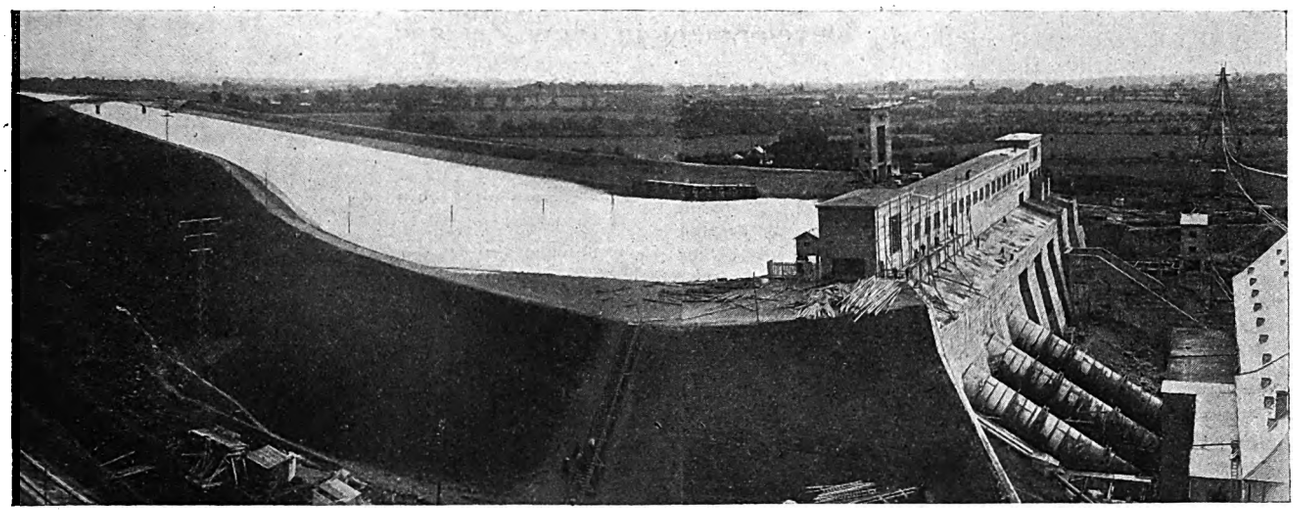
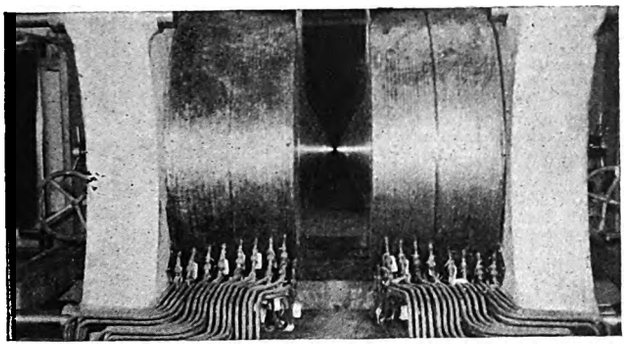
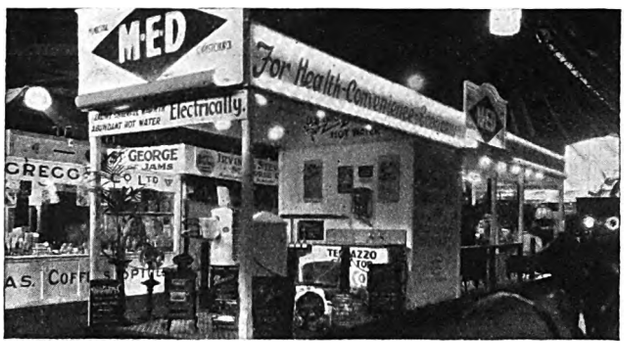
ELECTRICAL NEWS OF THE WEEK IN PICTURES.



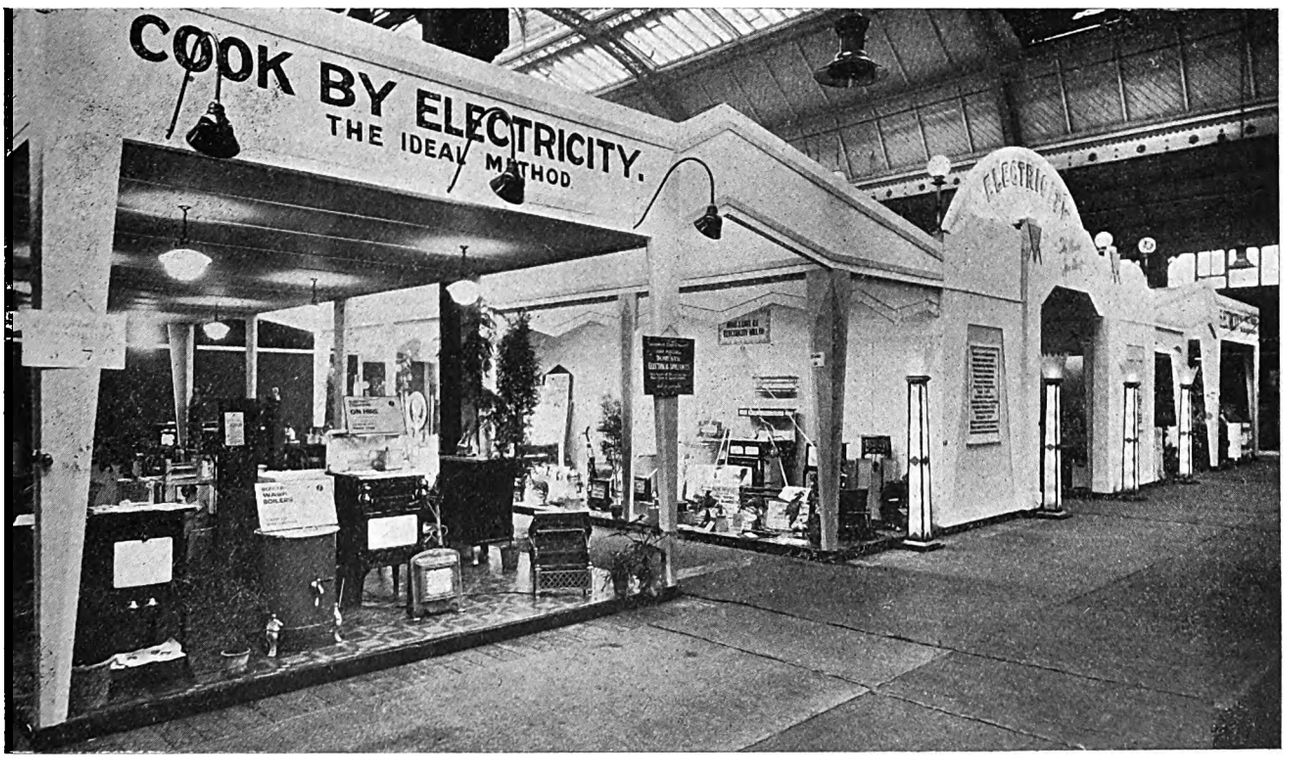
One end of the head race for the Shannon Electricity Scheme. This view shows a part of the 7½-mile cutting on the left, with the 100-foot fall to the Ardnacrusha power station on the right. Current is already being transmitted over a network south of Dublin to Limerick.



This electro-magnet, claimed to be one of the largest in the world, is part of the equipment at the Academy of Science of Paris. This picture and that of the Faraday electro-magnet published last week make an interesting comparison.



The stand of the Christchurch (N.Z.) Electricity Department at the local Winter Show. The exhibit was visited by 80 000 persons, excluding schoolchildren, and many inquiries were converted into sales.



The combined electrical stand at the Smoke Abatement Exhibition recently held in Manchester. The stand was a combined display by a number of supply undertakings in the neighbourhood, together with the E.C.A. and the E.D.A. The equipment was loaned by a number of manufacturers. In the centre of the stand was a series of seven rooms representing a house wired in accordance with the E.D.A. specification, whilst in other parts of the stand were sectionalised shows of domestic electrical equipment. Demonstrations of electric cooking for domestic purposes and also bread and confectionery baking were held daily. A section of the stand, seen in the centre, was designed to indicate what a unit of electricity will do. Another part of the exhibit was the showing of E.D.A. films.

COMPANY NEWS.

Improved Prices of Electrical Securities—Ferranti's Increased Net Profit—Telephone Manufacturing Co.'s New Policy—Reports and Dividends.

RECOVERY has occurred during the past week in the prices of electrical securities, the most noteworthy movements being in the shares of two leading cable manufacturing companies. W. T. Henley's ordinary shares, in spite of the deduction of the dividend from the price, register a rise of 5s., from £5 12s. 6d. to £5 17s. 6d., and Enfield Cable Works ordinary shares at £4 17s. 6d. have regained last week's fall of half-a-crown. Callender's are unchanged at £3 12s. 6d. Johnson and Phillips at 36s. 3d. are 1s. 3d. to the good, notwithstanding that their dividend is no longer included. The same applies to Ever Readies, which have risen from 18s. 3d. to 19s. General Electrics have moved up from 45s. to 46s. 3d., and Associated Electrical Industries have risen nearly 2s.

Hydro Electrics are up to 39, after having been higher, and International Holdings also finish below the best at 6¼. Radio Corporations are slightly better at 36, and Marconi Internationals have recovered from 41s. 3d. to 45s. Cables and Wireless issues have also hardened; the "A" stock at 81½ has regained the two points dropped last week, and the "B" stock at 44 has also recovered two points. International Telephone and Telegraph stock is up to 75 dollars again, recovering the five dollars lost last week, and American Telegraph and Telephone capital stock has advanced from 225 to 230.

Transportation shares have shown irregularity. District and Metropolitan railway ordinary stocks have risen 1 and ½ respectively; but British Electric Traction issues have fallen, the ordinary stock 3 points to below 120.

In the electricity supply section, Bournemouth and Poole shares have recovered to the extent of half-a-crown, and Clyde Valley to the extent of 1s. 3d. The latter's preference shares are 1s. down at 27s. 6d. Yorkshire Electric Power ordinary shares have risen from under 32s. to 33s. 6d., regaining last week's fall; and Midland Counties and Scottish Power ordinary shares at 27s. 6d. and 29s. are each sixpence to the good. County of London ordinary shares are a shade better, but South Londons have shed a shilling to 25s. 6d., and Westminsters 6d. to 25s.

Directors' Reports, etc.

PARA ELECTRIC RAILWAYS AND LIGHTING CO., LTD.—Div. on 6% cum. pref. shs. at rate of 3%, less tax, on acct. of year ending Nov. 30 will be payable on that date. Transfer books are closed until Nov. 30, inclusive.

VICTORIA FALLS AND TRANSVAAL POWER CO., LTD.—A drawing of 5½% 2nd mtge. debs. fallg. due for redemptn. on Jan. 1, 1930, will be made on Dec. 6 at the office of the company, 2, London Wall Bldgs., London, E.C.2, at 11 a.m.

PHILIPS' GLOWLAMPWORKS, LTD.—A proposal to increase cap. by £1 250 000 to £2 100 000 has been approved. A fusion between the company and the Splendor Factory has not yet been concluded, but negotiations are proceeding.

FEDERAL NEON SYSTEM.—This company has been formed in the United States to acquire by purchase the electrical advertising and neon tube business of the Federal Electric Co., and by exchange of shs. controllg. interests in Rainbow Luminous Products, Inc., and the National Neon Agency. An issue of £2 000 000 of the company's common stk. is to be offered for subscription.

CALCUTTA ELECTRIC SUPPLY CORPORATION, LTD.—Company's progress statement shows that rev. for 1928 was £955 129, agst. £930 291 for 1927, div. was 12% plus bonus 4d. p. sh. (the same for both years), electy. sold was 147 957 366 kWh, agst. 129 090 227, and houses connected at end of 1928 were 27 626, agst. 24 985. Electy. sold in 9 months ended Sept. 30, 1929, 127 290 079 kWh, increase 17 729 902 kWh.

INDO-EUROPEAN TELEGRAPH CO., LTD.—The directors have issued a notice informing the shhldrs. that an offer has been made by Imperial and International Communications, Ltd., for the purchase of shs. of the company at £55 p. sh. upon certain conditns. set out in the offer. Full particulars of such offer, which the directors recommend shhldrs. to accept, and of the steps to be taken by shhldrs. deciding to accept such offer can be obtained at the reg. office of the company, 18, Old Broad Street, London, E.C.2, and at Barclays Bank, Ltd., 54, Lombard Street, London, E.C.3.

CAPE ELECTRIC TRAMWAYS, LTD.—Pft. for year ended June, 1929, £32 755, agst. £38 348. After providg. for deb. int. and redemptn., blce. is £13 314, plus £28 625 brt. in. To res. £5 000, agst. £10 000, leavg. £36 939. Rpt. states positn. with rgeard to motor 'bus competitn. still continues to cause great anxiety, number of opositn. 'buses on the road hvg. doubled during period. Directors regret no div. can be considered until some amelioratn. takes place in present workg. conditns. Combined tramway and motor 'bus services show increase of 758 005 passengers and in receipts of £6 114, but this is much more than counterbalanced by increased expenditure.

NIGERIAN POWER AND TIN FIELDS CO.—First rpt., for period ended March 31, 1929, states Kurra Falls concession, with all works and plant thereon, has been sold to Nigerian Electricity Supply Corporation. Mining areas consist of mining leases over 8 175 acres and exclusive prospecting licenses over four square miles. Apart from a small amount of tin won during work carried out to fulfil Government's labour requirements, no mining operatns. have yet been commenced on these areas, Government having granted a suspensn. of labour obligatns. until such time as electric power is available. Proposals will be submitted for amalgamatn. with Nigerian Base Metals Corporation and Anglo-Nigerian Tin Mines. Directors recommend acceptance of scheme.

BRAZILIAN TRACTION, LIGHT AND POWER CO., LTD.—Half yearly int. on 5½% 1st mtge. bonds, due Dec. 1, 1929, will be paid by Messrs. Arnus-Gari, 9, Pasco de Gracia, Barcelona, agst. productn. of coupon 36 in the new form. Bondhldrs. have optn. of collectg. the int., in sterling at Bank of Scotland, 30, Bishopsgate, London, E.C., where listing forms can be obtained.—The final instalmt. of $9.30 in respect of the additional ord. shs. of no par value included in certificates of subscription held in respect of the Jan., 1929, issue must be paid on Dec. 2 at the Bank of Scotland, as above, Canadian Bank of Commerce, 2, Lombard Street, E.C.3, or Lloyds Bank, Ltd., 20, King William Street, E.C.4, London.

AMERICAN GAS AND ELECTRIC CO.—A circular, signed by the president and issued to the shhldrs., is to the followg. effect: Do not be alarmed as to the real value of your hldgs: in our company due to the unprecedented panic and hysteria which have been prevailg. upon the Stock Exchanges during the past few weeks. There is nothing in the situatn., as far as your company is concerned, which may occasn. any alarm. Our earngs. are increasg. We have contracts for large amts. of new business coming on to the system. Our public relatns. with our customers are of the very best. The company's assets are stated to be in excess of $400 000 000, and to include cash and call loans in excess of $15 000 000; high grade bonds and pfd. stk. in the treasury having a readily saleable value $60 000 000; physical property, largely now in operatn., paid for out of cash on hand and agst. which bonds and pfd. stks. can be issued and sold, amtg. to more than $40 000 000. Available surplus at Sept. 30, 1929, was $39 308 634.

Company Meetings.

FERRANTI, LTD.—Dr. S. Z. de Ferranti, presiding at the meeting on November 21st, said the net profit for the year was £66 976, against £54 615 for the previous year, an increase of £12 360. The directors had made the usual allocation of £15 000 to depreciation reserve account, and the total now standing to the credit of that account was £151 912, equal to more than one-third of the total value of the fixed assets represented by land, buildings, plant, machinery, etc. During the year £40 000 of the general reserve account was capitalised and transferred to ordinary share capital account. It was now proposed to transfer a similar sum out of profits to general reserve account, and this transfer would make the balance on this account £270 000, the same as last year. The balance-sheet showed that they had spent £44 867 on additional buildings, plant, machinery, fixtures and office furniture. The bank overdraft was £96 805, an increase of £64 831 over last year. This position arose partly from the fact that the balance of the first mortgage debenture stock was paid off in 1928 (£48 000 approximately), and partly from the expansion of trading which had taken place. It was anticipated that this expansion would continue, and this would necessitate raising further capital. The board were considering the method by which this further capital should be raised, and they would, of course, adopt the method which was most economical and desirable, after taking the best advice, and it might be that their suggestions would have to be submitted to the shareholders for approval. A dividend on the ordinary shares of 12%, tax free, was approved, and a balance of £39 572 is carried forward, an increase of £5 456.

TELEPHONE MANUFACTURING CO., LTD.—An extraordinary general meeting was held on Monday to consider the scheme for the separation of the manufacturing side of the company's business from the rental installation side. Mr. Fred. T. Jackson (chairman and managing director) stated that the adoption of this scheme would enable shareholders to participate in the progressive prosperity which had been attained for many years past by the installation side of the business. The profits earned for the past ten years, after charging depreciation and all expenses, but before charging certain non-recurring expenditure and interest, were as follows: 1919, £49 039; 1920, £53 366; 1921, £40 005; 1922, £41 172; 1923, £30 902; 1924, £43 364; 1925, £46 624; 1926, £46 658; 1927, £53 820; and 1928, £54 929. The Australian subsidiary was progressing satisfactorily, the profits for 1927 being £8 869, and for 1928, £12 982, and for the half-year ended June 30th, 1929, further expansion was shown. The average profits of the British installation companies over the past five years were over £49 000 per annum, and the combined profits of the British and Australian companies over the past two years were over £65 000 per annum. It was proposed that a new company be registered to take over the installation side, having a capital of £600 000 divided into 2 400 000 shares of 5s. each, and that the company to be registered to take over the manufacturing side should have a capital of £250 000, divided into a million shares of 5s. each, which would be equivalent to a shareholding of 7s. 6d. for each 10s. share held in the present company, being made up of one share of 5s. in Telephone Rentals, Ltd., for each 10s. share held in the Telephone Manufacturing Co., Ltd., and one share of 5s. in the new Telephone Manufacturing Co. (1929), Ltd., in place of every two shares held in the present company. The joint capital of the two new undertakings would be £750 000, compared with £1 000 000. It was proposed to utilise the difference in writing out of the balance-sheet fixtures, fittings, dies, expenses on share issue, etc. The approval of this scheme would mean that the new company, Telephone Rentals, Ltd., would, immediately the necessary formalities had been completed, declare an interim dividend of 2½%, and a final dividend in the early months of next year, and the Manufacturing Company on the new basis would have every opportunity of becoming a profit-earning concern. The resolution was carried by the requisite majority.

TECHNICAL CONSULTANT: Dr. Albert L. Mond, D.Sc. (Geneva), 19, Southampton Buildings, London, W.C.2.

SECRETARY AND REGISTERED OFFICE: Percy Bryant, 22, Birchin Lane, London, E.C.3.

TRANSFER OFFICE: Sewell, Hutchinson and Co., Finsbury Pavement House, London, E.C.2.

ABRIDGED PROSPECTUS.

The Company was incorporated on the 12th September, 1929, and intends to acquire (*a*) a freehold factory at Dudley, Worcester, and the plant, machinery, stock and equipment thereof, and the numerous patents and patent rights relating to the metals coating process; and (*b*) the whole of the Issued Share Capital of Metallisation (Sales), Ltd., of London, thereby giving this Company the benefit for Great Britain, Northern Ireland, the Irish Free State, and the Empire of India of all existing letters patent covering a process whereby any metallic or non-metallic surface (such as glass, rubber, paper, wood, textiles, etc.) can be covered with a coating from 1/20 m.m. up to any desired thickness of any metal that can be drawn into wire or obtained in powder form. The Company will be working in association with the Metals Coating Company of America Inc., Metallisator A/G, Berlin, and Metallisator A/G, Altona Works, Hamburg. Apart from the assets to be acquired as already referred to, the Company has through exceptional circumstances secured an option for six months to acquire 91 per cent. of the issued Ordinary Share Capital of Metals Coating Company of America Inc., which company holds the majority of the issued capital of Metallisator A/G of Berlin, which in turn holds the majority of the issued capital of Metallisator A/G of Hamburg, the exercising of which option would secure the world rights of all letters patent, together with the plant, factory premises, stock and goodwill of existing factories in Germany and America for a sum of £136 500, and would bring under the control of this Company world rights, establishing an effective world monopoly in the field of metal spraying.

The metals coating process is in continuous use in all the great industrial countries of the world. For example, in Germany important users include Siemens-Schuckert, A.E.G., Krupp, Thyssen and Co., Nord-Deutsche Lloyd; in America: General Electric Co., Westinghouse Electric and Manufacturing Co., Bethlehem Steel Co., Standard Oil Co., and Ford Motor Co.; in England: Guest, Keen and Nettlefolds, Ltd., Courtaulds, Ltd., English Electric Co., Ltd., Mond Nickel Co., Ltd., and Swan, Hunter and Wigham-Richardson, Ltd.

Report and Opinion of Dr. Albert L. Mond, D.Sc. (Geneva): In a report to the Directors of Metals Coating Co., Ltd., dated October 14th, 1929, Dr. Mond says: In the course of years of experience with this process numerous improvements have been made which are protected by Patents, which in my opinion sufficiently and adequately protect the subject of metal coating by the pistol, even when the extended term of the British Patent No. 25132/1913 (wire pistol) and the equivalent Patents in foreign countries have expired.

Powder-fed spraying pistols have been protected by British Patents Nos. 296 546, 298 858, 277 071, and in foreign countries.

Moreover, processes for metal coating by electrical means have been protected by British Patents Nos. 210 423 and 210 750 and by Patents in sixteen foreign countries. Also British Patent No. 196 695 is referred to. The value of the process, as far as convenience is concerned, is obvious and is recognised by most engineers and chemists.

The use of aluminium for coating, in the alumetising process is well known. It is possible by means of this wire-fed pistol to provide iron, steel and copper articles with a coating of aluminium or an aluminium alloy, which renders them immune from scaling at temperatures up to 1 000° C. There are several Patents for this alumetising process. I am of the opinion that the Patents and Patent applications under which you operate, contain valid subject matter and give you an effective monopoly of substantial duration for carrying out the metal spraying process by means of the wire-fed metal spraying pistol.

Report on Assets and Profits.—To the Directors, Metals Coating Co., Ltd.

GENTLEMEN, We have examined the accounts of Metallisation (Sales), Ltd., for the period from the incorporation of the Company on the 6th May, 1929, to the 31st October, 1929. The trading has resulted in a profit of £7 017 for the period of approximately five months, excluding Depreciation and Directors' Fees. The Assets and Liabilities of Metallisation (Sales), Ltd., on the 31st October, 1929, were: Plant, machinery, etc., £6 076; stock and work in progress, £2 648; capitalised exhibition expenditure, £1 560; debtors, £10 216; cash, £884. Total, £21 384, less Liabilities (Sundry Creditors), £4 367; Net Assets, £17 017. The further assets which you are acquiring, namely, the freehold factory at Dudley, and the Plant, Machinery, Stock, etc., thereof, are valued in excess of £30 000.

To comply with Paragraph 1 of Part II. of the Fourth Schedule of the Companies Act, 1929, we formally report that no dividends have been paid on any class of shares since the date of the incorporation of Metals Coating Co., Ltd., on the 12th September, 1929, and that no accounts have been made up.—Yours faithfully, Oscar Berry, Froude and Co., Chartered Accountants.

The issued and paid up capital of Metallisation (Sales), Ltd., is £10 000.

Estimate of Profit.—Assuming the sale of only 250 apparatus for the coming year and including the amounts earned by the various contracting plant, the net profits of the Company available for distribution should amount to about £35 000 per annum. In this connection it should be noted that in the past six weeks over 3 000 enquiries and negotiations for the sale of apparatus and contract work are on hand.

Working Capital.—The Directors estimate that after payment of the purchase price and the cost and expenses of the formation of the Company and this issue, the proceeds of the issue will provide approximately a sum of £60 000 for working capital and for the general purposes of the Company.

[ADVT.]

MUNICIPAL FINANCE.

Points from the Past Year's Accounts of Electricity Undertakings.

THE total revenue for the year 1928–9 of the 205 undertakings included in the following table and in the tables which appeared in our issues of August 9th, September 13th and November 1st, was £27 682 273. The gross profit on the year's working of the undertakings was £13 256 470, and the aggregate sales of electricity amounted to 4 740 713 058 kWh, while 79 undertakings out of the total number have contributed out of the year's profits or from reserve an aggregate of £456 914 to the relief of rates. In many cases the costs include items of a capital nature, and net profits have been reduced as the result of reduction of charges for current. As it is desired to make these tables as complete as possible, the Editor will be pleased to receive similar particulars of other municipal electricity undertakings.

Receiverships.

ELECTRODRIVES, LTD. D. E. Evans, of 29–30, King Street, Cheapside, E.C., 2, was appointed receiver and manager on November 11th, under powers contained in debenture dated October 5th, 1929.

PINNACLE INVESTMENT TRUST, LTD. E. L. Donald, C.A., of Atlantic House, 46, Holborn Viaduct, E.C.1, was appointed receiver and manager on November 13th, under powers contained in debenture dated August 1st, 1929.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced.*]

BETTA TRADING CO., LTD., London, W., gramophone and wireless dealers, etc.—Registered November 14, £6 000 and £8 000 debentures, to C. W. Chambers, 44, Dunstan Road, N.W.11, and Chambers and Bright (1929), Ltd., 204, Great Portland Street, W.; general charge.

CRAVEN HYDRO-ELECTRIC SUPPLY CO., LTD., near Skipton.—Registered November 14th, £5 000 debenture, to Linton Mills Estate Co., Ltd.; general charge.

ELECTRICAL AGENCIES (LONDON), LTD.—Registered November 18th, £800 debentures; general charge. *Nil. August 9th, 1928.

ELECTRO DYNAMIC CONSTRUCTION CO., LTD., London, S.E.—Registered November 15th, debenture, to Lloyds Bank, Ltd., securing all moneys due or to become due to the Bank; charged on lease of Dynamo Works, Devonshire Grove, S.E.15, also general charge. *£1 000. May 14th, 1929.

G. AND L. ELECTRICAL SUPPLY CO., LTD., London, W.C.—Registered November 18th, £2 000 debentures; general charge. *——. January 27th, 1928.

RAVEN (PETER) AND CO., LTD., Birmingham, dealers in electrical accessories, etc.—Registered November 15th, series of £1 000 debentures, present issue £400; general charge. *Nil. May 24th, 1929.

WOLF AND MORGAN, LTD., London, E.C., manufacturers of electrical apparatus.—Registered November 12th, £1 000 debentures, balance of £2 000; general charge. *——. September 28th, 1928.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

HASLAM (G.) AND CO., LTD., electrical engineers, The Broadway, Leigh-on-Sea. The statutory meeting of the creditors of the above was held recently, when Mr. H. J. B. Feist, the liquidator, reported that the liabilities were £801, of which £501 was due to the trade, and £300 to the bank. The assets comprised stock £355, estimated to realise £250; fixtures and fittings, £10; book debts, £240, expected to produce £200; cash at bank, £55; work in progress, £30; and motor car, £8; making a total of £553, or a deficiency of £248, so far as the creditors were concerned. The liquidator said that the liabilities might be slightly increased, whilst the book debts might not produce the figure at which they were set down.

It was reported that the business was established in 1918, and was carried on successfully as a private concern until September, 1922. The company was then formed with a nominal capital of £2 000, of which £1 712 had been issued and was fully paid. During the first year or two of its existence, the company was successful. A lock-up shop was acquired at London Road, Leigh, and the trade there had not been good, losses aggregating some £700 to £800 having been incurred. The shop at London Road had been closed down, and the stock removed to the Broadway premises. The latter were held on a lease which had three years unexpired at a rental of £85 per annum.

The creditors decided to confirm the voluntary liquidation of the company with Mr. W. A. J. Osborne, of Messrs. Corfield and Cripwell, Balfour House, Finsbury Pavement, E.C. as joint liquidator.

London Gazette, etc.

Company Winding-up.

STANDARD PLATINUM CONTACTS, LTD. Winding-up order, November 18th.

Winding-up Petition.

FELLOWS MANUFACTURING CO., LTD.—A creditors' petition for winding-up has been presented, and is to be heard at The Royal Courts of Justice, Strand, London, on December 9th.

Bankruptcy Information.

GASCOIGNE, Harry, 40, Cricklade Street, Cirencester, Glos. wireless dealer. Receiving order, November 19th, debtor's petition.

PEACE, ERNEST EVERITT, rear of 230, High Street, Erdington, Birmingham, trading as PEACE AND CO., manufacturing electrical engineer. First meeting, December 4th, 11 a.m., Official Receiver's Office, 191, Corporation Street, Birmingham. Public examination, January 8th, 2.30 p.m., Court House, Corporation Street, Birmingham.

Notice of Dividend.

PAGE, Edgar George Matthews, Bohemia Road, St. Leonards-on-Sea, dealer in wireless sets and accessories. First and final dividend, 20s. per £, payable, November 26th, [Official Receiver's Office, 12A, Marlborough Place, Brighton.

Notice of Intended Dividend.

GARNETT, William Terrell, trading as W. T. GARNETT'S CABLE CO., Barkerend Mills, Bradford, electric cable and wire manufacturer. Last day for receiving proofs, December 10th. Trustee, J. O. Morris, 12, Duke Street, Bradford, Official Receiver.

Order Made on Application for Discharge.

STRATHDEE, Andrew Knox Ewart, 923, Romford Road, Manor Park, trading as EMSCO RADIO, electrical engineer. Discharge suspended for three months until January 29th, 1930.

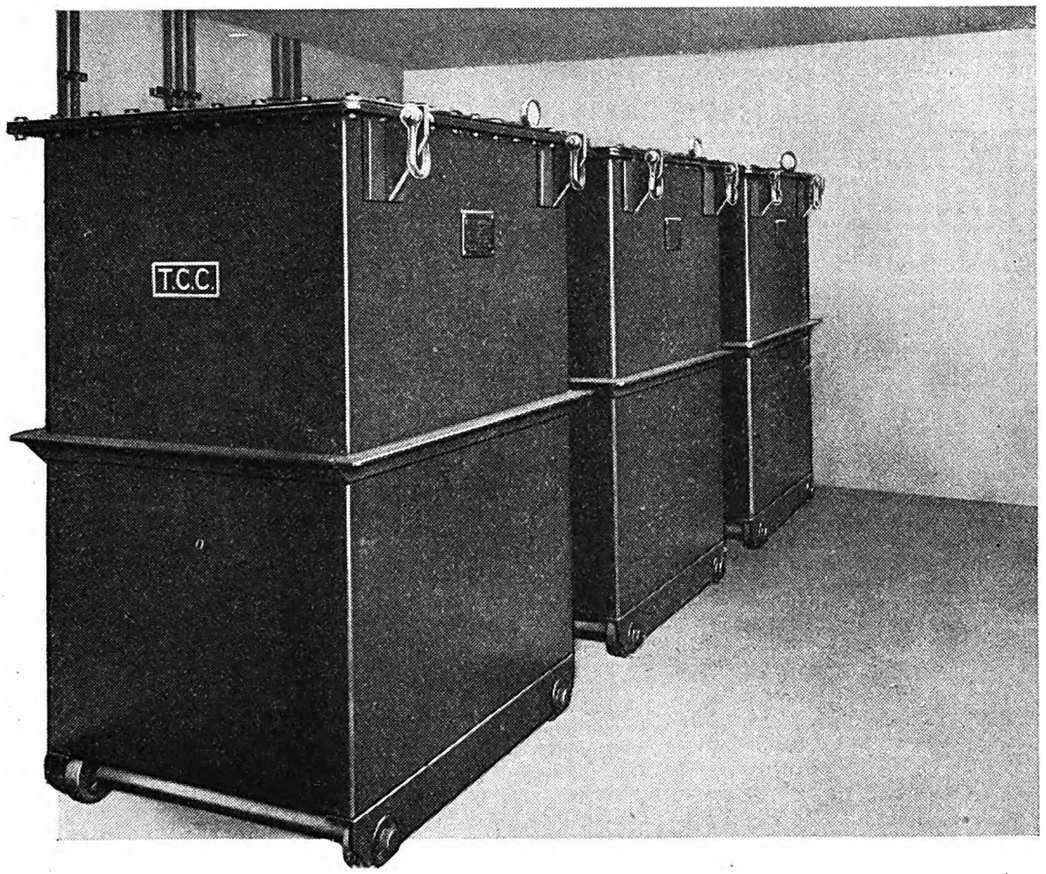
Famous Users of T.C.C. Power Condensers

And now —



A FAMOUS CEMENT FIRM

In many of Britain's most successful factories you'll find installations of T.C.C. Static Power Condensers. The photograph above shows three T.C.C. Condensers, each 260 kVA, the supply being 440 volts three-phase 50 cycles, installed by Messrs. Greaves, Bull & Lakin (Harbury) Ltd. We are anxious to advise you on your power factor correction problems. Write to us and place them before us, asking for Catalogue No. 51.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

318 647 C. J. Beaver and W. T. Glover and Co., Ltd. Impregnating paper for insulation of electric cables and apparatus therefor.
318 559 J. A. Crabtree. Electric switches. (4/4/28.)
318 502 C. Croom-Johnson. Electric accumulators. (2/5/28.)
318 557 J. J. V. Armstrong (Telefunken Ges. fur Drahtlose Telegraphie). High frequency telephone systems. (3/3/28.)
318 654 L. Mellersh-Jackson (Siemens and Halske Akt.-Ges.). Electro-optical cells for use in electrical picture transmission and television systems. (9/5/28.)
318 475 Igranic Electric Co., Ltd., J. Lucas, Ltd., A. H. Mackley and J. W. Burleigh. Electrically operated and controlled vehicles. (25/5/28.)
318 477 Standard Telephones and Cables, Ltd. (Western Electric Co., Inc.). Telephone systems. (31/5/28.)
291 385 British Thomson-Houston Co., Ltd. Electric remote-control systems. (31/5/27.)
291 407 Akt.-Ges. Brown, Boveri, et Cie. Quick-acting regulator of the vibrating type for keeping the current or voltage of generators constant. (1/6/27.)
318 507 Benjamin Electric, Ltd., and G. Campbell. Shock-absorbing mounts for thermionic valves or other electrical devices. (31/5/28.)
318 480 H. H. Berry and C. A. Painton. Changing signs. (1/6/28.)
318 565 J. E. Pollak (Associated Telephone and Telegraph Co.). Systems and apparatus for television. (1/6/28.)
318 569 Standard Telephones and Cables, Ltd. (Western Electric Co., Inc.). Signalling arrangements, particularly for use in telephone systems. (6/6/28.)
318 574 G. T. Church. Electrical heating apparatus particularly for use with incubators. (6/6/28.)
318 666 S. M. Rutnagur. Electric traction for railways. (7/6/28.)
318 667 Standard Telephones and Cables, Ltd., and S. Chapman. Testing arrangements for electromagnetic relays or the like. (8/6/28.)
292 126 T. S. Ramsdell. Automatic overload control device. (14/6/27.)
293 381 British Thomson-Houston Co., Ltd. Methods of and means for driving films in sound recording or reproducing apparatus. (5/7/27.)
318 669 British Thomson-Houston Co., Ltd., F. A. Fossey, C. J. Morton and T. H. Woodfield. Brush-holders for ignition dynamos. (8/6/28.)
318 671 Sir C. A. Parsons and J. Rosen. Ventilation of dynamo-electric machinery. (8/6/28.)
318 672 A. H. Marks and P. Russell (legal representatives of E. C. R. Marks (deceased) (H. N. Jasper). Electric disturbances neutraliser for radio communication. (8/6/28.)
308 749 J. Kremenezky, trading as J. Kremenezky (firm of)). Adjustable high-ohmic resistances and the method of manufacturing the same. (31/3/28.)
295 679 Associated Telephone and Telegraph Co. Train control systems. (17/8/27.)
318 677 H. Garner and G. H. Mulley. Electrically operated bolts or fastenings. (12/6/28.)
318 679 E. J. Wyborn. Variable condensers, and radio-receiving and the like apparatus incorporating variable condensers. (12/6/28.)
318 681 Automatic Telephone Manufacturing Co., Ltd., F. Kessler, and C. R. Woodland. Arrangements for mounting equipment of the kind used in telephone systems. (12/6/28.)
292 128 J. Pintsch Akt.-Ges. Buoys or similar signalling stations fitted with acoustical signalling apparatus. (14/6/27.)
318 683 Igranic Electric Co., Ltd., J. Lyons and Co., Ltd., S. R. Wright, A. Goddard, and G. Douglass. Electric signalling apparatus. (14/6/28.)
294 237 Electrolux, Ltd. Process of treating aluminium or other light metals. (22/7/27.)
292 603 E. Boder. Electric switching systems controlled by timing apparatus. (23/6/27.)
318 690 H. C. Pride. Holder for incandescent strip electric lights. (20/6/28.)
318 693 E. H. Chapman. Coupled electric inductance coils. (22/6/28.)
318 702 I. N. Whitesmith, J. A. Dorratt, and Associated Electrical Industries, Ltd. Electrical heating devices. (6/7/28.)
318 705 Elektro-Thermit Ges., and A. G. Crum. Welding of rails or the like by means of superheated molten metal. (10/7/28.)
297 454 Siemens and Halske Akt.-Ges. Telephone sets incorporating manually operable selectors. (22/9/27.)
318 708 Consulting and Radio Service, Ltd., and N. Turner. Electrical sound-producing device. (13/7/28.)
318 709 Gramophone Co., Ltd., and A. Whitaker. Photographic recording of acoustic or the like oscillations. (14/7/28.)
294 605 Associated Electrical Industries, Ltd. Electrical circuit interrupters. (27/7/27.)
318 716 G. T. McGlashan and G. S. Clark. Switchboards. (28/7/28.)

Applications for Patents.

25 310 C. L. Hodgskin. Electric lamps.
25 379 C. Leven. Electrical contacts.
25 305 R. W. Minshall. Thermionic valves.
25 339 G. Reittinger. Connection for cables. (20/8/28, Germany.)
25 354 J. Sinclair-Ross and J. Zetsche. Electric motors.
25 303 W. A. Stevens. Electric braking.

COMING EVENTS.

Friday, November 29th (To-day).

Institution of Electrical Engineers (South Midland Centre).—Grand Hotel, Birmingham. Annual dinner.

Institution of Mechanical Engineers.—Storey's Gate, St. James's Park, London. Open debate on "The Registration of Reliable Tests of Power-plant Machinery." 6 *p.m.*

Junior Institution of Engineers.—39, Victoria Street, London. Informal meeting. Lecture by Mr. W. C. Freeman on "Modern Welding Systems and Applications." 7.30 *p.m.*

Electrical Association for Women (Bristol Branch).—Fortt's Restaurant. Dance and whist drive. 8 *p.m.*—1 *a.m.*

Saturday, November 30th.

Association of Mining Electrical Engineers (South Wales Branch). Official visit to Engineering Exhibition. 3.30 *p.m.*

Monday, December 2nd.

Institution of Electrical Engineers (South Midland Centre).—University, Edmund Street, Birmingham. Paper by Mr. R. A. Chattock on "The Modern Use of Pulverised Fuel in Power Stations." 7 *p.m.*

E.L.M.A. Lighting Service Bureau, 15, Savoy Street, Strand, London. Twentieth Illumination Design Course. Lecture VII by Mr. W. J. Jones on "Miscellaneous Lighting Problems." 7.30 *p.m.*

Tuesday, December 3rd.

Institution of Electrical Engineers (North-Eastern Centre).—Annual dinner.

Institution of Electrical Engineers (Scottish Centre).—North British Station Hotel, Edinburgh. Paper by Prof. F. G. Baily on "Engineering from the Cape to Kenya." 7 *p.m.*

Electrical Association for Women (South Wales and Monmouthshire Branch).—Womanby Street, Cardiff. Cookery demonstration at the G.E.C. showrooms.

Electrical Contractors' Association (Derby Branch).—Ordinary meeting. 5 *p.m.*

Institution of Electrical Engineers (Students' Section, North-Western Centre).—Engineers' Club. Albert Square, Manchester. Lecture by Mr. F. J. R. Baldwin on "Overhead Line Work." 7.15 *p.m.*

Television Society.—Engineers' Club, Coventry Street, Piccadilly Circus, London. Lecture on "Television: Some Suggested Schemes," by Mr. E. G. Lewin. 8 *p.m.*

Wednesday, December 4th.

Radio Manufacturers' Association.—Savoy Hotel, Strand, London. Annual dinner.

Electrical Contractors' Association (Bath Sub-Branch).—Ordinary meeting.

Electrical Contractors' Association (Cardiff Branch).2.30 *p.m.*

Institution of Electrical Engineers (Wireless Section).—Institution, Savoy Place, Victoria Embankment, London. Paper by Mr. G. Shearing and Captain J. W. S. Dorling on "Naval Wireless Telegraphy Communications." 6 *p.m.*

Institution of Electrical Engineers (East Midland Sub-Centre).—Technical College, Derby. Paper by Lt.-Col. H. E. O'Brien on "Electric Traction." 6.45 *p.m.*

Institution of Heating and Ventilating Engineers.—Swedenborg Hall, 20, Hart Street, London. Paper by Mr. R. C. Ching on "Costing Methods for Heating Engineers." 7 *p.m.*

Wednesday, December 4th-Friday, December 6th.

British Institute of Radiology.—Central Hall, Westminster, London. Exhibition and annual meeting. Official opening, Wednesday. 2.30 *p.m.*

Thursday, December 5th.

Electrical Contractors' Association (Newcastle Branch).—Ordinary meeting. 11 *a.m.*

Electrical Contractors' Association (Bristol Branch).—Ordinary meeting. 3.15 *p.m.*

Batti-Wallah's Society.—Hotel Cecil, Strand, London. Luncheon. 1 *p.m.*

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Lecture by Dr. H. Norinder on "Surges and Over-Voltage Phenomena on Transmission Lines due to Lightning and Switching Disturbances." 6 *p.m.*

Electrical Society of Glasgow.—30, Gordon Street, Glasgow. Visit to the Electrical Engineering Department of the Royal Technical College, George Street.

Friday, December 6th.

Institution of Electrical Engineers (Meter and Instrument Section).—Institution, Savoy Place, Victoria Embankment, London. Paper by Dr. C. V. Drysdale on "Alternating-Current Potentiometers and their Applications." 7 *p.m.*

THE ELECTRICIAN

Vol. CIII.—No. 2688. Friday, December 6, 1929. [Registered at the General Post Office.] Sixpence

Retain that old-world charm

WHEN you are wiring residences where the decorations are valuable—where the cutting of old panelling would be sacrilege, then think of the Henley Wiring System.

It is the system that can be installed without damage to decorations, quickly, neatly and inexpensively.

This fine old house—Bradley Manor, Grimsby—has been wired throughout with the Henley Wiring System by Matt Jennison Ltd., Grimsby.

If you are not already using this famous system—use it for your next job and prove for yourself its all-round excellence.

Use the Universal Joint Box with the HenleyWiring System. It simplifies the wireman's job

Current Topics.

The Traffic Scheme.

IT is difficult to offer any useful opinion on the Government's proposed passenger traffic scheme for London, for Mr. MORRISON'S outline of his public ownership plan was singularly vague, while his closing avowal that in view of the intricacy of the matters in question no further statement is to be expected for some time, merely adds to the bewilderment of those who try to deduce the real intention of the Government. The system envisaged appears to be one under which the public will own the electric "tube" railways, the tramways, trains and omnibuses, the whole of which will be controlled by a board of business men appointed by the Government, and given complete control. It has been suggested that this board will operate in much the same way as the Central Electricity Board, but it is obviously impossible to discuss this aspect without fuller details. The scheme, so far as it is at present understood, has met with a decidedly mixed reception, some seeing in it the thin end of the nationalisation-of-everything wedge; others considering it markedly inferior to the co-ordination plans devised by the last Government. In view of the unsettling effect of such nebulous announcements of a scheme affecting capital running well into a hundred millions sterling, it is a pity that Mr. MORRISON did not delay his statement until such time as the further information he spoke of is available. One of the main dangers of the present situation is that certain suburban railway electrification projects may now be discouraged, and in view of the lukewarm attitude these railways have shown in the past towards electrification this eventuality seems more than probable. We should in fairness add that the prospect of being brought into direct competition with the big publicly-owned traffic combine would provide sufficient deterrent for any private enterprise.

Electric Cooking Utensils.

IT is well known that sales resistance against the adoption of electric cooking in the home, when encountered, is generally on the score of operating cost. That such complaints are largely due to the use of incorrectly designed boiling utensils on totally enclosed hotplates is equally familiar knowledge to supply engineers and others having contact with the domestic consumer. The obstacle seems slight, but its effect on cooker sales has been very considerable. Resistance of this kind can only be overcome by educational means, and as the initial cost of properly designed utensils may be somewhat higher than that of those in use the problem is not over easy. An inducement in the shape of the supply of a range of suitable utensils at cost price to all consumers taking electric cookers from the Corporation is being tried out by Mr. J. E. STARKIE at Burnley. Such enthusiasm is commendable, but it is doubtful whether the plan would prove commercially feasible to undertakings and contractors outside the municipal field.

A B.I.F. Inquiry.

MANY of our readers will be glad to hear that the Department of Overseas Trade is appointing a committee to examine the policy and conduct of the British Industries Fair and to consider means to increase its utility to British trade. Since the Warner Committee's report in 1921 new problems have arisen which make desirable an independent review of the whole position. One of the points which most affects British manufacturers of electrical and other goods is that of date, and that again is bound up with the question whether the main intention of the Fair is to attract foreign or purely home buyers. It started, we know, like the big continental trade fairs to assist export trade, but in recent years, at Birmingham, foreign buyers have been conspicuously in a minority, and the stands have been crowded with members of British trade associations who could view the manufacturers' products at any time or place convenient to both. Amongst the electrical exhibitions there has been a growing desire to change the date from February to June or July, in order to attract the many overseas visitors who would not think of coming over here in

Digitized by Google

February. These matters have not received very sympathetic consideration in the past, so we hope that they may secure some attention from LORD CHELMSFORD'S committee.

How Many Electrical Uses?

WE commend to the statistically-minded reader an investigation which has been undertaken by Mr. H. C. POWELL, of the Toronto Hydro-Electric System, into the number of different employments of electricity at the Canadian National Exhibition in 1929. Defining an electrical use as "an application of electricity as a means of producing an effect or result," he has succeeded in listing no fewer than 729 distinctly different ways under the general classifications—light, heat, power, sound, measuring instruments, and miscellaneous. As this total—of which Mr. POWELL gives a detailed list—is only concerned with an exhibition, it will be interesting to see if anyone can improve upon it. Gas is claimed to have "a thousand and one uses" though we suspect this to be a figure of speech. Surely electricity can do better than that—and supply chapter and verse to prove its claim.

Good Advice.

LORD BYNG has been responsible for many reforms in the Metropolitan Police, and his recent advice to public lighting authorities to increase the intensity of their street lighting as a means for reducing the frequency of street accidents will, if acted on, result in a further reform of some magnitude. The idea of a central public lighting authority for the Metropolis has been mooted before, but the difficulties in the way of its realisation seem, at present anyhow, to be insuperable. Yet the urgent need for very definite improvement exists in many London boroughs. The extra cost of adequate lighting with modern equipment is insignificant compared with the advantages which it provides. There are some who believe that if only one can get a portion of a street or district properly lighted the contiguous areas of gloom will look by comparison still more gloomy and thus arouse a public desire for an extension of the improved conditions. We do not deny that this may happen eventually. But in the meantime road users emerging from darkness to light or vice versa are unable quickly to adjust their vision to the change in luminosity, and are thus more likely to come to grief than if the lighting had been uniformly bad. In any case it is wrong in principle to expect, as do some local authorities, that motorists and shopkeepers shall light their streets. We hope that the latest warning will stimulate definite remedial action.

Electricity and the Architect.

FOR some time past it has been evident that architects are beginning to take a wider view of their responsibilities to the public, acquainting themselves with the numerous aids to comfortable home-making which electricity provides. The architect who thought that the limit of domestic electrical refinement was the provision of one lighting point in the most inconvenient position in each room is now learning better. He is finding that the mere provision of electric lighting is no greater attraction to his prospective clients than "main drainage" or "company's water." People now expect to be able to use electricity when and how they like, and the more the architectural profession realises this the better will it be for them and all concerned. One outward and visible sign of architectural concern for the details that matter most to the occupiers of houses is visible in the Building Materials Bureau which the Architectural Association opens to-day at its premises in Bedford Square, London. Here samples of various materials and accessories, including electrical goods, will be displayed, so that architects may keep in touch with all the latest developments in the manufacture of materials and articles used in building. This is certainly a step in the right direction, and we hope that it will be followed by other efforts to co-operate with the other professions and trades interested in housing. There is certainly room for closer collaboration between architects and electrical engineers.

Electrical Gifts.

A speaker at a London electrical meeting the other day said that he added a piece of domestic electrical equipment to his home every Christmastide. There is, of course, nothing particularly remarkable in this, unless one speculates on the probable turnover of electrical goods which would take place if every member of the electrical industry would only follow this simple example. Thousands of extra table lamps, kettles, toasters, curling irons, coffee percolators, and such like would be sold, but, what is still more important the families and friends of these electrical people would realise that at last we are beginning to take some of our own medicine. Nobody can ensure that every member of the industry buys himself an electrical Christmas gift, but if every reader of this note takes individual action a useful start will have been made.

Light for Legislation.

IT is interesting to learn that, at long last, an up-to-date system of electric lighting is being tried in the House of Commons. One of the last of the strongholds of gas, it retained the old gas chandeliers, and with such a mixture it is not surprising that the results are not altogether pleasing. Now, it appears, "lay" lighting is being tried in some of the corridors and there is a possibility that the system may find extensive use in the House. Perhaps when the interior lighting has been brought into line with modern practice, attention may be turned to the lighting of Parliament Square.

Fog Signals by Telephone.

A SIMPLE device for minimising the danger to shipping occasioned by foggy weather is at present being tried out on the Clyde. The apparatus is used in conjunction with fog signals and consists of a wireless telephone transmitter fitted with a disc of the gramophone record type, impressed with the words one, two, three, and so on, up to a given number. The operation of the device is based on the fact that whereas sound waves travel comparatively slowly, so-called wireless waves are almost instantaneous. When the fog-horn is blown the sound waves bring into operation the wireless transmitter and start the counting device. The interval between the words represents the length of time that sound takes to travel a mile and when a listener with a wireless receiver on the ship first hears the count he follows the transmission until someone on board indicates direct reception of the sound waves. When these are heard a simple calculation from the last figure received electrically gives some approach to accuracy in estimating the distance in miles between the ship and the fog signal.

TERMINAL APPARATUS FOR TRANSOCEANIC SUBMARINE CABLE TELEPHONY.*

Technical Details of Transmitting and Receiving Amplifiers Devised to Compensate for Attenuation of Long Submarine Telephone Cables.

By N. W. McLACHLAN, D.Sc., M.I.E.E., F.Inst.P.

IN commercial land line telephony it is the custom to insert special amplifying apparatus, usually termed a *repeater*, at intervals, so that from, say, London to Edinburgh the speech would pass down the line to a first repeater, thence to a second, and so on. At Edinburgh the speech would have substantially the same quality and characteristics as in a London suburb.

On a two wire circuit where the go and return conversation is conducted on the same line, the attenuation distance between consecutive repeaters is equivalent to about 20 miles of standard cable, whose specification is shown in Fig. 1. When a

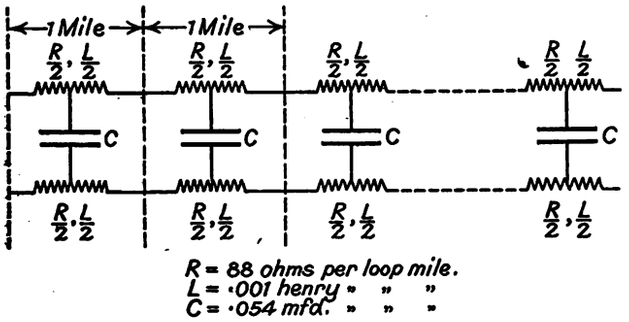

Fig. 1. Specification of standard cable mentioned in paper.

separate pair of wires is used for the go and return conversations, as on a four-wire circuit, the distance between repeaters can be as much as 40 m.s.c.† This represents the limit of modern repeater practice, which is governed by the tendency to self oscillation round the system of the thermionic amplifying valves.

The function of a repeater is twofold: (*a*) it must correct for the variation in the attenuation of the line with frequency,

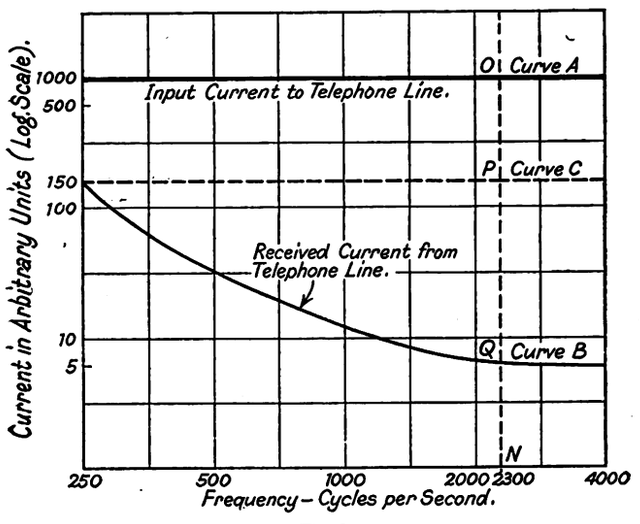

Fig. 2.

(*b*) it must amplify the incoming currents and restore them to a value equal to or greater than that at the microphone transmitter.

In Fig. 2, curve *A* represents a uniform current input at the beginning of a telephone line, whilst curve *B* represents the current at the end of the line. The repeater must correct the current until it is uniform at all frequencies, as in curve *C*; also, it must amplify to reproduce the level of the original curve *A*. If *QN* is 5 and *PN* is 150, the amplification at 2 300 ~ must be 30 times that at 250 ~. Curve *B*, which represents the influence of attenuation, depends upon the type of line or cable prior to the repeater. If Fig. 3 represents the attenuation curve of the landline or cable between two points, then the characteristic of the amplifier must be the same shape

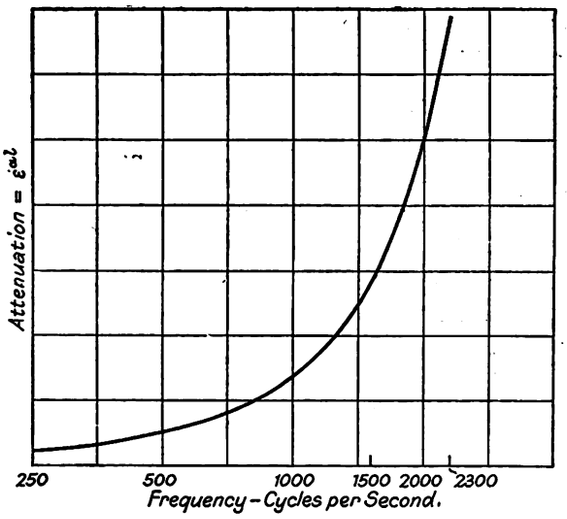

Fig. 3. Typical attenuation curve of landline or cable between two points.
α = attenuation coefficient. l = length of cable. ε = base of naperian logarithms.

to effect the desired result, i.e., to give equal representation to all output frequencies over the commercial telephonic range (250 ~ to 2 300 ~).

In designing end apparatus for long-distance submarine telephony, we are faced with conditions which are quite different from those on land. For a telephone cable across the Atlantic, distances are involved equal in attenuation to about 100 m.s.c. The respective *voltage* amplifications at 250 ~ and 2 300 ~ for 100 m.s.c. are 446 and 26·3 million. It should be observed that this is the voltage, and not the power amplification. At 2 300 ~ the latter is $6{\cdot}9 \times 10^{14}$—an enormous value, which corresponds to 148 transmission units (decibels).

The problem which confronts us in Transatlantic telephony is, therefore, to design end apparatus giving a voltage magnification of only 446 at 250 ~, but the stupendous figure of 26·3 million at 2 300 ~. A single amplifier to accomplish this is not impossible, but it is quite impracticable. Owing to interference at the terminal station of a submarine cable, to the agitation of electrons‡ in the wire of the cable and the

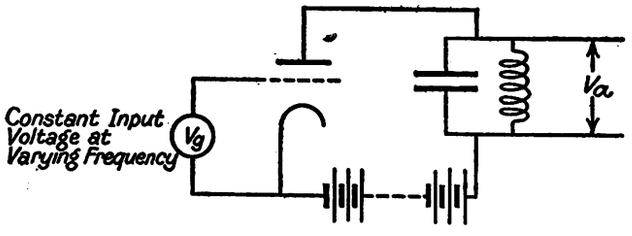

Fig. 4. Diagram showing tuned anode circuit.

transformer coils, etc., and to the irregular emission of electrons from the valve filaments, there would be a basic noise loud enough to render speech unintelligible. Unless special valves are used in the amplifier, the circuits are impulsed sufficiently for distracting noises of high pitch to occur, even with an amplification considerably less than $26{\cdot}3 \times 10^6$.

Moreover, to attain an overall amplification of this magnitude it is imperative to split the amplifier into two parts: (*a*) a power transmitter which raises the input level to the cable

* Manuscript received on June 20, 1929. ED.]

† Throughout this paper the attenuation of the standard cable is *not* referred to 800 cycles, but is taken at the actual frequency.

to about +35 m.s.c.; (*b*) a receiving amplifier capable of gaining the equivalent of 65 m.s.c. The voltage magnifications at both ends of the cable are given in Table I.*

TABLE I.

Frequency Cycles per sec.	Voltage Amplification at Transmitter. (Gain = 35 m.s.c.)	Voltage Amplification at Receiver. (Gain = 65 m.s.c.)	Combined Voltage Amplification. (Gain = 100 m.s.c.)	Transmission Units. (Decibels). (Gain = 100 m.s.c.)
250	8·5	52·5	446	53
500	19·6	250	4 900	74
1 000	62	2 140	133 000	102
1 500	144	10 200	$1{\cdot}47 \times 10^6$	123
2 000	279	34 600	$9{\cdot}65 \times 10^6$	140
2 300	398	66 100	$26{\cdot}3 \times 10^6$	148

Above values are for Standard Cable.
Where R = 88 Ω per loop mile,
C = 0·054 μF " " "
L = 0·001 H " " "

It might be thought that one could simulate the radio beam transmitters and, using the cable as a perfect beam, put the transmission level up to kilowatts. This, however, is not so simple as it seems, owing to the large voltages and currents

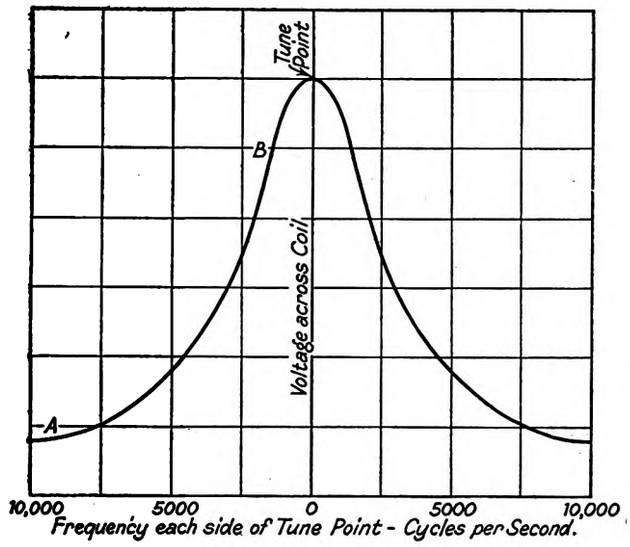

Fig. 5.

which the beginning of the cable would have to withstand. The cable would be of the loaded type, and we can assume for purposes of calculation that its characteristic impedance $\sqrt{\frac{L}{C}} = Z$ is substantially constant for all telephonic frequencies. Taking a normal input current of 1 mA r.m.s.—without previous amplification—the r.m.s voltage on the cable for $Z = 200$ Ω is 0·2. If the input level is raised to 35 m.s.c. the voltage, and therefore the current, is increased about 400 times at 2 300 ~, but considerably less at 250 ~. Assuming an average rise of 200 times over the frequency band, the r.m.s. current to the cable is 0·2 A, and the voltage 40. These quantities are quite unusual in telephone work where the permissible current is only a few milliamperes.

Taking first the case of the current into the head end part of the cable. This has a r.m.s. value of 0·2 A. In speech

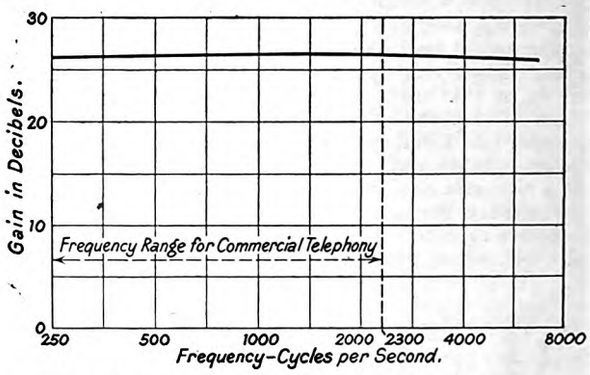

Fig. 7. Input transformer with mumetal core. Tested on cable having z = 600 ohms.

transmission, it is necessary to allow for peaks many times the r.m.s. value, and the maximum current *may* reach 3 A. If the radius of the copper conductor is *a*, and the thickness of the loading material *t*, the value of the magnetising force on the latter can be computed from the well-known formula $H_{max} = \frac{2\,I_{max}}{a + \frac{t}{2}}$ where I_{max} is the maximum current. Putting $I_{max} = 3$ A (0·3 absolute unit), $a = 0{\cdot}25$ cm., $t = 0{\cdot}005$ cm., we get $H_{max} = \frac{0{\cdot}6}{0{\cdot}255} = 2{\cdot}4$ c.g.s.

Alloys of the nickel-iron group as used for submarine telegraph cables have many times the permeability of iron, and are saturated by values of *H* of this order. Moreover, to avoid this condition with consequent distortion, it is essential in a long telephone cable to use a magnetic loading material which has special properties.

Rising Frequency Characteristic.

In the amplification system, the transmitter has a rising frequency characteristic to compensate for a loss equivalent to a certain length of cable. If all speech frequencies are equally represented at the *input* to the transmitter, the output from the transmitting valves to the cable will contain a much greater proportion of high than of low frequencies.

Since the attenuation of the cable increases with frequency, the length of the initial or head end part of the cable which must withstand heavy currents is less with a "shaped input" than it would be if the amplification were uniform throughout the frequency range—for equal r.m.s currents in the cable.

In the latter case (uniform amplification) there would be large low frequency currents which would persist to a considerable distance. Also, if the current at the upper frequencies,

* It is immaterial how the amplification and correction are shared by the receiver and transmitter, provided the attenuation of the cable is offset. The attenuation of a submarine telephone cable will in general differ from that of standard cable. Data pertaining to the latter is given herein by way of example.

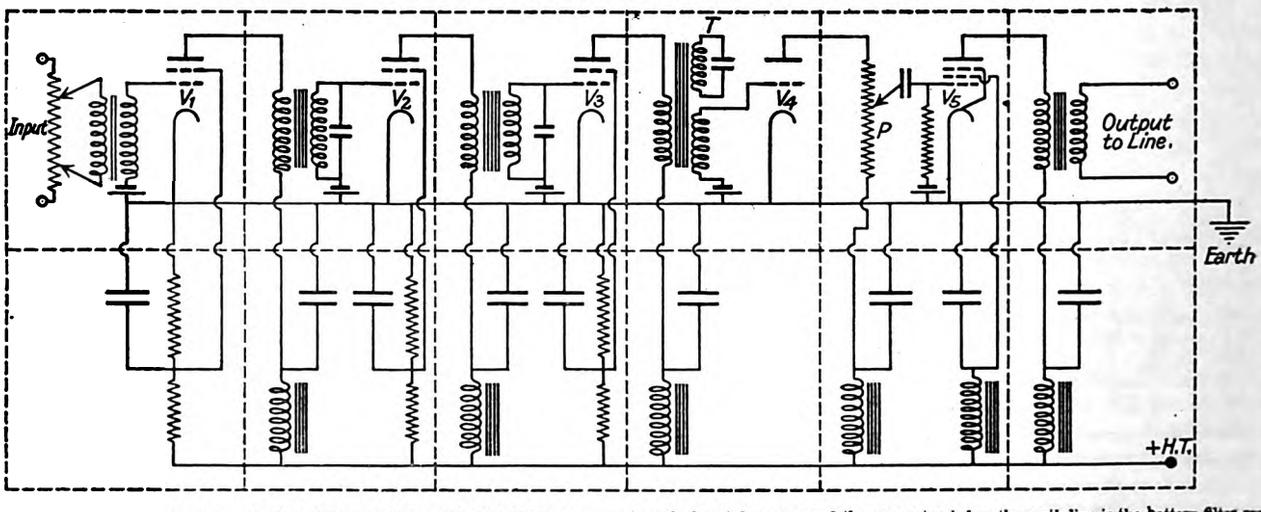

Fig. 6. General circuital arrangement of receiving amplifier. The dotted lines represent earthed metal screens and the apparatus below the earth line is the battery filter system

Digitized by Google

say, 2 000 ~, is large enough to cause distortion due to non-linear action of the loading material, the harmonics so created will lie outside the normal speech frequency band. Owing to the large attenuation above 3 000 ~, these harmonics will not be audible at the receiver, i.e., the cable acts as a filter.

Taking the voltage applied to the cable, the peak value to which the dielectric will be subjected is about 600. Special precautions must be taken to ensure that an adequate factor of safety is secured, since a fault in the dielectric of an ocean cable costing over a million sterling is a serious matter. Also, to reduce the attenuation to a low value, it is necessary to use a special dielectric.

The Receiving Amplifier.

Coming now to the receiving amplifier, we have to obtain a voltage amplification varying from 52·5 at 250 ~ to $6{\cdot}61 \times 10^4$ at 2 300 ~. Two problems arise: (*a*) how to vary the amplification progressively over the speech frequency range; (*b*) how to preserve the necessary stability and freedom from self-oscillation.

A discussion of various methods of achieving condition (*a*) would make this paper unduly long, and need not be pursued. To comply also with (*b*) there are definite limitations to most of the possible circuits, and it was essential, therefore, to

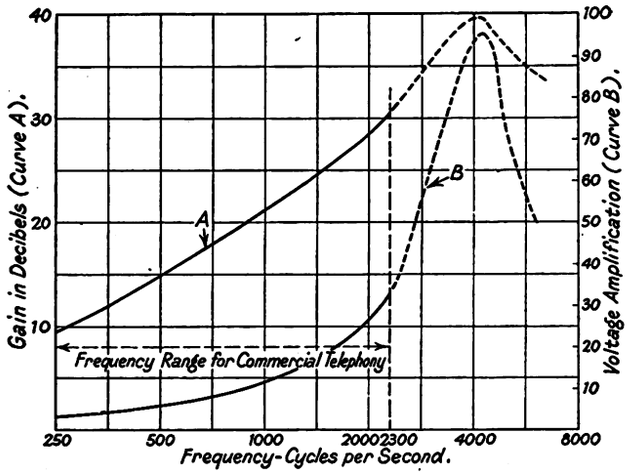

Fig. 8. Typical characteristic of stage comprising screened grid valve and resonant transformer.

devise a new scheme. Bearing in mind that the amplification-frequency curve must be concave upwards, as shown in Fig. 3, one has to find an arrangement which will comply with this condition.

Everyone is familiar with the tuned anode circuit used in radio receivers and illustrated in Fig. 4. When a constant voltage of varying frequency is applied to the grid of the valve, the voltage across the coil varies with the frequency, as shown in Fig. 5. The portion *AB* is concave upwards, and appears to offer possibilities. By using the tuned circuit as the secondary of a transformer whose primary is connected in the anode circuit of the valve, it is possible by manipulation of the circuital parameters to vary the shape of *A B* over wide limits.

Moreover, it occurred to the author that a similar procedure could be followed at audio frequencies to obtain the desired shaping for a cable amplifier. Accordingly, a transformer was designed to work with a triode of 30 000 Ω internal resistance. The characteristic of the combination was found to be quite good.

At the time this work was in progress (August, 1927) the author obtained a sample of a screened grid valve. This was tested in conjunction with a specially designed transformer, and it was found possible to correct for 20 m.s.c. in one stage. Thus it was decided to adopt the combination of a resonant transformer and a screened grid valve as a composite unit for a correction stage.

Although the anode to grid capacity of such valves is a relatively small amount, it is not possible to obtain a voltage magnification of the order of a million, without elaborate precautions. To avoid reaction it is imperative to incorporate various pieces of auxiliary apparatus in the amplifier, and to build the complete system in such a manner that capacity and electromagnetic coupling between stages, added inter-electrode capacity due to wiring, inductive loops and a.c. potential drop in h.t. and l.t. bus bars is reduced to a minimum. Unless precautions are taken, it is quite a simple matter for the h.t. or l.t. bus bars to convey energy (induced) from the output to the input of the apparatus. Only a minute amount of feed-back in a high magnification system is required to set the system into self-oscillation.

The general circuital arrangement of the receiving amplifier is shown diagrammatically in Fig. 6. To avoid reflection the

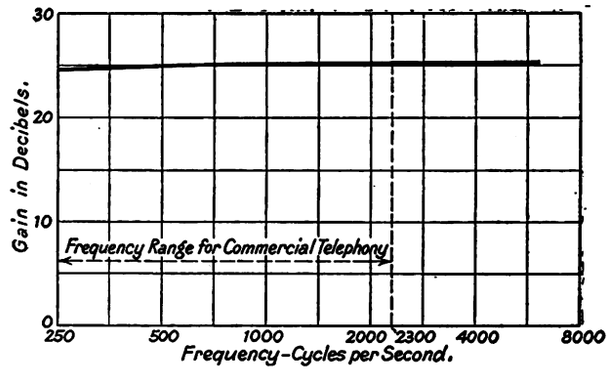

Fig. 9. Output transformer in anode circuit of pentode valve tested on cable having z=600 ohms.

end of the cable is bridged by a resistance equal to the surge impedance, i.e., $\sqrt{L/C}$. The primary of an input transformer having a ratio lying between 20/1 and 30/1 is connected across this resistance. The secondary is connected to the grid and filament of the first screened grid valve of the amplifier.

The characteristic of a typical input transformer with "mumetal" core is shown in Fig. 7. It is flat over a very wide frequency range, a feature attributable to the comparatively small number of turns, which is concomitant with a reduction in the self and mutual capacities of the windings. The high initial permeability of "mumetal" makes this possible. Care must be exercised that the peaks of the low frequency components of the speech are inadequate to cause valve distortion after being stepped up by the input transformer. Unless an adequate grid swing is permissible on the first and succeeding screened grid valves, this may happen.

Minified Lower Frequencies.

Thus in the correction stages, the lower frequencies are—in certain cases—minified rather than magnified. So far as the first valve is concerned the ratio of the input transformer must be selected to avoid valve distortion. It is desirable, however, in order to reduce the relative importance of valve noise, that the turns ratio should be as large as is compatible with a uniform frequency characteristic.

A resonant transformer is connected in the anode circuit of the first screened grid valve, and the combination gives an amplification frequency characteristic of the form shown in Fig. 8. Since the commercial speech band ranges from 250 ~ to 2 300 ~, the fact that the curve falls away on the right-hand side of the maximum value is immaterial, so long as the latter exceeds, say, 2 300 ~. This stage enables a correction equivalent to about 20 m.s.c. to be obtained.

Following this, other units are added until the requisite correction is attained. Where the attenuation of the cable

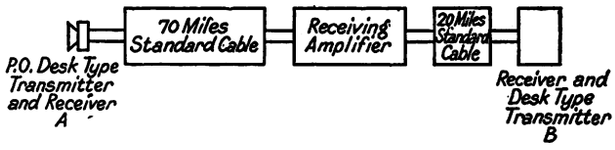

Fig. 10 Arrangement of apparatus for conducting speech tests in laboratory. Transmitter B is connected to receive A via 20 M.S.C. (not shown.)

departs materially from that of the cable of Fig. 1, it is necessary to modify the circuit accordingly.

No attempt is made to obtain very large magnification per stage, since it is desirable to work the valves on the linear portions of their characteristics. Otherwise harmonics of the lower frequencies will occur in that part of the audible range where the ear is most sensitive.

(To be concluded.)

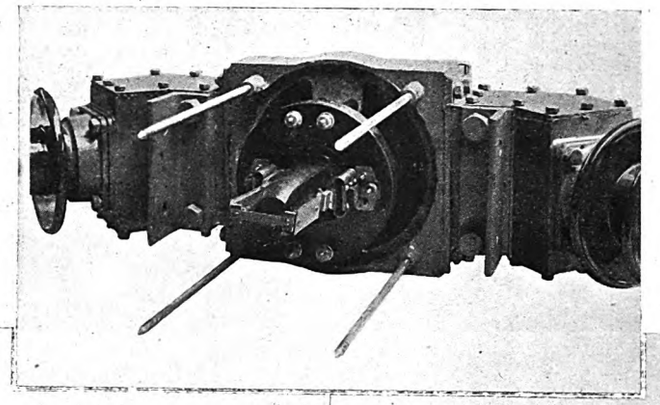
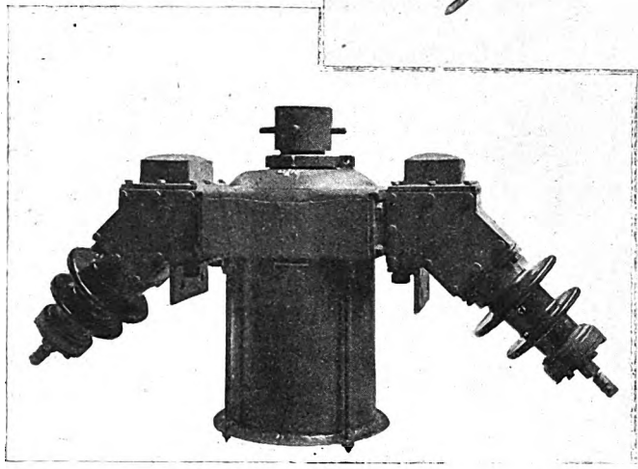
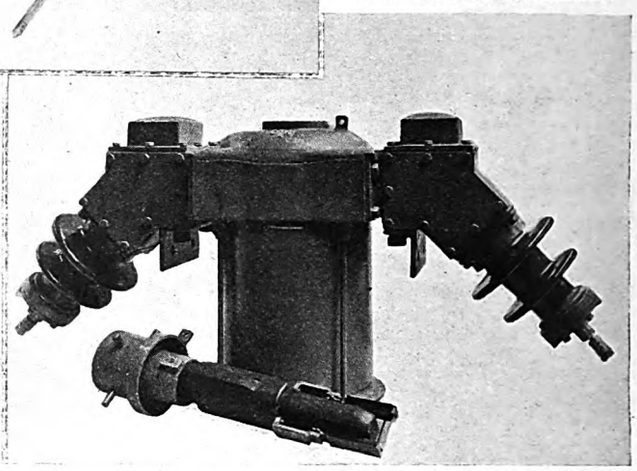
PLUG-TYPE OIL FUSES.

IN these pictures are seen a new plug-type oil fuse for 11 000 V service and for direct connection of the base conductors, produced by Ferguson, Pailin, Ltd. An internal view is seen on the right, while the pictures below illustrate the complete fuse, that on the right having the element withdrawn. The terminals are of bakelite-insulated copper, the external portion being protected by a one-piece porcelain insulator.



THE internal end of the stem ends in a compound - filled connecting chamber fitted with expansion cap. To minimise bird faults the bushing slopes downwards, and the supporting straps are bolted to the underside of the chambers. Langite gaskets are fitted below all external clamping surfaces. Alternative designs have been produced for sealing cables or for terminating both cable and bare conductor connections.





brickwork of the air that passed through the hollow combustion chamber walls was not sufficient to allow the CO_2 content to be raised higher than 14%, with the result that the thermal efficiency obtained was not quite as high as it might have been.

The steam-operated coal driers also proved unable to remove sufficient moisture from the coal, and it has been necessary to select as far as possible those coals which do not normally carry more than 15% of moisture, in order to obtain a resultant moisture content of about 10%. If a higher percentage of total moisture than this is allowed in the pulverised fuel, difficulties are experienced with the packing of the coal in the Fuller-Kinyon pumps, in the pulverised-fuel bins over the boilers, and in the screw feeders to the burners. This tends to uneven feeding of the coal into the furnaces and reduced efficiency of operation. Apart from these two troubles, which can be overcome by careful operation and attention, the plant has worked quite satisfactorily.

A very careful test was carried out on one of these boiler units which was fitted with an economiser, this test being designed to represent as far as possible the ordinary conditions obtaining in a boiler house. Owing to the impossibility of actually weighing pulverised fuel, the raw coal as fed to the coal driers had to be weighed and calculated forward to obtain the net weight of pulverised fuel fed to the furnace, and, in order to eliminate errors in observation as far as possible, the test was carried out over a period of six days, the boiler being steamed for 18 hours a day and banked for the remaining six. The detailed figures of this test are set out in a table in the original paper. From these figures it is seen that, calculated from the gross calorific value of the pulverised fuel entering the boiler, the combustion heat efficiency actually obtained was 80·35%. This, of course, takes into account the period during which the boiler was banked each day. If this banking period is eliminated, the combustion heat efficiency will be slightly higher. This figure of 80·35% compares with a boiler-house combustion efficiency of 72%, covering the operation of stoker-fired boilers only.

Some three years ago it was found necessary to increase still further the boiler capacity at Prince's station, Nechells, and, as the result of the experience on these Vickers-Spearing boilers, it was obvious that there were three considerations which must be taken into account :—

(1) If the bin-and-feeder system was to be retained, the coal must be dried to a lower moisture content.

(2) In order to run with a higher percentage of CO_2 in the furnace, better cooling of the brickwork must be obtained.

(3) The increased capital costs over an installation of mechanical stokers necessitated the employment of much larger boiler units.

It was therefore decided to instal boiler units having a normal evaporation of 150 000 lb. of steam per hour (actual) and an overload evaporation of 180 000 lb. of steam per hour (actual).

The boilers chosen were of the double Stirling type, as this pattern lent itself best to the space available in the existing boiler house.

Four boilers have been installed, each having a heating surface of 16 440 sq. ft. in the boiler proper and being equipped with two superheaters and two economisers. The combustion chamber, which has a volume of 19 000 cu. ft., has all four walls protected by water tubes having a surface of 4 700 sq. ft., which form part of the circulation system of the boiler. These tubes are fitted with firebrick tiles which form a continuous thickness of firebrick between the tubes and the furnace gases in the combustion chamber. No water-screen tubes are employed in these chambers, but the ashes at the bottom are kept in a molten state until they drip into the pit beneath, at the bottom of which they fall into a water sluice which carries them away. The combustion chambers are fitted with three burners at each end, through which the pulverised fuel with its primary air, and also the secondary air, enter the furnace. These boilers were designed by Messrs. Simon-Carves, Ltd.

The pulverised-fuel equipment consists of four large coal driers of the rotary kiln type, which are fired by small pulverised fuel furnaces. These driers reduce the total moisture in the coal from 20% to 6% without driving off any material part of the volatiles contained in the coal. The dry coal is conveyed by means of elevators and screw conveyors to dry-coal bunkers situated in the boiler house proper.

From these bunkers it is fed to four large motor-driven ball mills each capable of pulverising 12 tons per hour. These mills are air-swept, and the fuel is caught in cyclone collectors and stored in pulverised-fuel bins over the boilers. From these bins it is delivered by means of special feeders to the six burners installed in each boiler furnace. Arrangements are made to enable any mill to supply any pulverised-fuel bin by means of cross screw conveyors.

Two of these boilers have now been in operation for about 12 months and, as a result of this experience, it is apparent that the following modifications are desirable. The large

Digitized by Google

amount of moisture that is driven off the coal in the coal drier does not all get away through the vent provided, but a quantity of it passes over with the coal through the screw conveyors, which have to be hermetically sealed in order to prevent the dust from getting out. The temperature of the coal and the vapour in the conveyor is about 200 deg. F., and it is found that the moisture condenses on the inside surface of the conveyors and tends to promote clogging. The conveyors, therefore, have had to be lagged in order to prevent contact with the external low-temperature air.

With this coal of low moisture content there is no trouble of any kind as regards packing in the pulverised-fuel bins, and there is no intermittent working of the coal feeders to the burners. In the combustion chamber it was found that if the percentage of CO_2 in the gases is allowed to rise above 14%, the brick tiles in front of the tubes become burnt away, and the tubes become exposed. It has now been decided to leave all the tubes exposed and to insert the brick tiles behind them to form a wall of firebrick between the tubes and the outer casing. In this way it is anticipated that the percentage of CO_2 can be raised to 16% and a higher thermal efficiency obtained.

A test has recently been carried out on one of these boiler units, and here again the coal had to be weighed in its raw state before it entered the driers, and calculated forward to obtain the net weight of pulverised fuel fed to the furnace. On this account, and in order to eliminate errors of observation as far as possible, a continuous run over a period of 54 hours was made at approximately normal evaporation. Taking the gross calorific value of the pulverised fuel entering the combustion chamber, the combustion heat efficiency obtained was 84·69%. This test was carried out over a continuous period, and is not therefore comparable with the test on the Vickers-Spearing boiler. It compares, however, with a stoker-fired boiler combustion efficiency of 80%, obtained under similar test conditions. As explained above, it is hoped to increase the CO_2 percentage and to obtain a still higher combustion heat efficiency on this boiler.

As a result of the experience obtained on these two installations, it was decided for the new Hams Hall power station :—

(1) To adopt still larger boiler units of 200 000 lb. evaporation per hour each.

(2) To form the water walls of the combustion chambers of what are known as Murray fin tubes so as to do away with all possible brickwork in the furnace.

(3) To use unit pulverisers, five mills to be fitted to each boiler (four to run and one spare).

This arrangement is shown diagrammatically on page 706. The boilers are equipped with superheaters and air heaters, the whole of the air required for combustion being heated to a temperature of about 350 deg. F. The Atritor mills are air-swept, the hot air being used for this purpose.

Information has been obtained that both in America and on the Continent this system of firing pulverised-fuel furnaces is being largely adopted, and that satisfactory results are being obtained. It is anticipated, therefore, that this type of equipment will produce even better all-round results than those installations which have already been tested and which are described above.

ELECTRICAL ENGINEERS' BALL.

List of Members of General and Executive Committees.

IT has been arranged to hold the Electrical Engineers' Ball on February 7th next, at the Hotel Cecil, London, and the following committees have been formed :—

GENERAL COMMITTEE.

TRANSFORMERS AT HAMS HALL POWER STATION.

THE transformer chambers at the Birmingham Corporation's new power station at Hams Hall are arranged along one of the side walls of the building. This picture shows some of the 12 000 kVA three-phase, 25 periods, 11 000/33 000 V transformers which were supplied by Ferranti, Ltd.

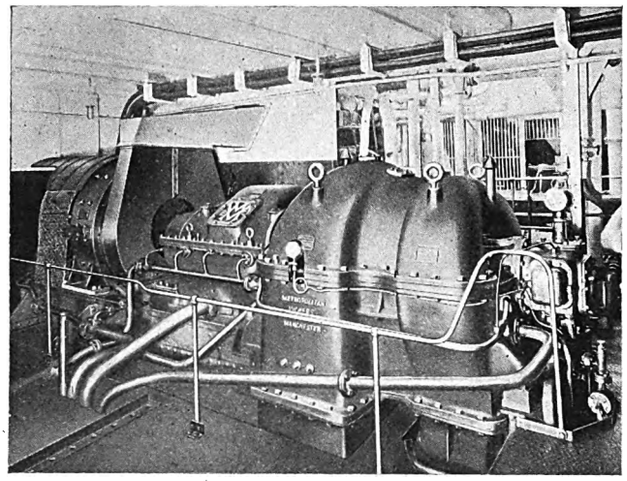
MARINE ELECTRICITY.

Electric "Supercharge"—A New and Most Promising Application of Electricity to Marine Propulsion Work.

By A. C. HARDY, B.Sc., A.M.I.Mar.E. (Author of "Merchant Ship Types.")

THE last month has been quite gratifying as far as marine electrical development is concerned, and has culminated in the placing with a British shipyard of a contract for the construction of a Diesel-electric cement carrying ship for service on the Great Lakes of North America. Particular interest is added to this ship because it is one of the first electric ships to be constructed for the Great Lakes of North America



The turbo-generator on the s.s. "City of Hong Kong," the electrical equipment of which is described in the accompanying article.

in this country since some of the very earliest electrically-propelled ships, which, owing to various mechanical difficulties now happily overcome in modern ships, were by no means the successes their designers intended them to be.

This new ship will have 2 500 H.P. Diesel-driven generator sets and is expected to have a speed of 9 knots, but while one is tempted to discuss this vessel and her possibilities in rather more detail, it is nevertheless necessary to devote the major portion of these notes this month to a discussion of auxiliary turbo-electric propulsion or electric "supercharge," as it has been called.

There are now at sea on their maiden voyages two vessels which have electricity used as an auxiliary to their propulsion in a novel and rather epoch-making manner. One of these is the P. and O. liner "Mooltan," and the other is the Ellerman liner "City of Hong Kong." Each ship is propelled by steam reciprocating engines taking steam from Scotch boilers, and each has on her propeller shaft an electric motor intended to boost the power, and hence the speed of the ship, without in any way increasing the fuel consumption. The electric motor, which is arranged at a suitable position along the length of the shaft where there is not likely to be any shaft vibration, takes its current from a generator, which is in turn driven through gearing by a low-pressure steam turbine. This steam turbine takes it steam from a low-pressure cylinder of the main steam reciprocating engine.

In other words, by this arrangement, low-pressure steam, instead of as in the usual course of events, going straight to the condenser is now as it were by-passed into a low-pressure turbine before reaching the condenser. In going through this low-pressure turbine it generates electrical energy, but at no cost as far as fuel consumption is concerned, but with, it is hoped, a very desirable increase in net operating speed.

British Electrical Enterprise.

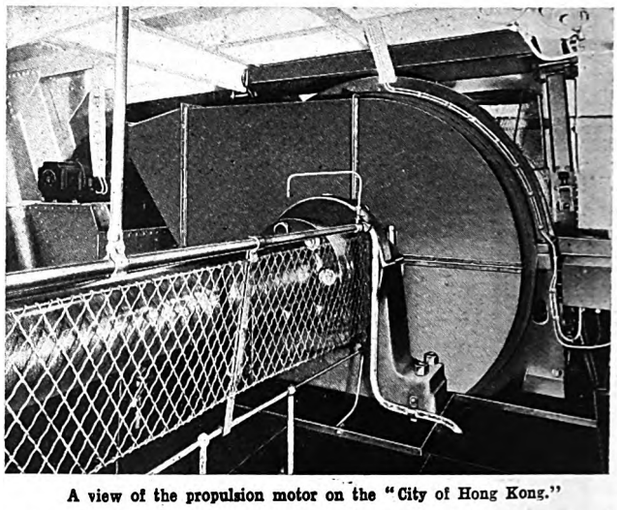
It is rather interesting that this development, (which is due entirely to the enterprise of two big electrical companies, the British Thomson-Houston Co. and the Metropolitan-Vickers Electrical Co., which are now devoting themselves whole-heartedly to the cause of marine electricity, should have come at a time when the Diesel-engined ship is developing so rapidly, and when in Diesel-engined ships "supercharge" effects are being widely employed in the working cylinders to effect an increase in power, and therefore of speed in the ship, again without any material increase in the fuel consumption. The parallel of course, is not mechanically an exact one, but economically speaking, engineers in each case are striving for the same effect, namely, something as far as possible for nothing.

The net result of all this is that a power plant can be designed say for x horse-power at a cost of so much for x plus y horse-power, the cost would be greater, the weight would be greater, and, above all, the fuel consumption would be greater. If now you can still design for x horse-power and with the fuel consumption, weights and sizes of x horse-power, obtain your x plus y horse-power, then you are virtually getting something for nothing, and you are getting it by means, in the Diesel engine, of pressure charging or "supercharge," and in the steam reciprocating engine, by means of electric "supercharge." Of course, in balancing up finally, one has got to consider the cost of, in one case, "supercharge" blowers or pumps, and in the case of the steam reciprocating engine, the cost of turbo-generators and motors on the shafts, but this cost, like all initial capital outlays in any vehicle of transportation whatever, is wiped out in a very short time by the economy of operation which results.

Authentic Voyage Reports.

That, in a nutshell, is what is being aimed at by engineers of the two big companies mentioned above in this electric "supercharge" which has been fitted to the "Mooltan" and the "City of Hong Kong." Both ships are now, as has been mentioned, on their maiden voyages, and it is hoped when they return to their home ports in this country, that for the sake of everybody interested in this new propulsion innovation, the electrical companies concerned will issue authentic voyage reports showing just what results have been obtained.

Meanwhile all we have to go upon is a report of the trials of "The City of Hong Kong" in Belfast Lough, which has been issued in some detail by the Metropolitan-Vickers Co. While these figures are, perhaps, not as full as one would wish from the point of view of stating exactly how the extra speed realised came into line with what the designers hoped, nevertheless, some remarkably interesting facts are revealed, not the least among which is that with the electric "supercharge" in operation an economy was effected in the total steam consumption of 23 per cent., the actual consumption of the engines of "The City of Hong Kong" with electric "supercharge" in operation being 9·085 lb. per indicated horse-power hour, whereas with electric "supercharge" out of operation this same figure was 11·82 lb. per indicated horse-power hour. Although no specific claim is made that an economy in fuel will result from the operation of this system, it seems not unlikely in view of the above figures.



A view of the propulsion motor on the "City of Hong Kong."

It should here be mentioned that the "City of Hong Kong" is a ship of 12 108 tons deadweight on a 28 ft. 10¾ in. draft, and was built in 1924. She had before conversion a normal service speed of about 12 knots and her quadruple expansion

Digitized by Google

steam reciprocating engine is rated for about 4 400 I.H.P. at 80 r.p.m. On trials with the new electrical gear in place at 75.2 r.p.m., the main engine was developing 3 190 I.H.P. With the electric "supercharge" operating, the revolutions increased to 84.5 r.p.m., and the power developed by the reciprocating engine rose to 3 385 I.H.P. The "equivalent indicated horse-power" output of the motor was 1 495 H.P., so that the total power developed for the ship was 4 880 H.P. The motor volts were 420 and the amps. 2 550.

It is to be regretted that no figures are available showing what increase of speed was obtained with this extra power. With the electrical gear out of operation, the condensate measured in lb. per hr. amounted to 38 650 lb., whereas with the electrical gear in operation, this figure increased to 44 300 lb. The boiler steam pressure increased from 220 lb. per sq. in. with the electrical gear out, and 221.6 lb. per sq. in. with the electrical gear in. It will be interesting to see in future installations what effect upon the net increase in power is obtained by the use of higher boiler pressures and super-heat.

It is interesting to note that the steam pressure at the main engine exhaust (lb. per sq. in. abs.) with the electrical gear in was 7.915 lb., and the steam pressure at the turbine inlet was 7.19 lb. per sq. in. The sea temperature at the time of the trial was fairly low, being 54.5 deg. F., the circulating water discharge temperature with the electrical gear in being 76.9 deg. F., and the circulating water pump speed 291 revs.

The trials of the ship were exceptionally complete and included a full speed run over a period of 12 hours. At the end of this trial the speed was reduced to about 75% of full speed, and it is interesting to note that the output of the electric "supercharge" was well maintained, the proportion of total power developed by the motor at full speed being 27½%, while at three-quarter speed it is stated the proportion was only reduced to about 20%. A number of reversals were carried out with the vessel steaming at about 80% of full speed. The electric "supercharge" motor was reversed with the main engine and attained full speed astern in approximately 10 seconds from shutting off steam in the ahead direction. In rough weather off the Irish coast with the vessel light and the propeller consequently racing, the load on the electrical machinery forming the coupling between the turbine and the engine varied from 20% to 100% of full load. Full propeller revolutions were maintained and propeller speed fluctuation was barely noticeable.

This variation in load indicates the extent to which the steadying effect of the turbine was being used, and indeed it is said to be a noticeable feature of this system of propulsion that the complete arrangement has a remarkably steadying effect on propeller racing.

We have spoken above of varying conditions under which electrical gear is either "in" or "out." This would appear to indicate that it is readily possible to reduce the ship to a condition of operating without the electric "supercharge," and it will be interesting as a matter of fact to note whether in practice the electrical gear is kept in when the ship is manœuvring.

Control of Auxiliary Equipment.

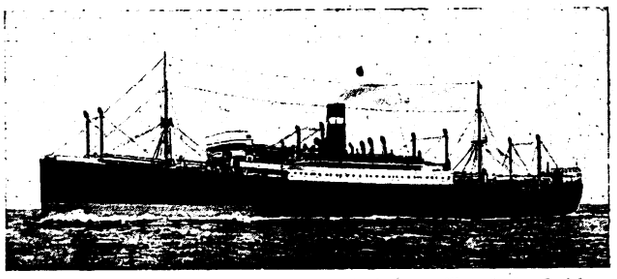
Trial trip experience would appear to indicate that there is no strenuous objection to this, and in fact as is the case with "supercharge" of Diesel engines themselves, it would appear that electric "supercharge" like certain forms of Diesel engine "supercharge" are to be kept in permanent use and are to be considered definitely as part of the main propelling equipment. It is now of interest, therefore, to discuss something of the arrangement adopted for the control of the auxiliary equipment and of the way in which such equipment is arranged.

It should here be mentioned that two types of equipment are available, one which concerns itself mainly with propulsion and which candidly we feel will have its greatest scope in the conversion of existing tonnage, and the other in which the turbine can be suitably proportioned so as to supply from its generator current not only for "supercharge" propulsion effects, but also for handling the whole of the auxiliary machinery load on the ship. This would appear to be particularly desirable where new tonnage is concerned, and may enable the shipowner, as suggested above, to build his engine for a lower power than the actual total power he requires to drive his ship at the designed speed, and at the same time obtain all the power that he requires for driving his auxiliary machinery electrically, practically for nothing. This, of course, can only happen when the ship is at sea, but in port one fells inclined to suggest the use of storage batteries for ship lighting, and perhaps for cooking, and, of course, as steam is always available, probably steam deck auxiliaries.

Automatic Operation.

There are many fascinating combinations of arrangement available for this type of powering, which, it cannot be too much emphasised, is easily one of the most epoch-making developments of the year. It should be stressed that once in commission the turbo-electric equipment functions automatically and requires no control as it adjusts itself to varying power requirements. Control of the equipment is obtained from an oil relay system supplied from an oil pump driven from the turbine shaft. Operation of all valves and safety features is included in this system, the arrangement being such that as long as pressure is maintained in the oil relay system, the requisite steam valves and electric switches are closed, and the turbo-electric equipment is in commission.

Oil pressure failure at once causes the relay operated steam valves to isolate the turbine from the exhaust steam supplied, and to connect the engine exhaust direct to the condenser.



s.s. "City of Hong Kong," the first ship to have auxiliary turbo-electric propulsion equipment.

By this same operation the electrical machinery can also be switched out of commission. The main control gear thus requires the engineer on watch only to open or to close a release valve on the oil relay system, and the emergency tripping devices operate by releasing the oil pressure in this system. A steam driven oil pump is provided to build up the oil pressure required to start the turbo-electric equipment and to flood the bearings. This pump is normally shut down after the equipment is running at full speed, but it may also be used if it is desired to keep the turbo-generator running when the ship is manœuvring in and out of port. This provision is necessary because the speed of the turbine itself might under such conditions fall too low to maintain the necessary oil pressure. This arrangement is not necessary in the case of equipment where the auxiliary machinery is driven from current supplied by the turbo-generator, because this latter runs at constant speed at all propeller revolutions from stop to full speed ahead or astern.

When auxiliaries are supplied in this way, the turbine is fitted with a section designed to take steam at normal boiler pressure and arranged to make up for any deficiency in exhaust steam required to furnish power for the auxiliary load. In this case, too, of course, the turbo-generator may be used to take care of the auxiliary load entirely on its own when the main reciprocating engines are shut down. This, of course, requires certain minor re-arrangements in the auxiliaries belonging to the turbine itself.

A typical single screw installation shows that the turbine is supplied through a separator with exhaust steam from the low-pressure cylinder of the reciprocating engine and exhausts into the common condenser. Because there is no direct mechanical connection between the turbine and the propeller shafting, the position of the turbine may be chosen at any place which best suits the run of the steam piping—a matter of some importance where large volumes of steam at very low pressures are to be dealt with.

A further advantage is obtained from the fact that the turbine may be built with steam connections on the under side, which facilitates inspection, because no steam joints need be broken nor heavy sections of pipe-work moved in opening up the turbine.

Another result of freedom in the choice of the position of the turbine is the small extent to which existing machinery is disturbed when a fast electric "supercharge" is added to an already completed vessel.

TRANSFORMER FIRE.

Details of the Explosion and Fire at Prince's Station, Nechells.

At midnight on November 18th an explosion and fire occurred in one of the transformer cubicles at the Prince's station, Nechells, in which are housed the 3 500 kW single-phase transformers which step the pressure up from 5 500 V to 33 000 V for transmission through the three-phase 12 000 kW trunk cables. Subsequent examination showed that one of the 33 000 V terminal chambers on the top of the transformer had been blown to pieces owing to the terminal having gone to earth through some bakelite bushing. The oil contained in this chamber and in the conservator tank above was released and set on fire. The force of the explosion blew open the iron doors which are interposed between the cubicle and the outside yard. The intense heat inside the cubicle, due to the blazing oil, burned the jointing between the valve and the transformer tank which is used for draining the oil out of the tank. This allowed the main body of oil in the tank to leak into the cubicle, and the fire was fed in this way. This oil unfortunately found its way through some apertures in the wall, through which the cooling pipes pass, and started a fire in the chamber behind the cubicle, through which the control cables from the main switchboard to the e.h.t. switch cubicles pass, and these control cables were burnt through and the operation of the switchgear was interfered with, thus entirely shutting down the station. The Summer Lane station and the Nechells (temporary) station were immediately got away and supply was restored in this way. Temporary control cables were immediately put in hand and by 7 a.m. three of the turbo-alternators, one trunk cable, and all the e.h.t. cables were at work again, and by the following afternoon the whole of the station was in commission.

Photographs are reproduced on page 719 of the transformer cubicle as it appeared after the explosion and fire, and of the temporary control cables that were run during the night-time to replace those that were burnt out.

CHESTERFIELD CONTRACTORS.

Second Annual Dinner and Dance of Chesterfield E.C.A. Sub-Branch.

The second annual dinner and dance of the Chesterfield Sub-Branch of the Electrical Contractors' Association was held at the Station Hotel, Chesterfield, on November 27th. The chairman, Mr. Edgar R. Morris, presided,

When proposing the toast of the Mayor and Corporation, Mr. Morris strongly favoured compulsory registration. Some unrecognised contractors carried out contracts at prices which did not leave them with a working margin of profit. He would like to know how many more fatal fires would have to occur through defective wiring before the Government was aroused to a sense of duty and protected the public from shoddy electrical work.

The Mayor (Counc. H. J. Watson) said electrical current was as cheap in Chesterfield as in Sheffield, and was cheaper than in most towns in the Midlands.

Ald. H. Varley, chairman of the Corporation Electricity Committee, said that prices for electricity in Chesterfield had been reduced 13½ % during the past year; they had secured 1 800 new consumers, made 383 extensions, and laid 33 miles of cable. During the last four years they had spent £27 000 on hired wiring schemes and during the last year had made an agreement with the Derbyshire and Notts Power Co., and their capacity of supply had been increased 70%.

Mr. D. H. Davies (Chesterfield Corporation Electrical Engineer) gave the toast of "The Electrical Contractors' Association, Allied Associations and Officials." He mentioned that during the last five years they had carried out 5 300 installations for the Corporation at a cost of £37 000.

Mr. T. Beardsall, chairman of the Northern Section E.C.A., and Mr. L. C. Penwill, general secretary E.C.A. and Allied Associations, replied.

The toast of the Northern Section was proposed by Mr. W. H. Burton, secretary of the Chesterfield Sub-Branch, and responded to by Mr. W. A. Shaw (past President), and Mr. H. Moss (member of the Council).

"The Visitors" was proposed by Mr. H. Drabble, and the response was made by Mr. I. Scott Mackenzie and Mr. C. B. Wagstaffe.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

The Legion Book.

[To the Editor.]

Sir,—May I draw the attention of the readers of The Electrician to the words spoken by H.R.H. The Prince of Wales at the Remembrance Festival at the Royal Albert Hall on Armistice Night? In the course of his speech His Royal Highness said:—

> I would appeal to everyone in the United Kingdom who can afford to do so to make a point of including a copy of this book among their Christmas presents.

Nearly all your readers will be engaged at the present moment in buying Christmas presents, and I feel that if they include a copy of "The Legion Book" in their Christmas lists they will not only be helping the cause of our ex-service men, but will also be making a present that will be enormously appreciated by the recipient.—I am, etc.,

Jellicoe,
President, British Legion.

London, S.W.1.
November 28th.

"Electric Cooking is Cheap."

[To the Editor.]

Sir,—Under the above heading in your issue of November 22nd your correspondent "Dubious" asks for a few particulars.

I enclose herewith a few tests taken recently on a Jackson Junior electric cooker, so that "Dubious" can, after finding out the cost of electricity for cooking purposes in his neighbourhood, see if it would pay him to instal an electric cooker.

Electric Cooker Tests.

Oven Loading	.. .. ..	1 360 watts.
Grill ,,	.. .. ..	1 500 ,,
Boiling Plate	.. .. ..	1 500 ,,
Total	.. ..	4 360 ,,

Food Cooked.	Consumption in kWh.
3½ lb. joint, rice pudding, Yorkshire pudding, potatoes (baked), peas (boiled)	2·63
3½ lb. joint, Yorkshire pudding	1·44
Chicken, cabbage, beans, potatoes	*3·36
4 lb. joint, boiled potatoes, beans, baked apples, custard, boiled gravy	2·97
3 lb. joint, baked potatoes, apple tart, and custard tart	2·64
4 lb. joint, pie, stewed plums	2·04
Grilled steak, boiled beans and potatoes and gravy for three persons	1·30
3½ lb. joint, Yorkshire pudding, apple tart, jam tarts, baked potatoes, and cabbage for three persons	2·62
3½ lb. joint, 1 tart and 1 custard pie	1·43
3½ lb. joint, boiled potatoes, cabbage, Yorkshire pudding, stewed fruit (oven still hot enough for cakes, etc., after joint taken out)	2·72
Bacon, eggs, tomatoes and toast for two persons; also 10 pints of water for tea, washing up, etc.	0·88
10 pints water for tea and washing up; also eggs, bacon, tomatoes, and toast for three persons	1·0
3½ lb. joint, Yorkshire pudding, baked apples, 1 lb. sausages	1·44
3½ lb. joint, Yorkshire pudding, baked potatoes, jam roll, baked apples	1·88

* This is unduly high through using enamelled saucepans with concave bottoms.

In my case I am more than satisfied with the results, and think that, if current can be obtained at 2d. or less per unit, it is well worth while to instal an electric cooker.

"Dubious," must not, however, compare costs on meter readings alone, as there are other advantages, such as better cooked food, cleanliness, absence of fumes and intense heat in the kitchen, which gives greater comfort and health to all concerned, the value of which cannot be calculated in mere pounds, shillings and pence.

In addition, I find that meat shrinkage is below 10%, so there is a direct saving in butchers' bills in my case.—I am, etc.,

A. B. Cousins.

Merthyr Tydfil.
November 28th.

NEWS IN BRIEF.

Price of Current in the U.S.—Electrical Women—Manchester and New Zealand Favour Electric Cooking—Belfast and an I.E.E. Students' Section.

LITTLE Burstead P. C. has decided to adopt street lighting by electricity.

On October 1st, the number of licensed radio sets in Sweden was 416 865, or 68·3 per every 1 000 inhabitants.

Colchester T.C. has applied for a loan of £10 000 for rebuilding premises in Osborne Street, for use as offices, etc., for the electricity department.

The Dominion Coal Co., Ltd., has awarded a contract for the design and construction of a generating station to be built on tide water at Glace Bay, N.S.

Gravesend Watch Committee has approved the Constables' Branch Board's application for electric heaters to be installed in five of the police boxes.

Middlesex County Council has voted £2 500 for furniture, internal telephones, electric bells, fire alarms, etc., at the Great George Street Offices, Westminster.

At the annual meeting of the Industrial Co-partnership Association on November 27th, Mr. F. W. Raffety, hon. treasurer, referred to the scope for big expansion in work of the Association, and appealed to the general public for largely increased support.

Dr. Edward Free, consulting engineer, addressing the Electrical Association of New York, last week, said sound-proof and windowless houses, electrically supplied with light and ventilation, and with medically prescribed artificial atmosphere were possible now, and would be general by 1950.

At a meeting of the Institute of Fuel, at Burlington House, London, on December 11th, a paper by Mr. W. D. Wylde, on "The Coal Burning Art as Applied to Steam Production" will be presented, in the author's absence abroad, by Mr. H. L. Pirie.

A ring of police boxes, equipped with telephones, etc., has been established around London, and came into operation on Monday.

The Government is urged by the London Chamber of Commerce to appoint a Committee of Inquiry into the desirability of setting up an independent statutory authority to administer the internal telephone and telegraph services of the Post Office.

The average price of current in the United States for the twelve months ended September 30th was 6·30 cents per kWh, as against 6·50 cents for the period ending June 30th, and 6·55 cents for the calendar year of 1928. The final average for the whole of 1929 is expected to be 6·2 cents per kWh.

As in the past, the Vienna Spring Fair, 1930 has been fixed for the week, immediately following the Leipsic Fair, *i.e.*, from March 9th till March 16th.

The Electrical Association for Women is about to extend its activities by opening a Bradford branch. Negotiations are going forward, and excellent support is already forthcoming. Miss Eva Moss (daughter of Mr. Harry Moss) is hon. sec. (*pro tem.*), and it is anticipated that the inaugural meeting will be held early in the New Year.

The North Wales Branch of the Electrical Association for Women celebrated its first birthday with a reception and luncheon at Colwyn Bay on November 30th. Mrs. S. Z. de Ferranti presided, and was supported by Dr. Ferranti, Miss Haslett, Lady Brooks, Mrs. Hyde, Mrs. Price-White and a representative assembly of over 100 members and their friends.

The heating of the Corporation tramcars electrically is being considered by Bury Tramways Committee.

The number of hired electric cookers connected to the Manchester mains during September was 81, making a total of 5 605 on circuit.

Guildford Highways Committee has asked the Borough Surveyor to report upon the use of electricity instead of gas for working the tarmac mixing plant at the depot.

Of a total of 457 power stations in Czechoslovakia, 311 are owned by supply companies and 146 by manufacturers. There are 13 000 miles of h.t. lines in the country, and this mileage is increasing at the rate of 17·5% per annum.

The General Purposes Committee of Middlesex County Council has considered resolutions from Newcastle Corporation regarding the certification and stamping of all electricity meters, and considers that the County Council should take no action in the matter.

A meeting of the Northern Ireland Branch of the I.E.E. was held at Belfast on November 27th, with a view to promoting a student section, with Belfast as centre. Mr. T. J. Monaghan, chairman of the Irish Centre, said he believed that such a section would receive every encouragement from the Institution.

It has been reported to Cardiff Electricity Committee that householders have been canvassed by sellers of electrical apparatus who have posed as representatives of the Corporation. Mr. C. G. Morley New, city electrical engineer, said it could not be made too clear that the Corporation did not employ any canvassers to sell any kind of electrical apparatus.

It is estimated that 2 000 electric washing machines and 16 000 electric cookers are in use in New Zealand. The value of electrical imports during the first six months of this year was £1 002 825.

The next monthly Individualist Bookshop luncheon will be held at the Hotel Cecil, London, on Wednesday, December 11th, when the chair will be taken by Sir Ernest Benn. The chief speaker will be the Marquis of Zetland, who will take as his subject "Individual versus Collective Action."

A discussion on "Problems in Illuminating Engineering" will take place at a meeting of the Illuminating Engineering Society at the Home Office Industrial Museum, Horseferry Road, Westminster, S.W.1, on December 10th at 7 p.m. The discussion will be opened by Mr. A. Cunnington, Mr. E. Stroud, Mr. F. C. Smith, Prof. H. Robertson and Mr. B. Ionides.

The Statistical Research Department of the N.E.L.A. estimates the value of plant and equipment of the American light and power industry at approximately ten and one-half billion dollars. The total number of consumers served is nearly twenty-four million, of which more than nineteen and a half million are domestic.

In a paper read at the Transport Congress last week, Mr. W. J. Jones (E.D.A.) drew attention to the need of efficient street lighting. It was difficult, he said, to find a bridge in this country which was worthily lighted, and he suggested luminous parapets and illuminated turrets. In cities where street lighting services were co-ordinated considerable improvement had resulted. In towns where a qualified public lighting engineer had been appointed, the organisation paid for itself in better service and economy.

LOOKING BACKWARD

FIFTY years ago, according to THE ELECTRICIAN, *dated December 6th, 1879 :—*

Following experiments, Messrs. W. and T. Avery were considering the use of the telephone between their Birmingham works and Ryder's Green, over 10 miles distant.

A beacon buoy, for which a British patent was granted, was lit on top "by means of a vacuum tube and an induction coil, the primary current being derived from large battery plates immersed in the sea."

* * *

TWENTY-FIVE years ago it was stated in THE ELECTRICIAN *of December 9th, 1904, that :—*

A proposal to run an electric tramway through rural districts in North Wales was the object of protests in the public press.

* * *

FIFTEEN years ago THE ELECTRICIAN, *for December 4th, 1914, recorded that :—*

The Yorkshire Electric Power Co. was renewing its Parliamentary application for electric lighting powers.

An Electrical Volunteer Force was being organised in Birmingham.

* * *

TEN years ago it was announced in THE ELECTRICIAN, *dated December 5th, 1919, that :—*

The "Daily Mail" had enlisted the services of Lord Moulton to demonstrate the drawbacks which would be caused to the public by the passing of the Electricity (Supply) Bill, one of the grounds being that it would put a premium on the waste of coal.

Digitized by Google

PERSONAL.

HERR L. V. Verebely, chief electrical engineer to the Hungarian State Railways, has been appointed Professor of Electrotechnics at Budapest Technical High School.

Mr. F. Forrest, chief assistant electrical engineer to Birmingham Corporation.

Ald. A. Sturgess has been elected chairman of Derby Electricity Committee in place of Ald. J. P. Wilkins, who has held the position for sixteen years.

The many friends of Mr. E. A. Gatehouse will be pleased to hear that he has practically recovered from his recent operation and is again an active member of the industry.

Mr. R. A. Chattock, city electrical engineer to Birmingham Corporation, is due to retire under the age limit at the end of the year. The chief assistant electrical engineer, Mr. F. Forrest, has been recommended for promotion at a salary of £1 800 per annum. (See page 721.)

Mr. Emile Garcke has been elected chairman of the executive committee of the Industrial Co-Partnership Association.

Mr. E. A. H. Bagnall, of the Hewittic Electric Co., Ltd., is sailing on December 13th for an extensive tour of India.

Mr. H. B. Dorrell, mains superintendent to the Bury electricity department, who has retired after over 26 years' service, has been presented by the staff and employees with a trunk and barometer.

Islington Electricity Committee recommends the promotion of Mr. F. W. J. Corbett, relief charge engineer, to the position of charge engineer.

Owing to the resignation of Ald. J. O. Roberts from the chairmanships of Gloucester Electricity and Transport Committees, Coun. H. Farmer has been elected chairman of the Electricity Committee and Ald. Gardner has been invited to become chairman of the Transport Committee.

The marriage of Mr. Richard Macue, of the staff of the Warrington Corporation electricity department, and Miss Winifred Hewitt was solemnised at Higher Lane Baptist Church, Lymm, on November 9th. The bridegroom received from his colleagues an inscribed chiming walnut clock.

Maidstone T.C. has agreed to grant a gratuity of £1 050 to the chief engineer, Mr. E. E. Hoadley, for special services rendered. When this decision was arrived at on November 27th, the chairman of the Electricity Committee mentioned that had the Council obtained other expert advice it would have cost at least £5 000.

Mr. R. F. Dixon, for nearly ten years manager of the Mansfield and District Tramway Co., has been appointed general manager of the Oxford Motor Services, Ltd. Mr. Dixon, prior to coming to Mansfield, was assistant manager of the Southampton Corporation Tramways, and was also formerly on the staff of the Hull Corporation Tramways.

Mr. S. M. Hill, station superintendent of the Lancashire Electric Power Co., has been recommended by Bath Electricity Committee for appointment as station superintendent at Portishead in place of Mr. S. A. Russell, who resigned to take up his appointment of resident engineer with Manchester Corporation. Mr. T. Wells has been recommended for appointment as boiler house superintendent.

Standard Telephones and Cables, Ltd. advise us that Mr. H. C. Trenam has resigned his position as deputy manager in order to accept the appointment of assistant European general sales manager of the International Standard Electric Corporation; Mr. F. J. E. Brake has relinquished his position of sales manager to become technical director of Standard Telephones and Cables, Ltd.; Mr. J. W. Keefe is appointed sales manager of the same company; Mr. H. A. P. Disney has resigned his position as secretary to Standard Telephones and Cables in order to take up special duties with the International Standard Electric Corporation, and Mr. H. G. Paterson has been appointed in his stead.

Obituary.

MR. WILLIAM CLAYTON, aged 40 years. He was a partner in the firm of Messrs. Clayton and Rogers, electrical contractors, of Plymouth.

LEGAL INTELLIGENCE.

Appeal by Manchester Corporation Dismissed by House of Lords.

JUDGMENT was, on November 28th, given by Lords Dunedin, Sumner and Blanesburgh in the House of Lords on the Manchester Corporation's appeal against an adverse decision of the majority of the Judges in the Court of Appeal who, reversing Mr. Justice Talbot, gave judgment in favour of Mr. A. Farnworth, of Barton-upon-Irwell, in his claim to damages and an injunction to restrain the Corporation from continuing a nuisance by the emission of fumes from the chimneys of the generating station near his farm.

Lord Dunedin said the case had given rise to much difference of judicial opinion and its decision was not only of great moment to both the parties concerned, but its aspects brought up a question of the widest public importance, and it would be well indeed if it could be brought home, not merely to those interested in the development of the law but to those who in the future were in the position which enabled them to settle and control the position of large generating stations.

Their lordships arrived at the conclusion that the appeal should be dismissed with certain modifications, and declared that the damages to be recoverable against the defendants should be such as have been sustained by the plaintiff up to the date when the injunction by the order awarded shall have ceased to be suspended, or shall have been dissolved, whichever event shall first happen. That immediately after the injunction there should be inserted in the order the following clause: "With liberty reserved to the defendants to apply to a Judge of the King's Bench Division to dissolve the said injunction (*a*) on their establishing, if it be not admitted by the plaintiff, that they have exhausted all reasonable modes of preventing mischief to the plaintiff, and (*b*) on their submitting in the future conduct of their power station to adopt and use the most effective of these modes until they have replaced them by other reasonable but more effective modes of prevention which may thereafter be discovered and which will hereafter be adopted and used." That the first suspensions of the injunction should continue for one year from the date of the order of this House in lieu of one year from the date of the order of the Court of Appeal.

Lord Dunedin moved that with these modifications of the order of the Court of Appeal, this appeal be dismissed with costs, and that the cause be referred to the King's Bench Division to act in accordance with their lordships' declaration. The respondent to have the costs of the appeal to the House.

TELEVISION DEVELOPMENT.

Intention of Making Apparatus Available to Public in January.

THE Baird Television Development Company, Ltd., makes the following announcement:—

"The granting of further facilities for broadcasting television by the British Broadcasting Corporation to the Baird Co. has altered the whole situation of the television position. The transmissions that have been taking place during past months have been so successful that the night facilities have been granted to us. These experiments have also been of the utmost use in understanding the special conditions obtaining at the London station. We have been assured that very shortly additional wave-lengths will be allotted to us, so that the public will be able to see as well as hear speakers and singers. The apparatus will be available to the public in January. We have received broadcasting facilities from the Irish Free State, and this we regard as of great importance. Irish transmissions are to begin very shortly. These developments enable us to look forward to the future with confidence."

NEW LECTURE SERVICE.

Electrical contractors and others in the industry no doubt hear of radio, scientific, school and other societies with vacant dates in their programmes, and in this connection the Marconiphone Co., Ltd., has prepared three lectures, each illustrated with lantern slides, which may be read by any member. The subjects dealt with are:—Screen grid valves and circuits, a.c. valves and circuits, and public speech and music amplifiers. Each lecture is timed to last from thirty-five to forty-five minutes when accompanied by its series of fifteen to twenty slides.

BUSINESS ITEMS.

THE address of the Lincoln office of CALLENDER'S CABLE AND CONSTRUCTION CO., LTD., has been changed to 5, Broadgate.

The BRITISH BROWN-BOVERI, LTD., announces that after December 7th the address of the company will be 56, Victoria Street, London, S.W.1.

The electrical installation and the wireless equipment at the new City Hospital at Derby were carried out by C. A. NEWTON AND CO., of St. James's Street, Derby.

Messrs. LAWSON, electrical and radio engineers, of St. Andrew's Street, Bury St. Edmunds, on November 30th opened premises at 67, St. John's Street.

Captain P. P. Eckersley visited Neath on December 3rd for the purpose of giving a public lecture at the Gwyn Hall under the auspices of the MARCONIPHONE CO., LTD.

HEWETSON, SON AND CO., electrical and radio engineers, of 7, Cross Street, London, S.E., have opened a new branch business at 8, King's Road, St. Leonards, Hastings.

Will any reader knowing the London address or agency of the HAMILTON BEACH CARPET WASHING MACHINE CO., of 114, Liberty Street, New York, please communicate with the Editor.

Authority has been granted for the raising of a loan of $495 000 for the erection of new school buildings and extensions and for the equipment of a technical school in Western Canada. Further particulars from the Department of Overseas Trade. (Reference C.X. 3 162.)

GEO. L. SCOTT AND CO., LTD., Morris House, 60-66, Rochester Row, London, S.W.1, announce that they have taken over the representation of the interests of the Forges et Ateliers de Constructions Electriques de Jeumont from Mr. E. E. Garrard, of 82, Victoria Street, London, S.W.1.

The Trade Commissioner in the British West Indies has received an inquiry from Georgetown, British Guiana, for British firms' catalogues of (1) electrical apparatus, including kettles, irons and other articles of household use, and (2) motor driven woodworking machinery. Further particulars from the Department of Overseas Trade. Ref. C.X.

MODERN HOMES.

Further Details Concerning the "Ideal Homes" Competition.

IN connection with the competition organised by the "Daily Mail" and the General Electric Co., Ltd., for British architects, decorative artists and electrical contractors, brief details of which were given in our issue of October 18th, the organisers announce that the framework of the building consists of 4 in. studding, but any thickness can be arranged for door and window openings, the height of the openings on gangway is 10 ft.; no treatment is required of the outside of the Pavilion; designs must include treatment for inside walls, floors, and ceilings; fittings and furnishings are left to the discretion of the competitors, and fittings and appliances must be original. The cost is left to the discretion of the competitor.

In both the sections open to artists and art students a set of fittings suitable for any room may be submitted, and competitors may submit more than one scheme for one room, if they desire; any methods of treatment may be employed and will be regarded as lighting devices; the perspective may be on a separate sheet if desired.

Electrical contractors may, if they desire, suggest decoration schemes. Fittings for the lighting scheme must be shown. The kitchen, the only place available for domestic duties, should be complete. Coloured lines can be used for the wiring diagram. The specification for the wiring can be on a separate sheet.

Each room competed for must be on a separate sheet, and drawings include sketches of fittings proposed to be used. A series of fittings in the artists' and art students' sections should be included in one sheet. Separate sheets should be sent in for the two sections of the competition for artists and art students. The designs for electric light fittings should be in colour. In the architects section the drawings can be ½ in. to 1 ft., but must be contained on one sheet of paper per room, size 22 in. by 30 in. In the artists' and art students' sections the fittings should be shown quarter full size.

Should members of a firm collaborate in the preparation, the scheme should be submitted in the name of the firm.

Competing architects are advised to collaborate with their electrical contractors in order to ensure that entries are not only artistically correct but electrically sound.

INDUSTRIAL COUNCILS.

Meeting of District Council (No. 3) North-Western Area of the Supply Industry.

THE annual conference of authorised electricity supply undertakers in the North-Western Area, for the purpose of electing employers' representatives on the District Council and District Joint Board, took place on November 26th, at the Town Hall, Manchester. The Conference, representing some 80 undertakers, was well attended.

The Secretary (Mr. A. H. Banks) explained the unavoidable absence of the chairman, Ald. T. E. Higham, this being the first occasion since the creation of the Council (ten years ago) upon which the chairman had been absent.

Ald. W. Walker, who was appointed to preside at the Conference, dealt with the salient points in the annual reports upon the work of the Council and Board during the past year, after which the reports were unanimously approved and adopted.

Three vacancies had arisen in the group of the largest undertakers, owing to the retiring representatives having ceased to be members of the Councils of the constituent undertakers, and new representatives were appointed by that group. The remainder of the retiring representatives were re-elected.

The members of the Council for the current year are:—GROUP A.—Mr. H. C. Lamb (Manchester); Mr. P. J. Robinson (Liverpool); Ald. G. Billington (Salford); Ald. W. E. Freeman (Oldham). GROUP B.—Ald. T. E. Higham (Accrington); Mr. B. T. Hawkins (Wallasey); Mr. F. V. L. Mathias (Warrington). GROUP C.—Ald. E. Boothman (Nelson); Mr. C. L. E. Stewart (Rawtenstall); GROUP D.—Mr. A. J. Hutchinson (Farnworth). GROUP E. (COMPANIES).—Mr. C. D. Taite (Lancashire Electric Power Co.); Mr. W. Fennell (Mid-Cheshire Electricity Supply Co., Ltd.). Alderman W. Walker (Manchester) co-opted member.

The same members are elected to the District Board, with the substitution of Ald. E. Porter (Blackburn) for Mr. Robinson, and Coun. J. Lund (Radcliffe) for Mr. A. J. Hutchinson.

GARCKE'S MANUAL.

Features of the New and Enlarged Edition Just Issued—Continued Progress of Industry.

THE 32nd annual edition of "Garcke's Manual of Electrical Undertakings," which is called the 1928-29 edition because it deals with the accounts of the undertakings for the period ending September 1929, has just been published. The book has grown to nearly 2 250 pages, and the data contained therein relates to 5 500 undertakings in Great Britain and all parts of the British Empire, and has been carefully revised. Two useful new features are particulars of new generating stations sanctioned, under construction, etc., which have been added to the "Progress of the Year" section, and an amplified "Contractors" section which now comprises practically every town and urban area in which supply is available, and the name of the electricity supply undertaking. The entries of the individual undertakings contain commercial, financial and engineering particulars, and the Directory section includes about 20 000 names and addresses of directors, managers, engineers and other officials. The five sections of the book dealing with individual undertakings or persons, are: (I.) Electric Supply and Traction; (II.) Telegraph and Telephone; (III.) Electrical Manufacturing and Miscellaneous; (IV.) British Dominions and Possessions; and (V) Directories of Officials, Contractors, etc.

The summaries in the "Progress" section show that the capital subscribed in 1 618 undertakings in the industry in Great Britain is over £944 000 000, including loans for municipal undertakings, an increase of over £70 000 000 over last year's figure.

Summaries of the technical data show that the total capacity of generating plant installed in 707 generating stations in Great Britain amounts approximately to 6 245 490 kW, against 5 577 125 kW last year.

Other features are details of Government departments and associations concerned with the industry; a list of electrical joint-stock companies recently incorporated; a Buyers' Guide; and 29 maps of electricity supply areas, and railway and tramway routes. The price of the volume, which is published by the Electrical Press, Fisher Street, Southampton Row, London, W.C.1, is, as usual, 35s. net, post free in Great Britain.

IN PARLIAMENT.

Grampian Electricity Supply Bill again before a Select Committee.

PARTIES interested in the Grampian electricity scheme met in a Committee Room of the House of Lords on November 25th to present their respective cases to the Select Committee. It was announced that the Earl of Clanwilliam, one of the members of the Committee, was unwell and would be unable to attend meetings of the Committee until the next week. Since the proceedings were cut short earlier this year by the death of Viscount Younger, the chairman of the Committee, which was then dealing with the Bill, the original scheme has undergone drastic modification; many of its prominent features have been eliminated, and the opposition to the existing scheme has considerably lessened. Viscount Chaplin was appointed to the Committee in the place of Lord Clanwilliam, to avoid any further delay.

Case for the Promoters.

Mr. E. Tyldesley Jones, K.C., for the promoters, said they had been able to make agreements with many of the landowners in the district, and the opposition was now of a vastly different character. The company was already in existence, and was supplying electricity in many parts of the North of Scotland. It was seeking an extension of the area of supply, and to that there was no opposition. It also sought authority to construct certain additional works in Strathglass. There was no question of State aid in this case. There would be no difficulty in raising the necessary capital. The company was creating a substantial rateable hereditament, and in this connection they were going to ask for some consideration from the Committee in the way of some relief from rating. In the Act of 1922, when they got extensive powers, they were authorised to raise £1 750 000 with further conditional powers up to £4 000 000. In this Bill they were going to ask for authority to increase the capital at once to £2 500 000 and to remove the £4 000 000 limit. There were also borrowing powers up to one-half of the issued capital. The Central Electricity Board had entered into agreement with the company to take a supply from the Rannoch and Tummel station not later than December 31st, 1930. The agreement was to continue until the Board's scheme for the North of Scotland was adopted, when the company's stations would become selected stations. The Cannick dam would hold up the water in Loch Mullardoch, from which 4 000 000 gallons per day would be turned into the Cannick from April to September and 2 000 000 gallons daily for the rest of the year. The remainder of the water would be diverted along a viaduct to the river Affric and finally discharged into the river after it had done its work at the power station. There was to be a continuous flow of 30 000 000 gallons per day turned into the river from September to April, and 75 000 000 gallons per day for the rest of the year. The works were now confined to a single generating station at Affric.

Mr. William M'Gill, director of the Grampian Electricity Supply Co., said they would be in a position to supply under the agreement with the Central Electricity Board some time before the time limit. The company proposed a maximum charge of 8d. per kWh in towns and 1s. in rural areas.

Mr. E. Murray, a director of the Scottish Power Co. and other similar power companies, said under the Grampian scheme ordinary consumers would get electricity for cooking, heating and lighting for 2d. to 3d. per kWh.

Mr. W. T. Halcrow, consulting engineer to the promoting company, said the estimated total cost of the scheme was £1 777 000.

Mr. Ian Macpherson, M.P., supported the scheme, and produced resolutions in its favour from the number of burghs in the district.

Mr. Harry Richardson gave technical evidence, and expressed the view that the hydro-electric station was more economical than a coal and steam generating scheme on the same scale.

London Traffic Facilities.

In the House of Commons on Monday Mr. Herbert Morrison, Minister of Transport, announced that the Government would immediately explore a plan for the consolidation of the present transport agencies now providing bus, tramway or local railway services in London. The Government agreed generally that a measure of unification under public control was essential to progress. There was little doubt that the elimination of wasteful competition would result in sufficient revenue being obtained to leave a margin available to attract fresh capital sufficient to provide for steady and continuous development of the traffic facilities. They had come to the conclusion that the ends in view could be achieved and the public interest could be safeguarded only if existing sectional financial interests were consolidated by the substitution of a single and simple form of public ownership for the complicated network of separate interests, private and municipal, which now added to the difficulties of the situation. They held that in any such scheme all the existing municipal interests should be included from the start. The relations to be established between the consolidated enterprise and the amalgamated railways was an important point, which merited and would receive careful consideration. While the Government had decided that the principle of public ownership should be applied, their intention would be to provide for the principle of commercial management of a self-supporting consolidated transport system.

On the same day Mr. Morrison informed a deputation which urged improved travelling facilities for the North Middlesex area that the London Electric Railway Co. had decided to seek powers in this session of Parliament to extend the tube from Finsbury Park, through Manor House, Turnpike Lane, Wood Green, Bounds Green, Arnos Grove, Chaseside and East Barnet to Cockfosters. He added that he had urged upon the London and North Eastern Railway Co. the desirability of electrifying its suburban systems. He was now more hopeful that in the near future the company would find it possible to electrify part of the suburban lines from King's Cross.

Wireless Telegraphy Act.

During the discussion in the House of Commons in Committee on the Expiring Laws Continuance Bill, the Wireless Telegraphy Act of 1904 was passed under review.

Captain Bourne who moved the omission of the Act from the Expiring Laws Continuance Bill, thought it was time a new Act should be passed.

Mr. Lees-Smith (Postmaster-General) said the Act had worked satisfactorily, and the Postmaster-General had been able to act fairly as the "policeman of the ether." An amending Act would no doubt be needed before many years. He mentioned that there were now 2 800 000 licences issued for wireless sets. Replying to questions, he said with regard to the transatlantic telephone service, the channels of communication were to be increased from three to five. A revision of fees was under consideration. On the recent breakdown of two cables belonging to the Imperial Communications Co., owing to storm, the beam system rendered invaluable service. It was decided to retain the Act in the Expiring Laws Continuance Bill.

Electricity Orders Approved.

The House of Commons has approved Electricity Supply Special Orders in respect of (1) part of rural district of Worksop; (2) urban district of Cudworth and township of Billingley in rural district of Barnsley; (3) urban district of Trawden; (4) parts of rural districts of Chipping Sodbury and Thornbury and part of rural district of Keynsham; (4) amendment of Burnham-on-Crouch and District Order, 1927; (5) increase of capital and borrowing powers of Leicestershire and Warwickshire Electric Power Co.; (6) rural districts of Escrick and Pocklington, Easingwold, Flaxton, Malton and Great Ouseburn; (7) borough of Congleton and urban district of Buglawton; (8) part of rural district of Runcorn; (9) rural districts of Cuckfield and Chailey; (10) part of rural district of Aysgarth; (11) urban district of Wimborne Minster and parts of rural districts of Poole, Wimborne and Cranbourne; (12) parts of rural districts of Salisbury and Fordingbridge; (13) burgh of Dunoon; (14) parts of rural districts of Aysgarth and Reeth; and (15) parish of Downton, in rural district of Salisbury.

DIESEL ENGINE USERS' ASSOCIATION.

The address of the new headquarters of the Diesel Engine Users' Association is now 307, Abbey House, Westminster, London, S.W.1, and all subscriptions for the year 1929 should be sent to the newly appointed honorary treasurer, Mr. F. A. Greene.

Mr. Percy Still has been obliged to give up the work of the honorary secretaryship, after serving the association in that capacity for fifteen years. His successor is Eng.-Capt. J. Hope Harrison, R.N., and Mr. C. O. Milton, who has been co-honorary secretary for the last two years, will continue to give his assistance. Mr. G. T. Greenland, assistant secretary, is also giving up his office.

POWER EQUIPMENT.

THE power factor compensators manufactured by the ENGLISH ELECTRIC CO., LTD., Queen's House, Kingsway, London, W.C.2, are primarily intended for application to new or existing induction motors and are of the type known as a.c. exciters. They may be driven by an independent motor or coupled to the main motor by direct drive or by belt. Their purpose is to generate an e.m.f. at slip frequency and to impress this on the rotor circuit of the main induction motor so as to correct the power factor of the rotor and consequently of the stator also. The revolving part of the machine consists of an armature and commutator similar to that of a d.c. exciter, but with the difference that the winding span is shorter to suit the three-phase connections. This armature runs in a laminated stator, having main poles, commutation poles and compensating windings; the number of main poles is three or a multiple of three. Normally, the fields are of the compound-wound type, the ends of the shunt field coils being connected across the brush arms through an adjustable resistance. The armature is supported in roller bearings and the shaft is extended to take a half-coupling or pulley. The speed adopted depends on the particular performance required, and may be 1 000 to 3 000 r.p.m.

Overload Capacity.

The overload capacity of an induction motor fitted with a compensator of this type, it is claimed, is somewhat improved due to the decreased impedance of the motor and power factor compensator circuit permitting an increased maximum input to the motor, while the speed characteristics will be practically unchanged, that is, the speed will drop slightly with increased torque.

Normally there will be no loss in efficiency, and for motors working at 2 200 V and over, the manufacturers state, there will be an increase in efficiency for a motor and compensator, compared to a motor of the same output without compensator. The simple form of starting gear consists of an open-star or straight-through type of liquid startor, the three connections on one side going straight to the rotor slipring terminals and the three connections on the other going to the compensator, the latter forming the neutral point. When the compensator is driven by an auxiliary motor the latter is supplied from the stator leads, if necessary, through a small transformer. Hence it is started and stopped automatically by the operation of the main oil switch. An overload relay trips the main oil switch in case of excessive current in the auxiliary motor circuit. A comparison between a motor with compensator equipment and a motor without will sometimes show that the improvement in power factor is obtained with little difference in cost.

We have received from H. BRAMMER AND CO., LTD., of 207, Kirkstall Road, Leeds, particulars of "Brammer" V belting for fan, dynamo driving and power transmission. This type of belt is constructed on the fish scale principle, thus giving only one single complete unit, which is interchangeable and detachable. The unit consists of a leather or rubber-impregnated fabric link, at one end of which are three holes, one large and two small, connected by a slit, while a stud is rivetted to the other end. The belt is built up by threading the stud through the large hole and pushing it back into the small one. When three or more links have been placed this way, the top overlapping end links are threaded on to the stud in the same way, and pulled into the front small hole, and so on. Among the claims made for this belting are no slip, no stretch, extreme durability, and flexibility.

The ELECTRO DYNAMO CONSTRUCTION CO., LTD., 733 Old Kent Road, London, S.E.15, draws our attention to the suitability of the company's variable speed polyphase motors for printing press drives. These machines have shunt characteristcs throughout the speed range which may be as great as 4—1, and the motor can exert twice full load torque at starting. There are no moving brushes, the single set of brush gear having a fixed position, and the armature has only one winding and no sliprings. The motor is started and speed controlled by a single combined startor-regulator of the inductive type giving an infinite number of steps and smooth acceleration from zero up to the maximum speed. The regulator has no sliding or moving contacts or sliprings and is of simple construction, whilst remote control by push button can be arranged for. Inching features are incorporated in the machine and are obtained without the use of resistances or switches.

SOUTH MIDLANDS I.E.E.

Annual Dinner of the Centre—Views on Overhead Lines

THERE was a large attendance at the annual dinner, at the Grand Hotel, Birmingham, on November 28th, of the South Midland Centre of the Institution of Electrical Engineers. Mr. G. R. J. Parkinson, chairman of the centre, presided.

Mr. NEVILLE CHAMBERLAIN, M.P., proposing the toast of "The Institution," said the labours of members of the Institution were indispensable to the country. For good or evil we had deliberately made ourselves dependent for our prosperity, and possibly even for our existence, upon commerce and trade. It was therefore vitally necessary if we were to maintain our position, that we should keep ourselves in the van of progress in electrical development. It was a fact that we lagged behind other countries in the extended use of electricity, and this might partly be due to the fact that we were the early pioneers.

The Electricity Act of 1926, Mr. Chamberlain added, was passed by the late Government to remove some of the disadvantages and some of the difficulties which had naturally arisen out of haphazard distribution and the various types of equipment of the earlier power stations. In passing that Act the Government had three objects in view. They desired to concentrate the power stations, pool the power resources, and standardise as far as possible the electrical equipment.

Alluding to the complaints about the erection of overhead systems on Sussex Downs, Mr. Chamberlain said he was frankly glad to see the public conscience awakened to this question of the preservation of what was left of the amenities of the country. He did not think, however, that the most serious danger in this direction arose out of the activities of Sir Andrew Duncan and his colleagues.

Sir T. F. PURVES, President of the Institution, responding, said the electrical science was going to play an increasing part in the extension of the amenities of civilisation and the progress of the human race. The Institution was faced with new problems, but he looked forward with great confidence to the help of the provincial centres in finding solutions for them.

Sir ANDREW DUNCAN, chairman of the Central Electricity Board, responding to the toast of "Kindred Societies and Guests," proposed by the chairman, said members of the Board were fully conscious of the very great interest with which the electrical question was being studied in Birmingham. No industry in this country was more alert, he claimed, than the electrical industry. Within the industry they were looking forward confidently to a great expansion in connection with railway electrification, and he was glad to find that members of the South Midland area of the Institution were determined to help forward the national electricity scheme.

THE SOCIAL SIDE.

The annual staff and employees' dance of the Mullard Companies was held at the new Royal Horticultural Hall, Westminster, on November 29th. Mr. and Mrs. S. R. Mullard received the guests, who included many well-known members of the electrical and radio trades. The attendance was little short of 2 000, this putting the function on a par for size with the Metropolitan-Vickers' carnival dances at Manchester. Paper hats and caps were provided in a surprising variety of shapes and sizes, and balloon showers fell from the roof at intervals during the evening.

Bouverie House, the Fleet Street headquarters of Benn Brothers, Ltd. (publishers of THE ELECTRICIAN), and associated companies, was the scene on November 28th of a very successful bazaar held in aid of the funds of the John Benn Hostel, an institution established in the East End some years ago in memory of the late Sir John Benn, the founder of the firm. The bazaar, which was organised entirely by the staff and held after office hours, was opened by Lady Benn, who said it was an excellent idea that every business organisation should have some piece of social work in which all the members could take a personal interest. She believed that the Bouverie House bazaar was the first of the kind to be organised by a staff and held after office hours in a business house in the heart of the city. There were nine stalls in the Reception Hall, and numerous side-shows in various parts of the building. The public attended in large numbers, and the proceeds amounted to about £200.

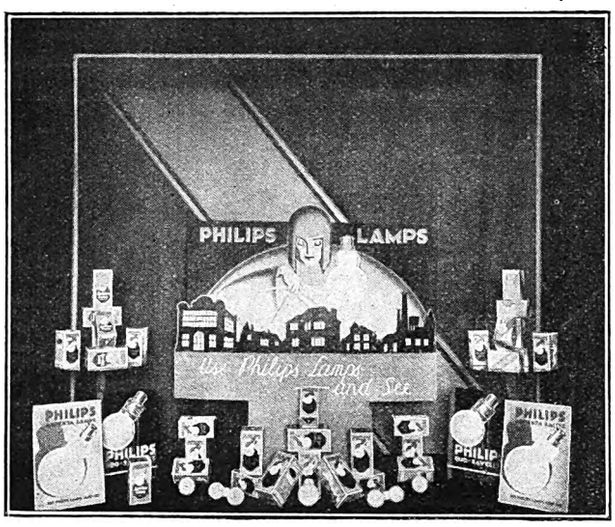
BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

BRADFORD EDUCATION DEPARTMENT.—Electric lighting installation at Bolling Secondary School for Girls. Particulars from the City Architect.

BRECONSHIRE STANDING JOINT COMMITTEE.—Electric light installation at Brecon Police Station. Particulars from Mr. H. C. W. Strickland, county architect, County Offices, Brecon.



AN attractive window display, the materials for which may be obtained from Philips Lamps, Ltd.

GLASGOW CORPORATION, December 7th.—Electrical work in connection with erection of observation ward at Belvedere Hospital. Specifications, etc., from the Office of Public Works, 64, Cochrane Street, Glasgow; deposit £3 3s.

BRAINTREE RURAL DISTRICT COUNCIL, December 10th.—Supply and fixing of electrically driven pumping plant. Specification, etc., from Mr. J. D. Haworth, 3, Central Buildings, Westminster, S.W.1; deposit £5.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, December 10th.—Extra high and medium pressure cable extensions (contract No. 48). Specification, etc., from Mr. R. W. Willis, electrical engineer and manager, 37, High Street, Cheadle, Cheshire; deposit £2 2s.

MANCHESTER CORPORATION, December 10th and December 17th.—(*a*) Delivery and placing into position, at Barton power station, of twelve single-phase feeder reactors (specification No. B. 71); (*b*) supply and erection, within Manchester area of supply of one 6 600 V sheet steel type transformer kiosk and switchgear (specification No. 259); (*c*) supply and placing in position, within Manchester area of supply of 125–250–500–750–1 000 kVA, 6 400/400 V, three-phase, oil immersed, self-cooled transformers (specification No. 260). Specifications, etc., from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s. for each. Tenders for (*a*) and (*c*) by December 10th, and for (*b*) by December 17th.

DUNDEE CORPORATION, December 11th.—Supply of three and four core, e.h.t. and l.t., paper insulated, lead covered and double steel tape armoured cable, for 6 600 and 660 V, respectively. Specifications from Mr. D. H. Bishop, Electricity Department, Dudhope Crescent Road, Dundee.

WANDSWORTH (LONDON) GUARDIANS, December 11th.—Supply of 18 electric sterilisers, inside size approximately 12 in. by 6 in. by 5 in.; with hinged lid, inside tray and automatic cut-out; finished chromium plating; loading 1 kW. Further particulars from the Engineer, St. James' Hospital, Ouseley Road, Balham, S.W.12.

BELFAST EDUCATION COMMITTEE, December 13th.—Electric lighting installation at North Road P.E. School. Specification from the Education Architect, Victoria Street, Belfast; deposit £1 1s.

MANCHESTER CORPORATION, December 13th.—Supply of electrically propelled tower ladder vehicles. Specification, etc., from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC., December 17th.—Rewiring for electric lighting at the Patent Office and the Public Record Office, London, W.C. Specification from the Contracts Branch, King Charles Street, S.W.1; deposit £1 1s. in each case.

KIRKCALDY EDUCATION AUTHORITY, December 18th.—Electric and heating installations, in connection with extensions of St. Agatha's R.C. School, Methil, and Bell-Baxter School, Cupar. Schedules from Mr. E. Sandilands, Education Offices, Kirkcaldy; deposit, £1 1s.

WEST RIDING MENTAL HOSPITALS BOARD, December 18th.—Electric light wiring in connection with erection of a sanatorium at Wadsley Mental Hospital, near Sheffield. Specification, etc., from Mr. W. E. H. Burton, West Riding Mental Hospitals Board, Wakefield.

HULL CORPORATION, December 19th.—Supply of electricity meters (contract No. 148). Forms of tender, etc., from Mr. J. N. Waite, city electrical engineer, Electricity Works, Sulcoates Lane, Hull; deposit £2.

MILLOM URBAN DISTRICT COUNCIL, December 20th.—Haverigg extension scheme, comprising e.h.t. and l.t. cables. pillar box, etc. (section A); and e.h.t. and l.t. switchgear, transformers, etc. (section B). Specification, etc., from Mr. A. Lawrence, solicitor, clerk to the Council.

CENTRAL ELECTRICITY BOARD, December 21st.—Supply and erection of 132 000 V transformers in connection with Mid-East England Electricity Scheme. Specification (No. M.E.E.F.T.1) and form of tender from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

HALIFAX CORPORATION, December 21st.—Electrician's work in connection with erection of new Girls' High School at Craven Lodge. Names of intending contractors to be sent by December 21st to Mr. A. C. Tipple, borough engineer, Crossley Street, Halifax; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, January 6th.—Supply and erection of 132 kV overhead transmission lines (special crossings and high spans), in connection with North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.—P.L. 2) and form of tender from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

IRISH FREE STATE DEPARTMENT OF INDUSTRY AND COMMERCE, December 7th.—Supply of pumping plant in connection with Shannon power development. Specifications (£1 1s.) from the Chief Engineer, 88, Merrion Square, Dublin.

VICTORIAN ELECTRICITY COMMISSION, December 9th.—Supply of 3 000 kVA transformers and spares (specification No. 29/119). (Reference B.X. 5 775.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 10th.—Switchboard keys and parts (schedule No. C.496). (Reference B.X. 5 776.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 10th.—Supply of electric lamps, lamp caps and sockets for the Government telephone service (schedule C. 497). (Reference B.X. 5 783.)

ROUMANIAN POSTS, TELEGRAPHS AND TELEPHONES, December 10th.—Bronze wire, hard and soft copper wire and copper sleeves. (Reference A.X. 8 809.)

BELGIAN POSTS AND TELEGRAPHS, December 11th.—Supply and laying of telephone cables between Mouseron, Wevelghem and Dottignies and between Ostend and La Panne. Cahier des Charges (No. 3 452) from the offices of the department, La Salle Madeleine, Brussels; charge 18 frs.

Digitized by Google

GATOOMA (SOUTHERN RHODESIA) MUNICIPALITY, December 12th.—Two fire-tube boilers, steam engines, alternators and switchboard, etc. (Reference A.X. 8 749.)

CHRISTCHURCH DRAINAGE BOARD, December 13th.—Supply and installation of four electrically-driven automatically-controlled pumping plants, each consisting of two horizontal centrifugal pumps with direct-coupled electric motor (contract No. 29/420); and two horizontal type, 3 H.P. a.c. motors direct-coupled with centrifugal sewage pumps (contract No. 29/421). (Reference A.X. 8 788.)

DUBLIN CORPORATION, December 14th.—Electric lighting and power installation at City Abattoir, North Circular Road, Dublin. Specification from the City Engineer, 28, Castle Street, Dublin, or Mr. F. McArdle, architect, 29, Rosemary Street, Belfast; deposit £3 3s.

JOHANNESBURG MUNICIPALITY, January 4th.—Supply of automatic traffic signals (contract No. 305). (Reference B.X. 5 924.)

CAPE TOWN MUNICIPALITY, January 7th.—Supply of 3-core 11 000 V cable (specification No. 482/1929). (Reference B.X. 5 925.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 14th.—Two air compressors (capacity not less than 800 cu. ft. of free air per min.), and two electric motors. (Reference A.X. 8 784.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of contact pressure testers (schedule No. C. 516). (Reference B.X. 5 821.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of telephone hand sets (schedule C. 526). (Reference B.X. 5 823.)

BLOEMFONTEIN MUNICIPALITY, January 10th.—Supply of automatic electric traffic signals (contract No. 5). (Reference B.X. 5 887.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, January 16th.—Supply of crude oil engine driven electric generating sets (tender No. 1589). (Reference B.X. 5 926.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 28th.—Supply of induction coils and register plates (schedule No. C. 533). (Reference B.X. 5 899.)

Overhead Lines.

EGYPTIAN MINISTRY OF PUBLIC WORKS, February 27th.—Supply and erection of h.t. three-phase, overhead transmission lines in the Northern Delta of the Nile. Specifications, etc., from the Chief Inspecting Engineer, Egyptian Government, 41, Tothill Street, London, S.W.1 (£10 5s., not returnable).

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Switchgear and controlling equipment. (Reference B.X. 5 798.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 110 kV switchgear, for interconnecting auto-transformers, for Waitaki power scheme, section 76. (Reference B.X. 5 797.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 66 kV switchgear and protective system for Lyttelton, Lake Coleridge power scheme, section 217. (Reference B.X. 5 796.)

VICTORIAN RAILWAY COMMISSION, March 30th.—Supply of d.c. neutral relays for power signalling purposes (contract No. 43 457). (Reference B.X. 5 793.)

Tenders Accepted.

BRIGHTON CORPORATION.—Edison Swan Electric Co., Ltd., supply of gasfilled lamps.

SHEFFIELD CORPORATION.—Hackbridge Electric Construction Co., Ltd., supply of four 500 kVA transformers, £969.

AUCKLAND (N.Z.) TRANSPORT BOARD.—British General Electric Co., supply of 104 Witton tramway motors and accessories, £15 000.

MANCHESTER-ALTRINCHAM RAILWAY.—Edward Wood and Co., constructional work, in connection with electrification of line, £50 000 (approximate).

HAMMERSMITH (LONDON) BOROUGH COUNCIL.—British Electric Transformer Co., Ltd., four 1 000 kVA transformers, £1 590; A. Reyrolle and Co., Ltd., £641 3s,; h.t. switchgear, £641 3s.

BEXHILL CORPORATION.—Edison Swan Electric Co., Ltd. 390 ordinary meters, £1 057 6s. 6d.; Chamberlain and Hookham, Ltd., ten prepayment meters, £33 12s. 6d.; Enfield Cable Works, Ltd., six months' renewal of cable contract. (All recommended.)

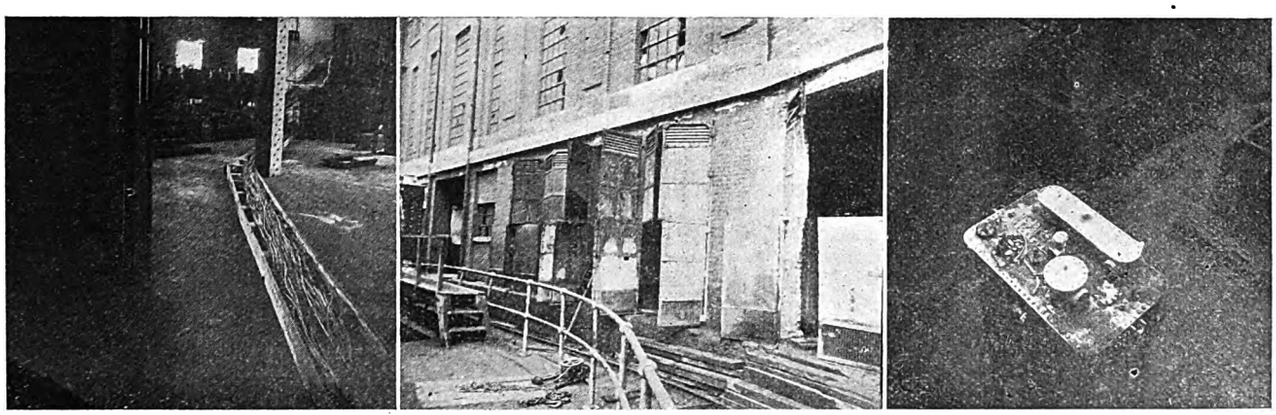
MANCHESTER CORPORATION.—S. H. Heywood and Co., Ltd., supply of electric overhead travelling crane, for the transport department; Ferguson, Pailin, Ltd., supply of 3-phase 33 000 V switchgear; Ferranti, Ltd., supply of two 10 000 kVA transformers.

GENERAL POST OFFICE.—Telephone exchange equipment, Silverthorn (Chingford) and Southend (multi-area), Standard Telephones and Cables, Ltd.; Basford (Nottingham multi-exchange area), Automatic Telephone Manufacturing Co., Ltd.; Telephone repeater equipment, Canterbury, General Electric Co., Ltd.

LEEDS CORPORATION.—Yorkshire Switchgear and Engineering Co., Ltd., supply of sub-station fuse panels, £346 10s. Supply of cables: W. T. Henley's Telegraph Works Co., Ltd., £1 824; Enfield Cable Works, Ltd., £1 611; Macintosh Cable Co., Ltd., £4 280; Hackbridge Cable Co., Ltd., £1 156 2s. 9d.; Derby Cables, Ltd., £1 995.

GLASGOW CORPORATION.—British Insulated Cables, Ltd. insulated bolts; R. Johnston, Clapham and Morris, Ltd., d c.c. wire; Dyer and Young, Ltd., armature coils; Titan Trackwork Co., Ltd., Edgar Allen and Co., Ltd. and Hadfields, Ltd., tramway special work (tongues and switches); Edgar Allen and Co., Ltd., special work (junctions).

HESTON AND ISLEWORTH URBAN DISTRICT COUNCIL.—Enfield Cable Works, Ltd., 5 000 yds. twin-armoured cable 0·01, £530; 500 yds. three-core cable, 0·0145 by 0·007 by 0·0145, £76. (Recommended). Also tendered: Siemens Bros. and Co., Ltd., £536 and £77; W. T. Henley's Telegraph Works Co., Ltd., £540 and £78; Macintosh Cable Co., Ltd., £545 and £79: Pirelli-General Cable Works, Ltd., £548 and £79; British Insulated Cables, Ltd., £550 and £79; W. T. Glover and Co., Ltd., £550 and £80; Callender's Cable and Construction Co., Ltd., £550 and £79.



VIEWS of the damage done and temporary measures taken at the Prince's station, Nechells, after the fire there on November 18th. The left-hand picture shows some of the temporary control cables, replacing those burnt out; the centre picture shows the effect of the explosion and fire in the transformer cubicle, and on the right is an illustration of the exploded terminal chamber on top of the transformer tank. *See page 712.*

ELECTRICITY SUPPLY.

London Power Co.'s Cable Tunnel—Overhead Lines in Doune—Loans for Mains and Machinery at Battersea—Change of System at Bolton—Electric and Gas Street Lighti g at Stoke Newington—Lowestoft Extensions.

THE Central Electricity Board is to erect a sub-station in Tottenham Lane, Hornsey.

Bedford Electricity Committee has acquired land in Prebend Street, for the extension of the generating station.

Whitehaven T.C. is to apply for a Special Order to supply current to Preston Quarter, Sandwith, and Hensingham.

Plymouth Electricity Committee has authorised cable extensions in 21 streets of the city, involving an expenditure of £3 660.

The Leicestershire and Warwickshire Electric Power Co. is to erect overhead cables at Lightbourne, to which the Southam U.D.C. offers no objection.

Barking Electricity Committee has received sanction to borrow £3 092 for mains; £2 682 for hired wiring, and £120 in connection with Becontree sub-station.

Application to the Commissioners for a loan of £57 079 is recommended by Preston Electricity Committee. The money is to be spent on the river wall, buildings and plant.

A new 1 350 H.P. Diesel engine at the Ashford (Kent) electricity works was started on November 22nd by Mrs. Wilson, wife of the Urban District Council's electrical engineer.

Maidstone T.C. is to give a supply of current to the West Kent Hospital, on the Hospital Committee undertaking to pay the capital charges on the actual expenditure for a period of 25 years.

Formby U.D.C. is to borrow £3 000 for sub-station equipment, meters, etc., and £1 000 for the free wiring scheme. £340 is also to be spent on the laying of a cable to the Villa de Marley.

Blackburn Ratepayers' Association has passed a resolution urging the T.C. to consider the high cost of electricity and calling on them to discontinue the extra 10% imposed during the coal strike.

St. Pancras (London) Electricity Committee has obtained sanction to borrow £8 715 for mains and services; £3 831 for meters; £2 214 for hired wiring and £2 580 for domestic apparatus for hire.

The London Power Co., Ltd., has obtained consent to construct a cable tunnel under the River Thames at Battersea, to carry cables from the new Battersea power station to the north side of the river.

Stoke-on-Trent Electricity Committee has obtained sanction to borrow £3 300 for the erection of sub-stations at Hem Heath, Porthill, etc.—The Committee is to seek sanction for a general loan of £10 000 for services.

The South Metropolitan Electric Light and Power Co., Ltd., has submitted for approval a standard price of 2d. per kWh for street lighting, and this is recommended for approval by the Public Control Committee of London County Council.

Glasgow Corporation Streets Committee recommends refusal of permission to Messrs. Harland and Wolff, Ltd. to carry seven overhead lines across Hydepark Street, in connection with the Diesel engine works, which are situated on both sides of the street.

Guildford Electricity Department has been unable to obtain the consent of the Lord of the Manor of Shere (Mr. Bray) for the erection of overhead lines on any of his lands. A deputation from the Council to interview Mr. Bray, and, if necessary, to take steps to obtain authority for the compulsory erection of the lines.

The Electricity Commissioners have sanctioned the borrowing by Battersea (London) B.C. of £11 721 in respect of mains and services. Sanctions are now to be sought for mains and services, £78 000; buildings, £18 164 and machinery £3 579.—The Electricity Committee has considered the detailed estimate of the Borough Surveyor, amounting to £29 608 13s., for the erection of the boiler house extension at the generating station' and recommends that the work be carried out.

The demand for power in Toronto and vicinity has long outgrown the capacity of the Niagara power plants, and some time back contracts were entered into for the supply of power from the Gatineau River in the Province of Ontario. The Gatineau Power Co.—a subsidiary of the Canadian Hydro-Electric Corporation, has just begun delivery of an additional 50 000 H.P. for transmission to Toronto. This new contract increases the total energy to be carried over the 220 000 V line from Paugan Falls to Leaside, Toronto, to 130 000 H.P.

The increased demand for current in Bolton district has necessitated a change in the system of supply. The three-phase system is to be adopted in place of d.c., involving an alteration to much apparatus. The residential district, and practically all the mills, are already on the three-phase system. To supply d.c., converting apparatus has been necessary. The existing plant is barely adequate to cope with the demand, and it is thought a standardisation of system would be preferable to adding fresh converting plant.

Bangor (co. Down) T.C. received last week a report from Mr. R. S. Irwin, electrical engineer and manager, following communications with Messrs. Sayers, the Council's consulting engineers, with regard to the method to be adopted in the laying of service cables on opposite sides of the street from the main distribution cables. The scheme now put forward by Messrs. Sayers, while satisfactory, would require a further capital expenditure of about £10 000. It was resolved that application be made to the Electricity Commissioners for sanction to this expenditure.

Swanscombe U.D.C. has received a communication from A.P.C.M., Ltd., stating that they propose to erect, subject to the Council's consent, line poles in connection with the transmission of current from Johnson's Works to their Alkerden clay plant, the poles which would probably be of concrete, and 26 ft. in height.—The Lighting Committee recommends that the tramway standards, which would be required if it were decided to light the streets by electricity, be earmarked, and that the question be fully considered next April.—The Committee recommends that the offer of the Kent Electric Power Co. to erect a trial lamp be accepted.

Stoke Newington (London) Electricity Committee is to extend mains at a cost of £540, and instal free wiring at a cost of £828.—The Committee has approved plans prepared by Messrs. Hobman and Porri for the new southern sub-station, and is to obtain tenders for its erection.—The Borough Engineer has prepared a scheme for lighting Green Lanes, Seven Sisters Road and Amhurst Park by 500 W electric or 900-c.p. gas lamps, spaced at intervals of 180 feet, on columns and brackets 18 ft. high to the source of light, the lanterns to overhang the carriageway. The Highways Committee considers it advisable to erect gas and electric lamps alternately.

An inquiry was held by Mr. A. D. Erskine on behalf of the Ministry of Transport at Doune, last week, when evidence was heard in an application by the Grampian Electricity Supply Co., to erect overhead lines in several main streets of Doune. Objections were entered by Doune Town Council and the Western District Committee of Perth County Council that these overhead works would affect the amenities of Doune. The objectors maintained that the footpaths generally in the burgh were too narrow to render them safe for pedestrians if poles were erected. After the hearing of the evidence the Inspector visited the streets in which it is proposed to erect the overhead wires.

Lowestoft Electricity Committee has received sanction to borrow £10 572 for mains and services and £3 410 for plant in connection with the supply of electricity to Kessingland.—In order that the payments to Yarmouth Corporation in respect of bulk supply of current may not be unduly inflated by the operation of the peak load charge, the General Manager, Lowestoft electricity department, is to circularise consumers of current for heating, power and cooking purposes, suggesting that they should reduce consumption to a minimum between 4.30 and 6 p.m. during November and December. The lighting of Normanton Drive is also being reduced by one-half until after 6 p.m. during these months.

Torquay Electricity Committee has approved a proposal by Mr. Selvey and Mr. Hollyer that a further main transmission line be provided between Newton Abbot and Torquay, to deal with the increasing demands of the borough. They propose a 33 000 V line, erected overhead from Newton Abbot to Lawes Bridge, and there laid underground and connected with the distribution system.—The Electricity Committee seeks sanction to borrow £15 000 for unspecified works in connection with l.t. mains and services.—A further cable is to be provided to give a supply to the Teignmouth Electric Lighting Co., Ltd., at the boundary of the urban district of Newton Abbot and the parish of Haccombe-with-Combe.

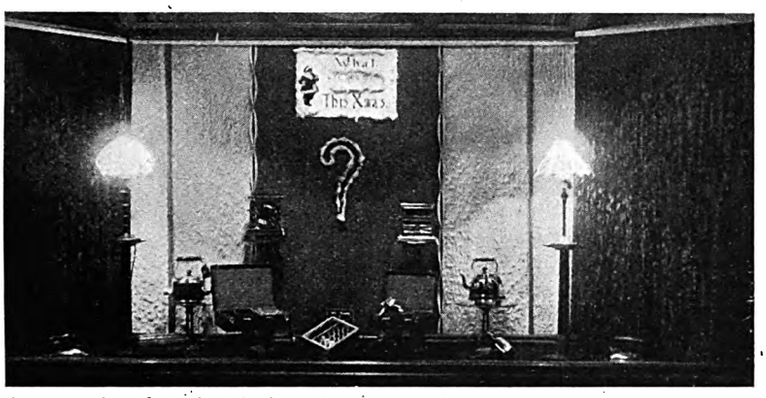
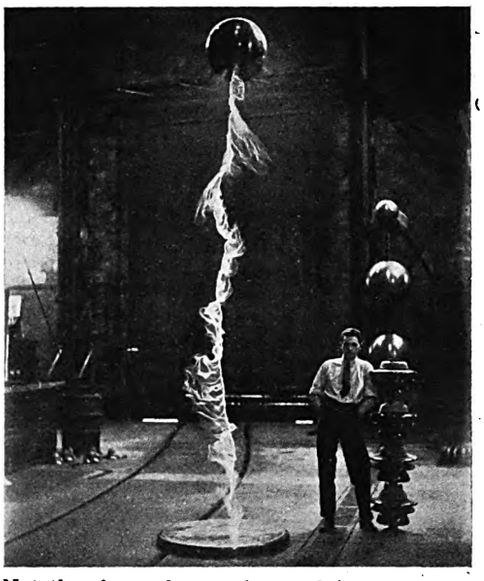
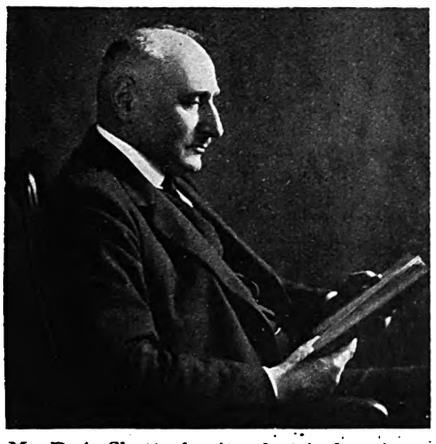
ELECTRICAL NEWS OF THE WEEK IN PICTURES.



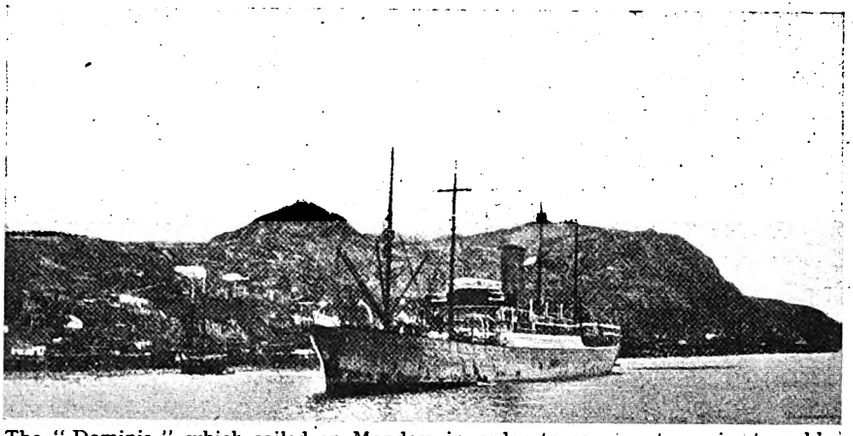
A suggestion that electrical goods are suitable as Christmas gifts is provided in this window at the Bradford electricity showrooms. The mark of interrogation is made of cotton wool on a red paper background, while the show-card above, edged with cotton wool, has a small picture of Santa Claus and bears the words " What are you giving this Xmas ? "



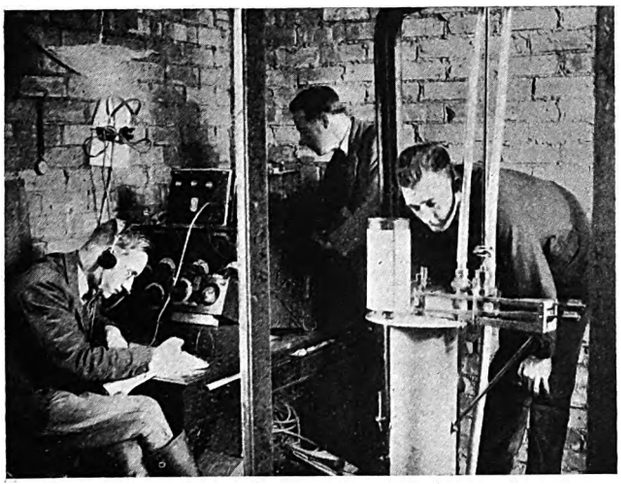
Not the ghost of some departed engineer, but the result of a demonstration with the 1 000 000 V testing transformer at normal frequency at the e.h.t. laboratory of the Metropolitan-Vickers Electrical Co., Trafford Park.



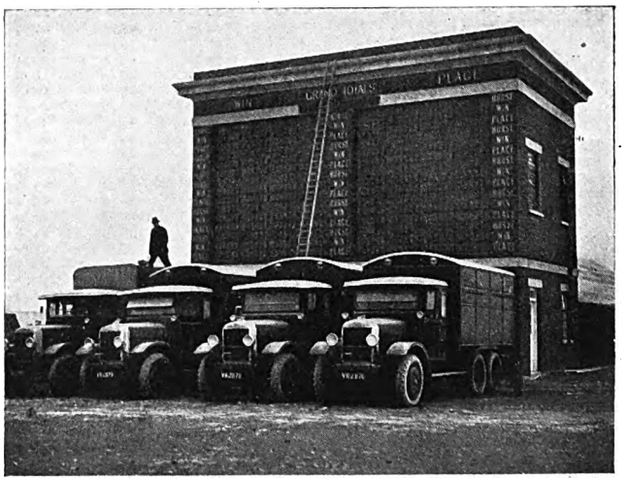
Mr. R. A. Chattock, city electrical engineer of Birmingham, who is due to retire under the age limit at the end of the year. As announced on page 714, he is to be succeeded by Mr. F. Forrest, the chief assistant.



The " Dominia," which sailed on Monday, in order to carry out repairs to cables damaged in the recent earthquake below the Atlantic. The " Lord Kelvin " and the " Cyrus Field " are already at work, and the Cunard s.s. " Ausonia " left Southampton on Saturday, November 30th, with 105 miles of cable on board. The c.s. " Cambria " will meet the " Ausonia " at Halifax, N.S., where the cable will be transferred and carried to the scene of repairs.



All ready for the launching of the R100. The meteorological offices and wireless station at Howden, where preparations are being made for the maiden trip of the latest British airship.



The latest six-wheeled Crossley vans, each with 100 V 400 A charging equipment on board, charging batteries at the central control board of the totalisators at Hurst Park race-course.

COMPANY NEWS.

India Rubber Co., Declares Ordinary Dividend—Radio Corporation's Big Profit for September Quarter—Reports and Dividends—New Companies.

THE announcement on Monday by the Minister of Transport, in the House of Commons, of the Government's intention to take over the London passenger transport undertakings, caused nervousness on the part of holders of shares in the various companies concerned, and rises which had already occurred in prices were in several instances lost. Few changes in quotations, however, are shown as compared with a week ago. The ordinary shares of the Underground Electric Railways Company of London have been sold, and, at the time of writing, are quoted at 21s. 6d., a fall of sixpence. District Railway Ordinary stock at 72 is half a point down, but Metropolitan Railway Consolidated stock at 62 is a point to the good. The ordinary stock of the British Electric Traction Co. has fallen two points, from 119½ to 117½.

In the manufacturing section interest appears suddenly to have evaporated. Callender's, Henley's and other cable companies' securities exhibited no change. International Automatic Telephone shares have moved up from 35s. to 36s. 3d., and General Electrics at 47s. 6d. are also 1s. 3d. higher.

Cables and Wireless stocks have weakened, the 7½% "A" ordinary stock from 81½ to 78½, and the "B" ordinary stock from 44½ to 40½. Radio Corporation of America shares have moved up a point to 37, and Marconi's International Marine shares are 1s. 3d. higher at 46s. 3d. American Telephone and Telegraph capital stock has lost the 5 points gained last week.

Movements in the electrical supply department have been irregular. Clyde Valley shares have improved another half-a-crown to 38s. 9d., Metropolitan Electrics 1s. 3d. from 36s. 3d. to 37s. 6d., Midland Counties 6d. from 27s. 6d. to 28s., and Yorkshire Electric Power 3d. from 33s. 6d. to 33s. 9d. Tokyo Electric Light sterling bonds have improved ½ to 94. Calcutta Supply shares have fallen 1s. 3d. to nearly 50s. 6d., County of London at just over 48s. are 7½d. down and Brompton and Kensington ordinary and Lancashire Electric Light and Power 7% participating preference shares are each 6d. lower, at 25s. 6d. and 27s. respectively. Hydro Electric Securities are unchanged at 38 and International Holdings at 5¾ are ½ down.

Directors' Reports, etc.

GREAT NORTHERN TELEGRAPH CO., LTD.—Div. of 2½%, less tax (same rate as last year) will be payable on Jan. 1.

ERNEST BENN, LTD.—Directors have declared intm. divs. of 3½% on pref. shs. and 2½% on ord. shs., both less tax.

CHLORIDE ELECTRICAL STORAGE CO., LTD.—Div. of 10%, tax free, on "A" and "B" ord. has been declared.

ATLAS LIGHT AND POWER CO.—The company will henceforth be known as the Atlas Electric and General Trust, Ltd.

ELECTRIC CONSTRUCTION CO., LTD.—It has been decided not to recommend an intm. div. on ord. shs. (agst. 3% last year).

PENNSYLVANIA WATER AND POWER CO.—Div. of $\$\frac{3}{4}$ for qrtr. endg. Dec. 30, 1929, on common shs. (agst. $\$\frac{5}{8}$) will be payable on Jan. 2.

BRAZILIAN TRACTION, LIGHT AND POWER CO., LTD.—Qrtrly. div. of 1½% on outstandg. cum. pref. shs. will be payable on Jan. 2.

CANADIAN GENERAL ELECTRIC CO., LTD.—Qrtrly. div. of 1¾% on pref. stk. for three months endg. Dec. 31st, 1929, will be payable on Jan. 1st, 1930.

CONSOLIDATED GAS, ELECTRIC LIGHT AND POWER CO. OF BALTIMORE.—A qrtrly. div. of 90 cents (agst. 75 cents) for qrter. endg. Dec. 31, 1929, will be payable on Jan. 2.

GLOBE TELEGRAPH AND TRUST CO., LTD.—Usual qrtrly. intm. div. of 5s. p. sh., tax free, on ord. shs. will be payable on Dec. 31, 1929. Transfer books will be closed from Dec. 10 to 16, inclusive.

LIGHTING TRADES, LTD.—Pft. for year ended March 13 was £1 311, agst. £16 963, plus £3 125 brt. in, makg. £4 436, which is carried fwd. A further £16 500 of 1st charge deb. has been repaid, leavg. £118 500 outstandg.

UNITED ELECTRIC TRAMWAYS CO. OF CARACAS, LTD.—Net rev. for year ended June 30, 1929, £7 843, agst. £4 947. Owing to loss of £8 857 on workg. of omnibuses, no div. is recommended. Fwd. £53 698, includg, £45 854 brt. in.

MANX ELECTRIC RAILWAY CO., LTD.—Gross receipts for year ended Sept. 30, 1929, £43 535, agst. £42 007; net receipts £11 893, agst £12 515; debt service £9 437 agst. £9 752. Pref. div. 2%, less tax, for half year to Sept. 30, agst. nil. Fwd. £3 492, agst. £3 641.

CALLENDER'S SHARE AND INVESTMENT TRUST, LTD.—Rev. for year ended Aug. 31, 1929, £45 598, agst. £35 156; net pft. £37 219, agst. £27 681; to res. £500 (same as previous year); to special res. £3 000 (nil). Div. 20%, less tax, agst. 15%. Fwd. £36 364, agst. £29 110.

RADIO CORPORATION OF AMERICA.—Gross income of corporation and subsidiaries for qrtr. ended Sept. 30, 1929, $63 272 926. After provisn. for exes., depreciatn, estimated income tax, and res. for year end adjustmts., pft. was $8 729 389, makg. total surplus for nine months, $13 725 876.

BURMA ELECTRIC SUPPLY CO., LTD.—Net pft. for year ended July 31, 1929, £13 611, agst. £13 995, after placing £5 000 to res. and depreciation fund, makg. the total £77 949. Pref. divs. absorbed £7 200. Fin. div. on ord. shs., 2½%, makg. 5% for year, agst. 6%. Fwd. £7 246, agst. £6 835. Earngs. of tramways have again been seriously depleted by bus competition. Rules for regulating omnibus traffic have not yet been effected.

S. SMITH AND SONS (MOTOR ACCESSORIES), LTD.—Tradg. pft. £164 793 for the year to Aug. 3, 1929, agst. £160 937 for previous year. After providg. for depreciatn., directors' fees, bank int. and income-tax, net blce. is £114 089 (agst. £110 521. Pref. div. absorbs £30 000. Div. 17½% on pfd. ord. and 37½% on dfd. ord. shs., same rates as last year. To res. £25 000, makg. £225 000. Written off patents £10 000. Fwd., £47 368, agst. £43 079. Premium of £53 000 resultg. from issue in Dec. last of 50 000 £1 pfd. ord. and 280 000 1s. dfd. has been transferred to share premium acct. after deductg. exes. £1 417. Transfer books closed until Dec. 10, inclusive.

LA PLATA ELECTRIC TRAMWAY CO., LTD.—An *ad referendum* agreement has been made for sale of company's undertakg. to La Nacional, a rival system operatg. in City of La Plata. La Nacional is to pay £375 000 plus an amt. to be fixed for certn. stores, and transfer will be effected on Jan. 1, 1930. On that date £45 000 will be paid in cash and remainder by issue of £330 000 5½% 1st mtge. debs. of La Nacional. Scheme of arrangemt. put fwd. is that cap. be cut from £450 000 to £250 000 by reducg. ord. shs. from £1 to 4s.; to pay on pref. div. at rate of 6% p.a. for the year endg. Dec. 31, 1929; to cancel arrears of pref. div. (totallg. £133 000), and to transfer 60% of ord. to pref. hldrs. at rate of three ord. for four pref. held.

BRITISH COLUMBIA POWER CORPORATION.—Expansn. in all departmts. during year ended June 30, 1929, is reported by this Corporation, which was formed in 1928 to acquire control of British Columbia Electric Railway and power and lighting systems. Gross rev. for twelve months, $14 681 263 (£2 936 252). Operatg. exes., $10 064 867, includg. municipal taxes $7 825 626, depreciation and renewals $1 825 467, and income taxes $413 773, leaving net rev. $4 616 396 (£923 279). Int. on bonded debt and div. on pref. stks. of subsidiary companies absorbed $1 983 415, and divs. on class "A" shs. $2 000 000, leaving blce. $837 763, which raises surplus fund to $66 203 528 (£13 240 705). Growth of freight traffic over inter-urban lines, resultg. from inter-connectns. with other steam lines, shows increase of $100 000 over last year, rev. from this source being now approximately $1 000 000. Passengers on railway system 77 694 731, compared with 77 063 656 in 1928, while freight tonnage was 533 391, against 487 896.

Company Meeting.

INDIA RUBBER GUTTA PERCHA AND TELEGRAPH WORKS CO., LTD.—Sir John Ferguson, presiding at the general meeting on November 28th, said the profit for the year, including dividends and profits on the sale of shares of subsidiary companies, after making due provision for depreciation and bad debts, was £22 828, and the disposable balance was £52 982. The directors saw no reason to delay longer a return to the ordinary shareholders, and it was proposed to declare a 2½% dividend to them, free of tax. With regard to Silvertown, sales had had a much larger drop than had been the case in the previous year. The work of erecting the new steam and power plant was well in hand, and there was every indication that they would have the whole installation in working order by the beginning of December. The total sales showed a decrease of 11·4%, Silvertown manufactures showing a decrease of 12·7%. As there had been an average drop in selling prices of between 12 and 13%, the decrease of 12·7% in sales meant that the volume or quantity of goods turned out had been roughly the same as for 1927–28. The current year had started under somewhat more promising conditions than had prevailed twelve months ago; the work of a general character awaiting manufacture stood at 11% higher. Submarine cable work had practically dropped to zero. At the Burton works they had to report a slight improvement, the turnover, however, having been insufficient to meet overhead charges. At Persan during the year there had been an improvement, within twelve months, equivalent to about £40 000. The year's trading showed a moderate profit, the first for a number of years, and the most substantial since 1920. The report and accounts were adopted.

METAL AND CHEMICAL PRICES.

		Tuesday, December 3rd. Price.	Inc.	Dec.

NEW COMPANIES.

DALLAS (AYR), LTD.—Cap., £5 000. Motor, mechanical and electrical engineers, etc. Reg. office: Burns Statue Square, Ayr.

SAM SHARPLES, LTD.—Cap., £1 000. Electrical and mechanical engineers and contractors, etc. Solicitor: M. Rigby, 15, Cooper Street, Manchester.

WIBERG TRUST, LTD.—Cap., £5 000. Electricians and mechanical engineers, etc. Solicitors: Reynolds, Sons and Gorst, 7, Arundel Street, Strand, London, W.C.2.

D. F. M. MANUFACTURING, LTD.—Cap., £1 000. Manufacturers of and dealers in electric fuse wire, fuse wire holders, etc. Reg. office: 7, Royal Bank Place, Glasgow, C.1.

TRADERS TOOLS, LTD.—Cap., £1 000. Tool makers, mechanical and electrical engineers, etc. Solicitors: Buckeridge and Braune, 3-4, Clements Inn, Strand, London, W.C.2.

FAIREST AND CO., LTD.—Cap., £250. Railway, tramway, electrical, mechanical and general engineers, etc. A permanent director: M. Fairest, 141, Worrall Road, Sheffield, engineer.

PERLA COMPOSIZIONE CO., LTD.—Cap., £100. Manufacturers of non-inflammable compositions used in manufacture of lamp shades, etc. Reg. office: 89, Gray's Inn Road, London, W.C.1.

C. E. GREENWOOD, LTD.—Cap., £2 000. Electrical engineers, manufacturers of, and dealers in, wireless and electrical apparatus, etc. Reg. office: Walmer House, 296, Regent Street, London, W.1.

CHIMICMAINE CO., LTD.—Cap., £100. Manufacturers of, and dealers in, electrical and scientific apparatus, appliances and instruments, etc. Reg. office: 7, New Court, Lincoln's Inn, London, W.C.2.

ARROW (PRESTON), LTD.—Cap., £100. Electrical, wireless, telephone and telegraph engineers, manufacturers of electric lamps, valves and wireless apparatus, etc. Reg. office: 17, Winckley Square, Preston.

DOVER COAL, GAS AND POWER CO., LTD.—Cap., £100. Colliery proprietors, manufacturers and suppliers of electricity, etc. A subscriber: G. T. Hannaford, Adelaide House, King William Street, London, E.C.3.

TRIUMPH RADIO CO., LTD.—Cap., £800. Radio or wireless telephony and telegraphy contractors, electrical engineering contractors, engineers, etc. Reg. office: 223, Vauxhall Bridge Road, London, S.W.1.

VUL-K-LEC, LTD.—Cap., £1 000. To acquire the business of electric vulcaniser manufacturers and suppliers carried on by B. Griffith, H. de Lisle Crawford and W. H. Fawcett, at 58, South John Street, Liverpool.

GRAPHONES, LTD.—Cap., £500. Wireless, electric lighting, telephone and general engineers, wireless experts, repairers of and dealers in radio and telephone apparatus, etc. Reg. office: 70, Cowbridge Road, Cardiff.

CHORISTER RADIO, LTD.—Cap., £100. Manufacturers of and agents for and dealers in wireless goods and in particular as manufacturers and sellers of Chorister Radio Products, etc. Reg. office: 15, Queensway, Ponder's End.

A. E. COLLIER AND CO., LTD.—Cap., £100. To acquire business of electricians, radio and wireless engineers, etc., carried on in Southport as Collier and Illingworth, Ltd. Solicitor: R. Hodge, 18, Hoghton Street, Southport.

STANDARD SWITCHGEAR, LTD.—Cap., £1 000. Marketers of electric light, cooking, heating, power and other electrical fittings and equipment, etc. J. B. Rudkin (managing director), Mount Joy, Hill View Road, Rayleigh, Essex.

ELITE IRON AND WIRE WORKS CO., LTD.—Cap., £1 000. Manufacturers and workers of, and dealers in, wire, cable, mechanical, electrical, telegraph, telephone and wireless engineers, etc. Reg. office: 34, Upper Cyprus Street, Holt Town, Manchester.

MASON (ELECTRO-MEDICAL), LTD.—Cap., £2 000. Manufacturers of and dealers in electrical apparatus and appliances; to promote and encourage study and investigation of electrical and electro-medical science, X-rays, etc. Reg. office: 96, Wigmore Street, London, W.1.

HEATH ELECTRICAL AND GRAMOPHONE CO., LTD.—Cap., £1 500. To acquire the business carried on by J. Cavendish, at 9, South End Road, Hampstead, N.W.3, as Heath Electrical Co., and to sell, purchase, let or hire, manufacture, fit, instal and maintain wireless and other electrical apparatus, etc.

ENGINEERING DISTRIBUTORS AND FINANCE, LTD.—Cap., £100. To carry on business as an issuing house for shares and securities of companies, and that of capitalists, financiers, concessionaires, merchants, contractors, engineers, manufacturers of electricity for light and power, etc. Reg. office: 419, Oxford Street, London, W.1.

BRITISH UNIVERSAL ILLUMINATIONS, LTD.—Cap., £100. To acquire business of the British Illuminations Co. and H. Stanley Smith and Co., electrical contractors, and to carry on same and business of electrical installation and other illuminating contractors, etc. A first director: H. S. Smith, 61, Southwater Road, St. Leonards-on-Sea, electrical contractor.

HUNTER AND PIQUART, LTD.—Cap., £300. Manufacturers of, agents for, and dealers in apparatus and accessories for use in connection with radio or wireless, in particular cables, wires, batteries, detectors, switches, pulleys, coils, condensers, head telephones, valves, rece,ivers, amplifiers and aerial and other insulators. Reg. office: 21 Glasshouse Yard, Aldersgate Street, London, E.C.1.

TRADE MARKS.

This list has been specially compiled for us from official sources by GEE AND CO., *Patent and Trade Marks Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.*

SILOLUXE. B505 144. Class 6. Electric vacuum cleaning machines. C.C.A. (Vacuum Cleaners), Ltd., Swinton House, 324, Gray's Inn Road, London, W.C.1; merchants.—August 8th, 1929. The applicants undertake that this mark, when registered, and the marks Nos. B505 143 and 505 145, shall be assigned or transmitted only as a whole and not separately. User claimed from April 9th, 1927.

ELECTRAC. 499 883. Class 6. Toothed gearing, being parts of machines, for use in connection with electric railways and tramways. The Moss Gear Co., Ltd., Crown Works, Chester Road, Tyburn, Birmingham; manufacturers.—February 9th, 1929.

CADENZA. (Sign.) 505 062. Class 8. Sound reproducing instruments. May Small, 4, Bridge Street, Oakengates, Shropshire; manufacturer.—August 6th, 1929.

GOVERNOR. 503 919. Class 8. Electric accumulators and batteries (not for medical purposes), electrical measuring instruments, electric cables. John Shaw and Sons, Wolverhampton, Ltd., Fryer Street, Wolverhampton; manufacturers and merchants.—June 25th, 1929.

KOH-I-NOOR. 505 325. Class 8. Philosophical and scientific instruments, but not including crystals, detectors or instruments or apparatus for use in wireless telegraphy and telephony. Hunter-Penrose, Ltd., 109, Farringdon Road, London, E.C.1; printers' engineers.—August 16th, 1929.

NOVOTONE. 505 488. Class 8. Instruments and apparatus for radio-signalling, sound reproducers and thermionic amplifiers, gramophones, gramophone pick-ups and parts of same. Gambrell Bros., Ltd., 307, Merton Road, Southfields, London, S.W. 18; manufacturers.—August 23rd, 1929.

GNOME. 506 062. Class 8. Radio receiving sets and loud speakers. Rees Mace Manufacturing Co., Ltd., 39A, Welbeck Street, London, W.1; manufacturers of electrical apparatus.—September 13th, 1929.

K.O. (Sign.) B506 244. Class 8. Electric batteries, not for medical purposes. Julius Toubkin, 33, Long Millgate, Manchester; merchant.—September 19th, 1929. User claimed from May 1st, 1923.

BARKROLE. 506 246. Class 8. Philosophical and scientific instruments. John Barker and Co., Ltd., 83, Kensington High Street, London, W.8; general merchants.—September 19th, 1929. To be associated with No. 482 386 (2 584).

BURCO. (Sign.) 503 503. Class 13. Electric urns and wash boilers, all being goods of ordinary metal not included in other Classes. Burnley Components, Ltd., Accrington Road, Rose Grove, Burnley; engineers.—June 10th, 1929.

INVERCONE. 506 145. Class 13. Electric light shades and reflectors, all being goods of ordinary metal not included in other classes. The Benjamin Electric, Ltd., Brantwood Works, Tariff Road, Tottenham, London, N.17.; manufacturers.—September 17th, 1929.

HOROLUX. 506 146. Class 13. Electric light shades and reflectors, all being goods of ordinary metal not included in other Classes. The Benjamin Electric, Ltd., Brantwood Works, Tariff Road, Tottenham, London, N.17; manufacturers.—September 17th, 1929.

ALPHA. 502 004-6 741 S. Class 18. Electric radiators and stoves. Wright Bindley and Gell, Ltd., North British Steel Works, Penistone Road, Sheffield, and Premier Works, Percy Road, Greet, Birmingham; manufacturers.—April 20th, 1929. To be associated with 502 003-6 740 S, xiii (not yet advertised).

ISOMONA. 504 019. Class 8. Parts of wireless telephonic apparatus. Haw and Co., Ltd., 845 to 850, Salisbury House, London Wall, London, E.C.2; merchants.—June 28th, 1929.

VIVA-RADIO. 505 387. Class 8. Instruments and apparatus for use in connection with wireless telephony and telegraphy and wireless telephonic apparatus in combination with gramophones. Columbia Gramophone Co., Ltd., 102 to 108, Clerkenwell Road, London, E.C.1; manufacturers.—August 17th, 1929. To be associated with No. 471 115 (2 523) and another.

VALUNDA. 506 104. Class 13. Electric switches of ordinary metal. Frederic Richard Francke, 28, Blomfield Road, Maida Vale, London, W.9; engineer.—September 16th, 1929.

LIVEJUICE. (Sign.) 506 025. Class 1. Electrolyte for lead-plate electric storage batteries. The Livejuice Manufacturing Co., 42, South Lambeth Road, London, S.W.8; manufacturers.—September 12th, 1929.

TROJAN.—505 760. Class 8. Wireless telephonic apparatus. The British Homophone Co., Ltd., 67 to 69, City Road, London, E.C.1; manufacturers. September 3rd, 1929.

OSTAR.—495 023. Class 13. Incandescent electric lamps (ordinary) electric switches (ordinary) and switch holders. Percy Thomas, 37, New Road, London, E.1; importer and dealer in electrical goods. September 14th, 1928.

H.M. (Monogram).—495 374. Class 50. Knobs (ungraduated), ammeter and voltmeter cases, battery cases, panels and the like fittings for radio receiving sets; switch covers and moulded parts of electrical control gear, all being goods (not included in other classes) made from moulding powders composed chiefly of synthetic resins, and all being made in Great Britain. Healey Mouldings, Ltd., 239 and 241, Great King Street, Birmingham; manufacturers. September 27th, 1928.

D.C. (Monogram).—504 121. Class 8. Electric cables. Derby Cables, Ltd., Alfreton Road, Derby; cable manufacturers. July 2nd, 1929.

PAM.—505 170. Class 8. Thermionic valve amplifiers. Claude Lyons, Ltd., 76, Old Hall Street, Liverpool; manufacturers. August 9th, 1929. (By consent.)

B.S.R. SELHURST RADIO (sign).—505 321. Class 8. Wireless telephonic loud speakers and transformers and components parts thereof. Arthur Baker, trading as Bakers Selhurst Radio, 89, Selhurst Road, South Norwood, London, S.E.25; manufacturer. August 15th, 1929. Registration of this trade mark shall give no right to the exclusive use of the word "Selhurst."

VIKING.—502 909. Class 13. Electric lamps for cycles. Luke Killick Ioft, 525, Canterbury Street, Gillingham, Kent; merchant; May 21st, 1929.

MEP.—506 327. Class 13. Electric head lamps for use on motor vehicles, motor cycles, bicycles and locomotives. Maurice Edgar Power, 41, Queensborough Terrace, Hyde Park, London, W.2; of no occupation. September 23rd, 1929.

NORMAL.—B503 557. Class 16. Insulators of porcelain for connecting electric wires. Naamlooze Vennootschap Ramie Union, 48, Haaksbergerstraat, Enschede, Holland; manufacturers. June 11th, 1929. User claimed from April 26th, 1926.

SIEMENS SCHUCKERT. (Sign.) 487 004. Class 8. Philosophical and scientific instruments. Siemens-Schuckertwerke Aktiengesellschaft, 101 to 110, Nonnendamm-Allee, Berlin-Siemensstadt, manufacturers.—December 21st, 1927. To be associated with No. 472 258 (2 553) and others. (By consent.) Registration of this trade mark shall give no right to the exclusive use of the words "Siemens-Schuckert."

TRICHORD. 505 825. Class 8. Wireless telephonic apparatus, gramophones and parts thereof. The British Homophone Co., Ltd., 67-69, City Road, London, E.C.1; manufacturers.—September 5th, 1929.

EXWELL.—506 681. Class 8. Philosophical and scientific instruments. Erich Cahn, Frohsinnstrasse 25, Aschaffenburg, Bavaria; engineer.—October 7th, 1929.

D. P. B503 296. Class 8. Electric batteries, not for medical purposes. The D.P. Battery Co., Ltd., Bakewell, Derbyshire; manufacturers.—June 1st, 1929. User claimed from December 1st, 1891.

CIFEL. 507 047. Class 8. Philosophical and scientific instruments. Fonteyn and Co., Ltd., 2, 4, 5 and 6, Blandford Mews, Baker Street, London, W.1; merchants.—October 18th, 1929.

PHOEBUS. 490 632. Class 13. Electric lamps (ordinary). The British Thomson-Houston Co., Ltd., Crown House, Aldwych, London, W.C.2; electrical engineers and manufacturers.—April 20th, 1928.

MAXIPHONE.—506 811. Class 8. Philosophical and scientific instruments, but not including electrical instruments for magnifying sounds. Lugton and Co., Ltd., 133 and 135, Old Street, London, E.C.1; factors. October 10th, 1929. (To be associated with No. 368 312 (1 952) and others.)

TROJAN (Sign).—506 762. Class 8. Wireless telephonic apparatus and gramophones and parts thereof and gramophone records. The British Homophone Co., Ltd., 67-69, City Road, London, E.C.1; manufacturers. October 9th, 1929. (To be associated with No. 505 760 (2 690).) Registration of this trade mark shall give no right to the exclusive use of the letter "T."

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

BIBBY, Arthur S., 135, Church Street, Preston, wireless dealer.—£17 2s. 5d. October 25th.

DICKIE (A.), LTD., Station Road, Portslade, wireless dealers £11 18s. 7d. October 9th.

ELECTRICAL ENGINEERING AND SUPPLY CO., 28, The Bank, Barnard Castle, wireless dealers. £37 16s. 6d. October 9th.

FERRIDAY, Lance, Arcade Wireless Shop, Stockton-on-Tees, wireless engineer. £18 13s. 2d. October 14th.

FREER, Mr. H. A., 110, Humberstone Drive, Leicester, wireless dealer. £28 18s. 10d. October 17th.

IRVING, R., 4, Bridge Road, Kirkstall, Leeds, wireless dealer. £18 5s. 6d. October 9th.

J. D. WIRELESS CO., 195, Breck Road, Liverpool, wireless dealers £46 16s. October 9th.

MAISEY, A. G., 280, Allerton Road, Allerton, wireless dealer. £14 10s. October 21st.

MITCHELL, Mr. D. C., Stein Road, Southbourne, wireless dealer. £15 0s. 10d. October 8th.

NEEDHAM AND PERCIVAL, 54, Nansen Road, Sparkhill, wireless dealers. £20 10s. 8d. October 8th.

SUMMERS, L., 30, London Road, Romford (trading as SOUTH ESSEX ELECTRIC CO.), electrical engineer. £22 2s. 5d. October 18th.

SPURR, E., 19, Bridge Street, Earlestown, wireless dealer. £10 17s. 10d. October 9th.

Bills of Sale.

BARNETT, Joseph, 126, High Road, Leyton, wireless dealer. Dated November 22nd, filed November 29th. £50.

BUCKLEY, Horace, Electricity House, Station Road, Marston Green, electrical engineer. Dated November 21st, filed November 23rd. £60.

CROSS, Alfred George, 134, Pope's Lane, South Ealing, electrical engineer. Dated November 21st, filed November 23rd. £40.

DIXON, Arthur Henry, 3, Powis Place, Great Ormonde Street, trading, in partnership, as electrical engineer. Dated November 22nd, filed November 28th. £60.

Receiverships.

MIDLAND RUBBER CO. (1913), LTD. (formerly MIDLAND RUBBER GOODS MANUFACTURING CO., LTD.). C. H. Smith, of Phœnix Chambers, Colmore Row, Birmingham, was appointed receiver on November 20th, 1929, under powers contained in first mortgage debenture dated November 15th, 1923.

REPRODUCTION, LTD.—O. F. Falk, of 19, Ironmonger Lane, E.C., was appointed receiver and manager by order of Court dated November 15th, 1929.

London Gazette, etc.

Winding-up Petition.

IDEAL WIRELESS CO., LTD. A creditors' petition for winding up has been presented by A. Risl (1927), Ltd., and is to be heard at the Royal Courts of Justice, Strand, London, W.C.2, on Monday, December 9th.

Company Winding-up Voluntarily.

TELEPHONE MANUFACTURING CO., LTD. By special resolution, Nov. 25th, F. C. T. Lane, 2, Norfolk Street, Strand, W.C.2, chartered accountant, appointed as liquidator for the purposes of reconstruction.

Bankruptcy Information.

HUDSON, Rex Chadwick, 1 and 2, Bridge Road, Chatburn, Lancashire, electrical contractor. Receiving order, November 25th, debtor's petition. First meeting, December 6th, 3.15 p.m., Official Receiver's Office, District Bank Chambers, Blackburn. Public examination, January 15th, 10.30 a.m., County Court House, Victoria Street, Blackburn.

Notice of Dividend.

SKIPPER, Sydney Harold, 35, Broad Bridge Street, Peterborough, lately trading as SKIPPER (S.H.) AND CO., electrical engineer. First and final dividend, 1s. per £, payable December 10th, Official Receiver's Office, 41, Sidney Street, Cambridge.

Orders Made on Applications for Discharge.

KELLY, Morris, 12, Jackson's Road, Manchester, radio apparatus dealer. Discharge refused, November 4th, with liberty to file a fresh application after the expiration of two years.

SANDGROUND, Arthur, 32, Allerton Road, Lordship Park, London, wireless factor. Discharged, October 16th, subject to consenting to judgment for £40.

Partnership Dissolved.

TOWER RADIO SUPPLIES (Morris DAVIS and Alfred BOWMAN), wireless dealers, 5, High Street, Shoreditch, E., by mutual consent as from November 19th, 1929. Debts received and paid by A. Bowman.

Bankruptcy Proceedings.

BATES, Victor Harold, trading as "THE LINTON RADIO SERVICE," High Street, Linton, Cambs., wireless engineer. The first meeting of creditors in this matter was held recently at the Official Receiver's Office, 1, Sidney Street, Cambridge, when a statement of affairs was filed showing liabilities ranking at £204 against assets of £56, thus leaving a deficiency of £148. The debtor attributed his failure to spending £30 on erecting a workshop; repairs of machinery and drawing sums in excess of profits made. The matter was left in the hands of the Official Receiver as trustee.

CLARKE, Harry Bell, 2, Devonshire Road, Carrington, Nottingham, electrical engineer. This debtor's application for discharge was heard on November 21st at the County Court House, Nottingham. The Receiving Order had been made in May of this year, when a statement of affairs was returned showing liabilities of £1 750, against assets that had realised £72. A dividend was to be paid of a little over 3½d. in the £. The discharge was suspended until such time as a dividend of 10s. in the £ was paid.

COLES, Allan James, 424, Pinner Road, lately 2A, Pinner Road, both Harrow, Middlesex, electrical engineer and contractor. The receiving order herein was made recently on the debtor's own petition. The first meeting of creditors was held recently at 29, Russell Square, London, W.C.1, when a statement of affairs was filed showing liabilities of £223, and assets estimated to produce £45, thus leaving a deficiency of £178.

GRIFFITHS, Philip Arthur, 124, Lodge Road, Redditch, late 2, Prospect Place, Redditch, and late Church Lench, near Evesham, Worcs, electrician. The public examination of this debtor was held on November 20th at Birmingham, when a statement of affairs was returned showing ranking liabilities of £451 and a deficiency of £423. Debtor said that he commenced trading as an electrical engineer in January, 1928, at Church Lench, having a capital of £300. At the end of March he estimated his loss at £5, and he then acquired the tenancy of thirteen acres of arable land and fifteen acres of pasture land adjoining his premises, and commenced trading as a market gardener. He later gave up the business and started as a greengrocer at Prospect Place, trading until January last, but owing to ill-health he was unable to attend to his work. He became aware of his position in November, 1928. The examination was closed subject to the signing of notes.

SANDS, Chaloner Wilkinson, High Street, King's Langley, Hertfordshire, electrical and wireless contractor. The public examination of this debtor was held on November 27th at the Court House, St. Albans, when a statement of affairs was filed showing ranking liabilities of £369, against assets estimated to produce £105, thus leaving a deficiency of £264. The debtor attributed his failure to lack of capital, keen competition, law costs of suing creditors and household and personal expenses in excess of profits. It would seem that for many years he was in employment and in May, 1926, when owing £95 for law costs, he purchased a retail wireless business for £50, which he paid out of £100 borrowed on the security of his reversionary interest under the will of his late grandfather. In the May of 1927 he added to his business that of an electrician, raising another £100 on the reversionary interest, but he did not have the benefit of that sum as the solicitors to whom he was owing £95 sued him for the recovery of that amount, which he paid. He was fairly successful, and the business provided him with a living until about eighteen months ago, but since then, owing to local competition, he had experienced difficulty in meeting his creditors' accounts as they became due. He had kept a fairly complete set of books with stocktaking sheets and a balance sheet made out to May, 1928. He had been drawing about £3 a week out of the business. He stated that he became aware of his position in October, 1928. The debtor was questioned regarding a sum of £1 17s. 6d. which he received after the Receiving Order had been made and which he stated he had used to get necessities at home. He had written to the Official Receiver stating that he would make it good, but he had not done so up to the present. The hearing was adjourned.

WRIGHT, Ronald Reginald, trading as WRIGHT BROS., 36, Normanton Road, Derby, wireless dealer. The public examination herein was held recently at the Court House, 20, St. Peter's Churchyard, Derby, when a statement of affairs was returned showing liabilities of £243, against assets of £146, thus leaving a deficiency of £97. The debtor, and a relative, it appeared, commenced trading in November, 1924, each contributing £30 capital, and a sum of money was borrowed from their parents and put into the business. In 1925 the relative withdrew, but received no payment. The failure was attributed to depreciation of stock, want of capital, and pressure by a creditor. The examination was closed.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

318 720 H. L. KIRKE, B. N. MACLARTY, and T. C. MACNAMARA. Thermionic valve circuits. (2/8/28.)
295 931 ELECTRICAL RESEARCH PRODUCTS, INC. Methods of and apparatus for applying material to cores. (20/8/27.)
305 643 T. M. HARRISON. Electrically heated vessels and the like. (10/2/28.)
318 728 H. G. LANDIS. Electric heater. (11/8/28.)
318 734 A. LANE. Cells for the production of gases by electrolytic processes. (21/8/28.)
297 456 ALLGEMEINE ELEKTRICITATS-GES. High speed synchronous motor combined with a gear-wheel transmission gearing for driving clocks, and for the control of tariff apparatus of all kinds. (23/9/27.)
300 177 SIEMENS-SCHUCKERTWERKE AKT.-GES. Electric current transformers for use in electric switchgear installations. (5/11/27.)
318 762 GENERAL ELECTRIC CO., LTD., and D. H. COCKBURN. Transportation of pulverulent materials. (27/9/28.)
318 764 A. PORDAGE. Automatic fire alarm. (3/10/28.)
318 768 BRITISH ELECTRIC PARI-MUTUEL, LTD., and F. HOWARD. Totalisators. (9/10/28.)
318 785 MULLARD RADIO VALVE CO., LTD., and P. W. S. VALENTINE. Electric circuits including smoothing elements. (25/10/28.)
318 786 H. H. THOMPSON, A. E. DAVIES, and W. E. BOX. Magnetic separators. (31/10/28.)
301 078 SIEMENS-SCHUCKERTWERKE AKT.-GES. Arrangement for switching off loads on extra high tension networks. (24/11/27.)
301 323 ELECTROLUX, LTD. Absorption refrigerating apparatus. (25/11/27.)
306 117 ALLMANNA SVENSKA ELEKTRISKA AKTIEBOLAGET. Current transformers. (17/2/98.)
316 204 AKT-GES. BROWN, BOVERI ET CIE. Means for equalising different torque effects on the working-shaft common to a combined power plant. (25/7/28.)
303 415 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Train control systems. (17/8/27.)
303 416 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Train control systems. (17/8/27.)
318 817 W. MCGEOCH AND CO., LTD., and C. W. FRASER. Globe fittings for electric lamps. (12/1/29.)
318 575 BENJAMIN ELECTRIC, LTD., and G. CAMPBELL. Shock absorbing mounts for thermionic valves or other electrical devices. (31/5/28.)
304 212 ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Rotary shearing machines for cutting off lengths of continuously moving material. (16/1/28.)
304 614 TELEFUNKEN GES. FUR DRAHTLOSE TELEGRAPHIE. Potential supply devices for use with thermionic valves and the like. (20/1/28.)
307 032 INTERNATIONAL GENERAL ELECTRIC CO., INC. Shuttles of looms for weaving. (1/3/28.)
308 823 D. S. LOEWE. Indirectly heated thermionic cathode. (25/6/27.)
313 607 ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Electric switches. (16/6/28.)
319 024 C. NEFF. Method of producing oscillations by means of two or more co-operating generators. (12/3/28.)
318 841 A. H. MARKS and P. RUSSELL (legal representatives of E. C. R. MARKS, deceased). (Western Union Telegraph Co.) Telegraph systems. (6/3/28.)
288 630 SIEMENS-SCHUCKERTWERKE AKT.-GES. Arrangement in asynchronous machines with commutator machines mounted in cascade. (14/4/27.)
288 987 BRITISH THOMSON-HOUSTON CO., LTD. Alternating-current commutator motors. (16/4/27.)
318 903 J. P. NAYLOR. Electric luminous signs and signalling apparatus and their controllers. (4/5/28.)
296 774 LANDIS AND GYR SOC. ANON. Means for varying the temperature co-efficients of induction-measuring instruments. (9/9/27.)
319 032 W. E. BEATTY (BELL TELEPHONE LABORATORIES, INC.). Telegraph systems. (14/5/28.)
319 033 A. E. WHITE (FANSTEEL PRODUCTS CO., INC.) Electrolytic condensers. (15/5/28.)
304 582 ALADDIN INDUSTRIES, LTD. Lamp fixtures. (21/1/28.)
318 847 C. H. VERITY. Synchronisation of machines for recording sounds and movements. (5/6/28.)
318 876 E. REISZ. Electrostatic loud speakers and the like. (8/6/28.)
292 077 ELECTRICAL RESEARCH PRODUCTS, INC.) Carrier frequency signalling systems. (11/6/27.)
319 037 H. N. MARVIN. Means for tuning radio sets. (9/6/28.)
318 942 J. NEALE. Means of mounting for light-sensitive bridges. (12/6/28.)
318 944 STANDARD TELEPHONES AND CABLES, LTD. (G. DEAKIN). Automatic and semi-automatic telephone exchange systems. (13/6/28.)
318 945 STANDARD TELEPHONES AND CABLES, LTD. (G. DEAKIN and L. POLINKOWSKY). Automatic and semi-automatic exchange systems. (13/6/28.)
318 946 STANDARD TELEPHONES AND CABLES, LTD. (WESTERN ELECTRIC CO., INC.). Signalling systems. (13/6/28.)
318 947 STANDARD TELEPHONES AND CABLES, LTD. (WESTERN ELECTRIC CO., INC.) Electric resistance units. (13/6/28.)
318 948 J. H. ST. H. MAWDSLEY. Dynamo-electric generators for electric welding. (13/6/28.)
318 950 A. WRIGHT. Electromagnetic devices. (13/6/28.)
292 597 ELECTRICAL RESEARCH PRODUCTS, INC. Synchronising systems for use in television systems. (23/6/27.)
318 953 AUTOMATIC TELEPHONE MANUFACTURING CO., LTD., and P. N. ROSEBY. Magnet cores. (13/6/28.)
292 130 MONTECATINI SOC. GENERALE PER L'INDUSTRIA MINERARIA ED AGRICOLA. Electrolytic cells. (14/6/27.)
319 046 STANDARD TELEPHONES AND CABLES. LTD. (L. J. J. SCHREIBER). Switching mechanism for automatic or semi-automatic telephone systems. (14/6/28.)
319 050 ELECTROLUX, LTD. (PLATEN-MUNTERS REFRIGERATING SYSTEM AKTIEBOLAG). Evaporator units for refrigerating apparatus. (15/6/28.)
319 051 C. F. BURTON and H. BURTON. Dials or the like for electrical condensers or other electrical instruments. (15/6/28.)
319 055 STANDARD TELEPHONES AND CABLES, LTD. (BELL TELEPHONE LABORATORIES, INC.). Aerial systems. (15/6/28.)
319 058 J. B. TUCKER. Electrical plug and socket connections. (16/6/28.)
319 061 RADIO INSTRUMENTS, LTD., and W. L. SHAW. Iron-cored inductances. (16/6/28.)
292 600 C. LORENZ AKT.-GES. Maintenance of constant frequency in high-frequency electric circuits. (21/6/27.)
319 072 BRITISH THOMSON-HOUSTON CO., LTD., and R. D. PARRY. Control of electric motor generator sets. (19/6/28.)
319 074 GENERAL ELECTRIC CO., LTD., and R. J. KAULA. Electric terminals. (19/6/28.)
319 080 J. DURHAM. Amplifiers of sound-producing instruments. (25/6/28.)
319 085 C. E. FRY. Coin-freed mechanism, particularly applicable to prepayment devices for use with electric meters. (29/6/28.)
319 088 N. E. GOODRICH. Massaging machine with electromagnetic engines. (3/7/28.)
319 095 R. NEITL. Electric lampholders. (16/7/28.)
319 100 P. D. TYERS. Portable wireless receiving apparatus. (19/7/28.)
319 115 L. TSCHORNER. Television apparatus. (15/8/28.)
299 865 SIEMENS-SCHUCKERTWERKE AKT.-GES. Induction motors. (3/11/27.)
319 120 E. QUARTIER. Means for automatically controlling an electromagnetic device. (20/8/28.)
319 121 M. TROUTON and WIRELESS MUSIC, LTD. Electromechanical vibrating devices for use, for example, in loud speakers. (21/8/28.)
319 133 A. H. SEABROOK and A. AVIS. Poles, masts and the like for supporting overhead electric wires and for similar purposes. (8/9/28.)
297 388 TELEFONAKTIEBOLAGET L. M. ERICSSON. Impulse senders of the finger disc type. (20/9/27.)
319 141 A. E. BOWYER-LOWE. Wireless receiving apparatus. (21/9/28.)
297 847 MARCONI'S WIRELESS TELEGRAPH CO., LTD. Thermionic valves. (29/9/27.)
298 202 E. BECK. Timepiece with electric driving mechanism. (5/10/27.)
298 241 SIEMENS AND HALSKE AKT.-GES. Electromagnetic relays with two armatures. (6/10/27.)
298 490 RHEINISCH-WESTFALISCHES ELEKTRIZITATSWERK AKT.-GES. Protecting device for current distributing plants. (7/10/27.)
319 156 H. H. THOMPSON, A. E. DAVIES and W. E. BOX. Magnetic separators. (30/10/28.)
300 124 TELEFUNKEN GES. FUR DRAHTLOSE TELEGRAPHIE. Apparatus for amplifying and for rectifying oscillations. (5/11/27.)
302 286 ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Electrical control devices. (13/12/27.)
319 167 J. FELDMAN. Construction of transformers, choking coils and other parts of wireless apparatus to facilitate assemblage. (13/12/28.)
302 908 BRITISH THOMSON-HOUSTON CO., LTD. Electron discharge devices. (22/12/27.)
319 175 E. F. SCHAFER. Combined table lamp and loud speaker. (24/12/28.)
319 176 W. GUY-PELL. Lamp shades. (2/1/29.)
304 656 SIEMENS-SCHUCKERTWERKE AKT.-GES. Projecting screen, more particularly for daylight projection. (23/1/28.)

COMING EVENTS.

Friday, December 6th (To-day).

Institution of Electrical Engineers (Meter and Instrument Section).—Institution, Savoy Place, Victoria Embankment, London. Paper by Dr. C. V. Drysdale on "Alternating Current Potentiometers and their Applications." 7 *p.m.*

Monday, December 9th.

Electrical Contractors' Association (Hastings Sub-Branch).—Ordinary meeting. Lewcock's Restaurant.

Electrical Contractors' Association (Liverpool Branch).—Ordinary meeting. 3 *p.m.*

Institution of Electrical Engineers (Western Centre).—Cadena Café, Eastgate Street, Gloucester. Paper by Mr. B. L. Goodlet on "The Testing of Porcelain Insulators." 6 *p.m.*

Institution of Electrical Engineers.—Savoy Place, Victoria Embankment, London. Informal meeting. Discussion on "To Earth or not to Earth." (Opened by Mr. W. R. Rawlings and Mr. T. C. Gilbert.) 7 *p.m.*

Institution of Electrical Engineers (Mersey and North Wales—Liverpool—Centre).—The University, Liverpool. Paper by Lieut.-Col. S. E. Monkhouse, and Mr. L. C. Grant on "The Heating of Buildings Electrically by Means of Thermal Storage." 7 *p.m.*

Institution of Electrical Engineers (North-Eastern Centre).—Armstrong College, Newcastle-on-Tyne. Paper by Messrs. B. A. G. Churcher and A. J. King on "The Analysis and Measurement of the Noise Emitted by Machinery." 7 *p.m.*

Sheffield Illumination Society.—Lecture Hall, Y.M.C.A., Fargate. Annual general meeting. 7.30 *p.m.*

Tuesday, December 10th.

Electrical Contractors' Association (Leicester Branch).—Ordinary meeting.

Electrical Contractors' Association (Swansea Branch).—Ordinary meeting.

Electrical Association for Women (Bristol and District Branch).—Electricity Offices, Colston Avenue. Lecture by Mr. F. L. Thomas on "Protective Devices."—Fuses, Faults, Safety First Methods. 3 *p.m.*

Institution of Electrical Engineers (North Midland Centre).—Hotel Metropole, King Street, Leeds. Paper by Lieut.-Col. S. E. Monkhouse and Mr. L. C. Grant on "The Heating of Buildings Electrically by Means of Thermal Storage." 7 *p.m.*

Institution of Electrical Engineers (North-Western Centre).—Engineers' Club, 17, Albert Square, Manchester. Twentieth Kelvin Lecture by Dr. G. C. Simpson, F.R.S., on "Lightning." 7 *p.m.*

Illuminating Engineering Society.—Home Office Industrial Museum, Horseferry Road, Westminster. Discussion on "Problems in Illuminating Engineering." 7 *p.m.*

Electrical Power Engineers' Association.—Junior Institution of Engineers, 39, Victoria Street, London. Paper by Mr. R. Livingstone on "Turbo-Alternators." 7.15 *p.m.*

Institution of Electrical Engineers (South Midland Students' Section), Coventry. Paper by Mr. A. H. Slade on "Routine Testing of D.C. Machinery." 7.30 *p.m.*

Electrical Contractors' Association (Bournemouth Branch).—Ordinary meeting. 7.30 *p.m.*

Wednesday, December 11th.

Electrical Contractors' Association (Eastbourne Sub-Branch).—South Street. Ordinary meeting.

Electrical Association for Women.—Visit to Messrs. Berry's Electric, Ltd., Touchbutton House, 85, Newman Street, London. Lecture-Demonstration on "Electric Christmas Cooking," by Mrs. A. Mole. 3 *p.m.*

Electrical Contractors' Association (Sheffield Branch).—Ordinary meeting. 5.30 *p.m.*

Institution of Railway Signal Engineers.—Institution, Savoy Place, Victoria Embankment, London. Paper by Mr. F. A. Downes on "Some Notes on A.C. Rectifiers." 6 *p.m.*

Institution of Civil Engineers.—Great George Street, Westminster. Informal meeting. Discussion on "The Heating of Buildings by Electricity off Supply Mains, with Special Reference to the Problem of Heat-Storage and Off-Peak Loads," by A. H. Baker and Mr. S. B. Donkin. 6 *p.m.*

Electrical Development Association (North-Western Area).—Lighting Service Bureau, 4, Fountain Street, Manchester. Paper by Mr. R. C. Hawkins on "The Value of Exhibitions to the Electrical Industry." 6.30 *p.m.*

Electrical Contractors' Association (Birmingham Branch).—Ordinary meeting.

Electrical Contractors' Association (Nottingham Branch).—Ordinary meeting.

Electrical Contractors' Association (East Yorks Branch).—Metropole Hall, Hull. Ordinary meeting. 3.30 *p.m.*

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Joint meeting with the British Section of the Société des Ingénieurs Civils de France. Paper by Messrs. L. A. E. Sekutowicz and A. Evain on "The Electrical Plant and Network of the Société Electrique de la Sidérurgie Lorraine." 6 *p.m.*

Institution of Electrical Engineers (Dundee Sub-Centre).—University College, Dundee. Paper by Mr. A. F. Stevenson on "Cable Design." 7.30 *p.m.*

Thursday, December 12th.

Institute of Patentees.—Caxton Hall, Westminster. Lecture by Sir Wm. Arbuthnot Lane on "Inventions as an Aid to Health." 8 *p.m.*

Friday, December 13th.

Institution of Electrical Engineers (North-Eastern Centre, Students' Section).—Visit to the Newcastle Breweries. 7 *p.m.*

Institution of Mechanical Engineers.—Storey's Gate, St. James's Park, London. General meeting. 6 *p.m.*

Radio Society of Great Britain.—Institution, Savoy Place, Victoria Embankment, London. Lecture by Dr. N. W. McLachlan on "Tone Compensation and Control for Electic Gramophones with Demonstration." 6 *p.m.*

Paisley Association of Electrical Engineers. Visit to Messrs. Babcock and Wilcox, Dumbarton. 7.30 *p.m.*

Saturday, December 14th.

Association of Mining Electrical Engineers (South Wales Branch).—South Wales Institute of Engineers, Park Place. Lecture by Mr. W. T. Anderson on "Mining Cables." 6 *p.m.*

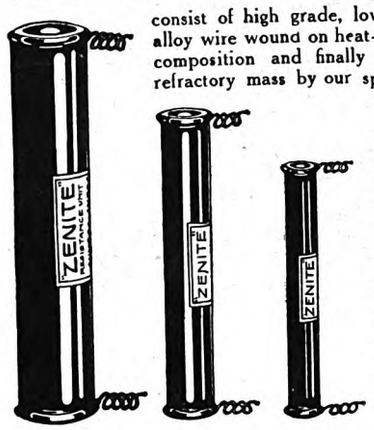
REGISTERED "ZENITE" TRADE MARK

VITREOUS ENAMELLED, EMBEDDED

RESISTANCE UNITS



consist of high grade, low temperature co-efficient alloy wire wound on heat-resisting tubes of special composition and finally embedded in a vitreous refractory mass by our special process.

For use in Motor Starters, Speed Regulators, Dimmers and for Protective purposes.

They can be supplied in seven sizes, 2" × ½" up to 8½" × 1½", and 130 standard windings between the limits of 0·1 ohm and 44 amperes and 150,000 ohms and 0·02 ampere; and can now be fitted with brass caps like cartridge fuses, a feature which makes for increased convenience.

WIRELESS WORK

"ZENITE" Units on account of their permanence are particularly suitable for "leaks" in connection with Medium Power Thermionic Valves as well as in the construction of Resistance Capacity Amplifiers.

COMPETITIVE PRICES and PROMPT DELIVERIES

Catalogue of Resistances and Units post free

The ZENITH ELECTRIC CO., Ltd.

Sole Makers of the well-known "Zenith" Electrical Products.
Contractors to the Admiralty, War Office, Air Ministry, Post Office, L.C.C., etc.

"TERRY" Spannerage

means a light, compact, convenient high-grade range of grips such as you really need. Each spanner accurately fits two nuts and ensures against burring. The complete set is Whitworth ⅛" to ½", and ¼" and 5/16" flats, but any spanner may be bought separately. Blued set 5, 3/6; Plated, 6/-. Why not get your spanner needs standardised? We can give you what you require.

LIST FREE.

The exclusive Terry "de luxe" Saddle gives 100% comfort.

May we quote for Springs of accuracy, long life . . . . and of low service cost? Send prints or samples, and quantities required. List free.

Current Topics.

The Commissioners' Statistics.

IT would be useless to attempt to deal at length with the data which occupies nearly 600 pages of the Electricity Commissioners' "Return of Engineering and Financial Statistics" relating to authorised undertakings in Great Britain for 1927–28, as readers' individual interests in this annual publication vary so widely. Although it is not easy to visualise the work as a Christmas gift "best-seller," it contains a wealth of information which is unobtainable from other sources, though one must regret so comprehensive a record should be arbitrarily confined to authorised undertakings only. In the year under review 490 generating stations had a plant capacity of 5 258 257 kW (an increase of 576 188 kW on the previous year) and sold to consumers a total of 7 003·4 million units (or nearly 19% more than the sales for 1926–27), which raises the per capita consumption to 158 units, a figure which is, of course, considerably below the actual consumption when unauthorised, traction and other unrecorded supplies are taken into account. As indicating the work ahead in the direction of frequency and voltage standardisation, it is of interest to note that while more than 77% of all the a.c. generating plant installed was of the accepted standard frequency of 50 cycles, the remaining 23% included equipment of 13 different frequencies with distribution at 17 different frequencies, and that the declared voltages at consumers' terminals for low and medium pressure a.c. and d.c. supplies, taken collectively, numbered 44. The aggregate values of the individual maximum loads on authorised generating stations were approximately 3 235 188 kW, a figure which does not necessarily constitute an accurate measurement of the combined simultaneous maximum load on the generating plant of all the undertakers. The ratio of this aggregate to the total capacity of generating plant installed indicates a plant capacity some 62% in excess of the maximum demand upon it, a figure we hope to see materially reduced in the near future. The combined load factor remained, as in the previous three years, at about 30%, but 12 more undertakings come into the 35–45% class and three more have attained 45% and over. The maximum was 59·5%, and load factors in excess of 50% were also recorded in four other cases. The average cost of generation for all undertakers, viz. 0·335d. per unit, is the lowest yet recorded, and 0·205d. cheaper than the cost for 1926–27.

The International Illumination Congress.

THE International Illumination Congress and the session of the Commission held in the United States last year probably formed the most important conference on lighting matters ever held. It was marked by great enthusiasm, and was attended by 500 delegates from Austria, Belgium, France, Germany, Great Britain, Holland, Italy, Japan, Sweden, Switzerland and the United States. As has already been announced, the next International Illumination Congress is to be held in Great Britain in 1931, and it is gratifying to note that all interested in the cause of better lighting are uniting to render this congress an outstanding success. In this country the machinery for the study of illumination is perhaps more perfectly organised than in many other places, and the aid of all the leading scientific, technical and commercial bodies concerned is being secured. The National Illumination Committee of Great Britain, in co-operation with the Illuminating Engineering Society, will be responsible for the event, and several committees are already at work on the detailed arrangements. The Congress will take place during the period September 3rd to 13th, 1931, and will be combined with a "voyage d'étude" of places of interest in England and Scotland, so that other cities beside

Digitized by Google

London will share in the work of the Congress. Papers dealing with the most varied aspects of lighting will be presented, and these will be grouped so as to ensure that topics of special local interest will be dealt with at each centre. The Congress will be followed by the technical meetings of the International Commission on Illumination, which will be held in Cambridge from September 13th to 19th.

Bad Debts.

On another page we publish an analysis of the annual bankruptcy report of the Board of Trade, which, published on the threshold of 1930, gives particulars of the insolvencies—both bankruptcies and deeds of arrangement with creditors—of 1928. The report is not nearly so communicative as it might be with regard to the electrical trades, and, indeed, its compilers seem to have overlooked the immense importance to which the industry has attained. The total annual failures in England and Wales appear to have settled down at something over six thousand, with liabilities of between 12 and 13 millions, the latter being much larger than the pre-war figure. There is also the uncomfortable feature that whereas, before the war, creditors might look forward to recovering, on the average, something like 3s. 6d. in the £, they now have to write off a figure approaching 90% of their liabilities to insolvent debtors.

A Warning Note.

With so much talk in the air concerning the development of our home and export trade it is interesting to observe that the United States looks upon the United Kingdom as " the most important " market in Europe for the sale of fractional horse-power motors, portable electric tools, bare and insulated copper wire and cables and domestic appliances. Confirmation of this view is given in the latest available export figures, which show that American electrical exports to this country during September increased by over £100 000 in value when compared with the same month last year. On the other hand, the *total* value of electrical imports into the U.S.A. during the same month reached the low figure of £50 000. The total value of similar imports into this country during September was £782 931, and though we have no available data as to the value of electrical goods exported solely to the United States during that month, the total value was £148 038 less than for the same month of 1928. Consequently, whereas the United States for September showed an increase in export trade with this country of over £100 000 in electrical goods alone, we in our world trading declined by nearly £150 000. Admittedly, these figures do not induce a spirit of cheerfulness, but we draw attention to them in the hope that our manufacturers will appreciate the keen competition that is being offered by the American manufacturer in our own domestic market.

The Radio Manufacturers.

The annual report for 1929 of the Radio Manufacturers' Association shows that the Executive Council has put in a very useful year's work. Not only has a satisfactory basis been found upon which to establish new licence terms with respect to royalties, but considerable headway has been made in standardising equipment among its members and in bringing into line with the I.E.E. Regulations much of the apparatus which hitherto has depended for its safety upon the foresight of the individual manufacturer. Membership of the Association increased during the year by 51, and it is interesting to note that many of the new-comers have both radio and gramophone interests; others are associated with the talking film industry. It was suggested at the annual meeting that the Association should impress upon the B.B.C. the necessity for advertising any special feature which was to form part of a future programme, for it has been found by members that the inclusion of some outstanding item in the programme has an immediate effect upon sales. One member went so far as to suggest that the R.M.A. should contract special expenditure in this direction, while still further sums should be spent on propaganda, the E.D.A. being quoted as an exemplary Association in this connection. The idea has a strong appeal, and possibly the R.M.A. will give it serious consideration. At the same time it must be recognised that the Executive Council has found little time for anything outside the royalty problem during the last twelve months, while even now there is much to be settled. With a satisfactory licence in operation the radio industry will doubtless regain a little of its lost enthusiasm. Until then let all electrical contractors concentrate their efforts on " Radio Week," confining further publicity efforts to the new year when regional broadcasting starts in earnest. Propaganda is very well for the future, but for the moment the best things possible for the industry are—Christmas and Sales.

The Advertising Broadcast.

While we have the greatest admiration for the enterprise of the daily paper which arranged the broadcast of the Carnera-Stribling fight in Paris last Saturday—it provided a service which was much appreciated by English listeners and few people would take exception to the mention of the newspaper's name by the B.B.C., which relayed the programme—we object to it, as we see in such an arrangement the thin end of the advertising wedge, which has detracted so much from the listener's enjoyment of American broadcasting. Any enterprising organisation which goes to the trouble and expense of arranging a special broadcast is entitled to have the fact mentioned. On the other hand, the B.B.C. has ample resources to enable it to make its own arrangements for such broadcasts. There was no advertising in B.B.C. programmes when the service was controlled by the radio manufacturers, and there is still less reason for its inclusion under the present regime.

Electricity and Natives.

There was a touch of unconscious humour in a daily paper's announcement of private members' business in the House of Commons this week, which mentioned that two Labour members would " call attention respectively to the demand for a cheap and abundant supply of electricity, particularly in the rural areas, and the need of protecting the welfare of the native population in the Colonies." This bracketing of widely different problems would be ludicrously funny but for the fact that neither the rural areas nor the natives are likely to benefit much from this attention. Except in the very few districts where rural electrification is being practically attempted, little has been done since the initiation of the experimental rural scheme in Bedfordshire. There must be quite a number of undertakings which have shelved development plans pending announcements of the results of the Bedford experiment. We do not suggest that nothing will be learnt from this effort, but we do feel that sufficient is known of the rural problem to permit immediate electrical development on sound lines.

METER MANUFACTURING PROBLEMS.*

Possible New Methods—Accuracy versus Cheapness—Maximum Demand Measurement—Metering Super-tension Supplies.

By E. W. HILL, M.I.E.E.

IS there something fundamentally wrong with our methods of measuring electrical energy? What do we do now in measuring energy by our meters? Do we not conduct an operation which for indirectness is comparable with the following hypothetical but possible method of measuring a distance? Suppose that, instead of straightforwardly applying a measuring scale to determine the distance between A in London and B in Edinburgh, for example, we traversed the distance in a vehicle, the while making determinations of its velocity as it varied from time to time, and of the duration of the journey; and that we then performed a complicated integration of velocity/time, and in that way ascertained the length of the journey. That would be measuring a scalar quantity, distance, by determining derived quantities—rates of motion—and integrating with respect to time; exactly, in principle, what practically all electricity meters do. Can no way be found of substituting a direct form of attack for this indirect one?

Nearly all the outward manifestations of electronic activity—electrostatic, thermal, chemical, magnetic—have been laid under contribution for effecting electrical measurements. The magnetic manifestation is the one now almost exclusively used for energy measurements. Is it beyond all bounds of possibility to utilise new combinations of these, or even hitherto neglected ones such, for example, as gaseous conduction or radiation phenomena? I must, I fear, leave this in the form of an interrogation. But the posing of the difficulty may perchance stimulate some of the younger generation to apply themselves to seeking a solution, by casting aside all preconceived ideas which have for the last 40 years accumulated round the subject.

Even with our present methods, another way of escape from our accuracy difficulty seems open, or at least not definitely closed. In measuring electrical energy we do not, indeed dare not, allow our instruments to absorb the energy that is measured, in the way that some forms of mechanical absorption dynamometers do. The flying electrons are caught in our instruments, made to give an account of themselves, and then allowed to pass on to their proper business of lighting our lamps or turning our motors, etc.

A Disproportionate Ratio.

Of course, they do not get through that ordeal quite scot-free; they have to do a little work. Not much, it is true—they have to turn a disc against a little magnetic friction, and turn the wheels of a counting train. The actual mechanical work is absurdly small; so is the levy demanded for this purpose from the electron flow—that is, small in comparison with the amount actually measured. But the disproportion between these two small amounts, *i.e.*, between the electrical input to, and the mechanical output from, the meter is simply amazing; it is something of the order of 50 000 to 1. This fact has never ceased to strike me with astonishment.

Why cannot a meter, considered as a motor, converting electrical energy into mechanical energy, be more efficient than that? Of course, it is admittedly a very small motor and, as we know, small motors are in general less efficient than large motors.

Engineering appliances, like motors, transformers, engines, etc., have a limit of size—not well defined, it is true—below which it is hopeless to expect any approach to ideal 100% efficiency. But it is a dismal thought that a meter can never be expected to have, as a motor, a better ratio of input to output than 50 000 to 1. It may be asked, "Why trouble?" Well, presumably a meter having higher mechanical working forces than at present would much better perform its functions as a meter, and our accuracy difficulties would tend to disappear in consequence. A curious consideration, however, emerges here. In presence of the eternal urge towards cheapness, manufacturers dare not make their meters much more efficient, in the sense I have just used the word, for the reason that higher efficiency means higher driving torque for the same watt loss; and higher torque necessitates stronger permanent magnets to damp down the disc movement. So that even a modest four-fold increase of efficiency would involve a positively prohibitive cost for the necessary permanent magnets. This is, indeed, not a fanciful notion. Manufacturers cannot afford to make ordinary meters, at prevailing prices, with torques much higher than they are now. May I suggest this as the reason why meters are not made far more accurately than they actually are.

I conceive the real function of supply meters to be to provide equitable and determinate means, rather than any arbitrary means (leading to approximations only) of fixing the relative amounts of individual consumers' contributions. But it is to be observed that, under the guise of two-part tariffs, arbitrary means are becoming more and more prevalent as part at least of the modern systems of charging.

What Manufacturers Want.

I consider that a broad distinction should be drawn between small meters for which low prices and low losses are admittedly important features, and large meters for which these features sink into relative insignificance. The manufacturer should surely be allowed a little more margin, economic and technical, to enable him to supply a better, more accurate, meter, for really important supplies. Especially important is this consideration when we remember that so many large meters have demand indicator attachments, upon the readings of which the transfer of large amounts of money depends.

The mention of demand indicators leads me to remark how curious it is that the exigencies of the conditions governing electrical generation and supply, combined with the efforts of the tariff builders, have imposed upon engineers the necessity of providing for the automatic measurement of a quantity based upon so artificial a conception as that of average maximum demand. It is a conception which involves a necessity unparalleled in any system of measurement, other than electrical, of which I am aware. It seems to be the exclusive privilege of electrical engineers to have to determine that particular value of unvarying rate of flow of energy, through a meter, which in a given time interval would have produced, had it been flowing, exactly the same number of integrated units as was really produced by the actual experienced load, however fluctuating.

Many problems, mainly of a mechanical nature, have presented themselves for solution in connection with maximum-demand measurement, and most of them are now satisfactorily solved. One problem, however, still remains unsolved, if we are content to allow the exception of thermal types of demand indicator. I refer to the fact that time switches, or equivalent apparatus, pick out successive time intervals for resetting demand-indicator mechanisms at arbitrarily allotted epochs, which may split the peak of the load curve instead of completely straddling it, in which eventuality the ideal maximum load period is not exactly accounted for. We still await a tripping apparatus endowed with prescience, capable of holding its hand as it were, and being ready to start a resetting period just when it can foresee the immediate incidence of a period which is going to embrace the true maximum load.

As though the artificiality of the maximum-demand conception were not enough, we have, superimposed upon it, the even more transcendental idea of kVA, and the problem of its measurement. On this particular subject I desire at the moment to do little more than pay a tribute to the work of those whose labours have crystallised out into some really beautiful examples of inventive skill, designed for kVA measurement. We may, I think, legitimately feel proud of the capacity of meter engineers for tackling and solving any problems, be they never so perplexing, and for exhibiting inventive genius second to none.

[Table.]

Progressive Reduction in Sizes and Weights of Induction Meters.

Digitized by Google

observers might be quite deceptive. On the technical side, development may seem to flow in a very placid stream. Meters are now, it may seem, much as they ever were. Truly, there have apparently been no spectacular or revolutionary advances, as there have been in other branches (e.g. wireless). Yet there has been not only steady and definite progress on the technical side, but enormous expansion in the way of new designs of meters for special purposes. As regards general development, one had only to glance back at the records of some 25 to 30 years to see, from the narrowest point of view, what phenomenal progress has been achieved. So we see the great advances that have been accomplished in economy of material and space (a condensed summary of which is given in the above table, in elegance of construction, and, hidden beneath and underlying all, great progress in subtleties of design. All meter engineers should rejoice that they live in an age when their problems are so much more interesting, even thrilling, than they used to be. Among others, still outstanding, there are the metering of super-tension supplies of 100 000 V and over, avoiding the tremendous difficulties of potential transformers for such voltages; and the impending problem of metering high-tension d.c. supplies.

PROTECTING METALS BY SHERARDISING.

Details of Process for Impregnating Metals with Zinc—Applications and Limitations—Practical and Commercial Considerations.

By A. P. PETRIE.

SHERARDISING, the process of applying zinc to the surface of articles made of iron or steel in order to prevent rust, is named after the discoverer of the process, Mr. Sherard Cowper-Coles. Other names have been given to the process by various firms, but the main principle remains that in every case the work to be treated is heated in zinc dust.

It may be news to many to know that it was discovered about 28 years ago, and that although it has been exploited by various companies who have undertaken the work as a commission trade, and it is also used by many large firms for the treatment of their own productions, Sherardising as such is very little known to the metal using trades.

One reason why the name "Sherardising" is so unfamiliar is that so very few articles which are so treated are advertised and sold as Sherardised. Either they are stated to be "rustless," "rust-proofed," or "treated by a special process to prevent rust," or else the fact is not mentioned at all. The process is quite distinct from most other methods of treating the surface of metal articles with a dissimilar metal in one important detail. This is that the zinc protection formed is an alloy of zinc with the surface of the article being treated.

The other methods, such as hot galvanising, electro-zincing, metal spraying, nickel or chromium plating, etc., of applying metal to the surface, result in coating the article with a skin of zinc, nickel, chromium, etc., as the case may be. This skin may vary in thickness and may be very closely adhering, but it is still a skin or layer of metal on the surface.

When Sherardising is properly carried out, the base metal is impregnated with zinc, which forms with it an alloy of progressive strength. From the deepest point of penetration, the zinc content increases rapidly as we near the surface, until we find, practically at the original surface of the base metal, an alloy consisting of 92% zinc and 8% iron (we exclude non-ferrous bases for the moment). It is upon this alloy that Sherardising almost entirely depends for its efficiency. Beyond this point, there is formed a layer of almost pure zinc approximately 0·0005 in. thick.

Depth of Penetration.

By increasing the time during which the articles being treated remain at the Sherardising temperature in the zinc dust, an increased penetration of zinc over and above the depth of about 0·002 in. usually obtained, takes place, but as a very much greater increase proportionately in the external layer of zinc is unavoidably coupled with this increase of time, it is a disadvantage to attempt it commercially, since the chief claim to commercial use of the process is the small dimensional increase combined with high efficiency as a rust-proofing process. Nevertheless, it is necessary to build up a layer of zinc of at least 0·002 in. external to the base metal surface in all cases where it is specified that the work shall pass the copper sulphate immersion or "Preece" test. It is necessary because in the test bright copper would be deposited, and therefore herald failure, on the stable alloy containing 8% of iron.

There is nothing to be gained, beyond slight extra resistance to mechanical abrasion, and much to be lost, by this increased external coating demanded by those who insist that this test be applied. It often occurs, therefore, that when nuts and bolts are specified to pass this test after Sherardising there is difficulty in replacing the nuts on the bolts, and the Sherardising is blamed. Yet no better protection from corrosion is obtained by the addition of the extra zinc. It is also interesting to note at this point that galvanised bolts are accepted as having passed the test even though there is no zinc at all on the threads, which are obviously never tested. (N.B.—The threads on galvanised bolts are nearly always cut *after* the galvanising process is completed, otherwise the threads would be filled up with spelter, and the nuts would not go on at all.)

Zinc dust, in which the work is heated, has one very peculiar property. This property is its catalytic action on water in splitting it into its two component gases. It is unfortunate that this property seems to remain with the solid zinc deposited by Sherardising, and is generally considered, by those who have studied the point, to be the cause of the failure of Sherardising as a protection when the work is immersed for quite short periods in "still water."

Limitations of the Process.

Some considerable disappointment could have been avoided in the past if users of the process had understood this limitation. Sherardised surfaces which have withstood the corrosive atmospheres of the south Lancashire district for five years, have shown signs of rust when immersed in a bowl of water for about a fortnight.

The theory held by most of those closely connected with the process is that the Sherardised zinc splits the water into hydrogen and oxygen as does zinc dust. The hydrogen bubbles, being light, rise to the surface and burst. The oxygen combines with the zinc to form zinc oxide. The zinc oxide floats away in suspension in the water, and leaves fresh zinc exposed to the same action. Thus the cycle goes on and minute pinholes are formed in the surface, until the base metal is reached at a point where iron oxide begins to form. This theory is supported by the appearance of the surface, which becomes dotted with very minute spots of rust. In running water, this does not happen, nor when exposed to ordinary atmospheric conditions, and it is thought that in such cases any oxygen bubbles which may be formed are immediately washed away before they can have any appreciable action on the zinc.

Whilst considering the limitations of Sherardising it may be interesting to many to know that although Sherardised iron or steel is rapidly freed of its zinc protection when immersed in hydrochloric or sulphuric acids, such is not the case with Sherardised brass. Even a heavy coating of zinc on the surface of Sherardised brass is not affected appreciably by such acids.

Copper alloys required to resist acid solutions are composed of copper and tin, and zinc is rigidly excluded. In a zinc-copper alloy it is the zinc which is primarily attacked by the acid, leaving the metal spongy. It would, therefore, seem natural to assume that the greater the proportion of zinc in such an alloy, the more rapidly destructive would be the attack of the acid. Yet, as proved by a long and thorough series of tests carried out some two years ago, the loss of weight in Sherardised brass lying in an acid bath is slightly less than the loss of weight in the same brass unsherardised in a bath of equal strength and at the same temperature.

For the purpose of the test and prior to it, the Sherardised test pieces were immersed for a period of two minutes in strong hydrochloric acid in order completely to remove the

Digitized by Google

external zinc which was not alloyed with the brass. This first bath caused furious effervescence for a short period, after which no action remained visible, showing that no free zinc remained upon the zinc brass alloy. The difference in the losses of Sherardised and unsherardised brass is so slight as to be of no practical importance, and one does not recommend the Sherardised brass as a resistant to be used in continual contact with acid, but where brass is exposed to an occasional contact with acid or acid fumes, Sherardising offers very distinct advantages. Unprotected brass under such conditions rapidly becomes coated with verdigris, which seems to act both as a conductor and a retainer of acid, hastening the decomposition of the brass. On Sherardised brass verdigris is unknown. There is no means by which the acid may be retained indefinitely in contact with the metal, which is thus preserved, besides retaining a clean appearance.

We now come to the practical and commercial considerations. Just as with other processes, so with Sherardising, it is necessary to prepare the work by thorough cleaning, although, unlike electrolytic processes, Sherardising is not detrimentally affected by the presence of a little grease or oil of most types, provided that the metal surface is free from rust and scale. The work is packed in containers with the zinc dust and heated in electric furnaces, and the temperature, which does not exceed 750 deg. F., is measured by pyrometers whose stems project into the centres of the containers. Although in theory there is no limit to the size of these containers, practically, it is not found to be advisable to exceed 24 in. diametrically, chiefly owing to the low heat conductivity of zinc dust and the consequent excessive heat liable to be generated at the periphery of the containers before the required temperature is reached at the centre. The limit of size longitudinally is only governed by purely mechanical considerations, and present day demands have resulted in the construction of containers 15 ft. 6 in. long for the treatment of tubes for the electrical and other trades.

The porosity of the metal has no relation to the degree of penetration, and better Sherardising is in fact obtained on a high-grade carbon steel than on a low-grade cast iron, simply because there is less impurity present. The greatest enemy of the Sherardiser is inrolled scale, Sherardising will not bridge impurities, as will galvanising, and it is essential in all cases that the surface presented to the zinc dust shall be only of metal. Remembering also that Sherardising is an alloy depending for its success upon both the constituents of that alloy, it becomes obvious that the better the metal of the article treated, the higher resistance will Sherardising offer to corrosion, and the better will be the appearance of the Sherardised surface.

The cost of Sherardising is really a cost per cubic foot of space available in the containers, and if a container of, say, 5 cu. ft. is filled with 5 cwt. of screws it will cost practically the same as if filled with, say, 1 cwt. of light gauge stampings. Therefore the price "per cwt" will be five times as much for the stampings as for the screws. In actual practice, however, it is often possible to fill up the space between the stampings with a few screws and so reduce all round costs, although this advantage is often nullified by the extra labour involved in sorting afterwards. Another point about the charges made for Sherardising is that as far as prices per cwt. go, they are nearly always in inverse proportion to hot galvanisers' charges. Small screws, nuts, washers, etc., and small tubes can be Sherardised at prices well below those charged for hot galvanising, but for large articles, particularly those made of sheet metal, the Sherardising cost is too great to be a commercial consideration.

Some Attractive Finishes.

The natural Sherardised surface is a matt grey, but one or two methods of improving the appearance are available. A finish very suitable for small tools or for antique iron work, is obtained by scratch brushing after Sherardising. A circular brush on a slow-speed polishing spindle is used, the bristles of the brush being either steel or brass wire. The brass wire bristles give a pleasing brassy tint to the work. This process, by giving a semi-polish to the otherwise matt surface renders the work less liable to accumulate dirty finger-marks or stains. The most attractive finish of all is generally considered to be the highly polished one obtained by polishing the work well before Sherardising and then mopping it again after Sherardising.

Although the dull finish is an objection very frequently raised against Sherardising, polishing is not to be recommended. The reason is that on a polishing mop revolving at about 2 500 r.p.m., it is very easy to wear away the whole of the protective surface, particularly on the corners, edges, or raised portions of an article. If the surface is actually polished away on these parts it does not become evident until rusting occurs, since polished steel is almost identical in appearance with polished zinc. In this connection many people may have noticed that nickel-plated steel articles generally begin to rust in the first instance on the corners or edges.

Brass articles, however, can be safely polished after being Sherardised. They cannot naturally rust if over polished, but apart from that the zinc amalgamation with the brass extends to a much greater depth into the softer metal. The finish obtained on brass is difficult to distinguish from chromium plate.

BOOK REVIEW.

Das Rechnen mit Symmetrischen Komponenten.

By Von Ing. Dr. Techn. Gunther Oberdorfer. (Leipzig: B. G. Teubner.) Pp. 74. 5 marks.

This is another German monograph on Fortescue's theory of unbalanced three-phase systems. It is based on the possibility of analysing such a system into three components —forward and reverse three-phase systems and a single-phase system. This was published first in America in 1918, and has since attracted a good deal of notice. It appears to be almost the standard method of short circuit calculation in recent American text-books and has received attention in France, Germany and Sweden, but not in this country, the only reference the writer can remember being a short article by Mr. Stubbings in "World Power."

The method is certainly very neat though rather artificial. The main thing is—does it justify inclusion in an average electrical engineer's technical equipment? The case against it is that unbalanced loading is usually very unstable and varies from moment to moment, and it is not often that conditions can be determined with sufficient accuracy for the calculation to be worth while. Short circuit problems are still very nebulous, and the rupturing capacity of a breaker is more often a figure in a manufacturer's list than a scientific fact. Indeed, it is a figure that is in general incapable either of proof or disproof.

To turn to this particular publication. It is in German, which is unfortunate, but the treatment is straightforward and the notation is simple and in line with ordinary standards, which is more than can be said of other work in this direction. The diagrams are clear and the printing good. The author discusses in considerable detail the application of the method to the various problems of three-phase networks such as may result from unbalanced loads and faults, and the student should find the description quite sufficient.

As to the degree of utility of the system, the reviewer prefers for the moment to keep an open mind. It is neat and mathematically attractive, but the student has so much to learn to-day that unnecessary mental luggage must be rigorously avoided. W. F. C.

THE ANALYSIS AND MEASUREMENT OF THE NOISE EMITTED BY MACHINERY.*

Electrical Methods Preferred—The Apparatus Used—Test Conditions—Dealing with Extraneous Noises—A Tentative Loudness Scale.

By B. A. G. CHURCHER, M.I.E.E., and A. J. KING, A.M.I.E.E.

THIS research was originally concerned primarily with noise emitted by motors, but the methods of inquiry are applicable to many other forms of engineering apparatus, e.g., transformers, integrating meters, large generators and converting plant, gear, etc.

It is necessary to be able to assess the noise emitted by a machine for two main purposes, (*a*) to ascertain whether the noise is in excess of a desirable or permissible standard, and (*b*) to determine the cause of the noise with a view to modifying or reducing it. It has been suggested that the ear is the ultimate judge; but the ear, whilst a very sensitive and discriminating detector of sounds, cannot furnish quantitative data, and further it can only record a personal impression. Precise measurements should be based on a definite standard rather than on opinions of individuals. Yet due regard must be paid to the susceptibility of the average ear to sounds of different kinds.

Action of Three Elements.

The occurrence of sound involves the action of three elements, the sound generator, which is essentially a vibrating body, the transmitting medium and the sound detector. In the original paper the authors discuss the problem mathematically and derive an equation for the rate at which energy flows outwards through unit cross section at a given distance from the centre of the source. A pressure of 1 dyne per cm^2 corresponds to a fairly loud sound, and a very sensitive apparatus is needed to detect sounds of low intensity. The power varies as the square of the pressure. In practice, moreover, we have to deal with highly complex sound waves.

In analysing sound for engineering purposes we require an apparatus that will measure sound pressure in absolute units over a range of at least 100 to 2 000 cycles per sec. and will deal with intensities varying from very feeble to very loud sounds. It is desirable to be able to measure transient sounds, and some form of graphical record is thus desirable. For steady sounds, however, oscillograms should be avoided owing to the complexity of sound waves yielded by most machinery. In the original paper methods of sound-measurement adopted in the past are briefly discussed. Telephone receivers have been applied to rough measurements, the reference point being usually the threshold intensity of the observer's ear. Examples of absolute methods are the Rayleigh disc and the radiation pressure method. Whilst these methods are not directly applicable to measurements on engineering apparatus they are of great value in the laboratory.

Electrical methods have much greater possibilities than purely mechanical ones, owing to the greater precision and completeness of results and the large range of intensity and frequency that can be covered. The authors therefore concentrated on apparatus of this type.

The apparatus consists essentially of a microphone which generates an e.m.f. having a known relation to the incident sound pressure, an amplifier of known characteristics, which amplifies the microphone e.m.f., and some means of measuring the complex electrical wave-form of the amplifier output. An oscillogram of the amplified voltage from the microphone may be taken, and may be analysed. Alternatively one may measure the frequency and amplitude of each of the components in turn by means of an electrical frequency tester.

In the original paper the authors describe in turn the various forms of apparatus designed on these lines, and explain in some detail the method of calibration of the microphone, a typical calibration curve of which is presented.

In the next section of the paper test-conditions for general sound measurements are discussed. The sound intensity as measured near any source is dependent on the presence of other bodies in the sound field which give rise to general reflection or absorption. In practice two cases arise, i.e., when the test-conditions are under control, and when they are not. The nearest approximation to the ideal condition of infinite space is a large open area free from buildings, measurements being made at sufficient height above the ground to obviate appreciable reflection therefrom. In the early stage of this work the flat roof of a laboratory was used. Fairly satisfactory freedom from reflection was obtained, but the effect of wind, rain and extraneous noises proved prohibitive. It was therefore decided to construct a special building for acoustical work.

In designing this building consideration was paid to three main requirements, *i.e.*, the reduction of extraneous noise to a tolerable value, (2) the provision of a testing space reasonably free from reflection, and (3) the provision of accommodation for the fundamental standards of sound measurement. The detector element is placed in a sound-proof room, all other apparatus being excluded. The measuring and auxiliary apparatus, together with the observer, are located in adjacent rooms. In the original paper sketches showing the nature of the building are included.

Where, as in the case of large machines, records have to be obtained in a factory building, power station, sub-station, etc., the difficulties are considerable. Although the walls of such buildings are highly reflecting, the interference trouble may not be prohibitive if the building is large and the machine is not too near the wall, or a switchboard or another large machine. Where reflection is suspected a pressure/distance curve should be taken.

Extraneous noises, sometimes loud and confused, constitute a great difficulty. Fortunately large machines usually make a large noise as compared with small ones, so that the notes under observation stand out clearly against the general background of noise. If the machine under test can be shut down for a short time and the extraneous noise remains reasonably constant, the supposed irrelevance of certain notes can be checked. Attempts to make sound measurements on, say, a normal 10 H.P. motor on a factory test-bed, where several other machines are running and where the background of noise is large, are quite futile. It is not that the results may be inaccurate; they will probably be unintelligible.

Other factors of importance are the influence of temporary test foundations on the magnitude and distribution of sound, the contribution to the aggregate sound of auxiliary apparatus such as driving motors or loading brakes, and the influence of want of dynamic balance or alignment in a temporary set-up.

Actual Test Results.

In the final section of the paper examples of actual test results are presented. Thus, in the case of a small motor the frequencies of the chief notes in the total noise are identified; the amplitude of these vibrations determined, and the source of the various component sounds inferred. Similar data are given for a 1 000 kW geared turbo-generator set and for a commercial horn-type loud speaker. In assessing the intensity of noise of a given frequency the difference in the logarithms of the intensities of two notes of similar frequency furnish a scale indicating difference in loudness of these two notes. In choosing suitable units for this new scale, telephone engineers have been guided by their previous standard, the "800-cycle standard mile." Instead, therefore, of taking just the logarithm to the base 10 of the sound energy, a unit 1/10th as large has been adopted, and this corresponds roughly to the old standard.

Experience in testing a large number of machines of all sizes and types has given some confidence in this tentative loudness scale. A preliminary aural estimate of the most offending component of a noise is always confirmed by a high loudness figure where the results of an analysis are available. But even if this loudness scale is accepted for the moment, the problem of assessing the total loudness of a number of components of different frequencies still remains. A solution of this problem has been proposed by J. C. Steinberg, but the authors have not yet had an opportunity of judging how far his methods can be applied.

In conclusion it is suggested that the methods described in this paper may prove applicable to numerous other problems. A new apparatus of a more portable and self-contained nature is being designed which may prove of service in analysing street noises.

TERMINAL APPARATUS FOR TRANSOCEANIC SUBMARINE CABLE TELEPHONY.*

Technical Details of Transmitting and Receiving Amplifiers Devised to Compensate for Attenuation of Long Submarine Telephone Cables.

By N. W. McLACHLAN, D.Sc., M.I.E.E., F.Inst.P.

(*Concluded from page* 705.)

THE amplifier can be tested for the generation of harmonics in three ways: (1) Applying a sine wave to the input and taking an oscillograph record of the output. The input can be increased to a value where the output departs from a sine wave. This gives the input limit. (2) Passing the output to a frequency bridge and comparing it with the effect of the input so far as out-of-balance harmonics are concerned. (3) Observing the variation in anode feed current to each valve when the signal is applied to the input. For quantitative work a harmonic analyser can be used.

The theory of the screened grid valve and audio-frequency resonant transformer is substantially similar to that given by the author for radio-frequency transformers.† It was shown that the maximum amplification obtainable is $\frac{m}{2}\left(\frac{R}{\rho}\right)^{\frac{1}{2}}$, where m = voltage magnification factor of valve, ρ = internal a.c. resistance of valve, and R = effective dynamic resistance of the secondary winding of the transformer (including loss in leads, subsequent valve holder, etc.). By suitable design it is possible to obtain an audio frequency amplification per stage exceeding 1 000. The conditions for maximum amplification, however, are not always compatible with the requisite correction curve, and, as stated previously, this degree of amplification would overload one or more of the valves.

A resistance-capacity stage follows the correction units, so that the intensity of the output can be controlled. The power valve comes afterwards, and it is coupled to the outgoing line by a suitable step-down transformer whose characteristic is shown in Fig. 9.

It is desirable to supply the amplifier from a common battery system, and this is accomplished by connecting separate battery filters (chokes and condensers) in all the screened grid and anode circuits. To secure the proper working voltage on the screening grids, a potential divider system is employed.

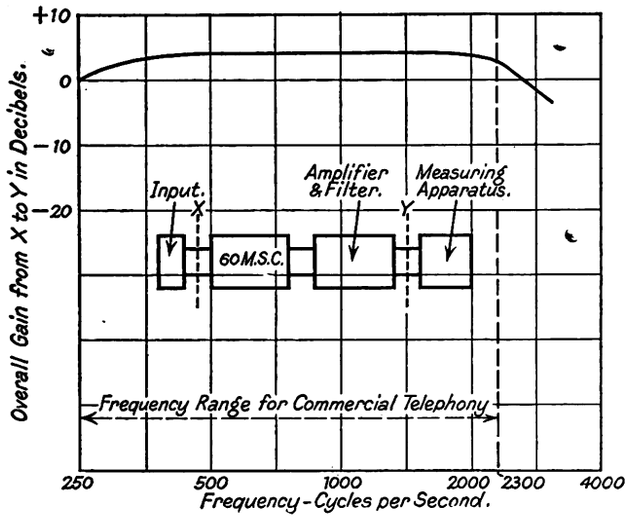

Fig. 11. Calibration curve of amplifier set to gain 60 M.S.C.

By aid of the amplifier of Fig. 6 it is easy to speak over a total of 90 m.s.c. (see Fig. 10). The additional 20 miles following the amplifier is to render the condition identical with that of a distant subscriber. The intensity is controlled by the potentiometer P, and the reserve amplification is adequate—apart from the additional correction necessary—to conduct satisfactory speech over distances of 110 m.s.c., i.e., 80 m.s.c. before the amplifier and 30 m.s.c. after it.

In listening direct to the amplifier‡ set to gain more than 70 m.s.c., it is usual to insert a cut-off filter to reduce the noise level due to extraneous interference, valve hiss, etc. A performance curve of the amplifier associated with a 2 700 ~ cut-off filter is shown in Fig. 11. For a gain of x miles the total talking distance is $x + 20$, since it is assumed that the level falls to — 20 m.s.c. at the subscriber. It will be seen from Fig. 11 that the curve is substantially flat over the commercial speech range, viz., 250 ~ to 2 300 ~.

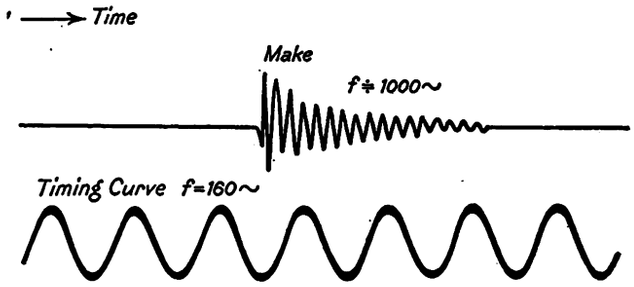

Fig. 12.

Although a gain of 90 m.s.c. has been obtained with a six stage amplifier there was a certain amount of noise caused by irregular electron emission from the valve filaments. The measured voltage amplification at 2 200 ~ was of the order of four million.

The various correction units and the battery filter circuits are housed in screening boxes of magnetic material. By means of a plug and jack system, any number of correction units, from one upwards, can be used, i.e., the amplifier can be adapted to suit any length of cable.

The degree of correction can be varied in the following ways:—(1) Altering the number of primary or secondary turns; (2) altering the capacity across the secondary winding; (3) putting a resistance or other suitable impedance across the primary, the secondary or across a tertiary winding; (4) altering the thickness of the core stampings; (5) altering the material of the core.

To eliminate the influence of the input impedance of the triode V_4 of Fig. 6 on the preceding transformer, the latter has a tertiary winding T across which a suitable condenser is connected. Both primary and secondary windings have supersonic resonance frequencies. If a standard resonant transformer [f = 4 000 ~] were used, the effect of the triode would be to lower the frequency to, say, 2 000 ~ thereby altering the correction.

The Transmitting Amplifier.

The transmitting amplifier is constructed on similar lines to the above. After the desired degree of accentuation of the upper frequencies, the voltage is fed to a pair of transmitting triodes arranged back to back. Thence the output is passed via a step-down transformer to the telephone cable. The power triodes are worked at any suitable voltage, e.g., 5 000, and the average *input* to the cable is of the order of 8 watts ($0{\cdot}2^2 \times 200$).

On economical grounds it is evident that the same cable must be used for the go and return conversations. Conditions are such that it is essential to incorporate a relay which operates when the speaker's voice is raised above a certain level, e.g., it must not be actuated by the action of breathing. One function of the voice relay is to disconnect subscriber A's transmitter, at the same time connecting his receiver to the cable when subscriber B is talking. The second function of the relay is to disconnect the cable from A's receiver and connect it to his power transmitter when he talks to B. By aid of a retardation device, the cable is connected to the transmitter before the voice current can pass thereto.

If a cable transmits frequencies of 2 300 ~ satisfactorily, it will transmit frequencies of 150 ~ with consummate ease. Thus, it can be regarded as a super-telegraph cable upon which

speeds of 500 words per min. or more are possible without serious distortion. At this speed a seven-channel scheme, with each channel running at 70 words per min., will enable direct printing to be conducted. It must be remembered, of course, that although the speed of any one channel is low, the distributor at each end of the cable must work at the combined speed of all the channels.

Apart from the line or cable, speech is subject to considerable distortion, due to the superposition of the natural oscillations of the microphone and the telephone receiver. The latter consists mainly of transients, some of which are really severe, as when saying the letter "p." In this case the air pressure rises precipitately as in an explosion. The corresponding effect upon the acoustic output from a telephone ear-piece is illustrated in Fig. 12. Owing to lack of damping (the ear-piece was not held to the ear) the oscillation of the telephone diaphragm is more prolonged than would be the case in practice. Nevertheless it is clear that on those portions of speech embodying severe transients, an oscillation of about 1 000 ~ is superposed which causes marked distortion and aural discomfort. The same effect—often more pronounced—is found at the microphone, and in practice the listener has the disadvantage of the two.

It is possible to lay bare the defects of the ordinary microphone and receiver by comparing the results with those from a Reisz microphone (which has no appreciable resonances) and a telephone receiver of the moving coil variety. The comparison is just as striking as that between the broadcast reproduction of 1922 and 1929. When these superior instruments are used in conjunction with the amplifiers described herein, the same striking effect is evinced, which proves that the system is capable of producing high quality commercial speech.

I wish to acknowledge my indebtedness to Mr. Willoughby S. Smith, managing director of the Telegraph Construction and Maintenance Co, for permission to publish the matter contained herein; also to Mr. G. A. V. Sowter, B.Sc., for his co-operation and valuable assistance in the design and testing of the apparatus.

BUDGETARY CONTROL AND SALES ANALYSIS.

A Recognised Method of Controlling and Developing Business.

ADDRESSING the members of the Business Research and Management Association, Mr. A. G. H. Dent stated that budgetary control had developed from scientific management, and was a recognised method of controlling and developing business efficiently by forecasting and deduction from all available facts and probable tendencies.

Forming part of the master budget, the sales budget should be made out by combining analysis of past results, analysis of prospects in all markets, study of orders on hand and carry over position, study of general business factors, which were closely related to business volume, analysis of current economic and industrial conditions, and study of salesmen's reports, and conforming to policies to be carried out. When these various factors had been studied and sales estimates produced and split up by territories and lines of merchandise, the estimates had to be scrutinised and adjusted from the viewpoint of production capacity, the company's finances, existing inventory, desired closing inventory, conditions in the labour market, and the raw material market situation.

It was necessary to steer between the two danger positions of excess production, causing loss through large amounts of capital being tied up, and insufficient production, which meant losses through inability to meet customers' demands.

Eliminating Seasonal Variations.

The technique of methods of analysis in analysing past results and in forecasting sales had grown during the last few years. It was possible to eliminate from business data of several years the seasonal variations, and the trend line of growth, leaving the cyclic movements which were related to the movements of the general business cycle. Some businesses had been successful in relating home trade volume of sales to a general economic conditions curve by forecasting processes while other producers manufacturing goods had constructed index curves and "barometers" for the industries which consumed their goods, and estimated future demand in this manner.

When the sales budget had been fixed the production plan was based upon these sales figures, and the physical volume of output, the programme of purchases of raw materials and supplies, the man-hours worked in the shops, the machines to be used, shipments, billings, expenses and receipts were all deduced from the sales figures. These estimates were the framework of the business year, and while subject to changes, provided a definite scheme of working.

The Thomas A. Edison Co., the Crabtree Co. of Walsall, the Walworth Manufacturing Co., Hans Renolds of Birmingham, the Graybar Electric Co., and Rowntrees of York were typical examples of British and American companies with budgetary control systems.

In the U.S.A., the Graybar Electric Co. merchandising some 60 000 different electrical products, regularly estimated demand and growth of its many lines analysing important internal and external factors and operating data. This company used the general business conditions curve prepared by the American Telephone and Telegraph Co. as an index of national prosperity. In Great Britain the Crabtree Co. had been very successful in forecasting future business movements from a trend line of growth, using the areas above and below this line as a basis of forecasting. This company now averaged out below 1% error on its budgetary estimates.

A Five-year Budget.

Budgetary plans were sometimes made out for a period of three or five years, the first year being detailed, and the others general in character. The American Telephone and Telegraph Co. operated a five year budget plan in this manner.

The budget period could be adjusted to the type of business, three-monthly, half-yearly or yearly. Retail houses having two marked seasons would use a six months' budget.

Economical manufacturing in advance during slack periods was possible when occasional analysis showed regular peak and trough periods of business. This made feasible steady employment and continuous machine operations.

When production for definite periods was deduced from sales estimates, it was necessary to add a percentage to cover possible heavy demands. This was a factor of safety determined by experience.

Commitments based on manufacturing schedules were generally made for shorter periods than the actual budget period. For instance, the Edison industries in the U.S.A. operated a 12 months' manufacturing budget, but orders for materials were carried out on a three months' or smaller period basis. This company not only derived purchases and stocks from original budget estimates, but also forecasted cash receipts in advance for monthly, 60 day and 90 day periods with reasonable accuracy.

Forecasting sales and associated figures was admittedly a difficult task, but it became a more accurate job when statistical study of important figures, such as production, shipments, stocks, orders, sales billings, gross profits, receipts, expenses, and receivables were consistently made, and the relationships between these figures ascertained and understood. Results actually obtained in some engineering firms were surprisingly accurate, and meant steady business, and economies which were immense compared with the cost of carrying out the work.

In keeping stock of sales and orders, it was necessary to analyse results against budget quotas by units, such as lines of merchandise, territories, agents, and salesmen. Overall figures hid important tendencies. In most instances monthly realisations were desirable, coupled with some index as to the general seasonal fluctuations of business. Forecasting future billings and receipts depended upon accurate detailed analysis. A very useful chart for this purpose was the Z chart, which showed a valuable figure, the moving total of sales or receipts, etc., at the end of each month. Other data on the chart were monthly and cumulative figures compared with budget estimates.

Detailed analysis showed which classes of goods were making a profit, and where. Unprofitable lines could be located and investigations made on eliminating them. New lines of opposite seasonal selling characteristics to those marketed could be introduced to balance up a very seasonal business. Rapidly increasing demand could be watched and stock position on a particular line maintained to keep pace with unusual growth. A variety of similar types could be studied with a view to standardisation, analysing the consumption by line and by class of customer, the profit per unit, and growth of sale. Results showing superfluous types led to consultation with customers with a view to acceptance of substitutes.

DEVELOPING THE ELECTRICITY SUPPLY INDUSTRY.*

Some Suggestions from the Contractors' Point of View—Abolish Meter Rents—Irritating Restriction ons Use of Motors—Building up the Domestic Load.

By HARRY MOSS, A.M.I.E.E.

A PROBLEM which will have to be given serious consideration shortly, is that of service charges. Personally, I think these are wrong, especially in the case of properties alongside distributors. When houses, shops, etc., are built right up to the pavement edge within 2 or 3 ft. of supply cables, or even stand back a yard or two from the pavement, a supply should be laid in free and willingly, but in the case of private properties some distance from the mains, 40, 50 or 100 yd., a different problem presents itself, and it would be only reasonable to expect the consumer to pay a proportion for crossing a lot of private land to give him a supply, unless a certain guaranteed sum per annum for a period of years was mutually arranged between the two parties.

We must bear in mind that, at the present day, the better class property, householder or shopkeeper on the route of supply is already taking a supply, and therefore what remains is a class that requires inducement, and who have not got pounds to put down for the privilege of a public service which ought to be theirs for the asking. There are miles of distributing mains laid that might bring in a much larger revenue by reaching a higher saturation point with new consumers who might be induced to come on to the supply if service charges were abolished.

Another thorn in the consumer's side is the question of meter rents. A charge for the rent of a meter of say, 5s. to measure 50s. worth of current per half year, and in some cases only 20s. worth, is as absurd as a coal hawker charging 5s. for the use of his weighing machine or scales when he sells you a ton of coal, or a butcher charging you 1d. per pound for use of his scales to weigh your meat; and both these tradesmen are compelled by law to keep their scales or measuring instruments in accurate working order. Moreover, the coal hawker and butcher will provide the means of transport for delivering their goods to you, without any charge.

Apart from tariffs there is another aspect of very great importance to the user, and that is the restrictions and regulations governing his motor equipment. The enforcement by some authorities of the use of the slip ring motor except in very small sizes, where squirrel-cage is allowed, is detrimental to electrification in some works, whilst the rules and regulations which make starting gear almost as expensive as the motor itself are a very definite brake on progress.

The large power stations now in use are a vastly different proposition from the small ones of a few years ago, and irksome restrictions regarding starting current of motors, the present limitations of squirrel-cage machines, and the elaborate requirements in connection with the starting gear, are things that ought to be swept away to-day.

Objections to Standing Charges.

There must be hundreds, if not thousands, of small power consumers or would-be consumers who object to a standing charge of so much per kVA connected, and I feel that all these standing charges should be swept aside, and replaced by a charge for current used, and current only.

It is very evident that if the day load for power is going to be increased to improve the load factor, the lowest flat rates for power, irrespective of maximum demand, must be given to the power consumer.

During the past few years there appears to have been a growing tendency among certain supply engineers to expend much time and effort on the sale of such small current consuming devices as vacuum cleaners and washers.

Is this done simply for the picturesque effect, because as current users they don't make any appreciable difference to the units sold? I often think, from the central station point of view, their efforts in this connection are wasted, and it can only be because they want to boost their sales departments that so much attention has been paid to the above apparatus, which to my way of thinking, ought to pass through the hands of the retailers to the users.

Have supply engineers thought that they will sell far more current by getting consumers to replace a 60 W lamp by a 100 W in a living room or kitchen, than by any cleaner or washer they may sell? The domestic iron is worth far more to the supply engineer as a current consumer than is a vacuum cleaner or washer.

An intensive effort among all present consumers and the maximum support to the E.D.A. Outlets Campaign, to instal more plug points, and especially heating plugs, is likely to have far greater results in units sold at the year end than all the cleaners and washers can possibly have.

A vacuum cleaner, in many houses, will only be used approximately ten minutes per day, or, say, one hour per week, and will make a demand on the central station for about one-sixth or one-fifth of a unit per week. A washer, working two hours per week, will consume approximately two-fifths or ½ unit per week. Now, whilst these two articles are very excellent pieces of electrical apparatus in the home, they are, as current consumers, practically worthless to the supply authority, and not worth a moment's consideration.

Increasing Sales of Energy.

Less effort spent on the foregoing, and more effort on the question of water heaters, long-hour current-consuming devices, and educating their customers to improve their existing lighting, especially in those rooms where lights are burning the longest, and also a concentrated campaign among their consumers to instal and use electric radiators, which will use more current in a day than a vacuum cleaner will in months, will pay them better than anything else in the domestic line.

If you take a town with say, 3 000 consumers, and can persuade each of these to replace two 60 W lamps with two 100 W, these burning, say, 1 000 hours per annum, your sales will immediately go up by ¼ million units.

Further, if you can get 3 000 consumers to use radiators, using only two units per day more than they are doing, you immediately increase your sales by over two million units.

Some years ago I urged, at a meeting of the I.E.E., the necessity of easily replaceable elements in heating apparatus, and it is pleasing to note that at the present time some manufacturers are embodying the idea in their designs. It is an absurd thing for a customer to have to have an electrician sent miles across town, spending valuable time and also travelling expenses, simply to slip a new bar into a radiator. Elements must be designed and made so that they may be as easily replaced as a lamp, and by this means the cost of maintenance of electrical installations, which means so much to a consumer, can be kept within reasonable bounds.

Whilst B.E.S.A. standards in connection with plugs, etc., are now common with our manufacturers, we are still floundering about with scores of different sizes of pins, plugs and sockets on heating apparatus, which is all wrong and a hindrance to development.

Whilst one manufacturer has only his own size of plugs to consider, the contractor or retailer has those of every make, and delay in carrying out repairs is frequent, owing to the impossibility of stocking every known make of spare part.

If we can get standardisation among our own manufacturers we can afford then to leave the foreigner with his own patterns in the background.

Whilst on this question of standardisation let me put in a very urgent plea for universal 3-pin earthing arrangements. If apparatus is thus fitted it does not matter whether the earthed pin is used or not in insulated situations, but it would be there if required.

A further point is service to the public, and I think I can rightly say that the organised contractors such as E.C.A. members and members of the National Register, can do, and will give greater and more efficient public service than the hundred-and-one so-called electrical engineers and contractors to be found in the back streets and yards of our towns to-day. Closer co-operation between the recognised and acknowledged contractors, supply authorities and manufacturers will lead to the exclusion of the jerry man and kerbstoner.

SHOWROOM ORGANISATION.*

Its Importance in Developing Uses of Electricity.

By A. C. BOSTEL, A.M.I.E.E.

A PROPERLY equipped electrical showroom plays such an important part in the development of the uses of electricity in the home, the shop and the factory, that I offer no apology in asking you to review with me its organisation, equipment and management.

It must be admitted that a large number of electrical showrooms are poorly equipped, and it is surprising to find in many showrooms a large amount of shoddy apparatus offered for sale, and the assistants who are supposed to sell these goods quite at a loss to give definite information of the cost of running them.

Let us consider the general position and lay-out of our showroom. The site should be carefully chosen, and preferably in the main thoroughfare. The window space should not be large, and about 100 sq. ft. per window gives plenty of room for attracting attention, and it is important not to crowd this window space with a large variety of subjects—the fewer the better. The overcrowding of window space with such things as distribution boards, switches, ceiling roses and other paraphernalia of the wiremen's art cannot stimulate interest in electrical appliances, nor create any attraction; but place a washing machine in the window with a girl working it, or an electric cooker with a joint in the oven, or even a kettle boiling on the hotplate, and watch the number of people who will be attracted.

The inside lighting of the window space should be arranged so that different colour schemes can be given to the display, and if a small revolving switch can switch on at intervals a series of three colours, the effect is surprising.

Too much thought cannot be given to the window display, and a study of the general lay-out of many of the retail shops in London will give many valuable hints, as some of the displays are works of art in presentation to the public of goods in beautiful surroundings.

Consumers should be encouraged to pay all accounts at the showrooms, and the pay counter should be so arranged that the consumer must pass the main display, or at a glance be impressed by the surroundings. In the event of the customer having to wait, encouragement must be given to examine the surrounding apparatus, and for this purpose the interior should be divided into sections as far as possible, each section devoted to a particular subject. For example, one section to table cookery, another to electric ironing, others to vacuum cleaners, coffee percolators, industrial apparatus, cooking stoves, water heaters, washing machines, etc.

Encouraging Inquiries.

Each section should be neatly set out with a short description of each piece of apparatus, with its price and running cost. Some people are shy to ask questions, and if they are able to gain some knowledge of the goods without the assistance of the salesman they are much more encouraged to make inquiries. I am very much against a too zealous salesman who pushes in front of every possible visitor and asks questions. The visitor should do that. This principle is recognised in most of our large stores; the public feel that they can comfortably examine the display without the annoyance of the importunate salesman.

By all means have your salesman handy, and he should be the judge, if he knows his job, of the moment when the visitor requires information.

The apparatus should be so displayed as to be easily handled; wired tables in the centre of the showroom and neat benches placed against the walls are admirable.

It is a mistake to place the goods, except lighting fittings, above the average eye level. Suitable tables and benches placed about the showroom at a height of about 3 ft. from the floor level would be quite high enough.

It should be remembered that in showroom display lay-outs, the accepted idea is to produce an environment which is subjugated to the apparatus or goods which are offered for sale, and in this respect an electric fire is shown to greater advantage if it is placed in a dummy fireplace with a mantelshelf than if it stood up against the wall or middle of the room with no appealing background. The same remarks apply to the display of a vacuum cleaner; place it on the floor or against the table and few people will notice it, but, on the other hand, place the cleaner on a carpet which has been covered with a white powder over which the cleaner has been drawn leaving that part of the carpet clean, and attention is given at once, and conveys to the customer the story surrounding the use of the cleaner. Such illustrations can be multiplied by the number of appliances, and they certainly catch the imagination, which is an inducement towards the inclination to buy. These settings do not want to be spectacular, just simple appealing frameworks to the picture of the display.

Do not show a large number of different makes of any piece of apparatus, for it confuses both the buyers' and sellers' minds as to what to buy or recommend; different makes take up time. Carefully investigate the various makers' goods and prices, decide which you consider the best, and sell the best of two or three different makes. By this means very little obsolescent stock will be left behind.

Group Displays Attract.

Group displays attract much more attention than the display of one article. If an electric iron is placed on a table or bench by itself it is rarely seen, but place a dozen or so in symmetrical form on the bench, and the eye is at once caught. The same remarks apply to fires or any piece of apparatus. Hence the necessity of arranging the whole showroom display in sections.

Lighting fittings should also be set out in groups; dining room fittings together, bedroom fittings together, and so on. Not only does the display look more attractive, but it also saves a considerable amount of the consumers' and salesmen's time. Fashions rapidly change in lighting fittings, so do not keep fittings that are out of date. It is far better to sell them off cheaply than to hang on to them; at the same time I do not encourage the display of fittings which are ahead of the times unless the showroom is in an appropriate neighbourhood.

* From a paper read at the November Sales Conference of the E.D.A. (South Wales and Monmouthshire Area).

THE BATTI-WALLAHS.

Mr. Watlington Explains how Electrification will Relieve Unemployment.

ABOUT 150 members of the Batti-Wallahs' Society and their friends were present at the Society's luncheon at the Hotel Cecil, London, on December 5th. Mr. H. L. Howard (the President) was in the chair, and the principal guest was Mr. Victor Watlington, managing director of the English Electric Co.

Mr. Watlington, in an address following the luncheon, pointed out how profoundly our position as an exporting nation had been influenced by the fact that we lived on an island in which no producer of goods was more than 100 miles from the seaboard. In some countries distances of 2 000 miles and over had to be traversed by goods destined for export. The enormous advantage which this facility bestowed upon us materially aided the development of a world-wide export business. It was not always realised that we had made our way by exporting what the overseas customers wanted. In recent times the United States and some other nations seemed to have specialised in selling the customer what the seller wanted him to have. Perhaps that feature accounted in some degree for the recent development of American export trade.

Whether or not we subscribed to Free Trade principles we could not get away from the fact that unless we imported something from a man, we could not sell him something in return. The real issue was that goods must be paid for by goods, and so we must have a big export trade.

In the early years of our industrial activity we had deliberately destroyed the agricultural industries for the benefit of manufacturers, and decided to buy our food on the score that this was cheaper than producing it. The result of this was that about 80% of our population lived in the towns and barely 20% in the country; and not all of these were engaged in agriculture. In the past we had always been able to find some place where the people were prepared to produce food for us and accept in return our coal, iron, cotton goods, etc; to-day these conditions did not generally exist. The advantage in the past was that those with whom we exchanged were satisfied with less than the people here. The theory of low wages and cheap food had had a good trial, and to-day one might wonder whether the advantages had been as great as had been anticipated. Possibly the time had arrived for consideration of the desirability of redistributing our population. It was a dangerous matter to talk about tariffs and free trade, but

Digitized by Google

most people would agree in wanting tariffs for their own industry and free trade for all the others.

The British electrical industry, Mr. Watlington continued, was in a very enviable position, because it was expanding, while the former staple industries were contracting. Being comparatively new, it was comparatively free from the rule-of-thumb methods of earlier industries. Furthermore, most of the people in the industry had been trained in a scientific manner, and to that extent probably had more logical and open minds than those engaged in the coal, metallurgical and similar industries.

Our exports of electrical machinery and apparatus only totalled about £7 500 000 in 1913. In 1928 the total was £18 300 000. The British Dominions furnished a big market for this apparatus, and in 1928 they took £11 000 000, or 61%.

A not so satisfactory feature in 1928 was that, for the first time, Germany's electrical exports were greater in value than our own, and also greater than the U.S.A. exports. There was no need for immediate alarm on this account, as a proportion of the German figure was represented by Reparations deliveries. In the future, these Reparations exports might constitute a real danger. For the first half of this year the British electrical exports totalled £9 000 000, against Germany's £13 000 000.

Study of the situation would show that the British Dominions represented our biggest market. There was a common tendency to-day to demand preferential treatment in trading with our Dominions. His own view was that the best preference one could have in any market, Dominion or otherwise, was the ability to supply what was wanted at the right price.

Cause for Optimism.

We needed to take a slightly more optimistic view of our position and achievements, instead of going out and telling the world what a terrible state we are in. Unemployment was a very old problem, and even so long ago as 1450 there were the equivalent of labour exchanges in some of our towns. To-day, out of a total of 11½ million registered workpeople roughly 10% were officially unemployed, these being mainly in the shipbuilding, iron and steel and coal trades. It was wrong to imagine that we had a standing army of people permanently out of work, for about half of those registered as unemployed would be working some of the time.

Exploring the prospect of reabsorbing these workers, Mr. Watlington said it was obviously absurd to try to get them employment in one industry. The only way was to improve and modernise the equipment of all our industries, a development in which the electrical industry could afford material assistance. If we could expedite the electrification of this country we would do away with a great deal of unemployment. Besides providing work inside the industry, electrical development would give employment to people normally engaged in other activities. For instance, excavating work for cable laying was very suitable for miners, and in the manufacture of cable ducts a considerable quantity of coal was used. In the electrical industry itself there was little unemployment, the figure being only about .4%. On the other hand, we had a surplus productive capacity in the neigbourhood of 40%, so that there was room for considerable further employment if only the industry obtained the necessary work.

Referring to rationalisation, which, he said, had been described by a dozen eminent men in a dozen different ways, Mr. Watlington said that to him it implied rationing, or balancing the demand and the outpit. Rationalisation had been very successful in Germany, where the coal industry decided to close the uneconomic pits and allocate the possible demand amongst those still producing. From a position of bankruptcy two years ago, Germany had recovered in a marvellous manner. What Germany had done we could do here, and it was up to the electrical industry, unfettered by tradition, to show the way in intelligent and helpful co-operation.

GLASGOW TECHNICAL COLLEGE.

The annual report of the 133rd session of the Royal Technical College, Glasgow, records distinctions gained by members of the College during the session. The number of day student class enrolments during the session was 3 580, compared with 3 316 in the 1927-8 session, and evening student class enrolments 5 951, against 6 456, the decrease in evening students being mainly attributable to the transfer to Glasgow Education Authority of craft classes, and the institution by surrounding education authorities of higher classes corresponding to those in the College.

Smethwick Fire Disaster.

[To The Editor.]

Sir,—The attention of the Council of the Institution of Electrical Engineers has been drawn to newspaper reports of the proceedings at the inquest, which concluded on September 25th last, upon eleven persons who lost their lives by reason of a fire at premises in Rolfe Street, Smethwick, on September 2nd.

Some of the evidence purported to show that the fire was due to a defective electrical installation in a neighbouring building, and in this connection one of the witnesses condemned the use of lead-covered rubber-insulated cables for the wiring of public buildings.

This statement has caused great uneasiness in the minds of consulting engineers, architects, electrical contractors and others, inasmuch as the use of lead-covered rubber-insulated cables is permitted by, and the proper methods of installation of such cables are set out in, the " Regulations for the Electrical Equipment of Buildings " issued by the Institution.

These regulations are recognised by consulting engineers, electrical contractors, electricity supply authorities and the Fire Offices, as representing the best standard practice, and the Fire Offices in particular commend their use.

The Council reaffirm, therefore, that they are of the opinion that lead-sheathed cables are both suitable and safe for electrical installations, if installed and maintained in accordance with the I.E.E. Wiring Regulations.

From the evidence given, as reported in the newspapers, there is every indication that the electrical installation which, it is suggested, caused the fire at Smethwick, did not comply with these Regulations.—I am, etc.,

P. F. Rowell,
Secretary, The Institution of Electrical Engineers.

Savoy Place, W.C.2.

"Electricity is Cheap."

[To The Editor.]

Sir,—I have to thank Mr. A. B. Cousins for his letter under the above heading in your last issue, giving details of the results obtained by using a Jackson Junior electric cooker. His figures, I think, prove that electric cooking with energy purchased at 2d. or less per kWh is a paying proposition. I also agree that other advantages which he mentions, such as cleanliness, and absence of fumes and intense heat in the kitchen, should be taken into account. Unfortunately, there are still districts in which electricity cannot yet be obtained at the rate Mr. Cousins mentions, and it is only with regard to electric cooking in such places that I remain,

Dubious.

December 10th.

Street Lighting Experiments.

[To the Editor.]

Sir,—The proposal that the main streets of our principal towns should be lighted to such an extent that it will become unnecessary for vehicles to use their own lights at night is not so impracticable as it may at first sight appear.

Already the City of London proper—the area under the control of the City Corporation—is so lighted that the use of the lamps on cars and 'buses is a mere formality rendered necessary only in compliance with the law on lighting-up. The City of London streets, lit by gas or electric lamps suspended over the centre of the roadway, are bright and shadowless by night, while the lighting is entirely devoid of glare. The headlights of a car, therefore, are no more necessary in the City at midnight than on a clear day at noon.

The general introduction of an equally effective system of illumination is mainly a question of local initiative. Progressive public bodies may see what can be done not only in the City of London, but also in less wealthy districts such as Lewisham, where the Borough Council is at present engaged on a most interesting series of experiments. The tests will be on an elaborate scale, with gas and electricity each allotted one mile of main road for their trial installations.

With the abolition of the speed limit for cars, the question of

Digitized by Google

getting rid of dazzling headlights becomes urgent. A fast-travelling car with its lights on will become a real danger in urban thoroughfares. The safe alternative is to get as near as possible to a daylight effect in street lighting, so that strong headlights may become unnecessary—and even illegal—in our principal towns.—I am, etc., W. J. LIBERTY,

Hon. Secretary, Association of Public Lighting Engineers.

London, S.W.1. December 5th.

"Standardised Page Sizes."

[To The Editor.]

SIR,—We have noted with pleasure the publication of the I.S.B.A. letter on the subject of standardisation of advertisement page size. We accordingly write to express our approval of the standards proposed. Whilst we should have preferred only one size—namely, 10 in. by 7 in., we appreciate the difficulties that this would mean to certain publishers, and, therefore, agree with the proposals that where a larger or smaller size is essential, this should be in the same proportion. The two additional sizes suggested should, we think, meet the requirements for such cases.

This company feel very strongly that the adoption of standards in advertising space is a reform long overdue. The money spent on designs and blocks of varying sizes is waste which can and should be avoided.

The publishers in the long run stand to gain by the proposals, as by their adoption advertisers would be enabled to cut out the waste expenditure from their allocation, and thereby take additional advertising space.—I am, etc.,

J. TAFFS.

For the English Electric Co.

London, W.C.2. November 29th.

Treatment of Sulphur Fumes.

[To The Editor.]

SIR,—Inspection of the interim report on the treatment of sulphur fumes, which was practically reprinted in THE ELECTRICIAN of November 29th, reveals to me as a power-station chemist, certain misleading features which, I think, for the guidance of engineers, call for the following criticism:

In the report stress is laid upon the small quantity of water found adequate for spraying—from 7 to 12 tons per ton of fuel—and figures are given showing the slight effect on the water used, the L.P. Co.'s chemists and advisers appearing to consider neutralisation of the effluent a non-essential refinment; the Government chemist, however, at the conclusion, states that he considers it necessary, and even then that there is still a question of harm to the river water from possible So_3.

Now, firstly, the Government chemist has evidently taken the fuel as evolving about 1·5% of sulphur, 250 tons of water of 20 parts per 100 000 alkalinity (as calcium carbonate) being stated as necessary for neutralisation of effluent from spraying gases from 1 ton of fuel. For,

20 parts calcium carbonate neutralise 16 parts So_3.

250 tons water = 560 000 lb.

560 000 lb. water, neutralising 16 lb. So_3 per 100 000 lb., will neutralise $16 \times 5{\cdot}6 = 87{\cdot}6$ lb. So_3.

2 240 lb. fuel, evolving 1·5% sulphur, gives therefore $\frac{2\,240 \times 1{\cdot}5}{100} = 33{\cdot}6$ lb. of sulphur, which is transformed to 84 lb. of So_3, which is very near the above figure for So_3 neutralised by 250 tons water. Now, taking 12 tons of water sprayed per ton of fuel, the effluent must contain about 84 lb. So_3 in 26 880 lb. water, or 313 lb. So_3 in 100 000 lb. water, whereas the effluent given on p. 8 of the report, stated to be from the use of 12 tons sprayed water per ton of fuel, is given as having acquired less than 44 parts So_3 per 100 000 —a very much weaker solution of acid.

Therefore, either far more water than 12 tons per ton was sprayed ($\frac{313}{44}$ = about 7 times as much, or 84 tons), or the sulphur extraction was hopelessly incomplete (only one-seventh of the total).

Moreover, the fuel usually burnt contained amounts of sulhpur such as 3·7%, 4·4%, etc., by the L.P. Co.'s own figures. Assuming, at a low estimate, that 3% of sulphur was evolved, then the effluent must contain twice as much So_3 as the above—namely, about 626 parts per 100 000, instead as about 44 as given. This makes the various figures in the report still further from actuality.—I am, etc.,

P. NARRACOTT.

London. December 9th.

CHROMIUM PLATING.

Preliminary Details of a New Direct Depositing Process.

CHROMIUM is deposited under many processes, but in nearly all of them the article to be chromium plated is nickel-plated first. The latest method, however, has just been brought to this country by Dr. Nast, and under it, chrome is thrown direct on to the surface of the base metal.

The advantages which Dr. Nast claims are:—

(*a*) That where chrome is thrown direct on to the base metal, it amalgamates with it and will neither peel nor chip; whereas chrome on the top of nickel is liable to both defects, because the nickel underneath the chrome is liable to chip or peel.

(*b*) That the direct method is cheaper, because it saves the lengthy process of nickel-plating first. (An article needs a forty minutes' immersion to nickel plate as against about ten minutes in a chrome bath, meaning that apart from the cost of the extra process itself, about four nickel baths are required to every chromium bath, if the work is not going to be held up through congestion in the nickelling department.)

The Northern Chromium Plating Co. are exploiting the new process at their Skinnerburn works in Newcastle, where an extensive plant is now in operation.

Under the new process an article is dismantled and de-nickelled, and is ground and buffed, until the base metal has a perfect polish. It is then wired for hanging in the chromium bath in such a way that all parts of the surface will get a fair share of the deposit.

Next, it is degreased in a special bath. This is necessary through an invention of Dr. Nast's which has a direct bearing on this method of plating, particularly in connection with the low cost. When chrome is being released from the acid in the chrome baths hydrogen bubbles, thinly coated with minute quantities of chrome, rise to the surface. These bubbles are lifted into the air by the hydrogen and form a serious menace to the health of the workers unless drawn away. An elaborate and costly system of exhaust and filterage is usual, but Dr. Nast has prepared an oil, which he floats on the surface of the acid. This oil decoats the hydrogen bubbles of chromium as they pass through to the surface, to be liberated as harmless hydrogen.

The article to be plated has to pass through this layer of oil on its way to the acid. Hence the necessity for it to be thoroughly degreased so that when it is passed through the oil (after it has been wetted) no oil adheres to the surface.

The article comes out of the chromium bath with a fine surface, which requires very little polishing.

It is claimed that the new direct process throws as well on to steel as to brass, copper and the many other popular alloys used for radiators, etc.

But, as is well known, all chromium plating is porous, and if the article plated is left for long periods in damp places, rust is liable to form in the base metal, with the result that the chromium above may crack. This difficulty is got over by treating the steel with a between coating giving it rustless properties.

The aluminium process is a very elaborate one, as the intractability of aluminium and its refusal to amalgamate with other metals has long been a problem. The Northern Chromium Co., however, claim a perfectly satisfactory method of plating this metal.

It is desirable to burn on the chromium plating of some articles so that it becomes extremely hard, and consequently has additional heat-resisting properties. The maximum degree of hardness claimed to be obtainable is 95 per cent. of the hardness of a diamond. The final hardness depends upon the amperage per sq. ft. used in the chrome bath. Normally, one does not desire the extreme hardness; for one thing the finished article is much more difficult to polish satisfactorily, and consequently the expense is proportionately greater.

ACCRINGTON ELECTRICITY SUPPLY.

The Electrical Engineer of Accrington has been instructed to estimate the cost of extending supply to Huncoat, and to ascertain whether it is possible to get a grant from the Unemployment Grants Committee towards the scheme. The chairman of the Electricity Committee reports that up to the present the electricity department's output has overtaken that of last year, and the cost per unit has been less than a year ago.

RADIO MANUFACTURERS' ASSOCIATION.

Annual Dinner and Meeting—Continued Increase in Membership—The Marconi Royalty Position—The Year's Work.

THERE was a large attendance at the annual dinner of the Radio Manufacturers' Association, held at the Savoy Hotel, London, on December 4th, Sir William Bull in the chair.

The toast of the R.M.A. was proposed by Mr. F. Kellaway, who said that no man would venture to make a prophecy with regard to the future of wireless, but in his opinion we were only at the beginning of what wireless was destined to do for mankind.

Their industry had made a greater change in the social life of the world than any other invention since printing. Broadcasting had done for the spoken word what printing had for the written word. Our public men, particularly politicians, had had the common sense to take advantage of the technique of broadcasting.

He referred to certain people who had brought discredit on the industry, and said that he hoped, before anyone subscribed any money for the proposals put before the public, they would look at the names of the men who were promoting them. It was high time that someone able to speak with authority should call attention to the scandalous abuse which was taking place in the last few years in connection with public flotations.

It was time that men with great names, and holding prominent positions, were a little more careful in allowing their names to be connected with exploitations of inventions which had never been properly examined.

After a brief response by Mr. J. T. Mould, chairman of the R.M.A., Capt. J. W. Barber proposed the toast of "Our Guests."

Lt.-Col. J. T. C. Moore-Brabazon, in reply, said he agreed with Mr. Kellaway in his warning against the "dud" company, but he would remind him that British investors put their money into the Marconi Co. long before it was a financial success. It would be a bad day for this country if investors did not put any money into companies before they were commercial successes.

The toast of "The Press" was given by Mr. R. M. Ellis and responded to by Mr. A. Beverley Baxter.

Mr. L. McMichael proposed "The Chairman," and after Mr. Mould's acknowledgment, the company adjourned for dancing and a cabaret entertainment.

The New Council.

The annual general meeting of the Association was held at the Hotel Cecil, London, on December 5th, when Sir William Bull was re-elected President and the ballot for 18 members to serve on the Executive Council was made, the following firms or their representatives being elected :—The Bowyer-Lowe Co., Ltd., the Brownie Wireless Co. of Great Britain, Ltd., Burndept Wireless (1928), Ltd., the Chloride Electrical Storage Co., Ltd., the Climax Radio Electric, Ltd., the Columbia Graphophone Co., Ltd., the Dubilier Condenser Co. (1925), Ltd., Ferranti, Ltd., the General Electric Co., Ltd., Graham Amplion, Ltd., Hart Collins, Ltd., the Igranic Electric Co., Ltd., Kolster-Brandes, Ltd., the Marconiphone Co., Ltd., L. McMichael, Ltd., the Mullard Radio Valve Co., Ltd., Pye Radio, Ltd., and Radio Instruments, Ltd.

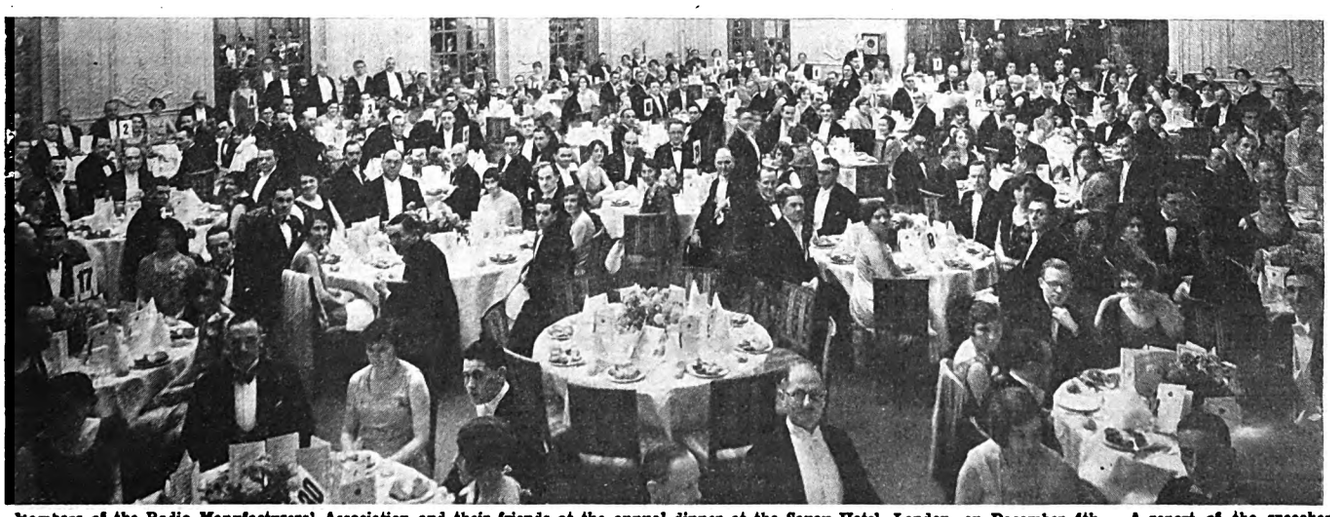
The annual report presented at the meeting stated that as was the case last year, outstanding among the matters dealt with during the year was the question of Marconi royalties.

A Difficult Problem.

At the time of the last annual general meeting, manufacturers as a whole, in accordance with the recommendation of the R.M.A., were working, for purposes of Royalty payments, on the terms of the award of the Comptroller-General of Patents on the "Brownie" application, namely, a royalty of 10 per cent. of the manufacturers' wholesale selling price —with a minimum charge of 5s. on the first valveholder and 2s. 6d. on each additional valveholder. It was then hoped that the appeal which had been lodged by the Marconi Co. against the Comptroller-General's decision would be heard at an early date and the whole position speedily stabilised. It was not until June, however, that the Marconi appeal came before Mr. Justice Luxmoore in the Chancery Division, when after a hearing judgment was given on June 18th allowing the appeal. In the serious position thus created, the R.M.A. Royalties Committee took immediate action. A preliminary and unofficial meeting between the Chairman of the Council and Mr. F. G. Kellaway, managing director of the Marconi Co., on June 20th, paved the way for the reception by Mr. Kellaway of a deputation from the R.M.A., the object of the deputation being to arrive at an amicable settlement—satisfactory alike to the licensor company and the trade—of the difficulties created by Mr. Justice Luxmoore's judgment.

Mr. Kellaway met the deputation in a spirit of accommodation, but discussion of the position speedily showed that no progress could be made towards the fixing of a mutually satisfactory royalty scale until certain information relative to royalty returns was before the negotiating parties. It was agreed, therefore, that a joint investigation of certain matters be immediately carried out, Mr. Kellaway consenting to stay for one month proceedings under any legal action already instituted for the recovery of the difference between 12s. 6d. per valveholder (to which the Marconi Co. were entitled under Mr. Justice Luxmoore's judgment) and the amount payable on the Brownie basis, and to defer, for a like period, the demand for payment of such difference. Further, in regard to arrears of royalty fees due from licensees as a result of the decision, Mr. Kellaway agreed, in the event of the negotiations reaching a satisfactory conclusion, to recommend to his board that the scale of royalty as thereby fixed should be operative as from August 28th, 1928, the date of the award given by the Comptroller-General of Patents. Upon the conclusion of this joint investigation, which occupied just over a fortnight, negotiations with Mr. Kellaway were at once resumed and, as a result, a basis of agreement was come to at a meeting held on July 19th, at which the R.M.A., the Marconi Co. and the Gramophone Co. were present.

At the meeting at which this basis of agreement was arrived at, it was also arranged that the R.M.A. would call a



Members of the Radio Manufacturers' Association and their friends at the annual dinner at the Savoy Hotel, London, on December 4th. A report of the speeches and of the annual general meeting, held next day, are given above.

D

Digitized by Google

general meeting of radio manufacturers and would there recommend to members the acceptance of the terms for a new licence.

This general meeting was accordingly held on July 24th, in the Grand Hall of the Hotel Cecil, and was attended by some 150 manufacturers and by representatives of the Press. At such meeting, whilst the terms of the agreement met with general satisfaction, exception was taken to certain items, notably the granting to the Marconi Co. (and the Gramophone Co.) of the free use of licensees' patents, and the probable inclusion of loud speaker patents in the agreement. Following the holding of this meeting the preparation of a new licence on the conditions agreed upon has been the subject of negotiation between the Marconi Co. and the R.M.A., and this has taken more time than was at first anticipated, so that the date of August 24th, originally named as the date by which applications for the new licence should be received by the Marconi Co., has had to be modified. The interim period was, however, well spent, as the continued negotiations resulted in the conclusion of a licence more favourable to manufacturers than that first offered by the Marconi Co.

The National Radio Exhibition.

The National Radio Exhibition, organised by the Association, and held in the New Hall, Olympia, from September 23rd to October 3rd, was open for ten days instead of the usual seven days. During the run of the show, the total paid attendance was 140 627 as against 123 531 during the seven days in 1928, 99 315 in 1927, and 116 570 in 1926, the exhibition being open on this last-named occasion for 13 days. Additional space this year permitted of the erection of 286 stands as against 264 in 1928, and 229 in 1927. It was a triumph for the Exhibitions Committee that they were able to arrange for the Prime Minister, the Rt. Hon. J. Ramsay MacDonald, to "introduce" the Exhibition in a talk from "Chequers" on September 21st, prior to the opening on the 23rd. Of the 185 exhibitors 113 were members of the Association, whereas last year the members numbered 83 out of a toal of 181. The net surplus on the Exhibition amounted to over £6 305.

As last year, the R.M.A., through its Exhibitions Committee, co-operated with Provincial Exhibitions, Ltd., and the Manchester "Evening Chronicle," in the organisation of the Manchester Radio Exhibition, held in the City Hall, Manchester, from October 16th to 26th, the net surplus of which, so far as the Association was concerned, amounted to £200 approximately.

In view of representations made by members at the time of the Ideal Home Exhibition held at Olympia last Spring, the Council has rented from the Organisers of the Exhibition a space occupying practically the whole of the side of the Gallery of the Main Hall to the right of the Main Entrance, sufficient to provide some 7 000 square feet stand area. At the time of preparing this Report detailed proposals for the lay-out of this wireless section of the exhibition are being worked out by the Exhibitions Organiser and the Exhibitions Committee.

The difficulty of securing a suitable tenancy for the organisation of a radio exhibition in Glasgow has, so far, remained insuperable, but there is now some reason to hope that during 1931 this project, long contemplated by the Association, will materialise.

Co-operation with B.R.V.M.A.

Events during the past year (such as the adoption by the B.R.V.M.A. of the Continental standards for a.c. valve caps without first ascertaining the views of set-makers on the proposals) led to the conclusion that, in order to achieve real effective co-operation between the two Associations, joint liaison meetings must be held at known and regular intervals. This being realised by the B.R.V.M.A., a properly constituted B.R.V.M.A. and R.M.A. Liaison Committee has now been set up consisting of five R.M.A. and four B.R.V.M.A. representatives, such Committee meeting regularly once a month, unless it is found that there is no agenda to discuss. By this means it is hoped that the two Associations will in future work in closer harmony than has been the case in the past.

Throughout the year the Association has continued its membership of the Radio Trade Committee on Broadcasting, where matters of importance to the radio industry have received consideration, and has continued to act in conjunction with the B.E.S.A. in standardising matters affecting the radio industry.

Evidence of the increasing esteem in which the R.M.A. is held among outside bodies is afforded by the fact that an invitation was extended to the Association to assist in the making of arrangements for the celebration of the Faraday Centenary by the Royal Institution in 1931. The Royal Institution asked the Institution of Electrical Engineers, in consultation with other interested bodies, to consider in what way the technical applications of Faraday's discovery of electro-magnetic induction could best be celebrated, and the I.E.E. invited the R.M.A. to appoint a representative to attend a Conference on this subject. The Council appointed its Chairman, Mr. J. T. Mould, to attend the Conference on its behalf and, at this Conference, Mr. Mould was elected to serve on a Committee appointed to proceed further with the arrangements for the Centenary Celebration.

At a meeting, attended by representatives of the B.R.V.M.A., the R.W.F., the W.R.A., the wireless Press, and the R.M.A., the question of the establishment of a Radio Trades Benevolent Fund was discussed and the general feeling was that, in a matter of this kind, it was essential that resources should be as large as possible, that the number of similar institutions was already too large, and that the radio industry should be covered by the Electrical Trades Benevolent Institution.

It was stated in the last annual report that the R.M.A. had lodged with the Board of Trade an application for an Order under the Merchandise Marks Act, 1926, for the marking of imported radio apparatus with the country of origin (on importation, or alternatively, on sale or exposure for sale in this country). The inquiry for the hearing of this application was finally fixed for September 30th and following days. In view of this date clashing with the National Radio Exhibition at Olympia it was feared that the delegated R.M.A. witnesses would be unable to spend the requisite time away from their stands at the show. Application was made, therefore, for another date, but the day of the hearing having already been published by the Board of Trade, the latter were disinclined to agree. For that reason it was decided to withdraw the application for the time being on the understanding that it might be renewed at a later date. A further consideration influencing such decision was the question, raised since the making of the application, as to how far the provisions of the Merchandise Marks Act make it obligatory on manufacturers when including any foreign apparatus in their sets to announce such fact in their advertisements and catalogues.

Progress in Brief.

Membership of the Association continues to increase and whereas at the date of the issue of the last annual report the membership roll contained the names of 101 firms, the present total is 152. A brief summary of the other work of the Association during the year under review is as follows:—(1) Through the medium of the Radio Trade Committee on Broadcasting, the B.B.C., the B.R.V.M.A. and the R.M.A. have drawn up a scheme of co-operation to assist educational organisations in obtaining and maintaining radio apparatus for the reception of educational programmes. Such scheme is now awaiting the sanction of the National Councils for Educational Broadcasting; (2) The drafting of a pamphlet on power supply to broadcast receivers has engaged the attention of the R.T.C.B., and such pamphlet is now nearing completion; (3) Action taken by the R.T.C.B. resulted in the satisfactory modification of a proposal by the Post Office to print on the back of wireless licences an instruction that all mains apparatus must conform with the Wiring Rules of the I.E.E.; (4) As a result of action taken by the R.M.A. Technical Committee, a proposed revision of the I.E.E. Regulations for radio apparatus connected to supply mains has been postponed; (5) The association has co-operated with the I.E.E. in the drawing up of a schedule of wireless waves of standard frequencies to be transmitted from the National Physical Laboratory; (6) Steps have been taken to determine the legal position of electricity supply authorities in regard to the replacement of radio equipment connected to their mains when changing over from d.c. to a.c. supply; (7) Modification of the wavelength changes of B.B.C. stations proposed under the Prague plan was secured by the association.

During the course of the meeting it was suggested that the Association should make some arrangement with the B.B.C. for advertising, well in advance, any special items in future programmes. Mr. Mould pointed out that this was already receiving the attention of the Council.

NEWS IN BRIEF.

Societies' Arrangements—Activities of Electrical Association for Women—York School Lighting—Physical and Opitical Societies' Exhibition.

BLACKBURN Corporation has decided to pay £75 4s. as compensation for damage done to crops on farms adjoining the Whitebirk electricity works.

About 2 000 telephone lines in the London area were damaged by the gales last week, and more than 200 trunk circuits were affected. Cork and other towns in Southern Ireland were completely cut off.

At a meeting of the Institution of Engineering Inspection at the Royal Society of Arts to-day (December 13th), Capt. B. H. Peter, general manager of the Westinghouse Brake and Saxby Signal Co., Ltd., will read a paper on "The Trend of Development in Railway Signalling."

Plymouth Works Committee has accepted the offer of the Transport Department for a battery for an electrically propelled vehicle, at £220.

A successful dance and whist drive was held by the Bristol and District Branch of the Electrical Association for Women at Fortt's Restaurant, Bristol, at which there was an attendance of 120 members and friends.

Leeds Baths Committee has asked the Baths Superintendent to make inquiries with respect to the installation of an electric motor to drive the filtration plant at Hunslet Baths, in substitution for the existing steam pump.

It has been reported to York Education Committee that of the 18 non-provided schools in the city, electric lighting has been installed in 13, and the Committee has decided to urge the managers of the five remaining schools to change over from gas to electricity as soon as possible.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN, *dated December 13th :—*

Messrs. Siemens were lighting "by means of three of their 6 000 candle machines, the shops of some enterprising Woolwich tradesmen."

It was recalled that Jean Paul Marat, one of the most prominent characters of the first French Revolution, wrote several important books on electricity.

Mr. Gladstone addressed a meeting in the Corn Exchange, Edinburgh, and his speech was telephonically relayed to an audience in a neighbouring hall.

* * *

TWENTY-FIVE years ago it was stated in THE ELECTRICIAN, *dated December 16th, 1904:—*

The newly-electrified Metropolitan Railway was opened.

That Mr. Justus Eck appealed for contributions to "a benevolent fund now in process of being organised for the electrical industry."

A succession of short-circuits, fires and explosions in the Bradford network deprived domestic consumers of a supply for a whole day.

The next meeting of the Institution of Electrical Engineers North Midland Students' Section will be held at the Technical College, Huddersfield, on December 17th at 7 p.m., when a paper on "Power Transformers" will be read by Mr. I. H. Hedley.

The Electrical Power Engineers' Association (Manchester Technical Group) has arranged for a lecture on December 18th, by Mr. H. L. Guy, on "Developments in Power Station Condensing Plant," at the Geographical Hall, St. Mary's Parsonage, Deansgate, Manchester.

The series of evening lectures by Mr. H. Bourne, of the Hendon Electric Supply Co., under the auspices of the Electrical Association for Women, are proving very popular amongst women demonstrators and domestic science teachers.

The Board of Trade Standing Committee under the Merchandise Marks Act will hold inquiries at the Board of Trade Offices, London, on dates to be announced later, as to whether imported dynamos, starting motors, magnetic cut outs, dash board (instrument board) fittings, high-tension distributors ignition coils, magnetos, batteries and ignition plugs, should bear a mark of origin.

Sir William Bragg, in the course of his Huxley biennial lecture at Charing Cross Hospital Medical School, London, recently, dealt with the analysis of the structure of materials by means of X-rays. It was a new method, he said, and opened up a new direction of inquiry into the relations between the properties of matter, organic and inorganic, and the atoms and molecules of which it was composed.

H.M. Stationery Office has issued statutory Orders No. 1 015, containing regulations made by the Electricity Commissioners relating to the method to be adopted for ascertaining the cost of production of electricity at selected generating stations; and No. 1 016, containing regulations, also prescribed by the Commissioners, with regard to the adjustment of the price for a supply of electricity according to power factor. The price of each of these Orders is 1d.

A chimney stack at the works of the Llanelly and District Electric Lighting and Traction Co. fell on Sunday evening as a result of the gale. The damage done caused a stoppage of the supply of energy, but it was resumed the same evening.

A meeting of the Overhead Lines' Association will be held at the Institution of Electrical Engineers on December 18th, at 5.30 p.m., when a discussion will be opened by Major Theodore Rich on "Some Continental and British Methods Compared."

Henley's Dramatic Club will present "The Skin Game" at the Cripplegate Theatre, Golden Lane, London, E.6, on December 16th, at 8 p.m. The charges for seats (all numbered and reserved) are from 3s. 6d. to 1s. 2d., and tickets can be obtained from Mr. W. G. Turner, at the company's offices, 11, Holborn Viaduct, London, E.C.1.

The Borough Electrical Engineer of Wimbledon has made arrangements for a showroom and demonstration room at 32, Hill Road, for two months, for daily demonstrations of electrical apparatus.

On the suggestion of the chairman, Eastbourne Electricity Committee has decided that the cost of the work of improving the lighting arrangements of the church schools in the borough shall be spread over a period of from three to four years.

Mr. E. E. Sharp recently lectured, at a meeting of the Electrical Association for Women, on some of his electrical experiences in Australia and New Zealand. He gave information regarding domestic electrical equipment in those countries, and the efforts of certain supply undertakings to provide, by means of electricity, a supply of hot water as nearly as possible comparable to the thermal springs in parts of New Zealand.

The Association of Provincial Electricity Undertakings has appointed Sir John Keane as arbitrator in accordance with the agreement made with the I.F.S. Electricity Supply Board regarding arbitration in cases of dispute in connection with the purchase price of undertakings by the Board. The Board has also to nominate an arbitrator.

With reference to recent statements which have appeared in the Press regarding the discovery, by Mr. T. A. Edison, of a process of making synthetic rubber from a weed called "golden rod," Mr. Edison denies the statement that golden rod rubber can be made at a cost of about 8d. a pound. The most he can promise to date is the production of synthetic rubber at a high price in case of war.

The 20th annual exhibition of the Physical and Optical Societies is to be held on January 7th, 8th, and 9th, at the Imperial College of Science, London. Over 80 firms intend exhibiting in the Trade Section, and in addition a group of research and experimental exhibits will be shown by Fellows of the societies and others, and a number of research laboratories and other institutions. Some interesting historical exhibits will also be included.

A paper by Mr. F. Forrest, chief assistant engineer of Birmingham electric supply department, was read to the Birmingham and Midlands branch of the Electrical Association for Women recently. Mr. Forrest, who visited America last year, stated in his paper that amongst the causes of the greater consumption of electricity in America were the more extreme climatic conditions in that country, low tariffs framed to stimulate long-hour use, low cost of lamps and other apparatus, and strong selling organisation. An ordinary 40 W lamp which cost 2s. 4d. in this country could be purchased anywhere in the States for 11d.

PERSONAL.

THE Marconi International Marine Communication Co., Ltd., announces that Mr. James O'Beirn has been appointed a director of that company.

Mr. H. W. Millatt, showroom manager of Chester electricity department, has been appointed sales manager of the Bedford undertaking, at a salary of £400 per annum.

Estate of the gross value of £47 587, with net personalty £47 307, was left by the late Mr. John Charles, Dwaffyd, Bridlington, Jones, formerly electrician-in-chief to the Eastern Telegraph Co., at Singapore.

Mr. H. Mozley, manager of Burnley electric tramways and omnibuses department, is retiring next March, after 29 years' service. He is to receive an illuminated address recording appreciation of his long and faithful duties.

Sir William McLintock has, the Minister of Transport states, been engaged to advise the Government in the London traffic problem. It will be remembered that Sir William took a prominent part in the cable and wireless merger.

The recommendation that Mr. S. M. Hill be appointed station superintendent at Portishead has been approved. Our reference last week to Bath Electricity Committee in connection with the appointment should, of course, have read Bristol.

L.C.C. Highways Committee recommends the appointment of Mr. John Hampden Parker, borough electrical engineer and transport manager of West Hartlepool, as electrical engineer in the tramways department at a commencing salary of £1 700 a year, rising to £1 900. See page 751.

Mr. Henry Young, late assistant secretary of the Royal Institution, has been presented with a silver rose bowl and cheque on his retirement after 50 years' service in the Institution. The presentation was made on December 2nd by Sir James Crichton-Browne on behalf of the members.

Barnes U.D.C. has received the resignation of Mr. G. C. Law, assistant electrical engineer, who has been appointed deputy electrical engineer and manager by Hammersmith (London) Borough Council. The Council decided that the thanks of the Council for Mr. Law's past services be recorded on vellum and sealed.

Following the resignation of Mr. H. W. Laing, tramways manager at Lytham St. Annes after 23 years' service, several departmental heads are passing into retirement shortly. These include Mr. J. Partington, rolling stock superintendent, with 27 years' service, and Mr. P. Partington, tramways electrical engineer, with 26 years' service.

Mr. William Beavis, manager of the Newhaven and Seaford Electricity Co.'s works at Newhaven, received a telephone call at his residence at Seaford early on Saturday and immediately left his home for the works in his car. He has not been seen since, and fragments of the car have been found in such a position as to lead to the conclusion that Mr. Beavis was blown into the sea during the gale which was raging at the time.

The appointment of Mr. Frank Forrest as successor to Mr. R. A. Chattock, city electrical engineer of the Birmingham electric supply department for a period of twenty-six years, who will retire in January, has been approved by the Corporation. The Electric Supply Committee has approved a report placing on record appreciation of Mr. Chattock's work. Mr. E. J. Jennings has been secretary to the department for the past twelve years, and Mr. Chattock's impending retirement has been taken as a fitting opportunity of altering the title of his office to that of "Secretary and Commercial Manager," the city electrical engineer continuing to be responsible for the whole of the engineering side of the department, both generation and distribution. See page 751.

Obituary.

SIR ROBERT ASHTON LISTER, on December 6th, aged 84 years, founder and chairman of R. A. Lister and Co., Ltd.

MR. WILLIAM RICHARD BOWER, on November 20th. He was for over 30 years head of the physics and electrical engineering department at the Huddersfield Technical College. He retired at the end of 1926.

MR. CHARLES ALBERT BLASCHECK, on November 26th, aged 55 years. He had been chief engineer of the Canterbury Corporation electricity department since 1902. He came to Canterbury from Norwich, where he had been chief assistant electrical engineer, and prior to that he had been with the St. James's and Pall Mall Electric Light Co., London. See page 751.

IN PARLIAMENT.

House of Lords Committee Rejects Grampian Electricity Bill as a Whole.

DURING last week, in the course of further consideration by a House of Lords Committee of the Grampian Electricity Company's Bill, Mr. A. D. Phillips, formerly electrical engineer and manager of the Fife Electric Power Co., explained the factors which made it necessary to charge higher prices in a scattered area than in a thickly populated town.

Mr. Arthur Collins gave evidence in support of the proposal for relief of part of the undertaking from valuation for rating.

Mr. J. Keith, K.C., addressing the Commttee on behalf of the local authorities who objected to the concession in the matter of rating, said if the water scheme could produce electricity cheaper than a steam power scheme there was no justification for subsidising it.

Sir John Snell, chairman of the Electricity Commissioners, said he had been in consultation with Sir Andrew Duncan, chairman of the Central Electricity Board, and they welcomed the scheme.

Evidence in opposition to the scheme was given by representatives of Stirling County Council and Inverness Town Council.

The Committee decided that no part of the Bill should proceed, but stated that this decision did not prejudice in any way any application for a Special Order for the extension of the present area, which might be made to the Electricity Commissioners, and, of course, did not prejudice any decision the Commissioners might see fit to arrive at.

Tyneside Tramways and Tramroads.

The Tyneside Tramways and Tramroad Co.'s Bill, in which the Company seeks authority to abandon its tramways and substitute motor omnibuses, has again been before a Select Committee of the House of Commons.

Mr. J. H. Thorpe, for the Wallsend Corporation, whose area is on the route from Newcastle to Tynemouth and Shields, announced that an agreement had been reached on certain conditions. The Corporation, therefore, withdrew its opposition.

Mr. Craig Henderson, K.C., addressed the Committee on behalf of the Tynemouth and District Electric Traction Co., Ltd., in opposition. He said the draft agreement between Newcastle Corporation and the promoters was in violation of an agreement between the Tynemouth and the Tyneside companies, and was to the prejudice of the former company. He suggested that a local inquiry should be held into the whole question.

A clause for the protection of Northumberland County Council in respect of the maintenance of the Gosforth tramways having been agreed to, the opposition of the County Council was withdrawn.

Mr. Tyldesley Jones, K.C., for United Automobile Services, Ltd., opposed any protection for the promoters if they ran on any other than their existing east to west route.

The committee found the preamble proved, and decided that the agreement between the company and the Corporation be scheduled to the Bill. They decided to allow extensions of the company's system up to 8 miles in Northumberland, such extensions to be subject to the consent of local authorities and the Ministry of Transport.

Replies to Questions.

The average number of persons per telephone in Great Britain (excluding Northern Ireland) at September 30th last was 24, and in Northern Ireland 56.

The total number of paid words in press and news messages transmitted by the Post Office wireless telegraph station at Rugby during the 12 months ended November 23rd, 1929, was 2 663 250.

The Postmaster-General is aware of the deficit on the telegraph account of the Post Office. An increase in the Press tariff would require legislation, which he is not at present prepared to initiate.

The £750 000 programme of special telephone development will, it is estimated, employ about 2 200 men and women for 12 months. The Postmaster-General hopes to be able to announce a corresponding acceleration of programme for next year.

The Postmaster-General is always willing to make the best arrangements practicable for diverting to underground, or to

Digitized by Google

another route, overhead telegraph and telephone wires in the vicinity of aerodromes, provided the owners of the aerodromes will bear the expense.

The number of new private telephones installed during the year ended September 30th, 1929, was 267 480 and deducting 144 071 given up, the net growth was 123 409. Residence telephones installed during the year was 90 032, the net growth being 50 428.

The Electricity Commissioners in a circular recently issued have urged all electricity undertakings to accelerate their expenditure on development so as to provide increased work in the next two years. The Central Electricity Board has also been requested to continue to press on with all possible speed with its constructional work.

It is the desire of the Minister of Transport that cheap and efficient services of electrical power and transport should be provided as far as possible in rural areas. Over 70 per cent. of the rural population is at present included within areas with an authorised supply of electricity, and applications in respect of a considerable proportion of the remaining area are pending.

No proposals have yet been submitted to the Government by the railway company for the construction of an electric railway from Liverpool Street, via Bethnal Green to Leytonstone and Waltham Cross and to Ilford and Hainault Forest. The Minister of Transport has already drawn the attention of the railway company to the necessity and desirability of these schemes.

In accordance with the provisions of the Telegraph Acts the consent of the local authority is sought before any overhead line is placed by the Post Office in any public road under its jurisdiction, and consultation, if necessary, follows. Due regard is paid to the question of amenities in framing applications for such consents and the lines are laid underground whenever this can be justified financially.

Northern Ireland Parliament.

In the Northern Ireland House of Commons last week, Mr. Milne Barbour, Minister of Commerce, said his attention had been called to resolutions by Londonderry and Tyrone Agricultural Committees and Tyrone County Council in favour of extended telephone services. He would point out that the terms upon which the Postmaster-General was prepared to provide telephone facilities in any particular district were the same as those obtaining in any corresponding district in England, Scotland or Wales. In these circumstances he did not feel that he should be justified in making representations to the Imperial Government for an extension of the scheme. Since April last 103 telephone call offices were being installed at rural post offices and rural railway stations situate within two miles of an existing telephone exchange.

Replying to Mr. Healy in the Northern House of Commons last week, Mr. Milne Barbour, Minister of Commerce, said a commencement had been made towards a scheme for the provision of an electricity supply on comprehensive lines in the Lagan Valley area by the construction of a high-tension main transmission line between Belfast and Lisburn. A beginning had also been made in the development of an electricity supply in North Down, where a high-tension transmission line was nearing completion, connecting Belfast with Holywood and Bangor. In the autumn Session of last year Parliament conferred powers on the Antrim Electricity Supply Co. to supply throughout the greater part of county Antrim and part of county Londonderry. That company was now proceeding with the first stage of the scheme by constructing a main transmission line from Larne to Ballymena and Randalstown. Any scheme of comprehensive development in Northern Ireland in the near future would involve the most use being made of the efficient generating station in Belfast.

THE SOCIAL SIDE.

A reunion dinner of ex-editors, advertising managers and staff of THE ELECTRICIAN was held on December 6th in the Knight's Room, Simpson's-in-the-Strand, London. Mr. W. G. A. Bond, resident director of the Shropshire Worcestershire and Staffordshire Electric Power Co., who was editor from 1895–1897, was in the chair. Reminiscences of the early days of the electrical industry, and of the journal which has been so closely associated with its development, were exchanged by Messrs. F. C. Raphael, W. E. Warrilow, F. H. Masters, and the Chairman, who incidentally recalled that THE ELECTRICIAN was the first periodical to be printed by the Monotype method.

BUSINESS ITEMS.

MOSSES AND MITCHELL, LTD., announce that, after having been established at 122–124, Golden Lane, London, E.C.1, for over 20 years, they have now removed to Chiswell Works, 60–64, Ironmonger Row, Old Street, E.C.1.

THE "Marconi" wireless telephone set of the new Dover lifeboat which, with its two 375 H.P. engines, is the fastest lifeboat in the world, and has been specially designed for the rescue of aeroplanes which have fallen into the sea.

All the aircraft taking part in the official opening of the Heston Air Park School, Brancknar, Middlesex, were fitted with radio equipment manufactured by ALFRED GRAHAM AND CO., LTD., Slough. The equipment selected for the light aeroplanes was Type G.A. 6, which consists of a receiving set of light weight and compact dimensions, and can be accommodated on the dashboard. The valves employed in the set are two Mullard P.M. 14, one P.M. 3A and one P.M.4.

The ELECTRIC FURNACE CO., LTD., of 17, Victoria Street, London, S.W., has formed and will be the sole proprietors of a subsidiary company, the ELECTRIC RESISTANCE FURNACE CO., LTD., to deal with electric resistance furnaces for industrial purposes. The new company will handle all installations of "Efco" resistance furnaces and stoves, and the benefits of patents and agreements for exchange of technical information and drawings with foreign countries, in so far as they apply to resistance furnaces, will be transferred from the Electric Furnace Co., Ltd. The latter will continue to supply electric melting furnaces of all kinds, such as the Héroult, Ajax-Wyatt and Ajax-Northrup furnaces, and contracts for complete metallurgical and electrical installations.

In connection with the "Exide Fortnight" limerick and window display competition which was held from October 7th to 19th, the first prize of £50 was awarded to Hattersley Bros., 346, Idle Road, Bradford. The winners of the second prize, of £25, were J. & C. Colbourne and Sons, of 179a, Dudley Road, Wolverhampton; and the winners of the third prize, of £10, Francis W. Harris and Co., Ltd., of High Street, Leek. Prizes of £5, £3 and £2 respectively were awarded to the window dressers of the first, second and third prize displays. Prizes of £5 each were awarded to twenty-five other competitors. These were Clifford and Co., Sidcup; D. J. Tredan, St. Helier, Jersey; the General Electrical Co., Ltd., Glasgow; Motor Mac's, Ltd., Bournemouth; James Scott and Co., Perth; V. Buckland, Derby; R. Darbyshire, Ltd., Blackpool; Jones Garage, Ltd., Lichfield; Morgan Bros., Swansea; Mann, Egerton and Co., Ltd., Norwich; Tamplin and Makovski, Ltd., Reigate; Castlehouse-Vasey and Co., Ltd., Scarborough; Leonard Bradbury, Droylsden, Manchester; Milne and Russell, Ltd., South Croydon; W. Rowntree and Sons, Ltd., Scarborough; Baglan Auto Electrical Co., Briton Ferry; W. H. Johnson and Sons, Ltd., King's Lynn; J. Blake and Co., Ltd., Liverpool; George Box, Ltd., Batley; the Chelston Electrical Works, Torquay; the Western Radio, Plymouth; Eric Thompson, Thirsk; Rossleigh, Ltd., Stirling; Moore of Brighton, Ltd., Weybridge; Smith and Bellhouse, Wolverhampton. See page 751.

E.T.B.I. COMPETITION.

Full List of Prizes and Chief Prize Winners in Cable Competition.

WE have received from the organisers of the Cable Competition, held in connection with the Electrical Trades Benevolent Institution, the final list of prizes and the chief prize winners. The solution to the competition was published in THE ELECTRICIAN of October 11th and we give below the names of some of the successful competitors :—

Prize (1) Portable " Gecophone Screen-Grid 4 " wireless set presented by the General Electric Co., Ltd., and won by G. J. Steer, Esq., 2, Carlton Crescent, Luton, Beds ; (2) 1-3 stage wireless set complete with valves, presented by the British Thomson-Houston Co., Ltd., won by Mrs. N. Baker, 13, Hemberton Road, Stockwell, S.W.9 ; (3) " Cosyglo " electric coal fire, presented by Siemens Electric Lamps and Supplies, Ltd., Mr. N. W. Riley, 34, Daventry Road, Manchester ; (4) 1-2 stage wireless set complete with valves, presented by the British Thomson-Houston Co., Ltd., Miss M. Savage, 36, Burleigh Avenue, Wallington, Surrey ; (5) " Arora " electric fire, presented by the Arora Co., Miss Jones, 4, Kenton Avenue, Harrow, Middlesex ; (6) " Ensign " tropical No. 12 camera in hide case with f/4.5. Aldis-Butcher lens, presented by Houghton-Butcher (Great Britain), Ltd., Mr. D. K. B. McGregor, 40, Aldbury Avenue, Wembley, Middlesex ; (7) wooden floor standard and shade, presented by Messrs. Young and Wildsmith, Miss H. M. David, 18, Conway Road, Cardiff ; (8) " Ediswan " electric radiator, presented by the Edison Swan Electric Co., Ltd., Mr. W. H. Tranmer, 15, Warwick Road, Reading ; (9) " Bandy " 10 in. desk and bracket fan, presented by Berkeley and Young, Ltd., Mr. P. M. Plucknett, 41, Wood Vale, London, N.10 ; (10) " Mullard " " H " type loud speaker, presented by the Mullard Wireless Service Co., Ltd., Mr. H. J. Yarwood, 14, Wake Green Road, Moseley, Birmingham.

The pewter rose bowl presented by Mr. Justus Eck, for selling the winning ticket was won by Mr. L. E. F. Baenziger, " Aros," Sandpit Lane, St. Albans, Herts.

Other Prizes and Donors.

Others prizes included :—" Ensign " folding all-distance camera, by the Houghton-Butcher Manufacturing Co., Ltd. ; real " Noritake " table standard with 14 in. dia. double silk, hand-painted shade, by L. G. Hawkins and Co., Ltd. ; " Amplion " standard cabinet cone loud speaker (A.C. 25), by Graham Amplion, Ltd. ; electrical goods to value of £3 3s., by Cryselco, Ltd. ; " Universal " chromium-plated toaster, by L. G. Hawkins and Co., Ltd. ; " Venner " silver grill, by Venner Time Switches, Ltd. ; " Mullard " high-tension units, by the Mullard Wireless Service Co., Ltd. ; " Ferranti " valve tester, by Ferranti, Ltd. ; " Neon " sign for any name of 12 letters, by Messrs. Marryat and Place ; " Ediswan " electric iron, by the Edison Swan Electric Co., Ltd. ; " Premier " accident-proof electric kettle, by Premier Electric Heaters, Ltd. ; " Berry's " electric coffee percolator, by Berry's Electric (1928), Ltd. ; " Xcel " nickel-plated safety kettle, by Siemens Electric Lamps and Supplies, Ltd. ; " Inventum " 1½ gallons electric cistern, by Drake and Gorham Wholesale, Ltd. ; " Philips " loud speakers, by Philips Lamps, Ltd. ; electric radiator, by Mr. J. Fotheringham. ; " Artic " electro-velocity radiator, by Arctic Fuse and Electrical Manufacturing Co., Ltd. ; " Benjamin " products to the value of £3 3s., by the Benjamin Electric, Ltd. ; " B.T.H. C.2 " horn type loud speaker, by the British Thomson-Houston Co., Ltd., Cardiff ; " Goltone " radio products to the value of £3 3s., by Ward and Goldstone, Ltd. ; " Godwinex " h.t. eliminator, by J. Dyson and Co., Ltd. ; " Premier " Smoothwell " electric iron, by Premier Electric Heaters, Ltd. ; " Polar Claricone " loud speaker, by Wingrove and Rogers (Polar), Ltd. ; " Waterman's Ideal " fountain pens, by L. G. Sloan, Ltd. ; " Ediswan " electric toaster, by the Edison Swan Electric Co., Ltd. ; " Mullard " " C " type loud speakers, by the Mullard Wireless Service Co., Ltd. ; type 1-C2 loud speaker, by the British Thomson-Houston Co., Ltd. ; " Stuart " model dynamo, by Stuart Turner, Ltd. ; " Formo " radio components to the value of £2 2s., by the Formo (Arthur Preen) Co., Ltd. ; electric kettle, by the A.E.G. Electric Co., Ltd. ; mottled " Spot " fountain pen and rolled gold " Spot " pencil, by the Mentore Manufacturing Co., Ltd. ; " Day-Fan " cleaner, presented by S. G. Leach and Co., Ltd. ; 3 doz. " Duophone " new electrical process records by the Duophone and Unbreakable Record Co., Ltd. ; cone loud speaker by the British Thomson-Houston Co., Ltd. ; " Varley " radio components, by Varley (Oliver Pell Control, Ltd.) ; " Rothman " greywood cabinet of " Pall Mall " virginia cigarettes, by Rothman's, Ltd. ; " Swan " No. 4 self-filling fountain pen with rolled gold clip, by " Swan " pens (Mabie Todd and Co., Ltd.) ; " Kunzle " 1½ lb. box of " Art Dessert " chocolates, by Messrs. Kunzle ; radio voltmeter, by the A.E.G. Electric Co., Ltd. ; electric heating pad, by the A.E.G. Electric Co., Ltd. ; " Durham-Duplex " razors, by Durham-Duplex Razor Co., Ltd. ; " Trojan " electric iron, by John Shaw and Sons, Wolverhampton, Ltd. ; " Player's " casket of medium navy cut cigarettes, by John Player and Sons ; domestic electric iron, by J. Gledson and Co. ; sets of tungsram barium valves, by the Tungsram Electric Lamp Works (Great Britain), Ltd. ; " Graham Farish " coupler complete with resistances, by Graham Farish, Ltd. ; " Brownie " crystal receivers, by the Brownie Wireless Co., Ltd.

ELECTRICAL RIFLEMEN.

Annual Dinner and Prize Giving of Electricity Supply Rifle League.

MEMBERS of the Electricity Supply Rifle League met on November 30th at the Talbot Restaurant, London, E.C., for their annual dinner and presentation of prizes. Mr. R. S. Downe (Brompton and Kensington) presided, and the 79 diners included Messrs. A. R. Bacon (County) and H. P. Gaze (Central) past Presidents, and Messrs. J. R. J. Bowden (Hackney), E. Harlow (City Co.), S. G. Nodes (Central), G. C. Weston (K. and K.), vice-presidents. Owing to the unfortunate absence of Mr. Pethard (S.M.R.C.), the toast of the League was taken as read and the Hon. Secretary had a few remarks to make as to the activities of the League during the past season. Mr. Harlow (City Co.) in a racy speech proposed " The President " (Mr. R. S. Downe) and commented on the fact that although he was President of the League, the club run by his undertaking had not been able to fire a single shot because it had not got a range.

The following were the prize winners :—CHAMPIONSHIP, 1ST DIVISION.—Central A, Shield, and silver medals to Messrs. A. J. Beale, H. P. Gaze, E. E. Lee, J. W. Lyons, A. E. Northrop, W. Pearce, F. Smith, W. G. Wright and W. C. Young (captain). CHAMPIONSHIP, 2ND DIVISION.—St. James, Shield, and silver medals to Messrs. H. P. Liddell (captain), C. J. Johnson, C. P. Fox, H. J. Clark, F. O. Andrews, E. L. Rigby, R. D. F. Powell, and G. A. Wilshire. The S.M.R.C. SILVER MEDAL for the best average in League matches, was awarded to Mr. S. Thomas (Shoreditch) with 97·85. The winners in the Knock-Out Competition (teams of three) were Central, comprising Messrs. Watkins, White and Wright ; St. James, with Messrs. Fox, Rigby and Clark, were runners up.

Possibles were registered during the season by Messrs. S. Thomas (Shoreditch), S. Driver, J. Crouchman and W. H. Baines (City Co.). The highest score during the season was :—Division 1 : Central A and City A, 586 ; and Division 2 : St. James, 580. The best average was : Division 1 : Central A, 582·57 ; and Division 2 : St. James, 571·71.

Final Results.

Owing to range difficulties it was not possible to complete all the matches and the final table of results was as follows :—

DIVISION 1.

	Shot.	Won	Lost	Scores. For	Against	Points
City A	8	7	1	4 640	4 022	14
Central A	8	7	1	4 078	4 027	14
City B	8	4	4	4 602	4 040	8
Shoreditch A ..	8	2	6	4 022	4 047	4
County A	8	0	8	2 276	3 482	0

B. and K. did not compete.

DIVISION 2.

	Shot	Won	Lost	Drawn	Scores. For	Against	Points
St. James ..	14	12	1	1	8 004	7 655	25
Greenwich ..	14	11	3	0	7 912	7 140	22
City C ..	14	10	3	1	7 929	7 144	21
Central B ..	13	8	5	0	7 376	7 172	16
K. and K. ..	12	4	8	0	5 037	6 683	8
Hackney ..	14	4	10	0	7 189	5 634	8
Shoreditch B	12	2	10	0	5 969	6 102	4
Barking ..	11	0	11	0	4 250	6 136	0

In the tie shoot for the championship of Division 1, Central A were successful.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

DUNDEE CORPORATION.—Electric lighting work in connection with additions and alterations at Lilybank Day Nursery. Further particulars from the City Engineer.

FORFARSHIRE INFIRMARY.—Supply of two sunray lamps, suitable for the Grampian scheme energy of 240 V. Further particulars from Messrs. Machardy and Whyte, joint secretaries, Forfar.

WREXHAM RURAL DISTRICT COUNCIL.—Electric light wiring of 160 houses to be erected on various sites. Specifications, etc., from the engineer, Mr. J. H. Edwards, Imperial Buildings, Wrexham; deposit £10.

BELFAST EDUCATION COMMITTEE, December 13th.—Electric lighting installation at North Road P.E. School. Specification from the Education Architect, Victoria Street, Belfast; deposit £1 1s.

Tower Ladder Vehicles.

MANCHESTER CORPORATION, December 13th.—Supply of electrically-propelled tower ladder vehicles. Specification, etc., from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester.

EDINBURGH CORPORATION, December 14th.—Supply of 25 air-brake equipments, suitable for electric tramcars. Specification, etc., from the Transport Manager, 2, St. James's Square, Edinburgh.

GLAMORGAN COUNTY COUNCIL, December 16th.—Electric lighting installation at Hensol Castle, near Pontyclun. Specification from the Clerk of the County Council, County Hall, Cardiff, or at Hensol Castle.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC., December 17th.—Rewiring for electric lighting at the Patent Office and the Public Record Office, London, W.C. Specification from the Contracts Branch, King Charles Street, S.W.1; deposit £1 1s. in each case.

MANCHESTER CORPORATION, December 17th.—Supply of copper bands for tramway rails. Specifications, etc., from the General Manager, Transport Department, 55, Piccadilly, Manchester.

GLASGOW EDUCATION AUTHORITY, December 18th.—Electric lighting and heating installations at South Carntyne Temporary School and Our Lady and St. Margaret's School Temporary Annexe. Specifications, etc., from the Education Offices (Property Department), 129, Bath Street, Glasgow; deposit £1 1s. per specification.

KIRKCALDY EDUCATION AUTHORITY, December 18th.—Electric and heating installations, in connection with extensions of St. Agatha's R.C. School, Methil, and Bell-Baxter School, Cupar. Schedules from Mr. E. Sandilands, Education Offices, Kirkcaldy; deposit £1 1s.

PORTSMOUTH GUARDIANS, December 18th.—Three months' supply of electric lamps and stores. Forms of tender, etc., from the clerk, Mr. W. E. Godfrey, 1, St. Michael's Road, Portsmouth.

WEST RIDING MENTAL HOSPITALS BOARD, December 18th.—Electric light wiring in connection with erection of a sanatorium at Wadsley Mental Hospital, near Sheffield. Specification, etc., from Mr. W. E. H. Burton, West Riding Mental Hospitals Board, Wakefield.

HULL CORPORATION, December 19th.—Supply of electricity meters (contract No. 148). Forms of tender, etc., from Mr. J. N. Waite, city electrical engineer, Electricity Works, Sculcoates Lane, Hull; deposit £2.

MILLOM URBAN DISTRICT COUNCIL, December 20th.—Haverigg extension scheme, comprising e.h.t. and l.t. cables, pillar box, etc. (section A); and e.h.t. and l.t. switchgear, transformers, etc. (section B). Specification, etc., from Mr. A. Lawrence, solicitor, clerk to the Council.

BARMING HEATH MENTAL HOSPITAL, December 21st.—Electrical installation for lighting, heating, etc. Specification, etc., from Mr. E. E. Hoadley, Corporation Electricity Works, Maidstone; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, December 21st.—Supply and erection of 132 000 V transformers in connection with Mid-East England Electricity Scheme. Specification (No. M.E.E.F.T.1) and form of tender from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

HALIFAX CORPORATION, December 21st.—Electrician's work in connection with erection of new Girls' High School at Craven Lodge. Names of intending contractors to be sent by December 21st to Mr. A. C. Tipple, borough engineer, Crossley Street, Halifax; deposit £2 2s.

WIRKSWORTH PARISH CHURCH, December 21st.—Electric light installation. Specification from Mr. T. H. Greatorex, The Birches, Cromford Road, Wirksworth; deposit £1 1s. Only members of the National Register of Electrical Installation Contractors are invited to tender.

LIVERPOOL CORPORATION, December 23rd.—Supply of 12 750 kVA, three-phase, 50 period, 6 600/400 V oil-cooled, step-down transformers. Tender form from the City Electrical Engineer, 24, Hatton Garden, Liverpool.

METROPOLITAN ASYLUMS BOARD, January 2nd.—Replating 500 Ah battery at St. Luke's Hospital, Lowestoft. Specification, etc., from the office of the Board, Victoria Embankment, London, E.C.4.; deposit, £1.

METROPOLITAN ASYLUMS BOARD, January 2nd.—Alterations of electric lighting installation at South-Western Fever Hospital, London Road, Stockwell, London, S.W.9. Specifications, etc., from the office of the Board, Victoria Embankment, London, E.C.4; deposit, £1.

CENTRAL ELECTRICITY BOARD, January 6th.—Supply and erection of 132 kV overhead transmission lines (special crossings and high spans), in connection with North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.—P.L. 2) and form of tender from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

ISLINGTON (LONDON) GUARDIANS, January 9th.—Supply and erection of five full-automatic push-button electric lifts at the Infirmary, Highgate Hill, N.19. Specification, etc., from Mr. Albert King, Guardians' Offices, St. John's Road, Upper Holloway, N.19; deposit £2.

ISLINGTON (LONDON) BOROUGH COUNCIL, January 17th.—One year's supply of cables, electricity meters, cable terminal and other boxes, switches, wires, lamps and sundries. Specification, etc., from the Town Clerk, Municipal Buildings, Upper Street, London, N.1.

CENTRAL ELECTRICITY BOARD, January 20th.—Supply and erection of 3·3 kV, 6·6 kV, and 11 kV switchgear, for connecting the Board's supply to undertakers' busbars. Specification (N.W.E.—G.S.1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

METROPOLITAN WATER BOARD, January 21st.—Supply and erection of four steam turbines, with pumps, and two electric generators for Surbiton pumping station. Specification, etc., from the Chief Engineer (Room 173), 173, Rosebery Avenue, London, E.C.1; deposit £3 3s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

CHRISTIAN BROTHERS, TRALEE (CO. KERRY).—Wiring installation in new schools. Specification from Messrs. McEntee and O'Kelly, 23, Upper O'Connell Street, Dublin; deposit £2 2s.

CHRISTCHURCH DRAINAGE BOARD, December 13th.—Supply and installation of four electrically-driven automatically-controlled pumping plants, each consisting of two horizontal centrifugal pumps with direct-coupled electric motor (contract No. 29/420); and two horizontal type, 3 H.P. a.c. motors direct-coupled with centrifugal sewage pumps (contract No. 29/421). (Reference A.X. 8 788.)

DUBLIN CORPORATION, December 14th.—Electric lighting and power installation at City Abattoir, North Circular Road, Dublin. Specification from the City Engineer, 28, Castle Street, Dublin, or Mr. F. McArdle, architect, 29, Rosemary Street, Belfast; deposit £3 3s.

Digitized by Google

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, December 16th.—Supply and erection of electrically-driven pumping plant, with ironwork, crane and gantries, for Junee water supply. (Reference A.X. 8 740.)

VICTORIAN ELECTRICITY COMMISSION, December 16th.—Oscillograph equipment. (Reference B.X. 5 692.)

MOROCCO POSTS AND TELEGRAPHS, December 17th.—Supply of two tons of 2 mm. copper wire and 75 tons of 2 mm. high conductivity copper wire.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 17th.—Secondary batteries (schedule C. 505). (Reference B.X. 5 777.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 17th.—Telephone fuses, heat coils and protectors (schedule C. 498). (Reference B.X. 5 784.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, December 17th.—Loading coil pots (schedule C. 499). (Reference B.X. 5 785.)

Accumulator Accessories.

BOMBAY, BARODA AND CENTRAL INDIA RAILWAY Co., December 20th.—Supply of (1) glass boxes for accumulators; (2) plates for accumulators, and (3) wood separators for accumulators. Specification, etc., from the secretary, Mr. S. G. S. Young, White Mansion, 91, Petty France, Westminster, S.W.1; on payment of £1 for No. 2 and 10s. each for Nos. 1 and 3 (not returnable).

IRISH FREE STATE PUBLIC WORKS DEPARTMENT, December 20th.—Electric lighting installation at Stationery Office, Beggar's Bush Barracks, Dublin. Specification, etc., from Mr. T. Cassedy, secretary, Office of Public Works, Dublin; deposit £1.

COPENHAGEN LIGHTING DEPARTMENT, December 21st.—Oil-cooled 10 000 kVA transformer, with pumps, motors and other accessories. (Reference B.X. 5 945.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, December 27th.—Telegraph material, including g.i. tubular arms, insulators, upper tubes for poles, etc. (tender No. 175). (Reference A.X. 8 734.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, December 28th.—Supply and erection at site of Mankabad Barracks of three Diesel engine driven electric generators, and sinking of two wells. Specifications (£1 0s. 6d., not returnable) from Chief Inspecting Engineer, 41, Tothill Street, Westminster, S.W.1.

EGYPTIAN MINISTRY OF PUBLIC WORKS, January 4th.—Supply and erection at site of Meadi Barracks, Cairo, of two Diesel engines to drive existing generators. Specifications (£1 0s. 6d., not returnable) from Chief Inspecting Engineer, 41, Tothill Street, Westminster, S.W.1.

JOHANNESBURG MUNICIPALITY, January 4th.—Supply of automatic traffic signals (contract No. 305). (Reference B.X. 5 924.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, January 6th.—Supply and erection of plant for supply of filtered and unfiltered water, including pumps, electric motors, etc. (Reference A.X. 8 746.)

CAPE TOWN MUNICIPALITY, January 7th.—Supply of 3-core 11 000 V cable (specification No. 482/1929). (Reference B.X. 5 925.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of timing clocks (schedule No. C. 507). (Reference B.X. 5 762.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Telephone cable terminal boxes (schedule C. 540). (Reference B.X. 5 938.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of testing instruments (schedule C. 504). (Reference B.X. 5 786.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of contact pressure testers (schedule No. C. 516). (Reference B.X. 5 821.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 7th.—Supply of telephone hand sets (schedule C. 526) (Reference B.X. 5 823.)

BLOEMFONTEIN MUNICIPALITY, January 10th.—Supply of automatic electric traffic signals (contract No. 5). (Reference B.X. 5 887.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 13th.—Supply of four-point jacks (P. and T. 151/1897). (Reference B.X. 5 840.)

VICTORIAN ELECTRICITY COMMISSION, January 13th.—Supply of 2 200 V switchgear and accessories (specification No. 30/2). (Reference B.X. 5 827.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 14th.—Two air compressors (capacity not less than 800 cu. ft. of free air per min.), and two electric motors. (Reference A.X. 8 784.)

INDIA STORE DEPARTMENT, January 15th.—Supply of wood separators for train-lighting cells. Form of tender (5s.) from the Director-General, Belvedere Road, Lambeth, London, S.E.1.

NEW ZEALAND POSTS AND TELEGRAPHS, January 16th.—Plug covers for telephone switchboard plugs. (Contract P. and T. 151/1 943.) (Reference B.X. 5 879.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, January 16th.—Supply of crude oil engine driven electric generating sets (tender No. 1 589). (Reference B.X. 5 926.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 21st.—Spare parts for automatic telephones. (Reference B.X. 5 917.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 21st.—Four electric motor driven ventilating fans. (Reference A.K. 8 857.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 28th.—Supply of 50 kV oil-immersed circuit breakers, with current transformers and relays (section 299). (Reference B.X. 5 878.)

POSTMASTER-GENERAL'S DEPARTMENT, January 28th.—Supply of telephone cycle signalling equipment. (Reference B.X. 5 906.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 28th.—Supply of induction coils and register plates. (schedule No. C. 533). (Reference B.X. 5 899.)

EGYPTIAN MINISTRY OF THE INTERIOR, February 1st.—Centrifugal well pump and direct coupled electric motor, with piping and accessories. (Reference A.X. 8 811.)

VICTORIAN ELECTRICITY COMMISSION, February 3rd.—Electrically-driven mobile coal-trimming machine, for Yallourn power station. (Reference A.X. 8 681.)

VICTORIAN ELECTRICITY COMMISSION, February 10th.—Supply of sine wave generating equipment and accessories (specification No. 30/3). (Reference B.X. 5 844.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 18th.—Telephone jacks and number plates (Schedule No. C. 541). (Reference B.X. 5 940.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Jumper rings and terminal strips (schedule C. 543). (Reference B.X. 5 941.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, February 27th.—Supply and erection of h.t. three-phase, overhead transmission lines in the Northern Delta of the Nile. Specifications, etc., from the Chief Inspecting Engineer, Egyptian Government, 41, Tothill Street, London, S.W.1 (£10 5s., not returnable).

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Switchgear and controlling equipment. (Reference B.X. 5 798.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 110 kV switchgear, for interconnecting auto-transformers, for Waitaki power scheme, section 76. (Reference B.X. 5 797.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th,—Supply of 66 kV switchgear and protective system for Lyttelton, Lake Coleridge power scheme, section 217. (Reference B.X.5 796.)

VICTORIAN RAILWAY COMMISSION, March 30th.—Supply of d.c. neutral relays for power signalling purposes (contract No. 43 457). (Reference B.X. 5 793.)

SOUTH AFRICAN IRON AND STEEL INDUSTRIAL CORPORATION, LTD., April 12th.—Electrical and other equipment for the various departments of the company's iron and steel works to be erected at Pretoria. Further information from the Committee of Consulting Engineers of the South African Iron and Steel Industrial Corporation, Ltd., c/o the International Construction Co., Ltd., 56, Kingsway, London, W.C.2.

Tenders Accepted.

CAIRO UNIVERSITY.—Holophane, Ltd., electric lighting installation.

BATH CORPORATION.—Lambeth and Son, electrical work at the Hospital, £659.

HULL CORPORATION.—Siemens Bros. and Co., Ltd., supply of 440 yds. of l.t. cable, £143.

ASHBOURNE URBAN DISTRICT COUNCIL.—Meldrums, Ltd., refuse destructor, £1 000 3s.

TYNEMOUTH CORPORATION.—Macintosh Cable Co., Ltd., supply of cable, £371 17s. 11d.

CONSETT IRON CO., LTD.—R. W. Leek and Co., electric light installations in 635 houses.

Digitized by Google

STAFFORDSHIRE EDUCATION COMMITTEE.—W. G. France, lighting of Wolverhampton School.

GRIMSBY CORPORATION.—Forest City Electric Co., Ltd., provision of street automatic light signals.

SCARBOROUGH CORPORATION.—British Insulated Cables, Ltd., supply of e.h.t. and l.t. cables, £18 531.

HORNSEY CORPORATION.—A. Reyrolle and Co., Ltd., alterations to switchboard, £855 8s. (Recommended).

WEST HAM GUARDIANS.—F. Hodson and Co., Ltd., installation of fire alarm system at Whipps Cross Hospital, £324.

SALFORD CORPORATION.—General Electric Co., Ltd., equipment for private automatic branch telephone exchange, £668. (Recommended.)

BRISTOL CORPORATION.—J. H. Winter and Co., electrical work at secondary school, to be erected at Cotham, £560. (Recommended.)

LEWISHAM (LONDON) BOROUGH COUNCIL.—A. J. Hewens and Sons, electrical installation at depot garage, £74 12s. 6d. (Recommended.)

PERTH EDUCATION AUTHORITY.—A Bell, electric light installation in connection with erection of academy, £1 258. (Recommended).

GRIMSBY CORPORATION.—Metropolitan Electric Cable and Construction Co., Ltd., supply of low pressure, paper-insulated, lead-covered cables.

SOUTHWARK (LONDON) BOROUGH COUNCIL.—Derby Cables, Ltd., supply of cable, £3 067; W. Lucy and Co., Ltd., supply of feeder pillars, £53 15s. each. (Both recommended.)

EASTBOURNE CORPORATION.—General Electric Co., Ltd., supply of two transformer kiosks, including gear and estimated cable connections, £1 049; Pirelli-General Cable Works, Ltd., supply of h.t. cable, £5 612.

GENERAL POST OFFICE.—Manufacture, drawing in and jointing of cables: Salisbury-Basingstoke, Pirelli-General Cable Works, Ltd.; telephone exchange equipment: Sydenham, Automatic Telephone Manufacturing Co., Ltd.

HULL CORPORATION.—T. Bolton and Sons, Ltd., supply of 3 tons of bronze wire, for telephones department, £326 2s. 9d; Equipment and Engineering Co., Ltd., supply of insulators, £128 12s. 6d., for telephones department, £128 12s. 6d. (Both recommended.)

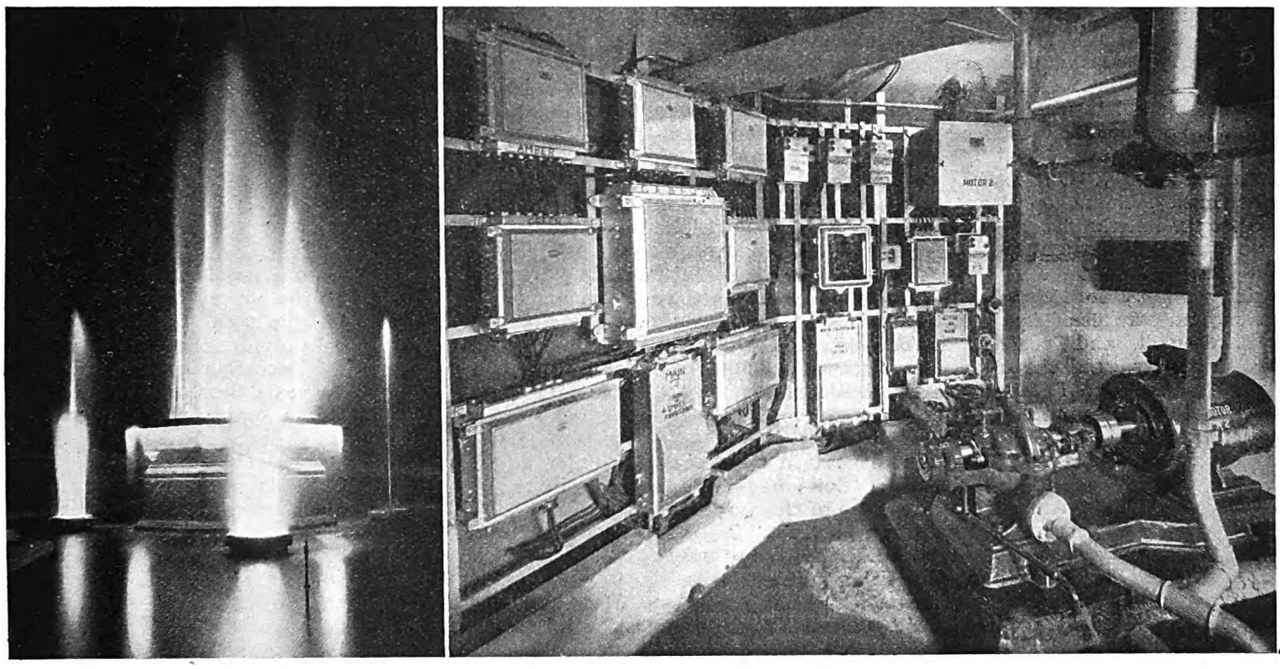
BIRKENHEAD CORPORATION.—Electrical supplies, etc., for technical college: Standard Telephones and Cables, Ltd., telephones and instruments, £11 2s.; Siemens Bros. and Co., Ltd., wall telephones, £3 3s.; Advance Lamp Co., Ltd., electrical supplies, £26 13s.

BARKING URBAN DISTRICT COUNCIL.—Derby Cables, Ltd., supply of 3 200 yds. of 4 core cable, £351; Hackbridge Electric Transformer Co., £186, supply of 400 kVA transformer at works of Messrs. Gross, Sherwood and Heald, £186. (Both recommended).

BIRTLEY PARISH COUNCIL.—F. Reid Ferens and Co., public electric lighting equipment, £2 005. (Contract was provisionally let to Watson and Norrie, Ltd., but this firm desired an additional sum of £180 over the contract price of £2 010, as the work would have to be carried out in the winter period, but Council rescinded resolution awarding contract to them.)

METROPOLITAN ASYLUMS BOARD.—Ericsson Telephones, Ltd., installation of central battery telephone system at South-Western Hospital, £437. (Recommended.) Also tendered: L. G. Tate and Co., Ltd., £492; T. Clarke and Co., Ltd., £493; Alpha Manufacturing and Electrical Co., Ltd., £523; General Installation Co., Ltd., £525; Phillips and Sons (Chiswick), Ltd., £890.

MANCHESTER CORPORATION.—Equipment and Engineering Co., Ltd., electric tram rail welding equipment; Titan Trackwork Co., Ltd., tramway special trackwork; R. Seddon and Sons, electrical installation at North Manchester High School for Boys; Brookes and Co. (1925), Ltd., electrical installation at Birchfields Road Municipal School; R. and J. Dempster, Ltd., electric light for waterless gasholder, Bradford Road.



BOURNEMOUTH'S ILLUMINATED ELECTRIC FOUNTAIN.

CONSIDERABLE public interest has been aroused by the illuminated electric fountain which has recently been installed in front of the new Pavilion at Bournemouth, and these pictures show the fountain in operation and the control room beneath the centre basin. There are six colour changes in the water jets in 8 minutes while 12 different lighting effects are produced every minute, giving a total of 72 different combined colours and water effects. Thirty special watertight floodlight projectors are used in the upper basin of the large centre fountain, each with a 1 000 W projector lamp. Each of the 4 small fountains contains one floodlight projector fitted with a coloured glass cover. The upper basin is, in addition, fitted with a bronze lip which houses a number of natural green glass vacuum lamps. The water jets and projectors are controlled by a motor-driven multi-way automatic control drum, the water jets being operated by 5 magnetic valves which continually alter the height of the sprays and jets. The water power for the 4 smaller fountains is obtained by means of a centrifugal pump driven by a 7½ H.P. squirrel cage B.T.H. motor, and for the large centre fountain by means of another centrifugal pump driven by a 10 H.P. motor. The control room is situated beneath the centre basin and is reached through a small door in the side of the centre fountain, though the dual controls fitted to the apparatus enable the fountain to be operated from another control room in the Pavilion. The fountain was supplied by the Edison Swan Electric Co., Ltd., the contactors, and J.A. 1 type switches were supplied and manufactured by the British Thomson-Houston Co., Ltd. and the erection of the electrical installation was carried out by Messrs. Aish and Co., of Bournemouth. The concrete constructions were built by the Bournemouth Corporation Park and Gardens Department under the supervision of Mr. W. Felstead and in accordance with drawings provided by the Edison Swan Electric Co., Ltd.

ELECTRICITY SUPPLY.

Inauguration of Fairlie Supply—Cost of Hams Hall Station—Bulk Supply for Hornsey—Power Co.'s Offer for Wakefield Undertaking—County of London Co.'s Maximum Price—Plymouth Corporation's Extensions.

MANCHESTER Electricity Committee seeks sanction to borrow £50 000 for distributing stations and £100 000 for feeder mains.

A supply of electricity, taken in bulk from Preston Corporation, was inaugurated in the townships of Kirkham and Wesham on November 28th.

The Mayoress of Tiverton (Mrs. Physick) formally started a new Ruston Hornsby Diesel engine driven generating set at the Corporation electricity works on November 30th.

Sanction is to be sought by Heston and Isleworth Electricity Committee to borrow £30 989 and £2 550 for l.t. mains and replacement of consumers' apparatus, respectively.

The offer of Heath and Co., owners of Tavistock electricity works, to light the village of Whitchurch by means of 24 lamps from dusk to midnight at a cost of £80 has been accepted.

Bolton Electricity Committee has decided to instal additional water cooling plant of the sprayer type, capable of dealing with 750 000 gallons per hour, at the Back-o'-th'-Bank generating station.

Macclesfield T.C. has appointed a committee to consider and report as to the purchase of the undertaking of the electricity Co. of Macclesfield, Ltd., and other matters which may arise in connection with the electricity supply within the borough.

Kensington (London) Works Committee has agreed to give permission to the Brompton and Kensington Electricity Supply Co. to alter vaults at 192 and 194, Finborough Road, so as to utilise them as a transformer station in connection with the supply to the Kensington, Fulham and Chelsea General Hospital.

The first stage of the Grampian hydro-electric scheme was concluded on November 29th, when Mr. George Balfour, M.P., fired the last shot in the tunnel between Loch Ericht and Loch Rannoch. Great progress has been made with the undertaking during the past year, and about 40% of the tunnel has already been lined with concrete.

The British Columbia Provincial Government proposes to spend $110 000 000 during the next ten years on hydro-electric development. The British Columbia Power Corporation and the West Kootenay Power and Light Co. will produce most of the new power supply, and on the completion of the programme the electric power production in the province will be equal to 1 500 792 H.P. In 1914 it was 64 474 H.P.

The Earl of Glasgow officiated at the inauguration of the electricity supply to Fairlie last week, in the presence of members and officials of Ayrshire Electricity Board, Ayrshire County Council, and local public bodies. Ex-Provost A. Millar, Saltcoats, said the current was now available from Largs in the north to Turnberry in the south, and the board was contemplating extending the cable to Girvan in the immediate future.

The Minister of Transport announces that in connection with the application of Wandsworth (London) Borough Council and certain consumers for a revision of the maximum price which the County of London Electric Supply Co. may charge for electricity supplied by them under the Wandsworth Electric Lighting Order, 1892, into which an inquiry was held by two of the Electricity Commissioners, he has made an Order reducing the maximum charge to 5d. per kWh as from December quarter readings, and reducing the minimum quarterly charge to 6s. 3d. in each of the winter quarters and 4s. 2d. in each of the summer quarters.

Col. T. C. Ekin held an inquiry last week, on behalf of the Electricity Commissioners, into the application of the Tilbury U.D.C. for a loan of £44 362 for electricity purposes. The inspector stated that he found that the sum really required by the council was £46 706 10s. 5d., and if so the council would have to pass a resolution amending the amount. The inspector criticised the loss on the undertaking and the absence of a charge for meters, and remarked that in the present state of affairs every unit sold brought in a net loss of 3d. It was arranged that the council should supply certain supplementary information, and pass an amended resolution as to the amount of the loan.

Reporting upon the new Hams Hall power station, Birmingham Electricity Committee says the actual cost of the works and commitments to-date amount to £1 526 500, or £190 100 in excess of the original estimate. The estimate covered accommodation for plant of a capacity of 60 000 kW. The buildings, as finally designed, were erected to accommodate 90 000 kW of plant, and already the committee is faced with the necessity of installing the extra 30 000 kW at an early date. With regard to the cooling towers, when detailed designs and calculations were more closely investigated, it was decided to make larger provision for the future. Another item responsible for the increased cost was a reservoir in connection with the water supply.

The City Engineer of Hull has received from the City Electrical Engineer a quotation for street lighting on the North Hull Estate and Derringham Bank Estate. The figure quoted for the 36 lamps to be erected on the North Hull estate extension and 84 lamps on Derringham Bank Estate is £4 per lamp per annum, including installation, etc. These terms are for an all-night lighting and for 100 W lamps, which will give 80 c.p. The offer has been accepted.—The Electricity Committee has approved a proposal to erect an overhead line from Sutton to Skirlaugh, in connection with the project to give a supply to the Hornsea area. The cost of such line and ancillary apparatus, inclusive of provision for a supply to Swine and Skirlaugh, is estimated at £15 186. The work is to be carried out by the electricity department's present contractors, Watsham's, Ltd., at schedule rates.

Plymouth Electricity Committee has received sanction to borrow £65 000 for new mains and services.—The Town Clerk and the Borough Electrical Engineer of Plymouth, with the Clerk and Electrical Engineer to Plympton R.D.C., have interviewed the Electricity Commissioners concerning Orders to supply in the urban districts of Ivybridge and Kingsbridge. The Commissioners intimated that they would be prepared, if necessary, to grant the Corporation the necessary powers to go through the Plympton area for the conveyance of a bulk supply beyond that area.—Plymouth Electricity Committee has decided to provide additional equipment at Prince Rock station, including a turbo-alternator and foundations, £42 500; boilers, chimney, etc., £39 333; feed and circulating pumps, etc., £4 200; circulating water screens and chamber, £3 080; steam and other piping, £4 400; switchgear, £8 713; cables, £900; and conveyor, £1 200.

Hornsey Electricity Committee reports that it has received a further communication from the London and Home Counties Joint Electricity Authority, offering terms for a permanent arrangement with regard to the supply by the Authority of electricity in bulk to meet the total requirements of the borough. The new proposal provides that (*a*) the agreement shall continue in force until December 31st, 1950; (*b*) that after the expiration of seven years the Council shall have the option at any time of taking a supply at the "grid" price instead of the price named in the agreement; (*c*) in consideration of an increase in the price already agreed the Joint Electricity Authority will repay in addition to the actual cost of generation at the Council's station the annual existing loan charges payable by the Council in respect of generation. The Committee recommends that this proposal be accepted.—The Electricity Committee is to lay a new feeder to Priory Road sub-station at a cost of £3 065.

With reference to the offer made by the Yorkshire Electric Power Co. to purchase Wakefield Corporation's electricity undertaking for £250 000, "plus a substantial sum," the General Purposes Committee reported last week the receipt of a further communication from the company. The council recommended that the Council's previous decision to refuse the offer be adhered to. Councillor A. A. Bonner referred to the loss sustained by the town recently (as the result of the collapse of the Hatry group), and said that if the corporation had an offer from the power company which would allow a large amount being left over after they had paid off the debt on the electricity undertaking he considered that they ought to think of this, with a view to assisting the town in its present position. An amendment to refer back the Committee's recommendation was not carried, the voting for and against it being equal. At a special meeting on the same day the council approved the promotion of a Bill in Parliament to authorise borrowing powers for making good the loss incurred in connection with the issue of the Wakefield 4½% loan.

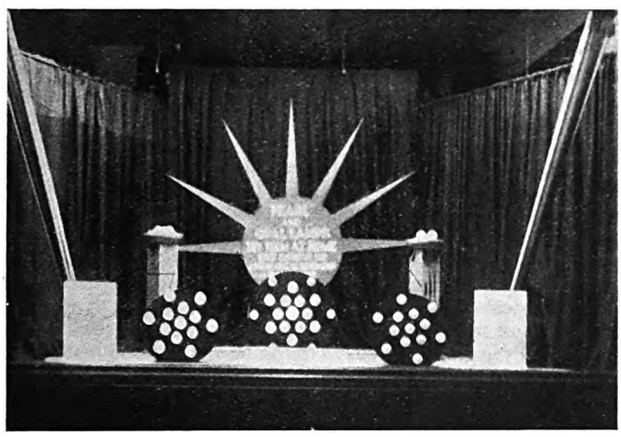
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

Mr. J. H. Parker, borough electrical engineer, West Hartlepool, who has been recommended for appointment as electrical engineer to the L.C.C. Tramways Department. See page 744.

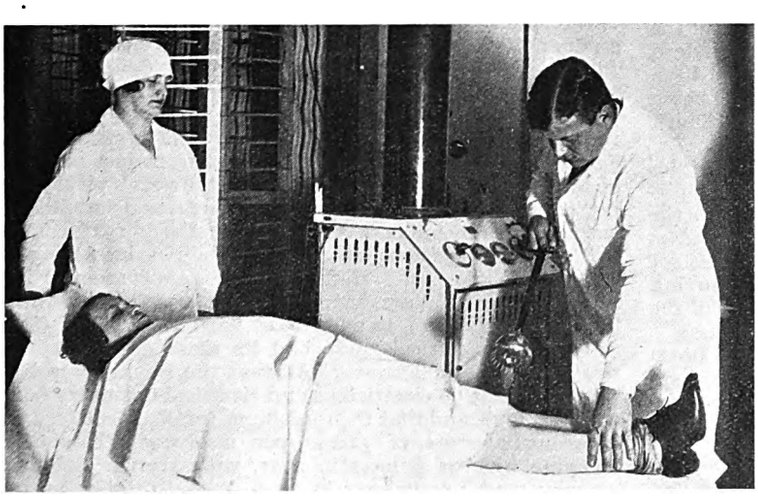
Mr. E. J. Jennings, who will in January assume the title of Secretary and Commercial Manager of the Birmingham Electric Supply Department. See page 744.

Mr. C. A. Blascheck, whose death on November 26th is referred to on page 744, was chief engineer of the Canterbury Municipal electricity undertaking for 27 years.



A novel arrangement for a window displaying pearl and opal lamps, designed by the sales staff of Keighley electricity Department. The window was intended to emphasise the improved appearance of decorations illuminated by lamps of these types.

The prize-winning window of Hattersley Bros., of Bradford, staged in connection with "Exide Fortnight." In the foreground are cavalry at the mercy of the batteries left and right. A full list of prize winners is given on page 745.



This apparatus, the invention of an Austrian doctor, is reported to be of considerable interest in the treatment of cancer. It is, we understand, a high frequency machine of high voltage and is used in conjunction with radium. It is now being used by the inventor in a special institute with a view to substantiating all the hopes that the arrangement seems to offer.

The lighthouse on the top of St. Bartholomew's Hospital, London, which has been erected in connection with a £1 000 000 reconstruction fund. Other details of the light are given on page 752.

THE NATIONAL REGISTER.

Further Seventeen Names Added to Registration List.

AT a meeting of the Executive Committee of the National Register of Electrical Installation Contractors on December 6th, applications for registration from twenty-five electrical installation contractors were considered, the Committee accepting seventeen and declining seven. At the same meeting one application was withdrawn.

The names and addresses of those contractors whose applications were successful are given below :—

Firth, James, Shaw Street, Bradford, Manchester.
Gaskell and Garraway, Ltd., Bridge Street, Taunton.
Wilkinson's Wireless and Electrical Co., 40, Clifton Street, Lytham, Lancs.
Penrose and Son, 62, Mutley Plain, Plymouth.
Swift, T. W., Robert Street, Selby, Yorks.
Maclean, Kenneth, 2, Cheltenham Road, Chorlton-cum-Hardy, Manchester.
Burton, Walter H., 13, Alexandra Road, Chesterfield.
King, H. H., and Co., 2, Stamford Road, Longsight, Manchester.
Podmore, William H., Merridale Road, Chapel Ash, Wolverhampton.
Hammond, Charles Wm., 25, Westbourne Road, Peverell, Plymouth.
Lowrey, Amos S., 5, North Street, Newcastle-on-Tyne.
Fear, Ernest J., Lyefield Road West, Charlton Kings, Cheltenham.
Hill, William Frank, 18, Parkholme Road, Dalston, London, E.8.
Wyeside Welding and Battery Service Co., 51/52, Whitecross Street, Hereford.
Thomas Lewis and Sons, Ltd., 54, North Parade, Aberystwyth.
Darby, George A., 28, Frederick Street, Birmingham.
Watson and Sons, Birmingham Street, Oldbury.

"BART'S" LIGHTHOUSE.

Electrical Aid to £1 000 000 Hospital Appeal—Estimated c.p. of 750 000.

VISITORS to London will no doubt have seen the beams thrown by the lighthouse on the top of St. Batholomew's Hospital, which was switched on by the Prince of Wales last week. The device is an actual lighthouse made by Collier and Co., Ltd., who have kindly lent it to the hospital for the purposes of a special appeal for £1 000 000 for the reconstruction fund. The light is fixed at the top of the new surgical and operation theatre block which is approaching completion, and its height is about 120 ft. above ground level. The lighthouse had to be fixed without holding-down bolts, as the roof was already asphalted, and it reflects great credit on the Clerk of the Works that the temporary fixings have withstood the violent gales. The lamp is a Philips 5 000 W 200 V of standard type, and is fixed cap upwards. The lenses are rotated by a one-eighth H.P. shunt motor, a series resistance of 100 Ω being inserted in the armature circuit at starting, to prevent a kick on the worm gear.

The model, which was switched on by the Prince of Wales in the Great Hall of the hospital simultaneously with the lighthouse on the roof of the new building, was presented to the hospital by the consulting electrical engineer, Mr. F. Charles Raphael, and is an exact small-scale copy of the lighthouse, except for slight differences in the lenses. It was equipped with a 100 W lamp, which was rotated by a motor in the base of the model at approximately the same speed as the lighthouse.

No measurement of the actual candle-power of the beam from the large lighthouse has been made, but it may be approximately estimated at 750 000, assuming the normal concentration by the dioptric lenses employed. The beam has been seen as far off as Bedford. See page 751.

ASSOCIATION OF EX-SIEMENS' MEN.

A smoking concert to be given by the Association of ex-Siemens' men will be held at Gatti's Restaurant, London, on January 14th, 1930. Tickets are 3s. each, and guests will be welcome. Mr. J. Snow Huddleston, Dagenham Dock, Essex, is the hon. secretary, and will be pleased to give full particulars of the Association to any intending members.

BANKRUPTCY REPORT.

The Toll of Insolvency—Creditors' Dead Loss 88%.

THE uncomfortable knowledge is gained from the Board of Trade's annual bankruptcy report that creditors may consider themselves lucky if they get as much as half-a-crown in the £ in satisfaction of their claims. This is the chief factor which emerges from analysis of the report for the year 1928—which was not issued until the end of November, 1929, the public officials concerned being apparently quite content if they just succeed (which they have not invariably done) in getting out the figures for any given year before the end of the following year. Of the gross assets set out in the debtors' own statements of account lodged with the court, the amount actually realised in the estates wound up by the official receivers during 1928 reached 67%, which is slightly more than in the previous year. In the cases wound up by non-official trustees the proportion of estimated assets actually realised, which in the previous year had improved from 30 to 50% dropped back in 1928 to under 40%. Deeds of arrangement invariably show a better return ; but the 75% proportion of estimated assets which was subsequently realised in 1927, was not quite maintained in 1928. If all the bankruptcies and deeds of arrangement be taken together, we find that the average amount yielded by the insolvent estates wound up in 1928 reached no more than 57% (as against 60% in 1927) of the assets as estimated by the debtors themselves. But the dividends actually paid amounted in 1928 to only 11¾% (against 12¼% in 1927) of the ranking liabilities, so that the creditors concerned find themselves in the unfortunate position of having to write off as dead loss over 88% of the amounts owing to them. Perhaps credit would not have been given so readily had they known that in nearly a quarter of the annual applications for discharge it is reported by the official receivers, and not disproved, that the bankrupts brought on or contributed to their bankruptcy by rash and hazardous speculations, or by unjustifiable extravagance in living, or by gambling, or by culpable neglect of their business affairs ; that in more than half the cases, the bankrupts have omitted to keep such books of accounts as are usual and proper in the business carried on by them and as sufficiently disclose their business transactions within the three years immediately preceding their bankruptcy, and in more than 40% of the cases have continued to trade after knowing themselves to be insolvent. Of the 1 037 applications for discharge dealt with in 1928, it was reported in 207 cases, or one in five, that the bankrupt had contracted a debt provable in the bankruptcy without having at the time of contracting it any reasonable or probable ground of expectations of being able to pay it. Fraud or fraudulent breach of trust was reported in fifteen cases. In 67 cases previous bankruptcy or composition with creditors had occurred.

Total for Year.

The total bankruptcies and deeds of arrangements for the twelve months in England and Wales slightly exceeded in number those of the previous year, being 6 221 in 1928, compared with 6 170 in 1927 ; but the average deficit shown by the debtors' statement of affairs, declined from £1 446 in 1927 to £1 355 in 1928, the liabilities aggregating £12 258 690 in 1928, as against £12 734 104 in 1927. The proportion of liabilities to assets, however, increased from just under 30% in 1927 to just over 31% in 1928. Of the year's total failures, rather more than 5% of both insolvents and liabilities was accounted for by builders, 326 of whom failed in 1928, compared with 287 the previous year, with liabilities increasing from £514 653 to £694 461. Builders' merchants consequently also had a bad year, failures increasing from 15 in 1927, with total liabilities of £34 323, to 20 in 1928, with liabilities of £87 779.

That the electrical trade had its share of bad debts our readers will be well aware. All that the Bankruptcy Report tells us is that 96 electricians and electrical enginners failed in the year 1928, and that their liabilities totalled £196 983, which gives an average of £2 052 per insolvent. These figures compare with 92 failures in 1927, with average liabilities of £1 336 ; and 104 failures in 1926, with liabilities averaging £907. The report tells us nothing about the wireless trade, or of the electrical manufacturing industry ; the figures of these important industries in so far as they are not included among electrical engineers, being presumably buried among those relating to miscellaneous metal workers and miscellaneous metal wares dealers, and possibly also among china, glass and earthenware dealers.

COMPANY NEWS.

Quiet Market in Electrical Securities—Cables and Wireless Still Weakening—County of London Co.'s New Issue—New Companies Registered.

BUSINESS in the stock markets has eased off considerably during the past week and fewer changes have occurred in the price quotations of electrical shares which are included in our usual tables.

Hydro Electric Securities have risen to 43, a gain of 5 points as compared with a week ago. Radio Corporation of America shares have also advanced smartly during the week, moving up from 37 to 44, an improvement of 7 points. International Holdings have improved from 5⅜ to 6⅛. The price of the American Telephone and Telegraph Co.'s capital stock has not only regained the 5 points yielded last week, but has put on a further 5 points, making 10 points in the week and bringing the market quotation up from 225 to 235. International Telephone and Telegraph stock is also appreciably higher than a week ago, having risen from 75 to 85 dollars. Marconi International Marine shares are half-a-crown up, from 46s. 3d. to 48s. 9d. The six per cent. preferred stock of the Anglo-American Telegraph Company is once again above par. A recovery is about due in Cables and Wireless issues, which have further weakened during the past week, the "A" ordinary stock having dropped a couple of points from 78½ to 76½ and the "B" ordinary stock having receded three points from 40½ to 37½.

The only movements of note among electrical transportation shares have been in Metropolitan Railway ordinary stock and in Rio de Janeiro Tramway 50-year Bonds, which have changed hands at 62½ and 82½ respectively.

In the manufacturing group, Associated Electrical Industries ordinary shares are 3s. lower, English Electric preference 1s. 3d. down at 7s. 6d., and British Thomson-Houston 6d. at 22s. 9d.

In the electricity supply section, County of London have fallen nearly 2s. on the new issue terms, and London Electric Supply ordinary shares are also easier. Whitehall Electric Investments debenture stock has improved one and a half points. Melbourne stock is 3 points up, but Victoria Falls shares are lower.

Directors' Reports, &c

BRITISH COLUMBIA POWER CORPORATION.—Div. of 50 cents p. sh. on " A " shs. is announced.

SHAWINIGAN WATER AND POWER CO.—Div. of $\$\frac{5}{8}$ per sh., agst. $\$\frac{1}{2}$ p. sh., for qtr. will be payable on Jan. 10.

BARCELONA TRACTION LIGHT AND POWER CO., LTD.—Qrtrly. div. of $1\frac{3}{4}\%$ on non-cum. participatg. pref. shs. will be payable on Dec. 31.

EVER READY CO. (GREAT BRITAIN), LTD.—Directors announce that sales for year to date are 23% in advance of those for corresponding period last year.

PETTERS, LTD.—Int. div. on $7\frac{1}{2}\%$ cum. pref. shs. in respect of half year ended Sept. 30, 1929, less tax, is announced. Transfer books will be closed until Dec. 18, inclusive.

CALLENDER'S CABLE AND CONSTRUCTION CO., LTD.—Deb. stk. and $6\frac{1}{2}\%$ and $7\frac{1}{2}\%$ " B " pref. sh. registers will be closed from Dec. 17 to 31, inclusive, for preparatn. of int. and div. warrts.

COUNTY OF LONDON ELECTRIC SUPPLY CO., LTD.—The directors have decided to make an issue of £1 ord. shs. at 36s. each. The issue is to be offered to ord. shhldrs. in proportion of one new ord. sh. for every three held.

ASSOCIATED GAS AND ELECTRIC CO.—The time for exercising rights to buy allotment certificates has been extended from Dec. 16 to Jan. 15. Certain classes of the co.s security hldrs. have the right until Jan. 15 to subscribe for one $8 int.-bearing certificate for each 8 shs. of stk. held.

GENERAL ELECTRIC CO. OF NEW YORK.—A split up of the co.'s stock at the rate of four to one is announced. The new stock is to receive $1.60 annual div., agst. the present $6, including $4 regular and extras. Qtrly. div. of $1.50 was declared on Dec. 6. Shhldrs. are to be asked to approve increase in authorised stk. from 7 400 000 shs. to 29 600 000 of no par value.

CIA. HISPANO-AMERICANA DE ELECTRICIDAD.—Intm. divs. gold Ptas. 35 (agst. Ptas. 30) on " A," " B " and " C " shs. and gold Ptas. 7 on " D " and " E " shs. (agst. Ptas. 6 on " D " and Ptas. 3 on " E ") are announced. Equivalt. of gold ptas. in other currencies will be on parity of gold Ptas. 5.18 per dollar and rate of exchange for dollars ruling on day of paymt. for currency in which div. is to be made.

VENEZUELA TELEPHONE AND ELECTRICAL APPLIANCES CO., LTD.—Pft. for year ended June 30, 1929, £53 995; int. on debs., £8 847; int. on loans £3 411; income tax, £3 350, leavg. blce., £38 387. Intm. pref. div. paid Jan. 1, 1929, absorbed £4 383, leavg. £34 004, plus £47 833 standg. to credit of undivided pfts. acct. Fin. pref. sh. div., paid July 1, 1929, required £4 383. Ord. div. recommended 8%, less tax, for year, and it is proposed to write off exes. of issue of new " A " shs., amounting to £6 059, to provide £1 500 for 6% 1st mtge. debs. sinking fund and to place £30 000 to res., leaving £31 128 to carry fwd. Ord. sh. registers are closed until Dec. 17, inclusive.

STOCK EXCHANGE NOTICES.—The Stock Exchange Committee has granted official quotations to 250 000 £1, fully paid, ord. shs. of Atlas Light and Power Co. (now Atlas Electric and General Trust, Ltd.); 200 000 £1, fully-paid, 6% cum. pref. shs. of the Shropshire, Worcestershire and Staffordshire Electric Power Co.; £110 000 4% con. pref. stk. of the Aldershot Gas, Water and District Lighting Co.; 1 000 000 £1, fully-paid, ord. and 500 000 £1, fully-paid pref. shs. of the Bristol Tramways and Carriage Co., Ltd. The Committee has granted permission to deal in £4, 25-year collateral trust 5% deb. stk., and $962 25 year collateral trust gold bonds of the Postal Telegraph and Cable Corporation; 3 205 £1, fully-paid, ord. shs. of Underground Electric Railways Co. of London, Ltd.

Company Meeting.

S. SMITH AND SONS (MOTOR ACCESSORIES), LTD.—Mr. W. Henderson-Cleland, presiding at the meeting on December 5th, said the accounts indicated that the financial position of the company was sound. The available balance for distribution was £119,168. The results of the company's trading were satisfactory, and showed continued progress. The commercial vehicle side of the business was one to which the directors had devoted considerable attention, and they were able now to offer a complete range of accessories for these vehicles. The majority of commercial vehicle manufacturers now standardised the company's principal lines. The K.L.G. sparking plug had maintained its reputation throughout the year as the premier plug, while the M-L Magneto Syndicate, Ltd., had also had a satisfactory year. The main products of the company and its subsidiaries, speedometers, and clocks, were now fitted as standard to over 95% of the British-made motor cars and commercial vehicles. During the past few years they had been successful in introducing three new lines for which large contracts had already been secured, including an electric petrol gauge. The report and accounts were unanimously adopted.

New Companies.

ESSANDBEE, LTD.—Cap., £500. Mechanical and electrical engineers, etc. A director: S. Belaosky (chairman), 18/20, Hewart Street, London, E.C.2.

W. MAJOR AND CO. (MANCHESTER), LTD.—Cap., £1 750. Contractors, electricians, etc. A first director: W. Major, 45, Polefield Road, Blackley, Manchester.

MORTIMER, GALL AND CO., LTD.—Cap., £500. Electrical and general engineers and contractors, manufacturers of and dealers in electrical, radio or other goods, etc. Reg. Office: 26, Cheapside, London, E.C.2.

R. W. LEEDALE AND CO. (DONCASTER), LTD.—Cap., £1 000. Manufacturers of and dealers in electrical, wireless or mechanical appliances, scientific instruments, etc. Reg. Office: Britannia Buildings, Silver Street, Doncaster.

T. ELVINS AND SONS, LTD.—Cap., £20 000. To adopt agreement with G. Elvins, F. C. Elvins and H. J. Elvins, to carry on the business of contractors, engineers, electricians, etc. Solicitors: Docker, Hosgood and Co., 10, Newhall Street, Birmingham.

RADIUM ELECTRIC, LTD.—Cap., £5 000. To adopt an agreement with Erco Radium Kompresse, M. Munzer, and carry on business of manufacturers of and dealers in electrical and radio-active apparatus of all kinds, including a radio-active electrical apparatus comprising an electrically heated compress pad or bandage, etc. Reg. Office: 24, Grosvenor Gardens, London, S.W.1.

BRITISH TELEHOR, LTD.—Cap., £100. To manufacture or deal in any equipment used in connection with transmitting or receiving, producing, recording, or reproducing by electrical or any other means any matter, whether consisting of sounds, images, signals, impulses or otherwise, etc. Solicitors: Herbert Oppenheimer, Nathan and Vandyk, 1, Finsbury Square, London, E.C.2.

DUNOON AND DISTRICT ELECTRICITY SUPPLY CO., LTD.—Cap., £20 000. To take over and put into operation the Special Order in respect of Dunoon, co. of Argyll, known as Dunoon Electricity Special Order, 1929, and to carry on business of electric light and power supply company. Solicitors: J. D. Langton and Passmore, 71, Powis Street, Woolwich, London, S.E.18.

RUSTON-BUCYRUS, LTD.—Cap., £800 000. To acquire (a) that part of undertaking of Ruston and Hornsby, Ltd., devoted to the manufacture and sale of excavators, and (b) the business carried on by Bucyrus-Erie Co. in certain parts of the world, and to carry on the business of manufacturers of, dealers in and agents for the sale of machinery for excavating and handling materials, manufacturers of and dealers in electric and other shovels, dredges, derricks, dragline excavators, hoisting and conveying machinery, etc. Solicitors: Coward, Chance and Co., 30, Mincing Lane, London, E.C.3.

SLAUGHTERN AND CO., 156, Ewell Road, Surbiton, radio and electrical engineers. £16 9s. 7d. October 30th.

Receivership.

FELLOW'S MANUFACTURING CO., LTD.—P. A. Bristow, C.A., of 68½, Upper Thames Street, E.C.4, was appointed receiver and manager on November 29, 1929, under powers contained in debentures dated September 27th, 1927.

Mortgages.

[NOTE.—*The Companies Act of* 1908 *provides that every Mortgage or Charge, as described therein, shall be registered within* 21 *days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *— followed by the date of the Summary, but such total may have been reduced.*]

HENDERSON (W. J.) AND CO., LTD., London, S.W., radio manufacturers.—Registered November 16th, £2 000 debenture, to A. F. Phelp, 54, Queen's Road, Brighton, wireless factor; general charge. *——. December 31st, 1928.

HERNE BAY AND DISTRICT ELECTRICITY SUPPLY CO., LTD.—Registered November 29th, series of £30 000 debentures, present issue £20 000; general charge. *Nil. October 1st, 1929.

LANGHAM RADIO, LTD., London, W.C.—Registered November 27th, debenture, to Lloyds Bank, Ltd., securing all moneys due or to become due to the Bank; general charge.

"M.P.A." WIRELESS, LTD., London, W.—Registered November 21st, £500 and £600 debentures part of £35,000 and bonus of 12½%; general charge.

SMETHURST AND CO. (LONDON), LTD., electricians.—Registered November 29th, deed of covenant securing £500, to Miss S. P. Findlater, c/o Barclays Bank, Ltd., 208, Regent Street, W.; charged on 72, Duke Street, Grosvenor Square, W. *Nil. December 31st, 1928.

UPFIELDS WIRELESS, LTD., Hastings.—Registered November 29th, £1 000 mortgage, to Hastings Permanent Building Society; charged on 5, Hughenden Place, Hastings. *Nil. March 26th, 1929.

Satisfactions.

CHARING CROSS ELECTRICITY SUPPLY CO., LTD. (late CHARING CROSS WEST END AND CITY ELECTRICITY SUPPLY CO., LTD.).—Satisfactions registered November 27th, £472,000, registered August 8th, 1901, to February 8th, 1906, and £250 000, registered April 28th, 1920.

KEIGHLEY ELECTRICAL ENGINEERING CO., LTD.—Satisfaction registered November 26th, £500, registered March 21st, 1928.

WILKINSON (THOMAS) (ARNSIDE), LTD., electrical engineers.—Satisfaction registered November 22nd, £10 250, registered April 18th, 1922.

London Gazette, etc.

Companies Winding-up Voluntarily.

BIFUEL CARBURETTORS, LTD. By special resolution December 5th. G. K. Mathers, chartered accountant, Fairfield Works, Bow, London, E.3, appointed as liquidator.

DIONOID BATTERY CO., LTD. By reason of its liabilities, November 28th. B. C. Davies, 6, East Parade, Sheffield, chartered accountant, appointed as liquidator.

Bankruptcy Information.

BROWN, John James, Handysides Arcade, Newcastle-upon-Tyne, wireless agent. Receiving order, December 5th. Creditor's petition.

WYNDHAM, James, trading as WYNDHAM'S WIRELESS AND GENERAL MANUFACTURING CO., 114, Tottenham Court Road, London, W.1, wireless and general manufacturer. Receiving order, December 5th. Creditor's petition. First meeting, December 19th, 11.30 a.m. and Public examination, January 21st, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

Notices of Intended Dividends.

SMITH, Boulton, trading as H. WORTON, The Crescent, Spalding. electrical engineer. Last day for receiving proofs, December 19th. Trustee, C. E. Turton, 4 and 6, West Street, Boston, Lincs.

TURTON, John William, Market Place, Banbury, Oxford. electrical engineer. Last day for receiving proofs, December 23rd. Trustee, G. Mallam, 37, Cornmarket Street, Oxford, Official Receiver,

Order Made on Application for Discharge.

LAMBERT, Frederick Victor, 27, Parrock Street, Gravesend, Kent, electrical contractor, trading as LAMBERT AND CURLEY. Discharge suspended for two months, until January 13th, 1930.

Partnership Dissolved.

THE FALKSLEY CO. (James William LEWSLEY, Frederick Vincent HOWITT and May COPESTAKE), electrical engineers, Great Hall Street, Derby Road, Nottingham, by mutual consent as from November 23rd, 1929. Debts received and paid by F. V. Howitt and M. Copestake.

Bankruptcy Proceedings.

LANGLOIS, Herbert Augustus, trading with another as THE LONDON ELECTRICAL CO., 119, St. Mary Street, Cardiff, formerly 124, Queen Street, Cardiff, electrical engineer. The application for discharge herein was heard on December 3rd at the Law Courts, Cathays Park, Cardiff. The receiving order had been made in 1926. It was reported that the debtor commenced trading on his own account in 1921 as an electrician, and in 1926 he was joined by another, but the business only lasted seven months. The concern got into debt to the extent of £1 024. It was stated that the debtor consented to judgment for £150, £50 to be paid immediately and the balance within eighteen months. His Honour granted the discharge.

PEACE, Ernest Everitt, rear of 230, High Street, Erdington, Birmingham, trading as PEACE AND CO., manufacturing electrical engineer. The first meeting of creditors herein was held on December 4th at the Official Receiver's Office, 191, Corporation Street, Birmingham, when a statement of affairs was produced showing ranking liabilities of £1 090, and there was a deficiency of £929. The debtor attributed his failure to bad trade, loss on experimental work, and bad debts. It would seem that in 1923 the debtor entered into partnership with another, putting £200 into the business. It was not successful, and in 1926 a composition of 10s. in the £ was paid. It was stated that the money to pay the composition was advanced by a relative of the debtor's in consideration of the partner withdrawing from the business on receipt of £5. The debtor took over the assets in connection with the business, and carried it on under the name of Peace and Co., but he was not successful, and had only been able to continue by creating an overdraft at the bank and by borrowing. The matter was left in the hands of the Official Receiver as trustee.

Winding-up Orders.

FELLOW'S MANUFACTURING CO., LTD.—In the Chancery Division, on Monday, Mr. Justice Bennett ordered the compulsory winding up of Fellow's Manufacturing Co., Ltd. Mr. Christie, for the petitioners, said they were judgment creditors for £418 6s. 3d., and they were supported by creditors for roughly £2 000. Mr. Herman said he appeared for the landlords on a claim of £145, and another counsel said he appeared for Marconi's Wireless Co. and supported the petition. The company did not appear.

IDEAL WIRELESS CO., LTD.—Mr. Justice Bennett, in the Chancery Division on Monday, made an order for the compulsory winding up of Ideal Wireless Co., Ltd., on a petition of a judgment creditor for £300. The company did not appear.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

318 841 A. H. Marks and P. Russell (legal representatives of E. C. R. Marks, (deceased)). (Western Union Telegraph Co.). Telegraph systems. (6/3/28.)
288 630 Siemens-Schuckertwerke Akt.-Ges. Arrangement in asynchronous machines with commutator machines mounted in cascade. 14/4/27.)
319 024 C. Neff. Method of producing oscillations by means of two or more co-operating generators. (12/3/28.)
288 987 British Thomson-Houston Co., Ltd. Alternating-current commutator motors. (16/4/27.)
318 903 J. P. Naylor. Electric luminous signs and signalling-apparatus and their controllers. (4/5/28.)
296 774 Landis and Gyr Soc. Anon. Means for varying the temperature coefficients of induction-measuring instruments. (9/9/27.)
319 032 W. E. Beatty (Bell Telephone Laboratories, Inc.). Telegraph systems. (14/5/28.)
319 033 A. E. White (Fansteel Products Co., Inc.). Electrolytic condensers. (15/5/28.)
304 582 Aladdin Industries, Ltd. Lamp fixtures. (21/1/28.)
318 847 C. H. Verity. Synchronisation of machines for recording sounds and movements. (5/6/28.)
318 876 E. Reisz. Electrostatic loud-speakers and the like. (8/6/28.)
292 077 Electrical Research Products, Inc. Carrier frequency signalling systems. (11/6/27.)
319 037 H. N. Marvin. Means for tuning radio sets. (9/6/28.)
318 942 J. Neale. Means of mounting for light-sensitive bridges. (12/6/28.)
318 944 Standard Telephones and Cables, Ltd. (G. Deakin). Automatic and semi-automatic telephone exchange systems. (13/6/28.)
318 945 Standard Telephones and Cables, Ltd. (G. Deakin and L. Polinkowsky). Automatic and semi-automatic exchange systems. (13/6/28.)
318 946 Standard Telephones and Cables, Ltd. (Western Electric Co., Inc.). Signalling systems. (13/6/28.)
318 947 Standard Telephones and Cables, Ltd. (Western Electric Co., Inc.). Electric resistance units. (13/6/28.)
318 948 J. H. St. H. Mawdsley. Dynamo-electric generators for electric welding. (13/6/28.)
318 950 A. Wright. Electromagnetic devices. (13/6/28.)
292 597 Electrical Research Products, Inc. Synchronising systems for use in television systems. (23/6/27.)
318 953 Automatic Telephone Manufacturing Co., Ltd., and P. N. Roseby. Magnet cores. (13/6/28.)
292 130 Montecatini Soc. Generale Per L'Industria Mineraria ed Agricola. Electrolytic cells. (14/6/27.)
319 046 Standard Telephones and Cables, Ltd. (L. J. J. Schreiber). Switching-mechanism for automatic or semi-automatic telephone systems. (14/6/28.)
319 050 Electrolux, Ltd. (Platen-Munters Refrigerating System Aktiebolag). Evaporator units for refrigerating-apparatus. (15/6/28.)
319 051 C. F. Burton and H. Burton. Dials or the like for electrical condensers or other electrical instruments. (15/6/28.)
319 055 Standard Telephones and Cables, Ltd. (Bell Telephone Laboratories, Inc.). Aerial systems. (15/6/28.)
319 058 J. B. Tucker. Electrical plug and socket connections. (16/6/28.)
319 061 Radio Instruments, Ltd., and W. L. Shaw. Iron-cored inductances. (16/6/28.)
292 600 C. Lorenz Akt.-Ges. Maintenance of constant frequency in high-frequency electric circuits. (24/6/27.)
319 072 British Thomson-Houston Co., Ltd., and R. D. Parry. Control of electric motor generator sets. (19/6/28.)
319 074 General Electric Co., Ltd., and R. J. Kaula. Electric terminals. (19/6/28.)
319 080 J. Durham. Amplifiers of sound-reproducing instruments. (25/6/28.)
319 085 C. E. Fry. Coin-freed mechanism, particularly applicable to prepayment devices for use with electric meters. (29/6/28.)
319 088 N. E. Goodrich. Massaging machine with electromagnetic engines. (3/7/28.)
319 095 R. Nettl. Electric lampholders. (16/7/28.)
319 100 P. D. Tyers. Portable wireless receiving apparatus. (19/7/28.)
319 115 L. Tschorner, L. Television apparatus. (15/8/28.)
299 865 Siemens-Schuckertwerke Akt.-Ges. Induction motors. (3/11/27.)
319 120 E. Quartier. Means for automatically controlling an electromagnetic device. (20/8/28.)
319 121 M. Trouton and Wireless Music, Ltd. Electromechanical vibrating devices for use, for example, in loud-speakers. (21/8/28.)
319 133 A. H. Seabrook and A. Avis. Poles, masts, and the like for supporting overhead electric wires and for similar purposes. (8/9/28.)
297 388 Telefonaktiebolaget L. M. Ericsson. Impulse senders of the finger-disc type. (20/9/27.)
319 141 A. E. Bowyer-Lowe. Wireless receiving-apparatus. (21/9/28.)
297 847 Marconi's Wireless Telegraph Co., Ltd. Thermionic valves. (29/9/27.)
319 147 R. Brandt. Method of and apparatus for the electrolytic revivification of ferrocyanide of potassium formed in the purification of gases by oxidation of hydrogen sulphide with ferricyanide of potassium. (4/10/28.)
298 241 Siemens and Halske Akt.-Ges. Electromagnetic relays with two armatures. (6/10/27.)
298 490 Rheinisch-Westfalisches Elektrizitatswerk Akt.-Ges. Protecting-device for current-distributing plants. (7/10/27.)
319 156 H. H. Thompson, A. E. Davies, and W. E. Box. Magnetic separators. (30/10/28.)
300 124 Telefunken Ges. für Drahtlose Telegraphie. Apparatus for amplifying and/or rectifying oscillations. (5/11/27.)

Applications for Patents.

August 31st.

26 565 R. H. Barbour and Electrical Apparatus Co., Ltd. Voltage control of transformers.
26 554 H. Bigg-Wither, W. Bruce-Brown and G. A. Pfister. Electrically-operated mechanism.
26 552 Ferranti, Ltd, E. D. T. Norris. Transformers.
26 530 H. F. Godfrey. Electric motor.
26 544 H. L. Kirks. Masts for wireless aerials.
26 543 M. Lazarus. Electric rectifying devices. (1/9/28, U.S.)
26 508 M. Wilderman. Electric batteries.

September 2nd.

26 658 W. Barsties. Devices for transmitting electrical indications, etc., to a distance.
26 666 Belling and Lee, Ltd., W. J. Byrne and E. M. Lee. Electrical connections.
26 633 J. Boot and Siemens and General Electric Railway Signal Co., Ltd. Electric signalling systems.
26 613 British Thomson-Houston Co., Ltd. and C. J. Morton. Ignition.
26 609 F. H. Constable and Radiovisor Parent, Ltd. Controlling temperature of light sensitive cells.
26 617 H. W. Cron and S. D. White. Electric junction boxes, etc.

COMING EVENTS.

Friday, December 13th (To-day).

Institution of Engineering Inspection.—Royal Society of Arts, John Street, Adelphi, London. Paper by Capt. B. H. Peter on "The Trend of Development in Railway Signalling." 5.30 *p.m.*

Junior Institution of Engineers.—Royal Society of Arts, John Street, Adelphi, London. Inaugural meeting. Induction of Sir Ernest Moir as President. Address, "Some Engineering Difficulties and How They Were Overcome." 7.30 *p.m.*

Saturday, December 14th.

Association of Mining Electrical Engineers (South Wales Branch).—South Wales Institute of Engineers, Park Place. Lecture by Mr. W. T. Anderson on "Mining Cables." 6 *p.m.*

Association of Mining Electrical Engineers (Western Sub-Branch).—Paper by Dr. Stanley Phillips on "Electricity in Mines—First Aid."

Monday, December 16th.

Institution of Electrical Engineers.—Royal Technical College, Glasgow. Lecture by Dr. H. Norinder on "Surges and Over-Voltage Phenomena on Transmission Lines due to Lightning and Switching Disturbances." 7.30 *p.m.*

Tuesday, December 17th.

Institution of Electrical Engineers (Students' Section of the North-Western Centre).—Engineers' Club, Albert Square, Manchester. Paper by Mr. J. M. Gillespie on "Some Problems in Industrial Control Gear." 7.15 *p.m.*

Association of Supervising Electrical Engineers.—Junior Institution of Engineers, 39, Victoria Street, London. Lecture by Mr. S. S. A. Watkins on "Synchronisation of Films and Speech." 7.15 *p.m.*

Paisley Association of Electrical Engineers.—39, High Street, Paisley. Lecture on "A New Electrical Method of Determining the Pressure in Engine Cylinders." 7.30 *p.m.*

Wednesday, December 18th.

Electrical Contractors' Association (Sussex Branch).—Midland Bank Chambers, Brighton. Ordinary meeting.

Overhead Lines Association.—Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London. Discussion introduced by Major T. Rich on "Some Continental and British Methods Compared." 5.30 *p.m.*

Electrical Power Engineers' Association. (Manchester Group).—Geographical Hall, St. Mary's Parsonage, Deansgate. Lecture by Mr. H. L. Guy on "Developments in Power Station Condensing Plant." 7.15 *p.m.*

Institution of Electrical Engineers (Sheffield Sub-Centre).—Royal Victoria Hotel. Paper by Mr. J. F. Colquhoun on "Public Street Lighting." 7.30 *p.m.*

Thursday, December 19th.

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Papers by Lt.-Col. S. E. Monkhouse and Mr. L. C. Grant on "The Heating of Buildings Electrically by Means of Thermal Storage," and Mr. T. G. N. Haldane on "The Heat Pump—An Economical Method of Producing Low-Grade Heat from Electricity." 6 *p.m.*

Institution of Electrical Engineers (Hampshire Sub-Centre).—Municipal College, Portsmouth. Paper by Mr. G. Shearing and Captain J. W. S. Doring on "Naval Wireless Telegraphy Communications." 7.30 *p.m.*

Friday, December 20th.

Electrical Development Association.—Roya Society of Arts, John Street Adelphi, London. "Display of Electrical Cinematograph Films." 7.30 *p.m.*

Junior Institution of Engineers.—39, Victoria Street, Westminster. Informal meeting. Lecture by Mr. W. Challis on "Light Signalling on the Southern Railway." 7.30 *p.m.*

CHRISTMAS HOLIDAYS.

The offices of "The Electrician" will be closed on Wednesday and Thursday, December 25th and 26th. Communications for the Special Annual Review Number, dated December 27th, should reach the Editor not later than Saturday, December 21st.

Current Topics.

Power Station Architecture.

IT is gratifying to note that the London Power Co. has retained the services of "a very eminent London architect" to design the building of the new Battersea power station. It may sound almost sacrilegious to say that most of the recently opened stations are architectural monstrosities, but unfortunately they are nothing more or less than that. Power stations assumed the general outline of to-day mainly because buildings so shaped will conveniently and economically house the necessary generating and boiler plant. So long as the power house remained a severely utilitarian job it had its redeeming features. Growth of a desire to make these structures more attractive has, unfortunately, gone unguided to the most precious limits of fussy applied ornamentation, which not only serves no good purpose but detracts from the essential dignity associated with any frankly engineering structure. Much of the blame for the present state of affairs must rest with the municipalities which entrust the borough surveyor with the architectural work of a power station. This is obviously wrong, and so long as the practice persists we cannot hope to have attractively designed power stations. Churches, cinemas and various other types of public building are now being erected in shapes owing little if anything to tradition, and all, or nearly all, to the purposes they fulfil in our modern civilisation. We can see the power station of the future, with its harmonious and pleasing lines, but we cannot tell how far into the future this prevision goes until some of our foremost architects have had an opportunity to design structures worthy to take their place among other public buildings of the twentieth century. As a start, we would suggest that the E.D.A. or some other interested body should inaugurate a competition, with suitable prizes for a design for a capital power station without restrictions on form or lay-out, except those naturally imposed by the plant which it will house.

Our First "Annual Review."

OUR next issue will contain the first comprehensive review of electrical industry affairs that has yet been published. One of the main features will be a review of technical progress in various branches of electrical and allied activity, written by specialists in their several spheres. Another interesting section will be a review of the progress made during the year by the numerous professional and trade associations connected with the industry. These two features alone will include some fifty separate signed contributions, and already it is certain that there will be an exceptionally big demand for copies of this authoritative review of the work of the industry during 1929.

E.D.A. Advertising.

WE have so often found it necessary to complain about the unsuitable positions formerly allotted in many of the daily papers to advertisements issued by the Electrical Development Association that we are particularly glad to notice the improvement in this respect in the placing of the "plug into comfort" series which is now appearing. One particularly happy choice of position was noticed in a London evening paper last Friday, where one of these announcements was included on a page which was otherwise solely devoted to builders' advertisements of houses for sale. The page is one that is carefully studied by those requiring house accommodation, and in such a context the advice "Ask your builder to fix an electric plug point in every room" may be expected to reach a section of the public that is directly interested in matters of this kind.

"Plug Conscious."

IT is pointed out in the latest E.D.A. Publicity Programme that the advertising activities now being undertaken in connection with the Electric Homes

Digitized by Google

(Outlet) Campaign are designed to make the public plug conscious, or in other words to make them realise the need for installing more plug points in their houses. The idea which, by the way, was first exploited by the Electrical Association for Women, is now being driven home by means of regular advertising in 72 national journals and through distribution of copies of the booklet "The House you Want." The constant and widespread reiteration of the single idea behind this effort cannot fail to do good, and we would urge contractors to make the most of the opportunities so created to equip houses in such a way as to permit the proper use of all classes of domestic electrical equipment. Thus the Outlet Campaign will carry a special trade significance as the provider of outlets for electrical appliances which would normally remain unsold on account of the prospective user's inability to make use of them.

Electricity and Ventilation.

It has long been recognised that proper ventilation bears a direct relation to the success of any business enterprise. The public instinctively avoids a theatre where the ventilation is known to be extremely poor. Retail shops, and especially the big stores, where many people congregate and where outdoor clothes are seldom removed, should have the very best of ventilating systems, not only for the sake of the comfort of customers, but for the sake of the efficiency of employees. The same thing is true, perhaps, in an even more marked degree, in restaurants. In the factory or on the farm, in homes, offices, hotels, laundries and garages, in fact in every indoor situation, positive ventilation that provides fresh air without decreasing the comfort of the room is of the utmost importance, particularly in cold weather. Bearing these facts in mind, and knowing that the electric fan provides the most efficient ventilating service, it is surprising that most of us still regard the fan business as a seasonal matter. Sales effort based on an appeal to the customer's appreciation of the advantages in maintenance of mental and physical energy, better and more even factory production, should arouse interest in good air conditions and the apparatus which creates them.

Restaurant Cooking Possibilities.

It cannot be said that the development of the use of electricity in English hotels or restaurants for cooking has been rapid or widespread. Probably it is quite 25 years since English caterers began to use electricity for some of the smaller culinary functions, but to-day there are few first-class English hotels where the greater part of the cooking is not still done on a large central coal range. It is a characteristic of the greatest chefs of the world that, though they may be continually devising new recipes, yet, in the methods of cooking them, they like the ways of their grandfathers. And from their own point of view they may be right. The chefs of old who have made culinary history used coal for fuel; and cuisine de luxe has evolved on the central coal range. Yet, for many years, the best ocean liner galleys have been electrically equipped. The time is certainly ripe for making a real effort to get the hotel cooking business, and there is no reason why other kitchens where economy of space is a primary consideration, such as those on railway trains, small high-class teashops and cinema cafés, should not be included in the drive. In the large hotels there are possibilities of greatly increased cooking installations for grills, fish fryers, hotplates, and (especially in the pastry kitchens), where it is specially necessary that there should be cleanliness, a cool atmosphere and easily controlled heat."

Britain's Overseas Trade.

Exports of British merchandise were valued at £63 125 000 in November 1929, or £2 428 000 per working day, as against £2 392 000 in October. The total British exports for the first eleven months of 1929 amounted to £671 125 000, or about 1·2 per cent. more than in the corresponding period of 1928. Exports of raw materials were up by £8 993 000, and those of manufactured goods down by £2 621 000, but changes in the level of values, which improve the position from the quantity point of view, must be remembered. Total imports into this country were about 3 per cent. higher than for the same period of last year, at £1 013 472 000, and it is interesting to note that raw materials increased in value by 6·5 per cent. Since most of this material will be shipped as exports in the form of manufactured goods, the increase is significant.

The Electrical Figures.

So far as our own industry is concerned it will be appreciated from the details of the Board of Trade returns published on another page, that electrical exports, with an improvement of £177 457 on November of 1928, are still holding their own. For the eleven months of this year electrical exports again showed an increase when compared with the corresponding months of last year, the amount in this case being nearly £1 000 000. Imports last month showed a rather unfortunate increase of £237 889, but this is partly offset by exports for the month showing an excess over imports of £929 376. The main contributors to the higher import total were telegraph and telephone instruments, £72 476, and electric glow lamps, £37 290. We shall not know until next year what improvement has been made over last year's grand total, but for the time being it is satisfactory to note that electrical exports, so far, exceed imports by £10 334 440, with still another four weeks to run. At this time last year the favourable trade balance stood at over £11 000 000, but since the prices of both raw materials and manufactured goods have dropped since November 1928, the lower cash volume does not by any means represent a smaller volume of exports. On the contrary it may quite conceivably mean an increase.

All Fuming on the Battersea Front.

Objectors to the erection of the new Battersea power station are fuming again; they seem, in fact to have fumes on the brain. Not content with definite assurances from the power station authorities and from the Government that the station would not be permitted to cause a nuisance they went on objecting. Not even the White Paper containing reports of eminent chemists on the success of tests at Grove Road have stopped their fuming, and this week the matter has again been raised in Parliament. As the position of the objectors is amply safeguarded by the conditions laid upon the London Power Co. one can only assume that continuance of the protests is due to reasons other than those for which so much publicity has been obtained. The fume problem is obviously one that must, and will be solved, but agitations of the kind referred to hinder rather than help those who are working to that end.

LOAD CONTROL.

Ingenious System for Reducing Risks of Failure to Supply—Telephonic Intercommunication—A "Mimic" System Diagram—Work of the Control Engineer—Maintaining Standard Frequency.

SOME idea of the ingenious nature of the arrangements made for reducing to a minimum risks of failure of its supply of energy were gleaned on the occasion of a recent inspection of the London Power Co.'s control room at Ergon House, Horseferry Road, Westminster.

The company's load, which is mainly lighting, varies from about 170 000 kW to 270 000 kW. There are four generating stations working—Willesden, Grove Road, Bow and Deptford West, and about fifteen switching and sub-stations. The system is interconnected in such a way that one generating station can take over part of another station's load in case of a sudden increase of demand or breakdown of any part of the plant, while each of the switching and sub-stations is connected with two generating stations, so that it can be switched over from one to the other when necessary.

The control room at Ergon House, where one or more control engineers are always on duty, is approximately 35 ft. square, and from this room the control of the whole of the system of the company is effected, largely through the medium of a suitably planned and efficient system of telephonic communication between the control centre, generating stations, switching stations and all the principal sub-stations connected to the system. In the centre of the control room is the control desk. The centre portion is called the control switchboard, and it is flanked on either side by control desks. The control desks are equipped with telephones through which any point of the system can be communicated with, and it is at these desks that the control engineers sit to perform their duties of controlling the system.

Station Data.

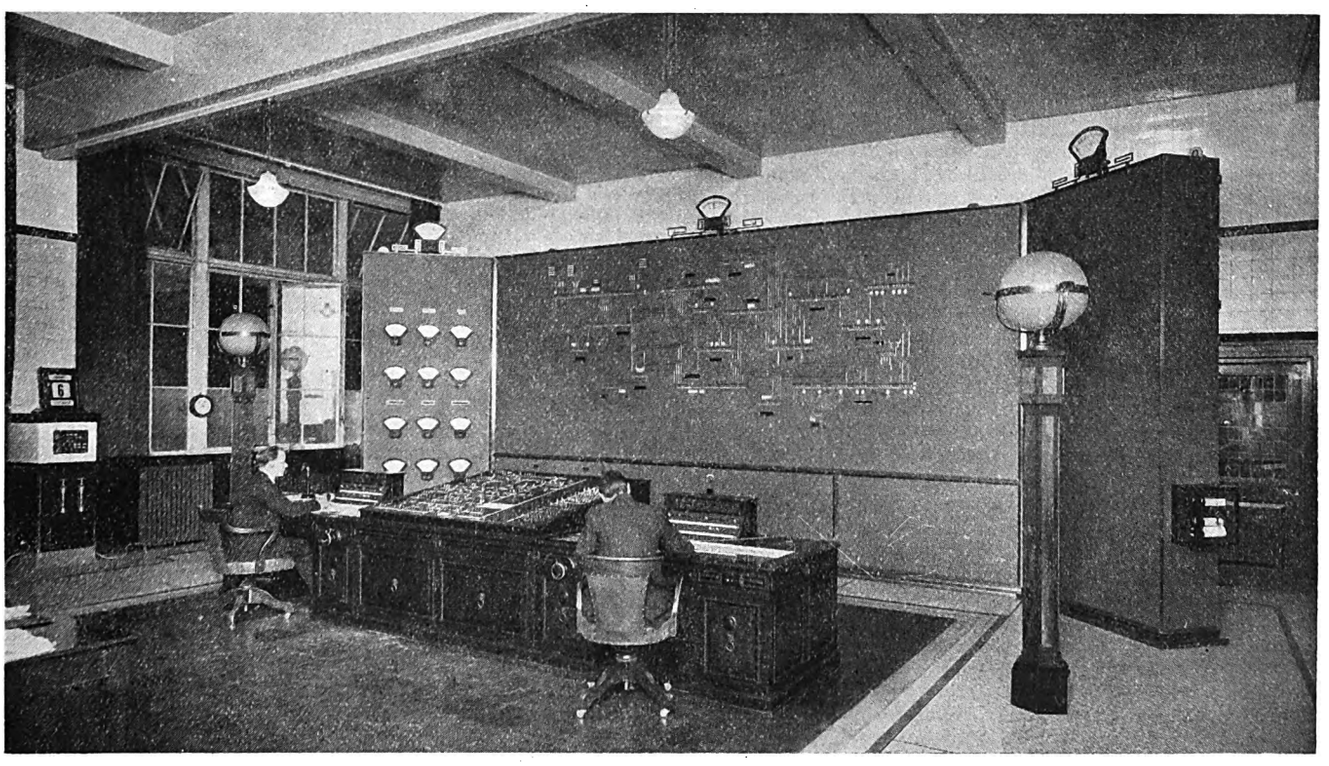
Facing the control desk is a steel structure which may be divided into three sections, viz.: a left wing, a centre panel, and a right wing. The left wing is the instrument panel, and is equipped with instruments indicating the following particulars from each generating station: (1) the operating steam pressure of the boilers; (2) the total instantaneous output of the station; (3) the voltage obtaining at the station; and (4) the frequency of the generators.

This information is transmitted automatically from each generating station to the instruments on the above-mentioned instrument panel in the control room by means of pilot wires laid between the generating stations and Ergon House, so that the indications showing on the master instruments in the generating stations are reproduced on the instruments in the control room. At the top of the left-hand wing or instrument panel is a voltmeter, indicating the voltage of the interconnected system. By means of a multiway switch the voltage obtaining at any one of the generating stations can be indicated on this instrument, and at the bottom of the left-hand wing is the frequency indicator of the system.

The System Diagram.

The centre panel is the system diagram panel, and it is upon this panel that the whole system is depicted diagrammatically. The panel itself is composed of $\frac{1}{4}$ in. thick steel plate. All feeders, and interconnecting cables between generating stations, switching stations and distributing stations, are depicted by monel metal strips. Thus a "mimic" diagram of the system is produced. It indicates in what manner the system is electrically coupled, and the in or out position of every switch on the system. The switches at every generating, switching or distributing station are represented on the diagram by small glazed holes called "light windows," and, by means of a special system of lighting, a green light or red light appears in the window, depending upon whether the switch at that point is switched out or in. No light appearing in the window indicates that the particular switch is out of commission. The illumination of the light windows representing switches on the system is controlled from the centre portion of the control desk by means of miniature switches operated by the control engineers as they modify the switching disposition of the system.

The control engineer, by means of the telephone, communicates with a responsible person at the point at which he requires an alteration to the switching conditions made. On completion of the operation he, by means of the miniature switches on the control switchboard, repeats the operation he directed to be carried out, thus reproducing on the "mimic" diagram the altered conditions of the switching at the point in question. Every light window representing a switch on the mimic diagram has a corresponding miniature switch on the control switchboard.



A view of the control desk with the instrument panel, system diagram panel and other devices used in the London Power Co.'s control room at Ergon House, details of which are given in the accompanying article.

Digitized by Google

At the bottom and left-hand corner of the central or system diagram panel there is a "plant panel," and upon this panel there is provided a light window for every boiler and generator installed at each of the generating stations. The illumination of these windows is also controlled by the control engineers, and is based on information obtained from the several generating stations. They are thus enabled at any time to observe at a glance the following particulars obtaining at each generating station :—(1) Boilers steaming ; (2) boilers in reserve ; (3) boilers out of commission ; (4) generators on line ; (5) generators in reserve, and (6) generators out of commission. Every boiler and generator is numbered, and has its own corresponding light window. A red light in the window indicates that the boiler or generator, as the case may be, is, in the case of a boiler—steaming ; and in the case of a generator, on line. A green light indicates that the boiler or generator is held in reserve, and non-illumination indicates that the plant is out of commission.

Above the centre panel is an instrument on which the total instantaneous load on the whole 50-cycle system is indicated, and in the centre of the lower panel there is inserted a cyclometer, upon which is indicated the total output capacity of the generators connected to the system, so that by deducting therefrom the reading of the kilowatt indicator the amount of reserve output is immediately obtained.

Maintaining Standard Frequency.

On the right hand wall of the control room there is a case containing a swinging pendulum and three dials. This apparatus constitutes the device for maintaining standard frequency over the whole system. The lowest dial is a special pendulum-driven clock indicating Greenwich mean time, and is designated the master clock. The centre dial is a specially constructed clock driven by a small synchronous motor off the interconnected system of the company. This clock keeps correct time provided an average frequency of 50 cycles per sec. is maintained. The top dial is a combination of the lowest and centre dials, and consequently it indicates the deviation between "electrical time" and "Greenwich mean time," or, in other words, it provides an indication of the amount by which the summated frequency of the electrical system is gaining or losing in comparison with standard time.

Practically similar instruments are installed in the generating stations. These are controlled so far as Greenwich mean time is concerned by the master clock in the control room at Ergon House. Therefore, any departure from standard frequency is at once seen and corrected. Electrical time or the frequency of the system is shown on the top dial by the movement of the red hand, while Greenwich time on the same dial is shown by the movement of the black hand, so that if the frequency of the system is greater than it should be the red hand will be in advance of the black, and conversely, if the speed of the system is less than it should be the red hand will be moving behind the black hand.

In designing the control system, emphasis has been laid on the desirability of maintaining personal contact between the control engineers and the personnel at the various power houses, switching stations and sub-stations, with the resulting establishment of a desirable teamwork spirit.

Messrs. A. Reyrolle and Co., Ltd., supplied the main control board, Messrs. Evershed and Vignoles, Ltd., the Midworth repeaters and instruments, Standard Telephones and Cables, Ltd., the telephone outfit, and Messrs. Everett, Edgcumbe and Co. the time clocks.

Another point of interest regarding the system is the collection of data with regard to changes in climatic conditions. The control engineers have collected valuable information to guide them in directing the generating stations supplying the system, as to what load will be required of them from day to day, and from hour to hour. For each successive week a schedule is sent in advance to the stations, disclosing an estimate of the morning and evening loads expected under normal conditions, so that the necessary plant may be held in readiness. By observing the daily actual load demand at or about 8 a.m., and after studying the weather conditions, the control engineer, by means of the use of functional constants, or by reference to specially prepared curves, is able to establish an estimate of the morning peak load. With this estimate in front of him he allocates the anticipated total load to the various generating stations, and, therefore, at or about the hour named above, each station is informed what proportion it will be expected to meet at the morning peak, is instructed what plant to have on line, and the amount of power to be held in reserve.

The same procedure takes place at or about 2 p.m. in connection with the evening peak load. The estimated load and the actual load obtained are recorded on a chart twice daily, each chart being of sufficient size to accommodate the necessary data for one month. This chart is analysed daily, and new functional constants are set down for future reference.

BOOK REVIEWS.

Electric Traction: A Treatise on the Application of Electric Power to Electric Traction on Railways and Tramways. By A. T. Dover. Second Edition. (London : Sir Isaac Pitman and Sons.) Pp. xx+719. 25s. net.

Developments in electric railway traction since this excellent work was first published have rendered desirable a revision of much of the original matter. Generally the plan and arrangement of the first edition have been retained but the new edition contains a number of additional worked examples and a section on trolley buses and their equipment. For those who are not familiar with the book, it should be explained that it deals with the principles relating to the application of electric power to railways, tramways, giving representative examples of modern practice in both fields.

The subject matter is arranged under the following heads : Mechanics of train movement ; control ; auxiliary apparatus ; rolling stock ; detailed study of train movement ; track and overhead construction ; distributing systems and sub-stations. Not only the student, but the practising engineer, will find the work most useful. G. W. L.

Electric Street Lighting. By Charles J. Stahl. (London : Chapman and Hall.) Pp. xi + 228. 17s. 6d. net.

That this book is concerned with American conditions is obvious from the author's statement that no attention is given to gas, "since it is not in general use for street lighting purposes." In this country street lighting has been one of the few remaining strongholds of gas, though this unsuitable illuminant is gradually being eliminated, in spite of strenuous attempts to boost the use of gas by the high-pressure system. Although the subject is dealt with from the American point of view many of the problems involved are common to both countries, and though the U.S.A. can show some remarkable examples of ornamental and "white way" lighting, the general level of street illumination there is little, if any, higher than it is here. It is difficult to go far into the principles of lighting without touching on technicalities, but the author has to some extent succeeded in his attempt to avoid such intricacies in order to make clear to the uninitiated such information as will be useful in the design of street lighting installations, and in the selection and use of suitable equipments for various conditions. From this point of view the book should appeal to members of Lighting Committees and others interested in the subject as representatives of the public. On the other hand, designing engineers and others engaged in street lighting work should gain from it some general assistance in the solution of constructional, maintenance and operating problems capable of some degree of standardised treatment. Within the limitations of such a comparatively short book the author has covered the ground very well. S. W.

Elements of Electrical Engineering. By Arthur L. Cook. (London : Chapman and Hall.) Pp. x + 584. 20s. net.

Intended as a short course in the fundamentals of electrical engineering and their application in practice, this work, now in its second edition, is directed to non-electrical as well as to electrical students in colleges, though the former is expected to have such a knowledge of the principles of electricity and magnetism as would be given in a course of physics. The first edition appeared in 1924, but apart from general revision, a considerable amount of new matter has been added. The chapters on commutation, armature reaction and commutating poles and compensating windings have been re-written, and the subjects have been treated from the standpoint of modern d.c. dynamos. The treatment of parallel a.c. circuits has been changed and made more general. A new set of problems has been substituted for those of the first edition, but the character of the problems has not been changed. W. L. S.

ROUND THE JOBS.

The Importance of the Electrical Sub-contract—Reflections on Some Stupid Conventions—Rising Mains for Flats—"To Earth or Not to Earth Interchangeable Apparatus."

By "CONTRACTOR."

AN American journalist, when engaging a young reporter, said: "What we want here is news and nothing but real news. If you see a dog biting a man on Broadway, that is not news, and we don't want it; but if you see a man biting a dog on Broadway, that is news, and we do want it." That story might be translated into terms of the electrical industry thus, I think: "If you hear anyone telling an electrician that it is his (the electrician's) fault, that is not news. But if you hear an electrician telling the other man that the latter is wrong, then that is news."

In the same way that, as a nation, we are a little bit prone to take the kicks without attempting to assert our superiority, so in the electrical industry—or, at any rate, in the contracting branch—we are a little bit prone to play the part of the office cat for the shortcomings of others. Of all the sub-contracts which go to the making of a modern building none is so important as the electrical sub-contract. That is not merely an arrogant statement from a prejudiced member of that side of the industry; it is a fact which a moment's thought will show to be correct.

Yet, in spite of this fact, the electrical sub-contract is probably the one which receives the least attention from the authorities interested in any constructional work. From first to last on the job, the electrician is a —— nuisance. In the first place, he is a nuisance because he cannot squeeze a $\frac{5}{8}$ in. tube into $\frac{1}{2}$ in. space. At the end he is a nuisance because the very nature of his trade ordains that he shall be the last on the job. Irate principals, architects, and builders dance round the poor electrician while he fits the last lampholder, squealing with rage because the lampholder was not erected a week ago, quite oblivious to the fact that a week ago the ceiling was not even plastered.

In this connection I think it is a wise plan for all electrical contractors to keep uppermost in their minds the importance to their customers of the electrical sub-contract, and to lose no opportunity, right from the very start, of impressing this fact upon their customers. I myself go further; I always tell my customers before the work starts that ours will be the last workmen on the job, just as surely as the guard's van is the last compartment in a train to reach the platform. And, incidentally, the analogy of the guard's van is appropriate in other directions as well.

There is rather a stupid convention which, like many stupid conventions, is dying hard, to the effect that all the paraphernalia connected with the introduction of electricity into a house, such as the meter, the main switch and fuse, and the distribution board, must be placed in some grotesquely conspicuous spot inside the house which they serve. Moreover, it seems to be the view that it is sacrilege to touch this gear with a paint-brush, and it is the commonest sight in the world to see a well-chosen wallpaper utterly ruined by these excrescences.

Sins of the Architect.

It is, of course, largely the fault of the person responsible for designing the house. This designer has probably had the brilliant idea of providing somewhere adequate space for the storage of coal so that this fuel need not be kept in a heap in the hall, but this brilliance has probably not extended to giving him the idea of providing adequate housing for the electrical control gear which his intelligence should have anticipated.

However, I am pessimistic enough to think that it will be many, many years before architects will have learnt sufficient about electricity to persuade them to provide such accommodation. Therefore, as electrical contractors, we must try to solve the problem thus brought about in the best way we can.

The vast majority of houses now being built contain a garage, which, in many cases, is part and parcel of the construction of the house. This, to my mind, is the ideal site for the electrical control gear, so long as discretion is used in the matter of placing it upon a dry wall. A further advantage of using the garage for this purpose is that it is usually situated on that side of the house nearest to the road, and that means nearest to the supply company's mains, so that a service brought to the garage will incur a minimum of cost.

Although there are exceptions, supply undertakings are not in the habit of giving anything away unless they are pressed. I daresay if I, in my business, were protected by Acts of Parliament in the same way that they are, I also might in time develop a somewhat independent attitude towards my customers.

One of the most depressing examples of this attitude is found in the absolute insistence of supply undertakings upon their rights in giving a service of electricity only to a block of buildings, and not to individual consumers. A man living in one of the top storey flats of an eight-storey building requiring an electric radiator or an electric cooker is faced with the prospect of running a main right down through the block back to the point of entry of the supply company near the pavement, unless his landlord has previously, at his own expense, had such rising main installed. It is, however, rare (in my experience) to find that adequate rising mains have been provided in such buildings for contingencies of this sort. Even where rising mains have been provided it is usually found that they have been designed on the basis of one 1kW fire per flat.

An Interesting Analogy.

This state of affairs is a great pity, and brings to mind the dreadful state of affairs which would exist if the butcher, the baker and candlestick-maker all refused to deliver their goods to the flat door, but insisted on dumping them exactly one inch inside the main door of the block of flats. But then the butcher and the baker and the candlestick-maker are not protected by Acts of Parliament, so they have to lump it and deliver to the flat door. There is only one solution that I can see. It is for the electrical contractor to canvass personally all the flats in such a block, asking if the tenants will combine to provide rising mains. But, even in this case, it is asking them to provide for future tenants of those flats as well as for themselves, and they may reasonably object. Again, if the electrical contractor succeeds in collecting a quorum, then it is true that he will himself benefit by such electrical installation work as may be necessary, but he will also have carried out what is really a labour of love on behalf of the electricity supply undertaking, whose revenue will be proportionately increased, both by the sale of electrical energy, and, if the contractor is not very quick, by the supply of all the electrical appliances for consuming such current.

It is a hard world!

"To earth or not to earth" is a vexed question, and one into which I am not going to be foolhardy enough to leap. For some time yet it will remain a matter of personal opinion, and the rules followed in various installation jobs will be those which appeal to the contractor who is responsible for the work.

Nevertheless, I think it is as well that every contractor should make up his mind as to which school of thought he favours. Even though he may change his mind later, he should have some principle which governs all his work. Thus, it is perfectly absurd for an installation to include some pieces of apparatus which are earthed through a 3-pin plug and other pieces of apparatus which are not. If there is one piece of apparatus in a house which is not earthed, then the customer can consider that he has wasted an enormous amount of money on the comparatively elaborate precautions taken to earth the remaining pieces of apparatus. This sounds obvious, yet it is not quite the platitude which it may seem, for at the present time there is a tendency—not nearly great enough a tendency, but, nevertheless, a tendency—to increase the number of domestic electrical appliances in use in the home. In such cases it is surely foolish to recommend a 3-pin plug for a new outlet when there already exist half a dozen 2-pin plugs in that household. If the contractor believes in earthing, then he should try to persuade his customer to have all his 2-pin plugs altered to 3-pin plugs; alternatively, he should be frank with his customer and point out that it is sheer waste of money to put a 3-pin plug in. Apart from all this, however, there is a much more serious aspect of the case, for where there is a household with some 2-pin and some 3-pin plugs there will be no interchangeability of apparatus, and that is damning to the development of the electrical idea.

"DRESSING" THE SHOPPING DISTRICT FOR CHRISTMAS.

Enlisting the Co-operation of Retail Traders in Creating a Festive Atmosphere—Successful Results of a Christmas Holiday Decorations Scheme—The Encouragement of Exterior Lighting for Private Houses.

By ERNEST A. DENCH.

IN many American communities the local business men combine to make the shopping streets radiate the Christmas spirit, by elaborate decorative and lighting schemes. It gives the city a festive atmosphere and tends to induce shoppers to come from near and far to inspect the gift wares offered by the local stores. For the benefit of electricity supply undertakings and installation contractors who desire to increase business in this way, the following experiences may be of interest.

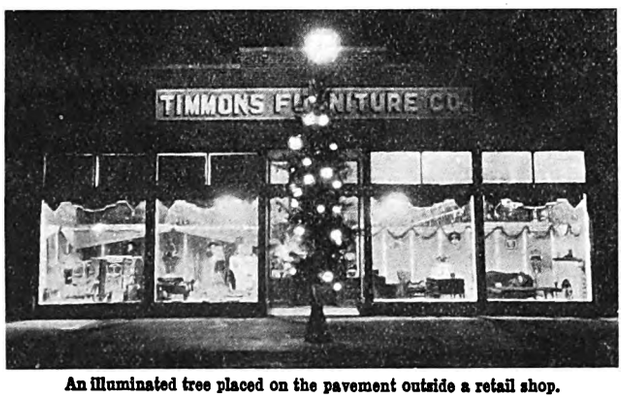
Co-operative Christmas illuminations in the shopping district of Salt Lake City.

In a small southern town last December, the retailers arranged, by being assessed so much a front foot for their business premises, for a series of coloured electric lamps to be strung along the main street. These lamps were hung in clusters at regular intervals on garland draped standards.

In other years the co-operating traders, for the good of the town, had defrayed the extra cost of the decorations in front of the premises of those retailers who refused to support the effort. Last year they tried to discipline their small-minded colleagues by allowing gaps to appear in front of certain shops. It didn't look well to outsiders, but it had to be done. Practically every retailer ought to be in accord with this exterior form of Christmas trading promotion. He may not think the financing is done correctly, or he may not like the layout, but these are minor details in comparison with the big issue.

A Holiday Decorations Committee.

None of the antagonistic spirit prevailing in the unnamed southern city marred the Christmas trade activities of the Retail Merchants' Bureau of the Salt Lake City (Utah) Chamber of Commerce. Here, the Holiday Decorations Committee decorated thirty blocks in the city's business district, where there are, all the year round, flag pole receptacles about 25 ft. apart. In each of these a 12 ft. Christmas tree was set. The Retail Merchants' Bureau purchased spruce trees with a minimum of 4 in. diameter at the butt. A 1 in. hole was drilled in the butt for a depth of 6 in., then two bands of heavy wire were clamped around the butt. A 12 in. length of pipe was next used; 6 in. in the base of the tree; while the other 6 in. went into the flag pole receptacles in the paving. This technique ensured the trees standing up through heavy wind storms. Last year 800 trees were used in the business district.



An illuminated tree placed on the pavement outside a retail shop.

Many of the co-operating stores added to the gala appearance of the trees in front of their premises by adorning them with coloured lights. The decorative scheme was enhanced by 210 evergreen wreaths, each of 3½ ft. diameter, hung upon the tramway trolley support wires midway between the curb and the outer tramway rail.

Salt Lake City's permanent street lighting system consists of standards supporting a series of three globes—two lower globes, with one above. Last December a special lantern designed by Mr. L. B. Gowans, illuminating engineer of the Utah Power and Light Co., was affixed to the two lower lights. The lantern, 3 ft. high and 20 in. in diameter, was made with sections or segments, in which were placed coloured glass. The decorative scheme last season embodied a straight coloured lighting effect—either green or red. The lantern was designed in four segments, so it will be possible, in forthcoming years, to vary the colour scheme with alternate sections of green and red. For special events, such as conventions and festivals, the prevailing colours can be duplicated at modest cost. In 1927, 210 of these lanterns were paid for out of the current year's budget. A further purchase of 210 lamps came out of the 1928 budget. The merchants in the business centre paid just over 1s. per foot of frontage for the service.

Example of Christmas lighting at a typical suburban home.

This Christmas spirit is infectious. One unexpected outcome was the spirited rivalry of residents in the suburban areas to duplicate, in some measure, the brilliance of the specially lighted streets. Here, of course, there was no uniform decorative arrangement; each home lover manifested his or her individuality, adapted to the type of house. Some of these lighting effects merit brief mention here.

At one of the most outstanding of the decorated residences of Salt Lake City, the front of the roof, over the small porch, was spanned with a large cut-out of Santa Claus and four reindeer; the whole illuminated by a spotlight from the edge of the roof. Near the chimney was what appeared at first sight to be a quarter of the moon. Actually, it was a cut-out attached to the chimney and bathed in a spotlight hidden on one of the trees in the garden. Beside each front entrance was a small decorated and lighted Christmas tree.

Near the back of the house, on the edge of the roof, was an allegorical figure in cut-out form of "The Three Wise Men of the East." Illiminated holly wreaths were in the house windows. In the garden there was a trellis studded with bouquets of coloured lamps.

Another dwelling had coloured electric lights attached to dwarf evergreens planted as a border against the house. Two rambler rose bushes were handled in the same manner and lighted wreaths of evergreens adorned the windows and doorway.

Experience at Salt Lake City has shown that this Christmas lighting is good for the electrical trade and for all the co-operating traders.

BOOK-KEEPING FOR ELECTRICAL CONTRACTORS—II.

Books the Trader Must Keep—The Functions of "Working" Books—Dealing with Shop Orders—Keeping Track on Uncompleted Work.

By S. HOWARD WITHEY, F.C.I.

THE electrical contractor who desires to obtain the maximum of reliable information concerning the organisation, control, and the trend of the business, should keep the following books :—

TAKINGS BOOK, or Cash Sales Book, for recording particulars of the shop sales and services rendered on a cash basis.

DAY BOOK, for details relating to all fittings, accessories, motors, machines, batteries, instruments, switchgear, etc., supplied to customers on credit. At the end of this book a few pages should be reserved for entering up all returns inwards and allowances made to customers in lieu thereof.

CASH BOOK, for recording all cash received and all cash paid, whether in the form of cheques, notes, or coin.

PETTY CASH BOOK, for the classification of expenditure which it is either impossible or undesirable to detail in the cash book proper.

PURCHASES BOOK, or Bought Journal, for the systematic analysis of all apparatus, tools, engines, materials, and stores purchased, and for the recording of working expenses and other business charges as they accrue. The returns outwards and allowances should be entered in the end section of this book.

CONTRACT LEDGER, for the different contract accounts.

SALES LEDGER, for the personal accounts of customers and debtors.

PURCHASES LEDGER, for the accounts of suppliers and trade creditors.

A Locked Book.

GENERAL LEDGER, in which will be kept all management expenses, accounts, stock accounts, and asset and liability accounts, also copies of the periodical trading accounts, profit and loss accounts, balance sheets, and the costing statistics. This book should be provided with a lock and key.

In addition to these books of account, there will be a number of working books, the most important of which will be the order book. The entries made in the order book will constitute the real foundation for all entries made in the financial books, and for this reason it should be kept in a business-like manner.

The practice of depositing orders in a drawer or on the office desk is not a good one, and whether they come to hand through the medium of the post, from agents or representatives, over the telephone or are received by the contractor verbally or by messenger, they should be set down at once in a special book kept for the purpose.

Some electrical contractors prefer to use loose printed order forms as a part of what is called the slip system of account-keeping, the impression being that a considerable volume of clerical work is thereby avoided. In practice, however, this is not always the case, but the greatest disadvantage associated with the use of loose sheets is that some of them get filed away before the orders have been completed, or before the amounts involved have been properly charged against the customers. In those cases where the contractor is compelled to carry on without any clerical assistance, and where each order has his personal attention, the forms should be numbered in consecutive order and kept on a separate file, the completed orders being bound in book form to constitute a kind of order book and day book combined.

Where a considerable shop trade is transacted a duplicate book kept on the pen or the pencil carbon-copy principle will be very suitable for recording the orders. When the details have been set down the original form should be handed to the person or transferred to the department immediately concerned in the execution of the order, the copy being retained in the book for purposes of future reference. If another copy of each order is found necessary for use in the office, a manifold order book should be used, this book consisting of thin tissue leaves.

By far the best method, however, is the printed order book method, which ensures, as far as possible, that no business is lost through failure to carry out the instructions of customers. The precise ruling for this book will naturally vary to some extent in individual cases, according to the size of the business and the particular class of trade or kind of electrical products sold, but it will be necessary to provide for the insertion of the date on which each order was actually received ; the order number ; the customer's name and postal address ; details of the appliances or components required or a specification of the installation desired, and the rate or price. As a rule these columns can be filled in at once. Upon the fulfilment of an order, such particulars as the date of completion, or the date of despatch ; the goods or articles supplied or installed ; and the folio on which the transaction has been booked in the contractor's day book, should be entered, a good general style of order book being as under :—

ELECTRICAL CONTRACTOR'S ORDER BOOK.

Date Received.	Order No.	Customer's Name and Address.	Particulars of Apparatus, Components, Installation, etc., Required.	Rate or Price.	Date of Despatch or Completion.	Goods Supplied or Work Performed.	Day Book Folio.	Remarks

When any unusual conditions or stipulations accompany an order, these should be plainly stated in the "Remarks" columns, with the delivery and other instructions. Although in the majority of instances the details shown in the column "Particulars of Apparatus, Components, Installation, etc., Required" and those in the column headed "Goods Supplied or Work Performed," will correspond with each other, the contractor may be temporarily out of stock of the particular components specified by a customer, and may supply a part or parts differing only slightly from those mentioned in the original order ; consequently both columns should always be filled in.

At the end of each day's work it is a good plan to examine the entries made in the order book, and to scrutinise the "Day Book Folio" column. If all the orders recorded on any one page have been fulfilled, as proved by the existence of a day book folio against each, a neat line should be drawn diagonally across that page from corner to corner, thereby avoiding the need for wading through the book when reference has to be made to the details connected with an order on hand. All orders having no day book folio against them will, of course, constitute the unfulfilled orders, and the contractor should constantly have his attention directed to these, any that appear to have been outstanding for an unduly long time being subjected to investigation, to prevent any work being overlooked or only partly executed.

Sustained Demand.

Although demands for electrical products of both standard and special design are reflected in the contractor's order book, the creation of sustained demand is a problem calling for scientific treatment. Reiterated messages calculated to meet the eye, not only of the customer but also of the potential customer, usually have very definite and permanent results, and to increase turnover in these days of acute competition the man of business must adopt only those methods of advertising and publicity which have proved themselves to be consistent business pullers. Broadly speaking there are three kinds of advertisement, viz. :—The large displayed prestige advertisement, the object of which is to convey to the public a fixed idea of financial strength and stability ; the stock clearance advertisement which, by its nature, is only temporary ; and the sales continuity advertisement calculated to spread the turnover more or less evenly throughout the working year. To the average electrical contractor the latter method will be more satisfactory, but whether it should be effected in the press, through the medium of the post, or in the shop window, or by a combination of any of these, is a matter for the individual to decide.

Fulfilled orders automatically pass out of the category of orders and become sales or contracts, necessitating entries being made in the contractor's day book. In the next instalment of this series the best method of booking the sales, and also the returns inwards and allowances will be shown.

NAVAL WIRELESS TELEGRAPH COMMUNICATIONS.*

Historical Details — Multiple Reception — Design of the Apparatus — Design of Transmitters for Long and Short Waves.

By G. SHEARING, B.Sc., M.I.E.E., and Capt. J. W. S. DORLING, R.N., M.I.E.E.

THE first experiments in wireless telegraphy in the Navy were commenced in 1896–7. Ranges up to 3½ miles were obtained. The transmitting apparatus consisted of a Heıtzian oscillator energised by an induction coil worked either from the electric light mains or from a 12 V battery. By the end of 1900, 43 ships and eight shore stations had been, or were being, equipped with wireless telegraph apparatus. In 1905 a naval wireless telegraph establishment was organised in " Vernon " and a 5 kW set installed in Portsmouth Harbour.

In 1906 the Wireless Telegraph Branch, in which men could specialise, was instituted, with good results. In subsequent years experiments were made with new wavelengths. In 1909 the crystal detector was first used. In 1910 a quenched spark set was built for a naval airship. During 1911–12 much experimental work was done with the Poulsen arc, and a 100 kW Poulsen arc was installed at Portsmouth in 1913.

Early Valve Reception.

In 1914 experiments on valve reception were commenced. Whilst spark and arc systems were mainly used on ships at sea during the war, it appeared probable that these systems would be superseded by the thermionic valve. Post-war developments have confirmed this view. Singl valves are now in use at sea capable of dissipating 8–10 kW at their anodes under oscillatory conditions.

Another feature has been the successful use of short wave communication.

Turning next to the requirements to be met by a naval wireless telegraph system, the authors point out that British men-of-war are to be found in all parts of the world. In the United Kingdom there are, therefore, wireless stations designed to communicate with ships in adjacent waters, and others for really long distance transmission. Each naval area has one or more wireless stations capable of communicating with (*a*) the Admiralty, either direct or through links; (*b*) the Commander-in-Chief of the station and his ships; (*c*) any merchant ships in the area; and (*d*) adjacent naval commands. To meet these requirements a medium power long wave valve transmitter of about 25 kW h.t. input, fitted for local working within a radius of, say, 1 500–2 000 miles, is usually fitted. For longer distances short-wave transmitters ranging from 2 to 10 kW h.t. input, are used.

Cruisers and other ships on foreign stations should be able to communicate with the shore station and with (*b*), (*c*) and (*d*). The equipment has the following characteristics:—(1) Range (long wave)—1 000–2 000 miles; (2) power (long wave)—12 kW h.t. input to transmitter; (3) power (short wave)—8 kW h.t. input; (4) valve transmitters are used in all cases; (5) receiving apparatus (long and short-wave), two or three sets are fitted; (6) direction-finding apparatus on the Bellini-Tosi system is fitted in most cruisers; (7) fire-control wireless sets are fitted for use when cruisers are concentrated in squadrons. It must also be robust, simple to handle, reliable under all climatic conditions, proof against vibration and the shock of gunfire, and capable of being maintained in full efficiency by the ship's wireless staff.

Next we must consider the main fleet, under the Commander-in-Chief who must be able to convey orders to any unit. Scouting units must be able to transmit information to the Commander-in-Chief and other senior officers. The Commander in-Chief must also be in touch with the Admiralty and other authorities.

All these lines of communication should work simultaneously without interference. This is usually done by multiple reception in the flagship, all transmissions being made by wireless guardships, pecially allocated for each wave. Short-distance apparatus is also fitted in special offices in the battleships, to permit of inter-communication within the fleet without interference with long distance lines. The striking feature of a fleet action is the speed with which everything happens. The two fleets may approach each other at 40–50 miles per hour; even with aircraft reconnaissance the time between first sighting the enemy and joining action may be only an hour or two. The volume of signalling during this period is very great, especially in the fleet flagship, and special means are necessary to ensure that no signal is delayed. The direction-finding sets fitted in some ships often prove of value in locating the exact position of enemy vessels or scouting vessels or aircraft. Wireless communications continue during the action. Also all ships use special low-power sets for fire-control.

In the next section of the paper the authors describe, by the aid of numerous sketches and diagrams, the design of offices and apparatus. Limitations of space on board ship have an important influence on design. Tests of apparatus are carried out by the contractor or dockyard under the supervision of H.M. Signal School, Portsmouth.

The powers supplies are next discussed. The power supply for both thermionic or spark wireless telegraph transmitters is mainly high tension low frequency a.c. For spark transmitters the frequency adopted was 350 cycles per sec. giving a note frequency of 700, but for valve transmitters this has been changed to 500 and 1 000 cycles respectively.

Power for the motor-generators is taken from d.c. busbars on power boards in the wireless office supplied from the ring mains, either 100 or 200 V being used. The ring main power supply is in duplicate. Duplication of machines and power panels is adopted, each motor-generator being installed complete with its own d.c. and a.c. control gear. Also either machine can be operated from either startor. The power panels are comprised in four main parts for the following purposes (1) d.c. supply and a.c. output board for the filament motor-alternators, (2) d.c. supply board for main alternators, (3) distribution board for lighting and auxiliary circuits, (4) a.c. distribution board for main alternator. Provision is also made for various indicating lamps and safety devices.

The authors next discuss in some detail the design of valve transmitters for long and short waves, the operating controls of valve transmitters, the design of valve transmitters having high constancy of frequency and transmitter oscillatory coils. Other features discussed are transmitting condensers and main aerial trunk and deck insulators. Two types of main aerial systems are employed:—(1) Sausage aerials having two or more legs, each comprising 10 wires on circular spreaders at about 1 ft. diameter, and (2) flat roof aerials of about 6–8 single wires in parallel, arranged along yards of 30 to 40 ft. in length. There is little difference as regards communication and the choice is settled mainly by mechanical considerations.

Accumulator Power Supplies.

The main receiving apparatus for heavy ships is installed in a silent room which forms a portion of the main wireless telegraph office. It is laid down as a general principle that all receiving instruments shall operate independently of the ship's mains, and the power supplies for anodes and filaments are therefore taken from accumulators. The question of providing an alternative power supply to the accumulator systems is now being studied. The wiring and arrangement of receivers to reduce interference has to be carefully carried out. Eight different sources of interference are mentioned. Interference from running machines is apt to prove especially troublesome.

Reference is also made to the design of receiving aerials and receiver design for wide frequency bands. Direction-finding apparatus has considerable tactical importance, and the authors, summarise various improvements which have made the process more expeditious.

* Abstract of a paper read before the Institution of Electrical Engineers.

BRISTOL ELECTRIC CLUB.

The Bristol Electric Club will celebrate its third birthday in January next, and at the second meeting of the Winter Session at the Crown Hotel, on December 13th, a supper and smoking concert were given. The performers at the concert were Messrs. S. Miller, E. Collins, G. Cooper, G. A. Davies, F. White, and Vie Davis, and the " Snooker " Cup, given by the president, Mr. A. H. Dowson, was presented to the winner, Mr. J. S. Mitchell, who is hon. secretary.

CONTRACTING EPISODES.

More Leaves from the Notebook of an Old Electrical Engineer.

By "ELCON."

THERE are jointers and jointers, and some should spell it joiners.

A "T" joint found to overheat badly came into my hands for repair. The through cable had a copper core of about 1 in. dia., and the tapping a core of about ½ in. dia., and the join was effected as follows. All but the outer ring of strands of the tapping had been sawn short, the inner stump being then butted against the through core and a quantity of solder dabbed on. The outer ring strands of the tapping were then bent back and twisted round—not the through core—but the tapping, leaving nothing but a few surface cakes of solder effecting the join.

* * *

Another joint I made friends with was made thus. The two ends of a cut "through" core were bared for about 4 in., and on to this the bared end of the tapping was laid and bound with copper wire, giving a formation like a closed-up pawnbroker's sign.

The copper cores were in this case about 1 in. and 1 in. and ½ in., and no soldering had been attempted. When opened, all but a few strands had been eaten away, and the insulation was baked to a cinder.

* * *

A small supply company carrying out their own wiring work were, soon after the opening of the station, "bows under" with work, and obtained several new hands. One private unoccupied house was given over to two of these people, who promptly asked to be allowed to do the wiring on a contract basis. This was agreed to, and at the end of a fortnight there did not appear to be much of the 80-point job left unfinished, and they then wanted to leave and be paid up. Following them to finish the job off, I soon discovered that these smart lads had merely suspended some bits of wire through the ceilings and down the wall, not a single point having any connection with any other point, switch, or fuse board.

* * *

I have met this trick when blocks of houses have been wired for builders; bits of wire being pushed up the ends of conduit for switch points, and hung from the ceilings for light points, the one having no connection with the other.

* * *

In a certain building I was wiring with p.i.l.c. cable, I was called upstairs by a workman, to find a gasfitter, somewhat fuddled, trying to tap a compo pipe into one of my main cables. His perplexity at the difficulty of making a hole in the cable would have been amusing in someone else's job. His language at finding "the pipe stuffed full of goodness knows what" was well up to standard.

* * *

A firm I was with received a complaint that a sub-contract for wiring was not proceeding fast enough, and that no one appeared to be in charge to whom reference could be made. I was detailed to investigate the matter, and regarding the latter part, pointed out to the complainants that so and so, one of the wiremen, was in charge of the job. The elderly engineer to whom I offered this explanation remarked in reply: "My boy, my experience has been that wiremen are usually plumbers, joiners, or gasfitters, who are no d—— good at their own trade." In regard to those days, he was not very far wrong; nowadays they don't seem to try the other trades.

* * *

An advertisement for an electrician to put in a small private plant led to a meeting with a contractor who personally supervised and worked on the job. The plant consisted of about 40 lights run from a 50-V set supplied by surplus steam, the lights being, in about half of the cases, situated over clay drying trays from which clouds of steam arose day and night, saturating the shed roofs to a state of continual drip. The wiring system chosen by friend contractor was slip joint tubing, with a wood block in lieu of tees and elbows to cover the tube ends. Keyholders suspended by workshop flex from ceiling roses were used throughout. The cheapest grade of wire was also used, and joints galore pulled into the tubing. No joints were soldered, and the only covering was two or three layers of black tape. The switchboard was made of the wood from a packing case painted black. I was paid off when the job arrived at the stage of joining up to the dynamo, and expect the absence of "that d—— electrician I employed" came in pretty useful when he had to face the music later on.

* * *

Another sample of choice work I came across was an installation of lighting and some 500 H.P. of motors (three of which were large units, and all of 3-phase induction type) in a works where moisture was very much in evidence. The whole of the gear supplied, motors, controllers, fuse panels, etc., were designed for use with v.i.r. cable, but the whole of the power wiring was carried out with paper insulated lead sheathed stuff. No sealing ends to cables were used and no attempt whatever was made to protect the exposed paper insulation, which was treated throughout as though it had been v.i.r. The firm responsible for this job had its note-paper headed with a slogan "quality tells" or something of the sort. I anticipate the officials who finally inspected the work had something to tell that firm about quality.

"TO EARTH OR NOT TO EARTH?"

Interesting Contractors' Problem Discussed at I.E.E. Meeting.

THE informal meeting of the Institution of Electrical Engineers held on December 9th was for a discussion opened by Messrs. W. R. Rawlings and T. C. Gilbert, from opposing points of view, on the perennial question "To Earth or not to Earth?" The importance of the subject attracted a very large and representative gathering, and the views expressed showed that the earthing question, despite the official stipulation, is as moot as ever. Mr. W. E. Bradshaw was in the chair.

Mr. Rawlings said he had read with great interest Mr. Gilbert's articles and entirely agreed that the subject needed the fullest publicity. He felt that the Press notices of the last discussion did a great and valuable service to the industry in bringing home the importance of safeguarding the public against the possible dangers of alternating current at 230 V. He thought it must all result in a definite call for better materials and workmanship.

Mr. Rawlings said that as all were agreed upon the need for protection the discussion could be reduced to two points: (1) To earth or not to earth? (2) What system of wiring gives best protection to the public?

Upon the first point he held with Mr. Gilbert that to insulate is best, but he had still to learn how this can be effectively done. Until motors, cookers, radiators, fans, irons, kettles, etc., could be made of insulated material he believed there could only be one course, namely, to earth. He was fully aware that the present method of earthing had flaws and was misleading, but he pressed for a general and stricter observance of the practice.

Upon the question of the best system of wiring, he advocated earthed concentric wiring as providing a safe system which gives intimation of any leakage by automatically cutting off supply to the affected section.

Mr. T. C. Gilbert, who followed, said that if only a fraction of the time and energy spent in advocating the earthing of all exposed metal had been given to the consideration of ways and means for eliminating such metal we should to-day be in a much sounder position. The earthing idea seemed delightfully simple, and if it had proved as simple in practice there would be no opposition to it; but applied to domestic portable apparatus it was so remote from our idea of good practice that only legislation could enforce it. If after thirty years the practical man was still unconvinced, surely there must be good reason to suspect that the idea was unsound.

He agreed that very great harm was done to the industry by electrical accidents, and said that means must be found to reduce the risks, in view of the forthcoming universal a.c. supply. But he held that earthing was unworthy of being the sole reply of the industry to the menace confronting unskilled users of electrical apparatus. There were too many weak links in the chain, the failure of any one of which was probable. With universally earthed equipment, it would not be necessary for victims to get into baths or connect themselves to earth by similar means, as a convenient earth would always be at hand. Recently he found a child poking the metal handle of a toy into the element of a radiator; luckily the latter had not been earthed and a serious accident was avoided.

In some of the newer cookers it was extremely difficult to obtain a shock, owing to the thick coating of vitreous enamel

Digitized by Google

with which they were covered. This was a step in the right direction, but even if we continued to construct cookers of iron our responsibility did not begin until we earthed the framework. There might be very high insulation between the boiling plate and the hob, and he could not repress a shudder when he thought of kettles, etc., used in proximity to this mass of earthed metal.

Mr. Gilbert declared that there was no domestic appliance in use to-day which could not be constructed of material other than metal, or, alternatively, could not be effectively insulated.

Dr. A. Ekström said that in his opinion earthing was a very dangerous practice to introduce into houses, because it brought a false sense of security. If we could not rely on it we were better without it, while in rural wiring it was very difficult or impossible to find an earth of sufficiently low resistance. In regard to domestic apparatus, he said that if only the handle of the iron or kettle were better insulated than at present a very great improvement would be effected. It was also desirable to insulate the knobs of water taps because they were firmly gripped.

Mr. S. W. Melsom was sorry that the advocates of earthing had confined their proposal to a dubious concentric wiring system. Could anyone doubt that the real solution was to insulate all apparatus? There was too much inclination to neglect the more reliable method of having the very best dielectric.

Mr. F. E. Phillips said that while tough-rubber insulated cables originated for use as colliery trailing cables, their use had been extended to all purposes. Government Departments used them largely, and innumerable important buildings had been so wired. Such cables could be exposed to the atmosphere or concealed at will. They withstood moisture and provided the ideal insulated system.

Messrs. C. J. Banister, A. J. Bousfield, W. E. Bradshaw, A. H. Dykes, A. Edwards, H. Willoughby Ellis, A. F. Harmer, B. Higgs, W. E. Lang, A. Morgan, W. A. Ritchie, E. S. Ritter, A. J. Stiling, and D. J. Watkins also spoke.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Standardised Page Sizes.

[To the Editor.]

Sir,—We have been very glad to see the correspondence in your columns on this subject, as it is one on which we feel very strongly. One of the great difficulties of the engineering advertiser has been that his preparatory charges were so disproportionate to the actual cost of space, due to the fact that while a "national" advertiser could repeat his advertisement in paper after paper, the engineering advertiser has had to have fresh blocks, and, perhaps, even a new drawing, for almost every medium.

Undoubtedly, a concerted movement for a standard page size will involve many difficulties for the trade journals themselves, but we are sure that they will meet these difficulties in a sympathetic way, bearing in mind that such a reduction in the preparatory charges will release a certain amount of money for expenditure on actual space.

We greatly hope that in a vast majority of cases it will be possible to standardise on the size of 10 in. by 7 in., without making use of the two alternatives put forward.—I am, etc.,

For Brookhirst Switchgear, Ltd.,
H. N. Goody,
Publicity Manager.

Chester,
December 13th.

[To the Editor.]

Sir,—We are heartily in favour of the proposals for the standardisation of the advertising page size in British trade and technical journals, as put forward by the Incorporated Society of British Advertisers.—I am, etc.,

For Eversheds and Vignoles, Ltd.,
A. W. Swan,
Publicity Department.

Chiswick,
December 13th.

[To the Editor.]

Sir,—I am in entire agreement with the letter under the above heading, which appeared in your issue of November 29th. Variations in page sizes are not only expensive, but are extremely inconvenient to the advertiser.

The additional expense involved in having special drawings and blocks made for certain papers is quite a considerable item in proportion to the total cost of buying and filling space in these papers. It seems absurd that one should have to spend possibly £4 to £5 on a revised drawing and new original half-tone block to occupy space which itself costs no more than that amount of money. Yet this is a very common experience of advertisers in technical and trade papers.

Advertisers, being human, naturally tend to eliminate from their programmes papers which are so far out of standard as to require individual alterations.

At present, probably 60% or 70% of trade and technical papers can use a block measuring 10 in. by 7 in., although in a number of these cases this can only be done by allowing extra white space round the advertisements. Of the remaining 30% or 40%, perhaps half can use blocks made in the same proportion as 10 in. by 7 in., while for the other half one has to have special drawings made.

Unfortunately, there are in this residium of unaccommodating papers a few journals of outstanding importance, which make it impossible for many advertisers to say that they will only take space in papers of standard size. Important though some of these papers may be, I would suggest that the size of their pages is a very diffinite handicap to them in getting and retaining business. The fact that such papers may at present be able to get all the advertising they need, is simply an example of the triumph of editorial merit over commercial ineptitude, and in no way justifies a policy which is manifestly inconvenient, expensive and objectionable to advertisers in general.

Standardisation of page size *must* come sooner or later. Individual papers will, of course, have their individual and peculiar difficulties to surmount in adopting a standard page size. Time, however, will not lessen these difficulties, but will tend rather to accentuate them.

Any objections which may be raised now by a particular paper will be still more cogent in five or ten years' time. Every month and every year of further delay in this vital matter will mean additional trouble and expense when the change is finally made.—I am, etc.,

H. E. Goody,
Advertising Department, The British Thomson-Houston Co., Ltd.

London, W.C.2.
December 16th.

Television.

[To the Editor.]

Sir,—I recently went to see an exhibition of Baird television at the offices of the British Broadcasting Corporation. The television was very successful, and I was easily able to recognise a moving picture of the Prince of Wales.

The picture, however, was only a few inches in diameter, and visible only to a small number of people, and for large pictures such as would be able to be seen by a large number of spectators, as, for instance, in cinematograph theatres, very considerable improvement upon present methods would be necessary.

As in present-day television the picture is divided into a number of parts or elements which are transmitted one after the other with sufficient rapidity to take advantage of visual persistence, the difficulty in the way of producing larger pictures is the dividing of the picture into a sufficient number of parts or elements to give reasonably close-grained results without interfering with other wireless transmissions.—I am, etc.,

A. A. Campbell Swinton.

London, S.W.1.
December 16th.

DIESEL ENGINE USERS' ASSOCIATION.

At a meeting of the Diesel Engine Users' Association at Caxton Hall, Westminster, on December 13th, a paper on "A Form of Coupling for Geared Diesel Engines for Land and Marine Purposes" was read by Mr. W. Brose. The form of coupling described was that developed in the Vulcan Yard, Hamburg, and based on the patents of Dr. Bauer. A keen and interesting discussion followed, in which a number of members and visitors participated.

NEWS IN BRIEF.

The Birmingham Electric Club—American Wireless and Cable Communication Systems—Cardiff and the Glamorgan Electricity Co.—Proposing Marriage by Wireless.

OLDHAM Waterworks Engineer has been instructed to obtain quotations for the lighting by electricity of the waterman's house, Blackstone Edge.

Manchester Town Hall Extension Special Committee has asked the Electricity Committee to allow the Chief Engineer, or one of his representatives, to confer with the architect with regard to the lighting of the new library buildings.

Wokingham T.C. has under consideration a proposal to adopt electric lighting of the town hall.

Cheltenham Corporation has adopted a proposal to provide electricity for lighting and gas for cooking in council houses.

The annual general meeting of the Birmingham Electric Club will be held at 7 p.m. to-day, Friday, at the Grand Hotel.

During the past week a decorated municipal tramcar has been touring Dundee in connection with a collection for a Christmas treat for poor children.

Rotherham Transport Committee recommends that grants be made to men who have operated their tramcars or 'buses with the least amount of current and petrol.

A sub-committee of Edinburgh Lord Provost's Committee has decided to adhere to its previous recommendation to install automatic road traffic signals at certain points.

The unification of the American wireless and cable communication systems was advocated before the Senate Inter-State Commerce Committee recently by Mr. Owen D. Young, chairman of the Radio Corporation.

Brighton Electricity Committee has decided to pay £1 per point to any contractor who undertakes the wiring of houses which fall within the Corporation's assisted wiring scheme, subject to the materials used being approved by the Electrical Engineer.

Hull Corporation has asked the Property Committee to consider the installation of electrical or other apparatus to improve the acoustics of the Council Chamber.

"The Daily Mail" Schoolboys' Exhibition will take place at the Horticultural Hall, Westminster, from December 31st to January 8th. Electrical and wireless apparatus and a "noctovision" installation will be amongst the attractions.

Ossett Education Committee is to install an electric furnace, in connection with the art work at the technical school, at a cost not exceeding £70.

It is reported that the first man to make a proposal of marriage by Transatlantic wireless telephony has just been married in London as a result of his enterprise.

The Glasgow Director of Housing reports that a charge of £1 per cooker will be made where the installation of an electric cooker necessitates the removal of a gas cooker.

Marylebone (London) Establishment Committee recommends that an additional assistant mains engineer in the electricity department be appointed at a salary of £359 2s. 9d. per annum.

The Bell Telephone Co. of Canada expects to spend $160 000 000 on extensions and replacement during the next five years and to instal 250 000 telephones in the provinces of Ontario and Quebec.

Glasgow Corporation Committee on Wages has recommended an increase of 1d. per hour in the wages of fitters at the Coplawhill and Elderslie tramcar works. The A.E.U. asked, on behalf of the men concerned, for an advance of 2d.

London County Council Education Committee proposes to give permission for wireless apparatus to be connected to electric lighting installations in schools, provided that the Chief Engineer is satisfied as to the suitability of the apparatus.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *dated December 20th, 1879:—*

Para rubber was quoted at 3s. 2d. per lb.

Glasgow had three rival telephone exchange companies, the Scottish Telephone Exchange Co.; the Edison Telephone Co.; and the Telephone Co (Bell's). Besides these, Mr. Graham, a telegraph engineer of the city, was prepared to establish private lines.

An electric detonator was used to fire a mine used in an attempt on the life of the Czar.

* * *

TWENTY-FIVE years ago it was stated in THE ELECTRICIAN *of December 23rd, 1904, that:—*

The L.B. & S.C. Railway was preparing specifications for electrically equipping a trial section of its system between Battersea Park and Peckham Rye.

A boy "short-circuited the conductors within the slot of the L.C.C. trams by means of an iron hoop."

An electric cigar lighter was introduced.

The de Forest Co., claimed to have established the longest overland wireless communication on record—a distance of 800 miles between Kansas City and Cleveland.

There were 27 tenders, ranging in price from £281 14s. to £550 10s. for the electrical installation in the Council House at Wandsworth.

* * *

FIFTEEN years ago THE ELECTRICIAN *of December 18th, 1914, reported that:—*

A shut-down at the L.C.C. Tramways power station caused a complete cessation of traffic on the system.

A German naval bombardment of Scarborough, Whitby and West Hartlepool, believed to be directed at the Scarborough wireless station caused no damage there.

* * *

TEN years ago, it was reported in THE ELECTRICIAN, *dated December 19th, 1919, that:—*

About 85% of the members of the British Insulated and Helsby Cable Co.'s staff had joined the newly-formed B.I. & H.C. Staff Guild.

Camberwell (London) Guardians have authorised an electric light installation in the master's house of the Constance Road Institution at a cost of from £40 to £50, plus fittings. The work is to be carried out by direct labour.

The Postmaster-General announces that the hours during which the reduced (night) charges apply on telephone calls from this country to Spain and Gibraltar are now 7 p.m. to 8 a.m., instead of 9 p.m. to 8 a.m. as hitherto. The charge for a three-minutes' call from London to Madrid is 14s. 3d. between 8 a.m. and 7 p.m. and 8s. 9d. between 7 p.m. and 8 p.m.

Bedford Chamber of Trade at a recent meeting, passed resolutions submitted by the Electrical Contractors' Section registering opposition to the proposal of the Corporation to open electrical showrooms, on the ground that it is an unwise expenditure of public money, and an unnecessary duplication of existing facilities provided by electrical firms in the town.

Cardiff Electricity Committee decided on Monday to suspend the Glamorgan Electricity Co. from the Corporation's list of contractors, in consequence of a report that the firm had sublet work allotted to them under the Corporation's "A" scheme of electricity extensions. The firm is to be at liberty to apply for reinstatement on the list at the end of twelve months.

Applications are invited for the following appointments: Overhead lines engineer in Hull Corporation's electricity department; chief lecturer in the electrical section of the engineering department of Halifax Municipal Technical College; borough electrical engineer and manager at Wolverhampton.

Nottingham Electricity Committee is making arrangements to open an electricity showroom on Smithy Row in the new Exchange block. A deputation of local electrical firms recently discussed with the Committee the possibility of some arrangement being made with them in regard to carrying out work for consumers.

On the occasion of a recent visit of members of the Western Centre of the Institution of Electrical Engineers to the Cardiff Engineering Exhibition, Mr. S. B. Haslam, chairman of the Western Centre, said there was need for a large public hall in Cardiff which would permit makers of electrical plant to participate in such exhibitions.

Coun. Bannister stated at a meeting of Nelson Town Council recently that several people were poaching electricity by tapping the power and using it for lighting. Ald. Smithson, chairman of the Electricity Committee, said the power rate was 2½d. per kWh, and that for lighting 5d. Those who used power plugs for lighting were liable to prosecution.

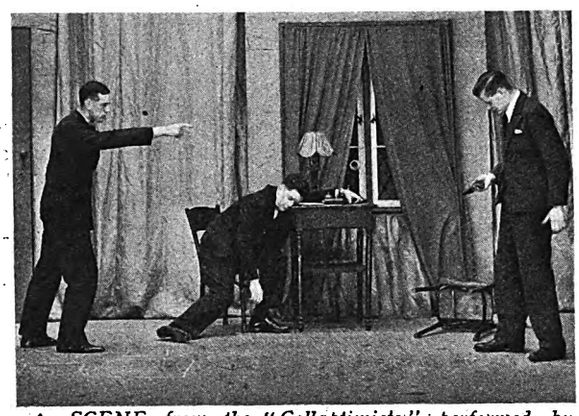
PERSONAL.

MR. R. H. Rawll, district installation engineer, Birmingham Corporation Electric Supply Department, has been selected to assist Mr. G. Rogers, who is in charge of the frequency change from 25 to 50 cycles of that undertaking in accordance with the Central England Scheme, and will be responsible for the necessary alterations to consumers' low tension plant and equipment. In the absence of Mr. Rogers, he will deputise for him in all matters relating to frequency charge work.



A SCENE from the "Collaptimists," performed by members of the M-V Apprentice Association. The play was staged at the M-V Club from December 11th to 14th inclusive.

Mr. George Tough, electrical engineer and manager, is retiring in April next, upon superannuation, from the service of the Coventry Corporation. He was first appointed mechanical assistant in 1899 and became electrical engineer and manager in 1908 so that he will have completed 31 years unbroken service. His term covers remarkable development as when he first went to Coventry the station, which had been opened three years, had only a capacity of 350 kW with 150 consumers while to-day the capacity is 70 000 kW with 21 291 consumers. The recently opened works at Longford which forms part of the national grid scheme, were planned by him and he supervised their erection and equipment.

The addition to the board of directors of Benn Brothers, Ltd., the publishers of THE ELECTRICIAN, of Miss F. Robinson and Mr. F. E. Hamer is an event of double significance. On the one hand a distinguished woman member of the staff joins the board—the first time that the honour of a seat on the directorate has been conferred upon one of her sex. On the other hand, the traditional policy is continued of appointing directors working in the business (of which the board is entirely composed), and a still larger proportion of its members now consists of those who have "risen from the ranks," having begun their careers with Benn Brothers upon equal terms with any of their colleagues doing the same sort of work. Miss Robinson has been for a long period staff manager, and secretary to Sir Ernest Benn, the chairman of the company and Mr. Hamer is the editor of "The Chemical Age." Made on the eve of the Jubilee Year of Benn Brothers, Ltd., these two appointments have not only given a lively pleasure to the immediate colleagues of Miss Robinson and Mr. Hamer, but have brought many congratulations from their numerous friends in the world of technical and trade journal publishing.

Obituary.

SIR HENRY JACKSON, on December 14th, aged 74 years. Sir Henry's name will always be coupled with the progress of wireless in the Fleet. In the 'nineties of last century he was among the first to engage in the practical application of Hertzian waves to telegraphy. He early made the acquaintance of Marconi, the two collaborating in important researches. In 1895 Sir Henry began systematic experiments and trials under sea-going conditions, inclusive of the use of balloons and kites, with the view of utilising the effect of Hertzian oscillations for naval signalling purposes. The results were embodied in a paper read before the Royal Society, entitled "On Some Phenomena Affecting the Transmission of Electric Waves over the Surface of the Sea and Earth," and in 1901 the Royal Society elected him into its fellowship. From 1929 to 1929 he was chairman of the Radio Research Board.

OVERSEAS TRADE.

Electrical Exports for Eleven Months Over £10 000 000 in Excess of Imports.

EXPORTS of electrical machinery, apparatus and materials shipped from the United Kingdom during November last amounted to £1 827 048 or £177 451 more than during the same month last year. Imports of similar goods during November, 1929, amounted to £897 672 as against £659 783 during November, 1928, representing an increase of £237 889.

For the eleven months of this year electrical exports amounted to £17 822 826, an increase of £924 641 when compared with the same period last year, while imports for the same period were valued at £7 488 386, an increase of £1 671 494 by the same comparison. These figures show that electrical exports during November last exceeded imports by £929 376, while for the eleven months the excess was no less than £10 334 440.

Exports of wires and cables, other than rubber insulated, improved during the month by £85 014; submarine telegraph and telephone cables also improved when compared with the same month last year, the increaseb eing £16 903. Increased shipments in telegraph and telephone instruments were recorded, the figures having advanced by £55 443.

We give below detailed figures for November, 1929, contrasted with those for the same month last year, and for the eleven months of the year compared with the same period of 1928 :—

	Month of November.		Eleven months.	
IMPORTS.	1928. £	1929. £	1928. £	1929. £
Electrical Machinery	135 988	161 196	1 573 049	1 702 475

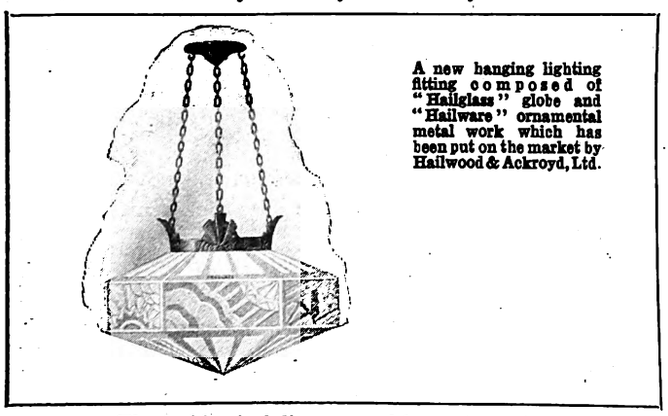
DOMESTIC ELECTRICAL APPARATUS AND APPLIANCES.

New Bakelite Accessories and Fittings—A Novel Adaptor for Domestic Use—Lamps for the Motorist.

CONSIDERABLE interest has lately been shown in the use of bakelite for electrical purposes, and contractors will be interested to hear that METRO-VICK SUPPLIES (Trafford Park, Manchester) are now manufacturing a line of bakelite accessories. These include a ceiling rose, a lampholder, and—the most recent addition—a bakelite adaptor. The ceiling rose is made in the popular size of 2½ in. diameter in both two- and three-way types. Colours are brown or cream, there are few parts—rendering wiring rapid and simple—and the material used combines lightness with mechanical strength. It is stated that the number of breakages in transit and in use are negligible. The fixing holes have 2 in. centres, suitable for B.E.S.A. conduit boxes, and the rose can be easily adapted for surface wiring by removing a small portion of the rim. Pillar-type terminals of adequate size for looping in are provided. The "Emvee" patent cordgrip will support a weight of 56 lbs.

The new lampholder has a universal application, as it will take flexibles of all sizes from twin to cab-tyre. The patent cordgrip clamps over a large area of the flexible, giving complete efficiency in service and at the same time reducing installation time to a minimum. "Emvee" plungers of the solid type are fitted, and it is claimed that they cannot stick or come loose. The incorporation of "Mycrome" alloy springs appears definitely to obviate the risk of springs softening while under heat—a report of the National Physical Laboratory, quoted by the firm, states that "Mycrome" springs, after being subject to a temperature of 200 deg. C. for 48 hours, slightly increased in tension." The Met-Vick bakelite adaptor also has a universal cord grip, and it is so designed as to eliminate strain of the conductors on the terminal screws. The terminals are substantial, and oval-shaped contacts are provided.

We have received from W. E. BEARDSALL AND CO., LTD., of 5, Victoria Bridge, Manchester, a sample of the "Xtra-Point" lampholder and plug, of which the company is now the sole selling agents. The unit can be substituted for the ordinary lampholder and will hang straight. The plug entries are inconspicuously placed in the upper part of the holder, and the unit is made of bakelite with metal parts of ample carrying capacity. A cord-lock effectively separates the flexibles without compression. The plug takes the current direct to the iron or other apparatus used, and not *via* the lampholder plungers, and will carry 5 A without overheating. The plug reversed will control either the light, the appliance or both. A Home Office pattern with skirt for use with portable tools in factories will shortly be ready followed by an Edison screw



A new hanging lighting fitting composed of "Hailglass" globe and "Hailware" ornamental metal work which has been put on the market by Hailwood & Ackroyd, Ltd.

pattern. The holder is fully covered by patents both at home and abroad.

FALK, STADELMANN AND CO., LTD., of Veritas House, 83–93, Farringdon Road, London, E.C.1, announce the addition to their range of "Ideal" domestic appliances of an automatic kettle. A button is provided for resetting the switch. The kettle is available in polished copper or nickel plated. The 2 pint size has a loading of 750 W, and the 3 pint a loading of 1 000 W.

A cabinet type loud-speaker possessing the various technical features of the well-known "Pure Music" range of instruments has now been placed on the market by the MULLARD WIRELESS SERVICE CO., LTD., of Mullard House, Charing Cross Road, London, W.C.2. The speaker, which is known as Type "K," consists of a balanced armature movement driving a 13 in. diameter cone, the whole being mounted in a polished oak cabinet, 19 in. square, with an attractive fretted front. By means of sockets at the back of the instrument either one third, two thirds or the whole of the speech coil can be utilised

The three-valve all-mains receiver of Radio Instruments Ltd., mounted in a special cabinet, fitted with a moving coil loud-speaker. We understand that the set was tested this week three miles from Brookman's Park, and cut out the 261 metre transmission at 10 deg. As there are 25 degrees between 261 metres and the normal London transmission of 356 meters, selectivity is assured.

so that the impedance of the speaker can be adjusted to suit the output circuit of the receiver. The front fret has been designed to present the minimum obstruction to the sound waves, and the back of the instrument is also of open construction, so that the natural reproduction from the balanced armature unit is not impaired by the presence of the cabinet.

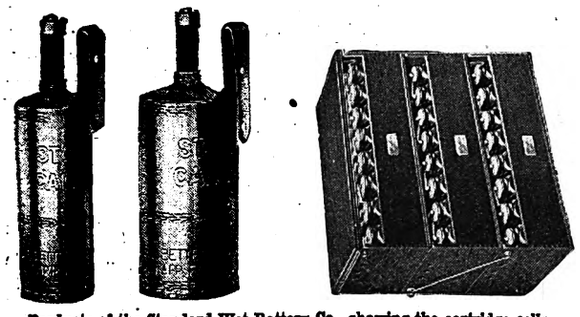
It is claimed that a special grade of moulded composition is used in the manufacture of "Ebolite" by S. G. LEACH AND CO., LTD., of 26–30, Artillery Lane, London, E.1. The material is applied to table standards and wall brackets of a type particularly suitable for use in bath-rooms. The standard (No. 6 001) has an overall height of 10½ in., and a base diameter of 5½ in. It is well balanced on a lead loaded base, and is said to be shockproof. An advantage of moulded composition—especially when buyers of fittings wish to instal them temporarily and later to remove them elsewhere—is its light weight. The approximate weight of the wall bracket (No. 6 003) is 7 oz.

Several advantages are presented by the range of cut-outs marketed by THOMPSON AND CO., 1 and 3, Old Swan Lane, London, E.C.4. The "Gardy" fuses can be replaced by unskilled persons with safety and freedom from trouble. No mistake can be made, for the reason that no other fuse but the correct one will fit the base. Pins and sockets are graded in diameter according to fusing capacity. Burn-outs can be instantly located by means of the mica window which exposes to view a part of the fuse wire which is of pure silver. Other advantages are the small number of component parts and the fact that any model can be adapted to different amperages without dismounting. The wide range of models offered appears to cover the needs of all systems of distribution—included is a combined cut-out with neutral link for use where a continuous earthing system is favoured. The "Gardy" tamper-proof model, which is covered by a separate patent, allows of guarding against interference by means of the substitution of an insulated socket for one of the pins, thus making it impossible for a foreign fuse to be inserted.

The daylight-blue automobile lamps of PHILIPS LAMPS, LTD., Philips House, Charing Cross Road, London, W.C.2,

Digitized by Google

employ a specially prepared blue glass to eliminate part of the red rays from the filament and make the light thrown upon the road approximate to daylight. It is claimed that the use of these lamps improves the driver's power of observation, reduces fatigue, and gives less dazzle than ordinary head lamps. Another solution of the anti-dazzle problem is claimed in the use of "Philips Duplo" lamps. The bulbs are provided with two filaments of equal lighting power, the first



Products of the Standard Wet Battery Co., showing the cartridge cells as separate units and in complete battery form.

giving a powerful beam for normal use, while the second—being partly enclosed in a metal cup—directs its light towards the upper part of the reflector, whence it is deflected on to the road. As this second filament is out of focus, the light is spread out across the road. In foggy weather the anti-dazzle beam is especially useful, as the full intensity of the beam can be directed on the road. The lamps can be fitted to all makes of cars, having twin filament lamps, without alteration to the wiring, and in the case of cars with single filament lamps, only a slight adjustment is necessary.

Following the success of the "Phililite" range of pendant fittings, Messrs. Philips have introduced a series of "Phililite" ceiling fittings. Owing to their small overall height, these fittings should be very suitable for low ceilings. The bowls are of three-ply glass having a low absorption factor, and the ceiling plate is of a pattern which makes erection quite simple. Sizes 26 and 30 are suitable for lamps of 60 to 100 W, and size 33 for lamps of 100 to 200 W.

A new type of h.t. wet battery for radio is announced by the STANDARD WET BATTERY CO., 184–188, Shaftesbury Avenue, London, W.C.2. The new battery is of the cartridge variety, and the manufacturers claim it to remove all grounds for objection to a wet battery where "messiness" in general is concerned. The standard cartridge was formerly composed of two separate electrodes—sac and zinc: it is now supplied as one complete component ready to be placed in the jar. Evaporation or spilling of the electrolyte is prevented by a waxed cork. Other features include push-clip connectors between units, and the treating of the zinc with special paint. It is stated that "10 dry cells in parallel give an equal life to one No. 4 standard cell."

The PERFECTA SEAMLESS STEEL TUBE AND CONDUIT CO. (1923), LTD. (Plume Street, Aston, Birmingham), have sent us particulars of their latest output of conduit and conduit fittings. The specifications of the various types of conduit are as follows:—Class A: (1) Light gauge close joint conduit. (2) Light gauge brazed conduit. (3) Light gauge seamless or solid drawn conduit. Class B: (1) Heavy gauge welded conduit. (2) Heavy gauge brazed conduit. (3) Heavy gauge seamless or cold-drawn conduit. All classes of conduit can be supplied either stove enamelled or hot galvanised. The machine used for straightening Perfecta conduit is said not only to leave the tube perfectly straight, but also to make it impossible for any particle of scale to adhere—so that an entirely clear surface is left for enamelling. The range of conduit fittings comprises four general types. The ordinary plain or socket fittings are intended for use with plain conduit or for competitive work where no continuity test is required. The competition type pin-grip fittings are of standard dimensions and are cast with a raised pillar to enable a $\frac{3}{32}$ in. screw to be used. Lug-grip type fittings also fall into the continuity group, and are of standard dimensions for use with class "A" conduit; they are of malleable iron, with nozzles bored to size and the lugs fitted with steel screws; these fittings are recommended by the makers for use on contract work where a screwed conduit system is not considered necessary. The fourth type consists of screwed fittings.

A new shadowless lamp for use in operating theatres is on view in the London showrooms—at Imperial House, Regent Street—of KELVIN, BOTTOMLEY AND BAIRD, LTD., of 18, Cambridge Street, Glasgow. Known as the K.B.B.–Galloi's Ideal Shadowless Lamp, it is designed to provide a light which is both intense and diffused. The shadowless illumination is produced by the design of the reflecting surfaces, no lenses being employed. The whole field of operation is sufficiently well lit, and sharp contrasts—which recent research into surgical lighting has shown to be the chief cause of fatigue to the surgeon—are avoided. The light is strong enough to illuminate adequately any wound, however deep. Dazzlement and noticeable heat are both obviated by the design of this lamp; which, also, is aseptic and adjustable in all directions. Included among the several models available are the large suspension model for the operating theatre proper, the wall bracket type for dental use, the portable floor-stand type and the floor stand type operated by accumulators as an emergency light.

We are given to understand that the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2, has adopted a special process of manufacture for "Magnet" h.t. batteries, and all models now have super-grip terminals to facilitate the making of intermediate tappings. An interesting "Gecko" line is the combined h.t.-accumulator and charger for a.c. and d.c. mains. Charging and discharging are controlled by a simple switch having two positions marked "Radio" and "Charge." The charger in the a.c. model consists of what is stated to be a new type of electrolytic rectifier, employing an electrolyte which gives off no fumes, remains cool, forms no sediment, is non-corrosive, and requires no attention. Another line, the "Gecko" 2 V unspillable accumulator, solidified type, is claimed to give complete purity of tone as a result of the absence of resistance and the even rate of discharge. The charge rate is 2 A and the overall dimensions $3\frac{1}{4}$ in. by $3\frac{1}{8}$ in. by 6 in.

An automatic heat-controlling device of particular use to those who use domestic irons is being marketed by E. R. MORTON, LTD., 117, Charlotte Street, London, W.1. This accessory, known as the "Safegard" heat control, consists of a brown bakelite appliance plug. It incorporates a thermal strip to which varying degrees of tension can be applied by means of a small disc. This disc is easily rotated by a milled edge, and the user can set it to any desired point, and the varying tension applied provides a wide range of temperature—varying in the case of an electric iron up to approximately 580 deg. Fahrenheit. At any point the temperature of a domestic electric appliance is kept even, the "Safegard" switching off automatically when the desired temperature is reached and switching on again when the temperature falls. The control is independent of the user and the device is in addition a protection against forgetfulness or carelessness, for should an iron to which it is fitted be left in circuit the temperature is maintained even by alternate switching off and on of the current. It is estimated that one-third the normal current used in ironing is saved by means of this device, which provides an even temperature of approximately 290 deg. F. at "medium" for average ironing, and 500 deg. F. at "hot" for heavy damp work. The device can also be used with any electrical appliance taking not more than 660 W. The present model is available for operation on a.c. only, from 100–250 V. Being fitted with Beaver patent sockets, it will fit practically any domestic appliance.

A New Cooker.

A new model of the Berry-McClary cooker marketed by BERRY'S ELECTRIC (1928), LTD., of Touchbutton House, 85–87, Newman Street, London, W.1, has the grill inside the oven, an arrangement that is claimed to have definite advantages in saving smell of cooking and loss of heat, and in enabling the grill to be of larger capacity than formerly. The use of the oven is not affected in any way. The whole oven interior, which is of vitreous enamel, can be removed for cleaning, and the round corners of the oven prevent any grease accumulating. The boiling plates, which are totally enclosed and in two sizes—9 in., 1 600 W, and $7\frac{1}{2}$ in., 1 250 W, are guaranteed for two years.

Eight new models have lately been added to the range of "Belling" electric fires produced by BELLING AND CO., Bridge Works, Southbury Road, Enfield. The "Empire" series has been introduced to meet the demand for a reliable fire at a very low price. The framework is of fine grain cast-iron with neat ornamentation, and the 2 kW size is in stoved matt black finish. Although inexpensive, this new fire has none of the disadvantages sometimes associated with cheap apparatus. The multi-parabola firebar is fitted as standard and in addition to the 2 kW size, this fire can be supplied

Digitized by Google

fitted with either one or three 1 kW firebars or with two, three or four 600 W firebars. It should be specially suitable for hiring purposes, housing schemes, etc. The "Radiant" is a reflector type of fire of attractive appearance. It is made in two sizes and fitted with horizontal plug-in elements lying in chromium plated wells. Amongst the other new fires are an imitation coal fire which, like all other "Belling" coal fires, is fitted with a flickering flame effect and two new reflector fires, one of which is of the "well" type and specially suitable for fitting into existing grates.

More New Fires.

The "Redot" electric fires of LIGHTING TRADES, LTD., 30–31, Farringdon Street, London, E.C.4, are chiefly notable for their comparatively low price and the standardised plug-in type of element, which—except in the instance of bowl fires—is loaded at 1 kW. The "Redot" fire bars appear unusually robust and are easily examined by lifting back their hinged support—in the upright type of fire. A novel fire of this series is E.77 047, which has a circular element in the centre of a screen, giving an effect not unlike that of a moving coil loud-speaker with sounding board. This fire is made of bronze throughout, is 24 in. high, 18½ in. wide, and has a rating of 800 W. Lighting Trades, Ltd., are also entering the cooker field. One of their principal lines comprises an oven unit and a hot-plate unit, which are sold separately or mounted together to form a complete cooker. The oven measurements are—inside, 12 in. high by 13 in. wide by 11 in. deep—overall, 19½ in. by 17 in. by 14 in. The hot-plate unit measures 4¾ in. by 17 in. by 14 in. When the units are sold separately iron stands are supplied as extras. The oven has a rating of 2 000 W, equally divided between the top and bottom heats; it is controlled by one rotary switch. The hot-plate also has a rotary switch, giving low, 700 W, medium, 800 W, and high, 1 500 W. Another small cooker is of sheet steel finished in black enamel with white enamelled drip plate and polished steel top. It has simmering ring, griller and boiling ring in addition to the oven, and the respective full heat ratings of these units are 550, 1 000, 1 450 and 2 200 W. A more complete model has an enamelled back piece supporting a plate rack. The door is fitted with snap latch and spring hinges.

A Portable Cardiograph.

For a number of years the electric cardiograph has played an important part in the diagnosis and treatment of heart disease. Until recently, however, the elaborateness and size of the equipment has limited its use to a few of the larger hospitals. Now, however, many physicians wish to utilise the cardiograph in their private practice, and to meet this condition the CAMBRIDGE INSTRUMENT CO., LTD. (of 45, Grosvenor Place, London, S.W.1) has introduced a portable electro-cardiograph, which is compact, robustly constructed and designed to need only a small amount of adjustment. The company has the portable cardiograph on view alongside the old style equipment, and the contrast between the formidable dimensions and complicated mechanism of the older machine and the simple neatness of the new is almost amusingly striking. Yet both instruments achieve the same results—as the records obtained from the same patient with the two models plainly testify. The recording system adopted for the new cardiograph is, in fact, the same as hitherto—this is essential, in order that records may be compared with published work—and it consists in essence of an Einthoven string galvanometer working at a projection distance giving a magnification of 600 diameters. This galvanometer, though of the Einthoven type, is of novel form, being particularly compact and light in weight. A fibre tension adjustment enables the sensitivity to be varied; it is shorter than in the standard instrument, and more readily accessible, owing to a new form of protecting sheath. The light from a 12 V lamp is focused on the fibre by an optical condenser carried on a sliding tube within the galvanometer. It is then projected by an apocromatic objective and suitable eyepiece. The beam of light is subsequently interrupted by the spokes of a rotating disc (which affords the time base for the records) and is reflected by a silvered lens on to a mirror, from which it is again reflected on to a photographic film. By this arrangement the full projection distance necessitated by the Einthoven convention is obtained within the compass of the portable case. The accessories, which include the holders for the sensitised film, the battery, the electrodes for strapping to the patient, and the leads, are all arranged for transporting easily in the minimum of space.

VALUE OF EXHIBITIONS.

Paper at the Second Manchester E.D.A. Sales Conference.

THE E.D.A. Officer for the North-Western Area, Mr. R. C. Hawkins, gave a paper on the "Value of Exhibitions to the Electrical Industry" at the second of the E.D.A. Sales Conferences being held at Manchester this season. Mr. L. Romero presided.

Mr. Hawkins claimed that, with more and more exhibitions held each year, they had to ask themselves the question whether or not they were worth while. He mentioned the various classes of exhibitions and said that his lecture mainly dealt with the "ideal home" type, the "general trade" type and "local" type.

He referred to the success which had attended all-electric houses at exhibitions in his locality and warned those present of the danger of these turning into mere displays of furniture. It was, therefore, essential that there should be an attractive story in every room in the house. It was impossible to think of an exhibition devoted to the home without adequate presentation of the "electrical story." It was essential to have demonstrations, but if satisfactory results were expected, simplicity should be aimed at, and what the speaker referred to as the "junk shop" should be avoided. By this he meant a large number of fancy cookers, kettles, etc., which only confused, and did not allow sufficient room for proper demonstrations.

They had had several general trades exhibitions in his area in which the supply undertakings and contractors had held stands, and these had proved successful. It was generally realised to-day that in spite of the great increase in the number of showrooms, the local exhibitions organised by supply undertakings with the help of contractors were essential to electrical progress. Mr. Hawkins explained that the reason an exhibition had a special value over and above the ordinary showroom and other forms of publicity was that it had much greater press publicity, and therefore had far greater local interest. The salient points were really applicable to all types of exhibitions. The question of how often to hold exhibitions was entirely dependent on local conditions. The duration should not be more than two weeks and exactly how long depended on the size of the particular town. It was impossible to assess the exact value of an exhibition or what business was due to it. Enquiries came very many months and even years afterwards. The great question was could the electrical industry afford to neglect the opportunity of telling its story in this way to the public. Several of the audience spoke on the subject of exhibitions but there was very little real discussion as most of those present agreed with the lecturer.

BRITISH INDUSTRIES FAIR.

Among those firms who will be exhibiting in the Wireless Section of the British Industries Fair, which is to be held in the new and reconstructed Olympia, London, from February 17th to 28th next, the following have definitely taken space: Amplifiers, Ltd., London; Bakelite, Ltd., London; E. K. Cole, Ltd., Leigh-on-Sea; Cooks Wireless Co., Ltd., Ipswich; Darwins, Ltd., Sheffield; J. J. Eastick and Sons, London; Ever Ready Co. (Great Britain), Ltd., London; the Formo Co. (Arthur Preen, Ltd.), London; Halcyon Wireless Co., Ltd., London; the Igranic Electric Co., Ltd., London; Indurite Agency, London; John and James Laker Co., Ltd., Beckenham, Kent; Eric J. Lever (Trix), Ltd., London; Lissen, Ltd., Richmond; the London Radio Manufacturing Co., Ltd., London; M.L. Magneto Syndicate, Ltd., Coventry; Neophone Engineering Co., London; Ormond Engineering Co., Ltd., London; Read Radio, Ltd., London; Rees Mace Manufacturing Co., Ltd., London; Whittingham Smith and Co., London.

The British Broadcasting Company formally came to an end on December 12th, when the last meeting of members was held at the Hotel Cecil to receive from Sir John Reith, the liquidator, an account showing how the property of the company had been disposed of. It was on November 14th, 1922, that the first B.B.C. programme was sent out from 2LO. Birmingham and Manchester followed next day, and Newcastle on Christmas Eve of the same year. The British Broadcasting Corporation, which succeeded the British Broadcasting Company, was instituted under Royal Charter on January 1st, 1927.

LEGAL INTELLIGENCE.

Corporation's Right to Purchase—Declaration Sought as to Terms.

MR. Justice Bennett, in the Chancery Division on December 11th, commenced the hearing of an action by Oxford Corporation against the Oxford Electricity Co., Ltd., claiming a declaration that, by virtue of the Oxford Electric Lighting Order, 1890, and a notice given in December, 1928, the corporation were entitled to purchase and the company was bound to sell its undertaking as from the date of the notice. The corporation further claimed that the price to be paid was to be fixed by ascertaining the amount of the company's capital as shown by their books to have been properly expended upon the undertaking at the date of the notice, and calculating its income at £5% on such capital, and then capitalising the income by multiplying it by the appropriate number of years' purchase. To find the number of years' purchase the corporation said one had to take the value of money at the date of notice to purchase. They further claimed they were entitled to the profits of the undertaking as from the date of the notice. Finally they asked for specific performance of the defendants' obligation to sell the undertaking to them and for an inquiry to ascertain the price payable in stock of the corporation.

Mr. Tyldesley Jones, K.C., and Mr. Wilfrid Hunt appeared for the corporation, and Mr. Wilfrid Greene, K.C., Mr. Craig Henderson, K.C., and Mr. Ronald Burrows for the company.

Mr. Jones said the City of Oxford had been extended by Act of Parliament since the date of the original electricity Order. The defendant company were the authorised undertakers to supply electricity in the city, including both the old and the later area. The Act extending the city boundaries expressly provided that nothing was to affect the rights of the corporation to purchase the electricity undertaking. In 1892 defendants constructed a generating station in the old city and laid down mains. In 1924 they extended their mains into the area which had been added to the old city. In 1928 the city council resolved to purchase the electricity undertaking at a price to be ascertained, in accordance with the 1890 Order. The Electricity Commissioners gave their consent to the purchase.

Mr. Justice Bennett asked who was to fix the "appropriate number of years'" purchase.

Mr. Greene: "I take the view that question will never arise."

His lordship said he understood the defendants were saying plaintiffs had to pay 20 years' purchase of the net profits.

Mr. Jones replied that that was so. The corporation said it should be 5% per annum on the capital of the company properly shown to have been expended. That would be a reasonable profit at the date of the original Order (1890) as, at that date, 2½% Consols stood at par and a 5% electrical investment at that time would be a good one.

Counsel's Speech for the Company.

Mr. Wilfrid Greene, K.C., for the company, said the term "capitalised net profits" was used in the 1890 Order and net profits could only refer to something real. If they took an imaginary rate of profit of 5% how could they describe that as net profits? What plaintiffs were contending for was not the capitalisation of net profits, but the capitalisation of a purely imaginary and notional figure of 5%. Mr. Tyldesley Jones had assumed that the draughtsman of the Order or the legislature which passed the Order was going to treat 5% as a reasonable return in 1890 on an investment in an electric lighting company. But, in 1890, electric lighting was in its infancy. You could not have got people to regard 5% as the sort of profit to be expected from an investment in such a new industry. Mr. Jones had referred to 2½% Consols being at par in 1890, but that circumstance had no sort of relevancy to the question the Court had to decide. The true criterion was the profit to be expected from the new industry in 1890. It was clear the basis on which the plaintiffs were proceeding was that less than 20 years' purchase was the proper price. Five per cent. to-day from an electric lighting undertaking would not be sufficient for the ordinary investor. If the construction of capital expenditure put forward by Mr. Jones were to prevail, it would mean that over £111 000 of capital expenditure would pass to the corporation without their paying anything for it.

The hearing finished, and Mr. Justice Bennett reserved his judgment.

IN PARLIAMENT.

Government Hints at Possible Nationalisation of Electricity Supply Industry.

IN the House of Commons last week, Mr. D. Hopkin submitted a motion that the House was of opinion that electricity supply should be organised on such a basis that national economic interests would be paramount. The Electricity Commission, he said, required more ginger. Col. Ashley defended the Commissioners from the charge of inefficiency. Mr. Chuter Ede said in one district in Surrey there was at present a very great fear of American money. There was, for instance, the Greater London and Counties Trust, which was largely financed by American money and was partly controlled by members of the late Government. It was feared that the development of that part of the country would be utilised to enrich American investors unless something was done to ensure that these trust undertakings would be bought out and placed under public control. Mr. G. Balfour thought it was unfair to compare municipal enterprises with private undertakings, because the former served compact lucrative and densely populated districts, while the private companies served large and sparsely populated areas. The Minister of Transport said the progress made in recent years was very impressive. He believed that in the near future it would have to be considered whether the electricity supply could safely be left to private enterprise or whether it should be taken into the hands of the community, with business management, and carried on in the public interest. Sir Philip Dawson said the remarkable work done by the Central Electricity Board was not generally realised.

The motion was carried.

Replies to Questions.

The following are points from recent answers to questions in the House of Commons:—

Negotiations are in progress in regard both to the general development of electrical power in Tanganyika and to a scheme for the production of electric power from the Pangani Falls. Every endeavour has been made, and will be made, to expedite the matter.

The Post Office has provided or authorised 124 public telephones recently at rural post offices and railway stations in Northern Ireland. The question whether telephones can be provided at a number of the remaining 280 offices and stations without such facilities is under consideration.

The Postmaster-General has been informed that five transatlantic cables were damaged by the earthquake off Cape Breton on November 11th, in addition to a number of cables between Newfoundland and the coast of North America, and that on December 9th 12 transatlantic cables were working.

Mr. Thomas (Lord Privy Seal) does not think extensions and improvements of the London tube railways which are the subject of an application under the Development (Loan Guarantees and Grants) Act should be delayed as a result of the recent announcement of the Government's policy in regard to the co-ordination of London passenger traffic.

In reply to a suggestion that a small inclusive charge should be made for fitting a plug and socket arrangement for a telephone instrument to be used in a separate room instead of the present charge of 14s. a year, the Assistant Postmaster-General says owing to the necessity for maintenance, the substitution of an inclusive initial payment would not be practicable, but the question of reducing the annual charge is under consideration.

Barmouth U.D.C. by an Act passed in July of this year obtained authority to give a supply of electricity in an area including their urban district. The Electricity Commissioners have been informed that the question of the construction of the electric line from Maentwrog to Barmouth is now receiving the close attention of the North Wales Power Co. who are charged with the duty of affording the bulk supply.

Habitual users of the trunk telephone service were inconvenienced by the interruptions caused by the telephonist when offering successive extensions of time under the old procedure. Under the new system, operators are instructed to notify the passing of time 10 seconds before the expiry of each three-minute period, and subscribers are given the right to extend calls by one minute periods, instead of three minutes, on distances over 35 miles. The Assistant Postmaster-General is considering whether greater accuracy can be attained by mechanical aids.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

DUNDEE CORPORATION.—Electric light installation, etc., at the slaughterhouses. Particulars from Mr. G. Baxter, city engineer, 91, Commercial Street, Dundee.

MILLOM URBAN DISTRICT COUNCIL, December 20th.—Haverigg extension scheme, comprising e.h.t. and l.t. cables, pillar box, etc. (section A); and e.h.t. and l.t. switchgear, transformers, etc. (section B). .Specification, etc., from Mr. A. Lawrence, solicitor, clerk to the Council.

QUEENSBURY EDUCATION SUB-COMMITTEE, December 20th. Electric light installation at Catherine Slack Council School. Specification from Mr. B. Leah, Education Office, Bingley.

BARMING HEATH MENTAL HOSPITAL, December 21st.—Electrical installation for lighting, heating, etc. Specification, etc., from Mr. E. E. Hoadley, Corporation Electricity Works, Maidstone; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, December 21st.—Supply and erection of 132 000 V transformers in connection with Mid-East England Electricity Scheme. Specification (No. M.E.E.F.T.1) and form of tender from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

DARTFORD URBAN DISTRICT COUNCIL, December 21st. Supply of about 3 400 yards of 0·1 sq. in. three core e.h.t. cable. Specification, etc., from the Electrical Engineer.

HALIFAX CORPORATION, December 21st.—Electrician's work in connection with erection of new Girls' High School at Craven Lodge. Names of intending contractors to be sent by December 21st to Mr. A. C. Tipple, borough engineer, Crossley Street, Halifax; deposit £2 2s.

WIRKSWORTH PARISH CHURCH, December 21st.—Electric light installation. Specification from Mr. T. H. Greatorex, The Birches, Cromford Road, Wirksworth; deposit £1 1s. Only members of the National Register of Electrical Installation Contractors are invited to tender.

EDINBURGH EDUCATION AUTHORITY, December 23rd.—Electrical installation at Nursery School, Tollcross. Schedules from Mr. J. Stewart, Education Offices, Edinburgh.

LIVERPOOL CORPORATION, December 23rd.—Supply of 12 750 kVA, three-phase, 50 period, 6 600/400 V, oil-cooled, step-down transformers. Tender form from the City Electrical Engineer, 24, Hatton Garden, Liverpool.

GLASGOW CORPORATION, December 26th.—Electric lighting installations at (1) Ashfield, and (2) Braidfaulds Street No. 1 housing schemes. Specifications, etc., from the Electricity Department, 75, Waterloo Street, Glasgow.

LEEDS GUARDIANS, December 27th.—Supply of electric lamps until March 31st, 1930. Specification, etc., from the clerk, Mr. J. H. Ford, 11, South Parade, Leeds. Stamped, addressed envelope to be sent.

BRADFORD CORPORATION, December 31st.—Electric passenger and good lifts in block of shop and office premises in Leeds Road, Bridge Street and Hall Ings. Specifications, etc., from the City Architect, Town Hall, Bradford.

NORTH-WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, December 31st.—Supply and erection of extra high pressure and low pressure overhead transmission lines. Specification from the clerk, Mr. H. H. Battle, Stoke-on-Trent; deposit £2.

METROPOLITAN ASYLUMS BOARD, January 2nd.—Re-plating 500 Ah storage battery at St. Luke's Hospital, Lowestoft. Specification, etc., from the Office of the Board, Victoria Embankment, E.C.4.; deposit £1.

METROPOLITAN ASYLUMS BOARD, January 2nd.—Alterations of electric lighting installation at South-Western Fever Hospital, London Road, Stockwell, London, S.W.9. Specifications, etc., from the office of the Board, Victoria Embankment, London, E.C.4; deposit £1.

CENTRAL ELECTRICITY BOARD, January 6th.—Supply and erection of 132 kV overhead transmission lines (special crossings and high spans), in connection with North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.—P.L. 2) and form of tender from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

WHARFEDALE RURAL DISTRICT COUNCIL, January 6th.—Electrician's work in connection with erection of 10 non-parlour houses, in three blocks, on housing site at Mill Lane, Pool. Bills of quantities, etc., from the Surveyor, Council Offices, Menston; deposit £1 1s.

ISLINGTON (LONDON) GUARDIANS, January 9th.—Supply and erection of five full-automatic push-button electric lifts at the Infirmary, Highgate Hill, N.19. Specification, etc., from Mr. Albert King, Guardians' Offices, St. John's Road, Upper Holloway, N.19; deposit £2.

CAMBERWELL (LONDON) BOROUGH COUNCIL, January 13th.—Maintenance of electric lighting, heating and power installations, telephones, etc. (tender form H), and supply of electric lamps (form S). Forms of tender from the Borough Engineer.

ISLINGTON (LONDON) BOROUGH COUNCIL, January 17th.—One year's supply of cables, electricity meters, cable terminal and other boxes, switches, wires, lamps and sundries. Specification, etc., from the Town Clerk, Municipal Buildings, Upper Street, London, N.1.

CENTRAL ELECTRICITY BOARD, January 20th.—Supply and erection of 3·3 kV, 6·6 kV, and 11 kV switchgear, for connecting the Board's supply to undertakers' busbars. Specification (N.W.E.—G.S.1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

METROPOLITAN WATER BOARD, January 21st.—Supply and erection of four steam turbines, with pumps, and two electric generators, for Surbiton pumping station. Specification, etc., from the Chief Engineer (Room 173), 173, Rosebery Avenue, London, E.C.1; deposit £3 3s.

GRIMSBY CORPORATION, January 23rd.—Manufacture, supply and erection of 10 000 kW three-phase turbo-alternator, with condensing plant. Specification, etc., from Mr. S. R. Windle, Electricity Offices, Moss Road, Grimsby; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

BOMBAY, BARODA AND CENTRAL INDIA RAILWAY CO., December 20th.—Supply of (1) glass boxes for accumulators; (2) plates for accumulators, and (3) wood separators for accumulators. Specification, etc., from the secretary, Mr. S. G. S. Young, White Mansion, 91, Petty France, Westminster, S.W.1; on payment of £1 for No. 2 and 10s. each for Nos. 1 and 3 (not returnable).

IRISH FREE STATE PUBLIC WORKS DEPARTMENT, December 20th.—Electric lighting installation at Stationery Office, Beggar's Bush Barracks, Dublin. Specification, etc., from Mr. T. Cassedy, secretary, Office of Public Works, Dublin; deposit £1.

COPENHAGEN LIGHTING DEPARTMENT, December 21st.—Oil-cooled 10 000 kVA transformer, with pumps, motors and other accessories. (Reference B.X. 5 945.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, December 27th.—Telegraph material, including g.i. tubular arms, insulators, upper tubes for poles, etc. (tender No. 175). (Reference A.X. 8 734.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, December 28th.—Supply and erection at site of Mankabad Barracks of three Diesel engine driven electric generators, and sinking of two wells. Specifications (£1 0s. 6d., not returnable) from Chief Inspecting Engineet, 41, Tothill Street, Westminster, S.W.1.

LOURENCO MARQUES TENDERING DEPARTMENT OF THE TREASURY, January 3rd.—Supply of oil-engine driven d.c. generator and battery. (Reference B.X. 5 961.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, January 4th.—Supply and erection at site of Meadi Barracks, Cairo, of two Diesel engines to drive existing generators. Specifications (£1 0s. 6d., not returnable) from Chief Inspecting Engineer, 41, Tothill Street, Westminster, S.W.1.

JOHANNESBURG MUNICIPALITY, January 4th.—Supply of automatic traffic signals (contract No. 305). (Reference B.X. 5 924.)

Digitized by Google

EGYPTIAN MINISTRY OF PUBLIC WORKS, January 6th.—Supply and erection of plant for supply of filtered and unfiltered water, including pumps, electric motors, etc. (Reference A.X. 8 746.)

CAPE TOWN MUNICIPALITY, January 7th.—Supply of 3-core 11 000 V cable (specification No. 482/1929.) (Reference B.X. 5 925.)

TENERIFFE (CANARY ISLANDS) MUNICIPALITY, January 14th.—Supply of tramcars, rails and tramway equipment. (Reference A.X. 8 872).

CAPE TOWN MUNICIPALITY, January 15th.—Supply of direct-coupled, electric motor driven, centrifugal pump for sewage works (specification No. 475/1 829). (Reference A.X. 8 836.)

INDIA STORE DEPARTMENT, January 15th.—Supply of wood separators for train-lighting cells. Form of tender (5s.) from the Director-General, Belvedere Road, Lambeth, London, S.E.1.

NEW ZEALAND GOVERNMENT RAILWAYS, January 15th.—Supply of automatic telephone exchange equipment for new station at Auckland. (Reference B.X. 5 841.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 16th.—Plug covers for telephone switchboard plugs. (Contract P. and T. 151/1 943.) (Reference B.X. 5 879.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, January 16th.—Supply of crude oil engine driven electric generating sets (tender No. 1 589). (Reference B.X. 5 926.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 21st.—Spare parts for automatic telephones. (Reference B.X. 5 917.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 21st.—Four electric motor driven ventilating fans. (Reference A.K. 8 857.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 27th.—Supply of breastplate transmitters. (P. and T., 151/1 994). (Reference B.X. 5 956.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 28th.—Supply of 50 kV oil-immersed circuit breakers, with current transformers and relays (section 299). (Reference B.X. 5 878.)

POSTMASTER-GENERAL'S DEPARTMENT, January 28th.—Supply of telephone cycle signalling equipment. (Reference B.X. 5 906.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 28th.—Supply of induction coils and register plates (schedule No. C. 533). (Reference B.X. 5 899.)

EGYPTIAN MINISTRY OF THE INTERIOR, February 1st.—Centrifugal well pump and direct-coupled electric motor, with piping and accessories. (Reference A.X. 8 811.)

NEW ZEALAND POSTS AND TELEGRAPHS, February 3rd.—Supply of protector blocks (carbon and porcelain). (Reference B.X. 5 948.)

VICTORIAN ELECTRICITY COMMISSION, February 3rd.—Electrically-driven mobile coal-trimming machine, for Yallourn power station. (Reference A.X. 8 681.)

NEW ZEALAND POSTS AND TELEGRAPHS, February 5th.—Supply of indication alarm fuses. (Reference B.X. 5 947).

VICTORIAN ELECTRICITY COMMISSION, February 10th.—Supply of sine wave generating equipment and accessories (specification No. 30/3). (Reference B.X. 5 844.)

NEW ZEALAND POSTS AND TELEGRAPHS, February 13th.—Supply of opal lamp caps (P. and T., 151/2 025). (Reference B.X. 5 955.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 18th.—Telephone jacks and number plates (Schedule No. C. 541). (Reference B.X. 5 940.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Jumper rings and terminal strips (schedule C. 543). (Refference B.X. 5 941.)

Overhead Lines.

EGYPTIAN MINISTRY OF PUBLIC WORKS, February 27th.—Supply and erection of h.t. three-phase, overhead transmission lines in the Northern Delta of the Nile. Specifications, etc., from the Chief Inspecting Engineer, Egyptian Government, 41, Tothill Street, London, S.W.1. (£10 5s., not returnable).

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Switchgear and controlling equipment. (Reference B.X. 5 798.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 110 kV switchgear, for interconnecting auto-transformers, for Waitaki power scheme, section 76. (Reference B.X. 5 797.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 66 kV switchgear and protective system for Lyttelton, Lake Coleridge, power scheme, section 217. (Reference B.X. 5 796.)

VICTORIAN RAILWAY COMMISSION, March 30th.—Supply of d.c. neutral relays for power signalling purposes (contract No. 43 457.) (Reference B.X. 5 793.)

SOUTH AFRICAN IRON AND STEEL INDUSTRIAL CORPORATION, LTD., April 12th.—Electrical and other equipment for the various departments of the company's iron and steel works to be erected at Pretoria. Further information from the Committee of Consulting Engineers of the South African Iron and Steel Industrial Corporation, Ltd., c/o the International Construction Co., Ltd., 56, Kingsway, London, W.C.2.

Tenders Accepted.

LLANDUDNO URBAN DISTRICT COUNCIL.—A. Fairlie, wiring 17 houses, £105.

BLEAN GUARDIANS.—Amalgamated Lamp Co., supply of electric lamps for six months.

CLUTTON GUARDIANS.—J. H. Winter and Co., electric light installation at the Institution.

BRISTOL EDUCATION COMMITTEE.—J. H. Winter and Co., electrical work in connection with erection of secondary school at Cotham, £560.

AYRSHIRE EDUCATION COMMITTEE.—M. and R. Young, electrical work in connection with erection of a Primary School at Heathfield, £234.

STOKE NEWINGTON (LONDON) BOROUGH COUNCIL.—Lucy and Co., Ltd., supply of section pillars, in connection with extension of distribution system, £324. (Recommended.)

SLEAFORD URBAN DISTRICT COUNCIL.—Callender's Cable and Construction Co., Ltd., renewing public lighting cable in Watergate; General Electric Co., Ltd., supply of switchgear.

NEWMILL URBAN DISTRICT COUNCIL.—Yorkshire Electric Power Co. supply and fixing of a cubicle at the Council Offices sub-station to control 11 000 volt line to Lee Mills, £104.

HAMMERSMITH (LONDON) BOROUGH COUNCIL.—J. and J. Bescoby, Ltd., supply of cable drum carriage (carrying capacity, 6 tons), £94. (Recommended.) British Insulated Cables, Ltd., also tendered, £122.

ROTHERHAM CORPORATION. A. Reyrolle and Co., Ltd., supply of two pairs of 10 000 kVA 660 V type switches, £256 per pair; plus £9 11s. 3d. per switch for automatic control; British Thomson-Houston Co., Ltd., supply of two oil switches and meter panel, £249 10s.

GENERAL POST OFFICE.—Telephone exchange equipment, Woking, Automatic Telephone Manufacturing Co., Ltd.; Popesgrove (Twickenham) and Rock Ferry, Siemens Bros. and Co., Ltd.; telephone repeater equipment, Dundee, Standard Telephones and Cables, Ltd.; power plant for repeater station, Dundee, Haslam and Newton, Ltd.

GLASGOW CORPORATION.—Macfarlane Engineering Co., two frequency changers, £572; Metropolitan-Vickers Electrical Co., Ltd.. two reconstructed rotary convertors, £246 12s., and nine motors, £1 061 13s.; Crompton Parkinson, Ltd., 29 motors, £516 8s.; English Electric Co., Ltd., 24 motors, £268 11s.; R. Johnson, Clapham and Morris, Ltd., d.c.c. wire. (All recommended.)

LIVERPOOL CORPORATION.—Tramway special trackwork: Breck Road and Breckfield Road, North Junction, Titan Trackwork Co., Ltd., £659; Grove Street and Upper Parliament Street Junction, Hadfields, Ltd., £2 155; High Street (Wavertree Clock Tower) North Junction, E. Allen and Co., Ltd., £626; London Road and Moss Street Junction, Titan Trackwork Co., Ltd., £2 169. (All recommended.)

ROTHERHAM CORPORATION.—Callender's Cable and Construction Co., Ltd., supply of 1 200 yds. of three core e.h.t. cable, required in connection with a supply to Kilnhurst colliery, £620, and 2 600 yds. of 0·1 three-core e.h.t. cable in connection with Dalton trolley vehicle routes, £1 352; A. Reyrolle and Co., Ltd., supply of l.t. switch equipment, in connection with supply to Kilnhurst colliery, £228; British Thomson-Houston Co., Ltd., supply of one 450 H.P. and one 110 H.P. a.c. motors for circulating water pump and Parsons' ventilating fans, £630. (All recommended.)

HACKNEY (LONDON) BOROUGH COUNCIL.—Simon-Carves, Ltd., additions to boiler plant at Millfields Road generating station, including installation of three water-tube boilers each having evaporative capacity of 125 000 to 150 000 lb. of steam per hour, travelling grate, mechanical stokers, economisers, superheaters, mechanical draught plant, and independent chimney to each boiler, foundations and civil engineering work, steel-framed brick boiler house, and coal handling and storage plant. Total value of boiler plant contract £250 000 (approximately). (Tender recommended for acceptance).

WORK IN PROSPECT.

ALMONDBURY (YORKS.) — 36 houses. Particulars, Borough Engineer, 25, Ramsden Street, Huddersfield.

BARTON-ON-HUMBER.—New secondary school. Particulars, Mr. H. G. Gamble, architect, Bank Street Chambers, Lincoln.

BATTERSEA.—New stores, etc., for B.C. Particulars, Mr. Dresden, borough surveyor.

BELFAST.—Erection and completion of extensions to the Dufferin Hospital. Particulars, Messrs. Young and MacKenzie, architects, Belfast.

BIRMINGHAM.—New premises for Ansell's Brewery, Ltd. Particulars, Mr. H. W. Hobbins, 33, New Hall Street, Birmingham.

BLACKPOOL.—New hospital. Particulars, Messrs. J. S. Gibson, and Gordon, 5, Old Bond Street, London, W.1.

BOSTON.—Hospital extensions. Particulars, the Borough Surveyor.

BRIDLINGTON.—Municipal offices. Particulars, Borough Surveyor.

BRISTOL.—Large factory. J. S. Fry and Sons, Ltd. Particulars, Major Cadbury.

CANNOCK.—Schools and extensions. Particulars, the secretary, Mr. W. E. Swift.

CARSHALTON.—Church. Particulars, Messrs. H. N. and E. H. Philcox.

CHALFONT ST. PETER.—Cinema theatre. Particulars, Mr. C. M. Street.

CHELMSFORD.—Houses (124). Particulars, the Borough Surveyor.—School (250 places). Particulars, the Priest in Charge.

CHESTERFIELD.—Extensions, Royal Hospital. Particulars, the Secretary.

CROYDON.—Houses (20). Particulars, the Borough Engineer.

DEPTFORD.—Blocks of shops. Particulars, the Superintending Architect.

EAST HAM.—Hospital extensions. Particulars, the Borough Engineer.

EALING (LONDON).—17 houses. Particulars, Haymills, Ltd., 1, Grand Parade, Forty Lane, Wembley Park. 24 houses. Particulars, Messrs. Langley and Robinson, 237, Golder's Green Road, N.W.11. Six shops and flats. Particulars, Reinforced Concrete Houses, Ltd., Adelphi Terrace, 2, Robert Street, Adelphi. Eleven houses. Particulars, Mr. A. G. S. Lyford.

FAILSWORTH.—Housing scheme. Particulars, the Surveyor.

FARNHAM ROYAL (BUCKS).—Hotel. Particulars, Taylor, Walker and Co., brewers, Limehouse, E.

FOLKESTONE.—Schools and extensions. Particulars, the Director of Education.

GRANTHAM.—School (200 places). Particulars, the Director of Education.

GREENFORD.—40 houses. Particulars, Richard Costain and Sons, Fitzalan House, Arundel Street, London, W.C.2.—112 houses. Particulars, Mr. R. A. C. Churchward, architect, 12, Victoria Street, London, S.W.1.

HALE (SALISBURY).—Village hall. Particulars, the hon. sec., Mr. L. C. Currie.

HALIFAX.—New Girls' High School. Particulars, Mr. A. C. Tipple, borough engineer, Crossley Street, Halifax.

HORNCHURCH.—Senior school. Particulars, Mr. J. Stuart, Chelmsford.

HOVE.—Schools and extensions. Particulars, the Director of Education.

IRLAM.—Houses (50). Particulars, Joseph Chapman and Son (Patricroft), Ltd., Eccles.

KENILWORTH.—School. Particulars, the Director of Education, Leamington.

LAINDON.—School extensions. Particulars, Mr. J. Stuart, Chelmsford.

LIVERPOOL.—Cinema. Particulars, Mr. E. Shennan, architect, 14, North John Street.

MAIDSTONE.—Transport offices. Particulars, the Borough Surveyor.

MANCHESTER.—Alterations to Langham Hotel. Particulars, Messrs. Pye and Bennett, architects, 2, Booth Street.—New dairy and offices. Particulars, Mr. Peter Cummings, 51, King Street, Manchester.

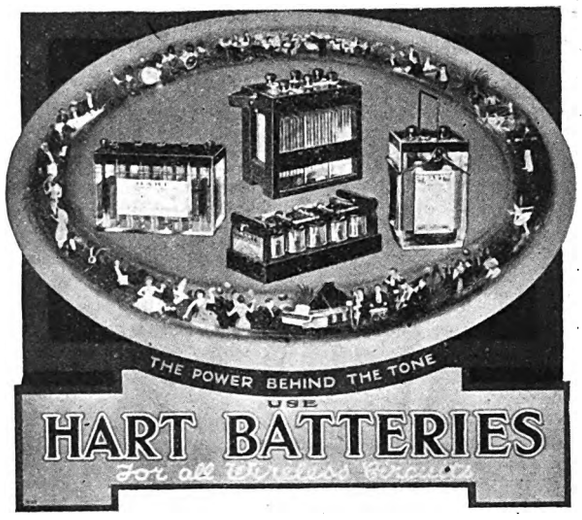
NANTWICH.—Housing scheme. Particulars, the Surveyor.

NEWCASTLE-UNDER-LYME.—Shop premises. Particulars, Messrs. G. Hallins and R. Jones, architects, Lloyds Bank Chambers.

TRADE PUBLICATIONS.

A RECENT issue of the BASTIAN METER CO., LTD., of Slough, is leaflet No. 36 dealing with electric heaters.

The December blotter of MAVOR AND COULSON, LTD., 47, Broad Street, Glasgow, S.E., has been received.



A new coloured showcard issued by the Hart Accumulator Co., Ltd.

TRELLEBORGS EBONITE WORKS, LTD., 4, Union Place, Wells Street, London, W.1, have issued new literature relative to new retail prices.

The current stock list of SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., of 38/39, Upper Thames Street, London, E.C.4, has been received.

The AUTOMATIC TELEPHONE MANUFACTURING CO., LTD., Strowger Works, Liverpool, has sent us a new folder relative to private automatic telephone exchanges.

The GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2, has published folder L.5 234 describing the company's bakelite electric bells and accessories.

We have received from the SHAFTESBURY RADIO CO., 184-188, Shaftesbury Avenue, London, W.C.2, a newly published leaflet describing the "Water Star" loud speaker unit.

Publication No. 6 637, dealing with "Igranic-Elkon" rectifiers and superseding No. 6 477, has been issued by the IGRANIC ELECTRIC CO., LTD., 149, Queen Victoria Street, London, E.C.4.

The MARCONIPHONE CO., LTD., 210-212, Tottenham Court Road, London, W.1, has published a new catalogue dealing with receivers, loud speakers, valves, batteries, chargers, mains units, electrical pick-ups, etc.

Folder 4102/6 embodying the ratings of "Cosmos" lamps has been issued by METRO-VICK SUPPLIES, Metro-Vick House, 155, Charing Cross Road, London, W.C.2. This issue supersedes form M.S. 4892, and may be overprinted.

"Blindfolded and Handcuffed" is the title given to the latest publication of the BENJAMIN ELECTRIC LTD., Brantwood Works, Tariff Road, Tottenham, London, N.17. The issue deals with the subject of correct lighting. The reference is No. 1101.

We have received from FALK STADELMANN AND CO., LTD., 83/93, Farringdon Road, London, E.C.1, copies of pamphlet No. 1375 dealing with the "Efesco" vacuum cleaner, and letter No. P.1376 on the same subject and intended for use as a covering letter when posting the pamphlet.

KORTING AND MATHIESEN ELECTRICAL, LTD., 711/715, Fulham Road, London, S.W.6, have published four new leaflets, covering "Pilolite" fittings, "Kandem" reflectors, "Farlite" lanterns, and "Catena" couplings. The references are 91 029, F.14 529, L.21 529, and A.11 228, in the order given.

A new electrical accessories catalogue has been issued by "M.K." ELECTRIC, LTD., Wakefield Street, Edmonton, London, N.18. The new issue gives particulars of a number of new lines including safety plugs, moulded adaptors, B.S. gauge three-pin, 15 A switch plugs and d.p. horizontal 15 A switch plugs.

ELECTRICITY SUPPLY.

Bradford Mains Extensions—New Plant for Exeter—Mansfield Assisted Wiring Scheme—Portstewart Declines Bulk Supply—Eastbourne Parade Lighting—St. James' and Pall Mall Co.'s Reduced Charges—Rotherham Corporation's Bill.

COVENTRY Electricity Committee is to extend mains at a cost of £4 018.

Maidstone T.C. has received sanction to borrow £36 683 for mains, services and works.

Bradford Electricity Committee seeks sanction to borrow £200 000 for mains and services.

Sheffield Electricity Committee has authorised mains extensions at a cost of £8 525.

Hampstead (London) B.C. has been recommended to seek sanction to borrow £47 000 for cables.

Blackburn Electricity Committee is applying for sanction to borrow £20 000 for mains and services.

Leeds Electricity Committee has obtained sanction for loans of £175 000 for services and £50 000 for assisted wiring.

Exeter Electricity Committee recommends the purchase of a steam turbo-alternator at an estimated cost of £65 000.

Blackpool Corporation is applying for sanction to a loan of £5 000 for an electricity feeder cable and £2 550 for tramway feeder cable.

Coventry Electricity Committee has approved extensions of plant at the Longford generating station, at an estimated cost of £162 000.

Walsall electricity department is to carry out extensions to supply to houses on the Wolverhampton Road housing site at a cost of £3 150.

Barnstaple T.C. has applied for a loan of £4 231 17s. 10d. for work in connection with the electricity scheme submitted by Mr. J. H. Rider.

Highbridge U.D.C. has withdrawn its opposition to the erection of overhead lines in Church Street by the North Somerset Electric Supply Co.

The North Somerset Electric Supply Co. has informed Langport R.D.C. of its intention to apply for consent to erect overhead lines from Butleigh to Somerton. The Council is offering no objection.

Newry U.D.C., subject to the approval of the Electricity Commissioners, has decided to apply for loans totalling £7 500 for the purpose of carrying out free wiring of houses in the urban district and for extending the electric mains.

Portsmouth Electricity Committee has received sanction to borrow £1 759 for the purchase of sites and erection of sub-stations at Lee-on-Solent, Gable Head and Stubbington, and £16 000 for mains in connection with the extension to Sarisbury.

The South London Electric Supply Corporation, Ltd., announces that from and after the December meter readings, the lighting flat rate will be reduced from 6d. to 5¼d. per kWh. and the unit charge from 1d. to ¾d. under the domestic and business " all-in " rates.

Dungannon (Co. Tyrone) U.D.C. has received a request from the Dungannon Gas Co. for the Council's consent to the grant to the gas company of an Electricity Order in respect of the urban district and adjacent rural area. The Council has decided to take no action.

Wimbledon Electricity Committee has decided to provide a 3 750 kW turbo-alternator with switchgear and auxiliaries, at a cost of £20 000, to meet the growth of demand for electricity.—The Committee has obtained sanction to borrow £30 000 for mains and services.

Godalming T.C. has been notified by the Aldershot Gas Water and District Lighting Co. of its intention to make immediate application to the Electricity Commissioners for a Special Order to sanction the transfer to them (the Aldershot Gas, etc., Co.) of the Urban Supply Co.'s undertaking at Godalming.

Birkenhead Corporation has decided to include in its Bill in Parliament a clause to secure power to extend the limits of the electricity supply area.—The Electricity Committee has received sanction to borrow £8 966 for extensions of mains.—The Committee is to seek sanction to borrow £21 653 for a new h.t. switchboard and rotary convertor for the Bentinck Street electricity station.

Bristol Electricity Committee recommends that powers be included in the Corporation's proposed Bill to authorise the construction of sub-stations and transforming stations in any street within the area in which the Corporation is authorised to supply electricity and for powers to include within the city boundary land used for siding accommodation adjoining the new station at Portshead.

In connection with the assisted wiring scheme, the Borough Electrical Engineer of Mansfield has given detailed costs of 29 installations carried out by the department, and he has been given authority to carry out 50 more installations with a view to arriving at a definite conclusion as to whether it would be in the town's interest that the assisted wiring scheme should be carried out by the department or put out to contract.

Clauses are to be included in Rotherham Corporation's Bill in the ensuing session of Parliament extending the electricity supply area at Thorpe, so as to include the whole of Thorpe Hesley and Hesley Bar.—The Housing Committee has instructed the Borough Engineer to arrange for staircase lights with two-way switches in about 1 400 houses at Eastdene, at a cost not exceeding £1 3s. per house, the work to be carried out by the electricity department.

The St. James' and Pall Mall Electric Light Co., Ltd. (London), has reduced the charge for electricity for power, heating and cooking from 1d. to ¾d. per kWh. The minimum charge for lighting has also been reduced from 10s. per quarter to 6s. per quarter for the two winter quarters and to 4s. per quarter for the two summer quarters. The charge for lighting was reduced at the commencement of this year to 4d. per kWh for the first 2 000 kWh per annum and 3d. per kWh for further consumption.

The report to the Canadian Department of Trade and Commerce on the electricity and gas inspection services for the year ended March 31st, 1929, states that 324 998 electricity meters were tested, an increase of 31 673 over the previous year, and the number of meters in service increased by about 78 000 to a total of about 1 500 000. Electricity produced for export during the year was 1 604 212 276 kWh, a decrease of 70 643 731. Revenue collected by virtue of the export duty was $351 109, a decrease of $22 567.

Mr. S. R. Henry, chairman, reported at a meeting of Portstewart U.D.C. last week that he and the electricity works manager, Mr. M'Mullan, had attended a conference in Coleraine in reference to proposals of the Antrim Electricity Supply Co. The figures at which the company would be prepared to give Portstewart a bulk supply, when added to the distributing cost and cost of maintenance would represent about 0d. per kWh. That did not seem very attractive, especially to the Portstewart and Portrush people, who had already their own plants installed. Mr. H. Lynch said the electricity supply in Portstewart should be run entirely as a separate department, and the cost of steet lighting and the pumping of water by electricity made a charge on the rates. This suggestion was agreed to.

Stoke-on-Trent Electricity Committee has decided to give a supply of electricity to Harrison and Sons, Joiners' Square mill, opposite the central power house, Hanley, on a restricted hour basis for the long hour power load of not less than 200 H.P., at £4 per kVA and ¼d. kWh, with the usual coal clause.—In connection with change-over work on consumers' premises, it has been decided to seek sanction to borrow £5 000 for change-over of consumers' apparatus, for as long a period as possible.—The Electricity Committee has voted £6 500 for mains and equipment in connection with supplies to the Springfield Tileries of Messrs. Wheatley and Co., at Stone Road, Trent Vale, and mains are to be extended, at a cost of £3 500, in connection with supplies to the works of Messrs. Bullers, Ltd., at Milton.

Sanction to borrow £25 000 for extension of mains and services; £5 000 for sub-stations; and £7 837 for parade lighting is being sought by Eastbourne Electricity Committee.—In anticipation of the granting at an early date of the application by Eastbourne Corporation for a Fringe Order to supply certain specified premises in East Dean and Friston, the Finance Committee seeks sanction to borrow £11 430.—The Electricity Committee has authorised the consulting engineer to invite tenders for l.t. work in the parishes of East Dean and Friston.—Revised plans and estimates dealing with the substitution of underground for overhead transmission lines have been lodged with the Electricity Commissioners. The total estimated capital expenditure for underground transmission is £11 430, and overhead transmission £6 800.

ELECTRICAL NEWS OF THE WEEK IN PICTURES.

The popularity of lotteries on the Continent has resulted in the development of electrically-operated calculating machines, and the instrument shown in the picture is one of the latest designs for automatic working.

Admiral of the Fleet Sir Henry Jackson, whose death on December 14th is referred to on page 768.

The latest comfort provided by American railways is the telephone, by means of which communication may be established with any part of a train. The service is free.

The January E.D.A. window display. The general effect is obtained by pleating the ends of ten lengths of crêpe paper and fixing these firmly to the window background. Each piece of crêpe is then stretched to its full length, the end rolled over a small stick or strip of cardboard and nailed to the background. The whole of the material is now available from the E.D.A.

The recent bad weather and earthquake disturbances in the bed of the North Atlantic have been responsible for a number of cables breaking down. Cable ships are already repairing the damage, and in this view of Sennen Cove, Cornwall, part of a new section of cable may be seen being hauled ashore.

BUSINESS ITEMS.

THE LIGHTING TRADES, LTD., of 30-31, Farringdon Street, E.C.4, announce that they supplied the lighting fittings for the airship R101 to the special requirements of Messrs. Haslam and Newton.

The address of the BRITISH PORCELAIN CO., LTD. has been changed to Artillery House, Artillery Row, London, S.W.1. The telephone number remains Victoria 0615.

A special Christmas display of fittings, radiators, kettles, irons, curling tongs, standards, fancy shades, cigar lighters, etc., by Mr. Harry Moss. The large stone columns rather spoil the picture but the display when seen is unusually attractive.

The CLARKSON THIMBLE TUBE BOILER CO., LTD., 613, Australia House, Strand, London, W.C.2, announces that AUSTINLITE, LTD., have removed to Lighthouse Works, Smethwich, Birmingham.

An agent, established at Suresnes, is desirous of obtaining the representation of British manufacturers of electrical apparatus and specialities. The Department of Overseas Trade has further details. (Reference No. 626.)

A well-established firm in Salonika wishes to represent in Macedonia and Thrace, British manufacturers of electrical machinery, storage batteries, turbines, Diesel engines, steam engines and boilers, etc. Further particulars from the Department of Overseas Trade. (Reference No. 630.)

Important orders received by HART ACCUMULATOR CO., LTD., recently include one for two batteries, each consisting of 25 " STF. 67 " cells, having a capacity of 9 693 ampere hours, to be installed in the new Whitehall Telephone Exchange.

M. W. WOODS, LTD., Denmark Street, Colchester, announce that the association of interests between S. G. Leach and Co. Ltd., and themselves has been terminated, and an office has been opened at Kingsway Chambers, 46, Kingsway, London, W.C.2, with Mr. M. G. Woods in charge.

The ELECTRO DYNAMO CONSTRUCTION CO., LTD., 733B, Old Kent Road, London, S.E.15, announces the appointment of Mr. G. H. W. Gasper, 48, Palatine Buildings, Victoria Street, Manchester, G. W. Mayle and Co., 134, St. Vincent Street, Glasgow, C.2, and Mr. D. Baldwin, 69, Albion Street, Leeds, as agents for Lancashire, Scotland and Yorkshire.

The MARCONI'S WIRELESS TELEGRAPH CO., LTD. Marconi House, Strand, London, W.C.2, announces that short-wave wireless messages transmitted by the exploration party of Major C. Court-Treatt, from a portable Marconi equipment in the Sudan, have been received as far afield as the U.S.A.

We understand from a telegram received from Australia that Central and Paddington automatic telephone exchanges have just been successfully opened for public service at Brisbane. The event is notable because the transfer of these two exchanges, totalling nearly 10 000 lines, is the largest yet undertaken in Australia. The conversion to the automatic system was commenced in 1925 when South Exchange with nearly 4 000 lines was opened. Since then the system has steadily grown until it now comprises three main automatic exchanges and seven satellite exchanges equipped for a total of over 20 000 lines. All the automatic exchanges in Brisbane area have been manufactured and installed by SIEMENS BROTHERS AND CO., LTD., Woolwich.

ELECTRIC TRACTION.

Underground Railway Committee and Development in the Manchester Area.

THE report of the Underground Railway Committee will be considered at the New Year meeting of Manchester City Council. The scheme approved by the Committee comprises an inner circle tapping the five big railway stations and also the busy areas of Piccadilly and New Cross. From this circular route five radial lines would run to Didsbury, Levenshulme, Openshaw, Newton Heath and Cheetham Hill. The cost of the scheme is estimated at £11 000 000, of which it is hoped that the Government will contribute 50%. The Committee recommends that the Council approve the scheme, and asks Salford to take joint action and approach the Government on the subject of financial aid.

Newport (Mon.) Corporation is to replace its tramcars on the Chepstow Road route by railless trolley vehicles.

Lieut.-Col. Anderson, of the Ministry of Transport, has approved Bradford Corporation's Allerton railless trolley route.

Llanelly Electric Lighting and Tramways Committee proposes to scrap the electric tramway system and to run trolley buses.

Maidstone T.C. has decided to equip a further trackless trolley route from St. Luke's Church to the top of St. Philip's Avenue.

Croydon T.C. has received sanction to a loan of £1 610 for doubling the tramway track near the " Rising Sun," North End.

The Hastings and District Tramways Co. is introducing a bill in Parliament for powers to run trolley buses on many new routes in the town, and to Battle.

Nottingham Corporation on December 2nd authorised the promotion of a Bill in Parliament to secure powers to extend the municipal trolley omnibus services.

Leicester Tramways Committee recommends the City Council to apply for powers to convert any of its existing tramway routes to trackless trolley omnibuses.

It is stated that the Pennsylvania Railway will shortly place an order for 150 electric locomotives, estimated to cost £3 200 000, for use on the New York-Philadelphia-Washington line.

The Southern Railway Co. has announced that the work of electrifying the Brighton line will be put in hand within the next few months, and the new services should be running in two or three years.

Glasgow Corporation is promoting a Provisional Order, which contains a suggested provision that railways in the city shall be worked by electricity or other motive power which does not involve the emission of smoke.

Trolley Buses for London.

The London Underground Group is promoting a Bill in Parliament, including clauses to authorise the use of railless trolley vehicles. The first experiments with such vehicles are to be made in the neighbourhood of Kingston.

The London United Tramways Co. is promoting a Parliamentary Bill to authorise the running of trackless trolley omnibuses in place of the existing tramcars. If the Bill is passed it is intended to experiment on certain routes.

Wath-upon-Dearne U.D.C. has not yet consented to the promotion of a Bill by the Dearne District Light Railway Committee (which operates the Dearne Valley tramway) to authorise the conversion of the whole or part of the tramway to the railless trolley system. At a recent meeting of the Wath Council, voting upon the question was equal.

On the occasion of the recent opening of Salford's new bus garage and tramcar depôt, in Eccles New Road, Ald. W. Greenwood, chairman of the Tramways and Motor Omnibus Committee, said that the day of the tramcar was not over was shown by the fact that about a million and a half passengers per annum were carried on the Corporation tramcars.

For many years there has been criticism in Carlisle City Council regarding the condition of the track of the city tramways, which are run under Parliamentary powers by the Carlisle and District Transport Co., Ltd. The Council has adopted the recommendation of the General Purposes Committee that the Council exercise its powers by seeing that the track is put into a satisfactory state of repair and maintained in good order in future.

COMPANY NEWS.

Further Fall of Electricity Supply Securities—Burma Electric Supply Co. Abandons Omnibuses—Reports and Dividends—New Companies.

THE principal movement shown this week by our usual comparison of electrical share price quotations is a further fall of nearly 4s. 6d. in County of London Supply ordinary shares, from 46s. 3d. to under 42s. The new shares were dealt in at 3s. 6d. premium, after opening at 3s. 9d. Bournemouth and Poole shares have weakened 1s. 3d., from 58s. 9d. to 57s. 6d., and Yorkshire Power from 33s. 9d. to 32s. 6d., while Midland Counties Supply shares are 6d. down at 27s. 6d. London Power Company 5% debenture stock (of which there is in issue nearly 14 millions sterling) has moved up a point to 98. Tokyo bonds at 92 are a couple of points lower.

Hydro Electric Securities at under 42 have lost more than half of last week's advance, and International Holdings are a little lower. Radio Corporation of America shares have maintained the higher level reached a week ago, and are a point higher at 45. Cables and Wireless stocks have remained steady. Several cablegram companies' stocks have moved up slightly, Eastern preference and debenture issues and Eastern Extension debenture stock improving a point, and Western Telegraph debenture stock following suit. American Telephone and Telegraph capital stock has been sold by profit-takers and the quotation, at 225, has lost the 10 points gained last week. The same remark applies to International Telephone and Telegraph Stock, which has relapsed from 85 to 80 dollars. Marconi International Marine shares, too, at 47s. 6d., have lost half of the 2s. 6d. gained last week. Anglo-American Telegraph ordinary and preference stocks, United River Plate Telegraph debentures and New York Telephone mortgage bonds are all a point to the good.

In the transportation and equipment sections, British Electric Traction preferred ordinary stock has risen two points and London and Suburban "A" debentures 2½. British Columbia Electric Railway preference stock has risen a point, to 88½. English Electric Co.'s ordinary shares have changed hands at 3s. 9d., and the quotation has been marked down to that figure. W. T. Henley's shares are up 1s. 3d., to 118s. 9d., and Siemens debenture stock is a point higher at 92½. General Electric "B" preference shares have put on 6d., to 25s. 6d.

EDISON BELL, LTD.—Net pft. for year ended Sept. 30, £28 146, compared with net blce. of £20 158 for previous 15 months, plus £33 139 from sale of foreign trading interests. Fin. div. 5%, making 10%, agst. 12½%. Written off pref. issue exes., £3 000. Last year £20 000 was placed to reserve. Fwd. £8 676, agst. £9 780.

BRAZILIAN TRACTION, LIGHT AND POWER CO., LTD.—The special arrangemts. whereby certificates of subscriptn. for additional ord. shs. cd. be exchanged for definitive certificates without the delay and risk of transmission to Canada has terminated, and all certificates of subscription must be sent for exchange to National Trust Co., Ltd., Toronto, Canada.

COMPANIES TO BE STRUCK OFF THE REGISTER.—The following companies will be struck off the register unless cause to the contrary is shown before February 26:—Airships Electric Advertising Co., Chippenham Electric Supply Co., Dunlop Marine Course Signal Syndicate, Eureka Electric and Wireless Maintenance Guarantee Co., International Inventions and Patents Exploitation Co., Melksham Electric Supply Co., Midland Electrical Tube Co., Trowbridge Electric Supply Co., Winchcomb Electric Light and Power Co.

INDO-EUROPEAN TELEGRAPH CO., LTD.—Directors certify that Part 3 of agreemt. dated Nov. 22, 1929, and made between Imperial and International Communications, Ltd., of the first part, H. L. M. Tritton and others of the second part and certain shhldrs. of Indo-European Telegraph Co., Ltd., of the third part became unconditnl. and operative on Dec. 13, 1929, and the directors also state that any shhdr. of the Indo-European Telegraph Co., Ltd. who intends to accept the offer of Imperial and International Communications, Ltd., to purchase his shs. should do so at once, as the offer will be withdrawn very shortly.

AMERICAN RADIO AND CABLE MERGER.—Details of the proposed agreemt. betwn. the Radio Corporation and the International Telephone and Telegraph Corporation, were given to the U.S.A. Senate Committee last week. The International Telephone and Telegraph Corporation is to pay 400 000 shs. to the Radio Corporation for the combinatn. of the business, the paymt. of stock to be spread over five years. General G. N. Harboard, president of the Radio Corporation, recommended to the Senate Interstate Commerce Committee that legislation be passed to legalise the merger.

EDISON BELL (INTERNATIONAL), LTD.—Rept. for period from Sept. 13, 1928, to Sept. 30, 1929, shows pft. £5 620, which is carried fwd. Directors state that, while prospectus estimates have not been fully justified, plans for developmt. of company have proceeded satisfactorily. Turnover is increasg. month by month, and business is now on a sound basis and making steady progress. Subsidiary companies are in active and successful operatn. in France, Italy and Yugoslavia, business in the Far East is progressg. in satisfactory manner, and general tradg. in other countries is being gradually extended on profitable basis.

Company Meeting.

BURMA ELECTRIC SUPPLY CO., LTD.—Mr. C. O. Webb, presiding at the meeting on December 11th, said the earnings for the year to July 31st were £19 184, compared with £25 213 for the previous 12 months, the reduction following the diminution of the traffic receipts of the trams and motor omnibuses, this being due to competition of omnibuses run chiefly by individual owners. The board has decided to discontinue the company's experimental service of omnibuses. They had proved by their experiment that it would not be possible to run a regular service with a properly equipped fleet of buses at the low fares which they had charged on their trams. For no adequate reason which had reached the board, the adoption of rules to control the running of other owners' omnibuses had been postponed from month to month, and no steps had been taken to enforce them. With regard to the supply of current for lighting and power, during the past year they had made considerable progress in the change over from the original system of supply at 500 V to a standard voltage of 250. Their receipts from the sale of current showed an increase of £1 496, which was due to increased sales and not to the alteration in their rates on the change over to the lower voltage, which had not affected last year's figures. As regarded the future of the tramways, they hoped the authorities would eventually realise the disservice they might be rendering to the travelling public if the present conditions were allowed to continue. The report and accounts were adopted and a dividend on the ordinary shares of 2½%, less tax, making a total of 5% for the year, was approved.

New Companies.

R. J. ROBINSON AND CO., LTD.—Cap., £1 000. Engineers, electricians, etc. Solicitors: Falkner, Son and Roberts, Louth, Lincs.

HYPERLITE UNITS, LTD.—Cap., £100. Manufacturers of hyperlite units, electrical signs and apparatus, etc. Reg. Office: 25, Islington Green, London, N.1.

GRAINGER AND THRELFALL, LTD.—Cap., £1 000. Manufacturers of and dealers in glass tubing, electrical goods, etc. Solicitor: J. Haswell, 32, West Street, Gateshead.

VULCANIZED FIBRE MARKETING BOARD, LTD.—Cap., £1 000. To promote marketing of vulcanised fibre and insulating materials, etc. Director: F. N. MacEchern (chairman), Merven, Christchurch Avenue, Finchley, London, N.12.

CHAS. PRESTON AND CO., LTD.—Cap., £3 500. To acquire business carried on by L. St. Alphonse, as Chas. Preston and Co., and to carry on business of agents for, and factors of, electrical, wireless and builders' appliances, fittings and accessories, etc. Reg. Office: 41, Berners Street, London, W.1.

CONTRACT FINANCE CORPORATION, LTD.—Cap., £10 000. The objects are to finance contracts and hire purchase or other agreements, and to carry on the business of manufacturers of, and dealers in, plant, machinery for electrical, mechanical and chemical industries, wireless apparatus, etc. First directors are not named. Qualification: holding 500 shares, of any class, in the Bank of London, Ltd. Reg. Office: 11, Pancras Lane, London, E.C.4.

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

ABRAHAMS, S. W., Station Approach, Well Hall, wireless dealer. £17 19s. October 22nd.

ARCHERS (ELTHAM), LTD., 74, High Street, Eltham, wireless dealers. £21 5s. 8d. October 23, and £14 18s. 2d., October 22nd.

BRITISH ELECTRICAL MANUFACTURING CO., Alexandra Works, Brentview Road, Hendon, manufacturers. £114 17s. 6d. October 1st.

BROSAN, MR. R., 267, High Road, Willesden Green, wireless dealer. £21 10s. 4d. October 18th.

CROMPTON, S. AND J., 129, Chiswick High Road, Chiswick, wireless dealers. £13 10s. October 28th.

RED TRIANGLE ELECTRIC CO., LTD., 37, Tothill Street, Westminster. £13 15s. 8d. October 18th.

WESTON ELECTRIC LAMP CO., 47, Victoria Street, S.W., manufacturers. £17 5s. 10d. August 21st.

Receiverships.

BABINGTON (B.) AND CO., LTD.—H. Mason, of 156, Moor Street, Birmingham, was appointed receiver on December 2nd, 1929, under powers contained in debentures dated November 6th, 1911.

CLEETHORPES RADIO SUPPLY, LTD.—A. J. Weaver, corporate accountant, of 77, Victoria Street, Grimsby, was appointed receiver on November 22nd, 1929, under powers contained in mortgage debentures dated April 23rd, 1928, and May 1st, 1929.

DODMAN (E. V.), LTD.—T. W. Daffern, of 19/20, High Street, Coventry, was appointed receiver and manager on November 23rd, 1929, under powers contained in debenture dated December 7th, 1927.

GLADDEN AND DAVIES, LTD.—C. E. W. Lavender, C.A., of Trafford Park, Manchester, was appointed receiver on December 5th, under powers contained in debenture dated October 11th, 1929.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced.*]

BRITISH BATTERY CO., LTD., Watford.—Registered November 29th, £300 debenture, to E. H. E. Morley, The Homestead, Sydney Road, Watford; general charge. *Nil. October 18th, 1928.

ELECTRICAL ENTERPRISE, LTD., London, S.W.—Registered November 22nd, £6 000 debenture to Branch Nominees, Ltd., 15, Bishopsgate, E.C.; general charge; also registered November 22nd, £2 450 debentures; general charge (2nd charge). *Nil. May 13th, 1929.

RIDGED CONE CO., LTD., London, W.C., wireless engineers. Registered December 3rd, £800 debentures; general charge. *Nil. December 31st, 1928.

RUNBAKEN MOTOR AND ELECTRICAL ACCESSORIES, LTD., Manchester. Registered November 26th, £5 000 debentures; general charge.

Satisfaction.

HEWITTIC ELECTRIC CO., LTD., Hersham. Satisfaction registered December 4th, £10 000, registered November 1st, 1927.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

MAJESTONE, LTD., 20a, Russell Street, Leeds. The statutory meeting of the creditors in the voluntary liquidation of this company was held recently, when a statement of affairs was submitted which showed ranking liabilities of £1 823, of which £1 584 was due to the trade, and £239 to cash creditors. In addition, there were fully secured creditors for £150. There was also a contingent liability on bills of exchange amounting to £262, none of which was expected to rank. The assets comprised machinery £10, estimated to realise £5; fixtures and fittings £39, expected to produce £10; stock £591, valued at £400; book debts £962, estimated to realise £850; deposit £3 10s.; cash at bank £14, making a total of £1 282. After allowing £65 for preferential claims, the net assets were £1 217, or a deficiency as regarded the creditors of £606. The issued capital is £201, and the deficiency as regards the shareholders £807. It was reported that the company was registered on July 1st last to take over certain stock, etc. The trading of the company had been disappointing and the directors had declined to finance it further. No remuneration had been drawn by any of the directors. The turnover had only been £2 138, with a gross profit of £454, and a net loss of £416. The deficiency was accounted for by the loss on the trading, and the depreciation written off the assets. During the meeting a suggestion was made that the cash creditors should postpone their claims, and it was decided to confirm the voluntary liquidation of the company with Mr. S. Croudson, I.A., 12, East Parade, Leeds, as liquidator, with a committee. The principal creditors are: Hardman and Co., £432; Clareth Reproductions, Ltd., £195; Grainge, —., £71; Taylor, E., £38; Redhead, W., £30; L. L. Magneto Co., Ltd., £25; Dewhirst and Ibbotson, £19; Mullard Wireless Co., £18; Cinema Utilities, Ltd., £345; Ellison and Lees, £117; Tate, M. A., £45; Longhorn, P., and Son, £33.

London Gazette, etc.

Bankruptcy Information.

BROWN, John James, Handysides Arcade, Newcastle-upon-Tyne, wireless agent. First meeting, December 20th, 11.30 a.m., Official Receiver's Office, 81, St. Mary's Place, Newcastle-upon-Tyne. Public examination, January 8th, 10.30 a.m., Court House, 56, Westgate Road, Newcastle-upon-Tyne.

Notices of Dividends.

JOLIVARD, Kenneth Paul James, described in the Receiving Order as K. JOLIVARD AND CO., 66, Victoria Street, London, S.W., electrical engineer. First and final dividend, 4d. per £, payable Bankruptcy Buildings, Carey Street, London, W.C.2.

PRICE, Frederick, and TARVER, Charles Reekes, 15, Working Street, Cardiff, electrical engineers, trading as FRED PRICE, TARVER AND CO. First and final dividend, 1s. 6½d. per £, payable December 24th, Official Receiver's Office, 34, Park Place, Cardiff.

Notices of Intended Dividends.

BLAIR, Edward Winnington, electrical engineer and contractor, 6, Queen's Parade, Brent Street, Hendon, Middlesex, trading as BLAIR AND SON. Last day for receiving proofs, January 2nd. Trustee, T. Gourlay, 29, Russell Square, London, W.C.1., Official Receiver.

WOODHEAD, Titus Ernest, 26, Central Drive, Blackpool, electrical factor. Last day for receiving proofs, January 2nd. Trustee, H. Parker, 9, Cannon Street, Preston, Official Receiver.

WRIGHT, Ronald Reginald, trading as WRIGHT BROS., 36, Normanton Road, Derby, wireless dealer. Last day for receiving proofs, January 3rd. Trustee, L. A. West, 22, Regent Street, Park Row, Nottingham, Official Receiver.

Partnerships Dissolved.

ASHELL AND CO. (Hubert ASHWORTH and Tom MITCHELL), automobile electrical engineers and exide battery service agents, Yorkshire Street, Bacup, by mutual consent as from December 9th, 1929. Debts received and paid by H. Ashworth, who will continue the business.

WEIR ENGINEERING CO. (Henry Lawrence Dingwall FORDYCE and Joseph Reginald Montague STANFIELD), general mechanical automobile motor boat and electric engineers, by mutual consent as from November 30th, 1929. Debts received and paid by J. R. M. Stanfield.

METAL AND CHEMICAL PRICES.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

302 286 Associated Electrical Industries, Ltd. Electrical control devices. (13/12/27.)
319 167 J. Feldman. Construction of transformers, choking-coils, and other parts of wireless apparatus to facilitate assemblage. (13/12/28.)
302 908 British Thomson-Houston Co., Ltd. Electron-discharge devices. (22/12/27.)
319 175 E. F. Schafer. Combined table-lamp and loud-speaker. (24/12/28.)
319 176 W. Guy-Pell. Lamp shades. (2/1/29.)
304 656 Siemens-Schuckertwerke Akt.-Ges. Projecting-screen, more particularly for daylight projection. (23/1/28.)
305 049 Siemens and Halske Akt.-Ges. Power-supply apparatus suitable for use in supplying thermionic valves and the like. (27/1/28.)
318 956 Standard Telephones and Cables, Ltd. (G. Deakin and L. Polinkowsky). Automatic and semi-automatic exchange systems. (13/6/28.)
318 957 Standard Telephones and Cables, Ltd. (G. Deakin and L. Polinkowsky). Automatic and semi-automatic exchange systems. (13/6/28.)
319 063 Standard Telephones and Cables, Ltd. (G. Deakin and L. Polinkowsky). Automatic and semi-automatic exchange systems. (13/6/28.)
319 292 General Electric Co., Ltd., and W. Wilson. Electric relays. (20/4/28.)
319 198 Dr. M. Wilderman. Electric batteries. (17/5/28.)
319 199 H. Friedlander. Sound-amplifying constructions and the like. (12/6/28.)
319 229 General Electric Co., Ltd., and C. H. Marshall. Wagon-tipping apparatus. (14/6/28.)
292 131 A. Vogel. Process for preventing the occurrence of excess voltages in electrolytic cells for the electrolysis of water. (14/6/27.)
319 385 A. H. Marks and P. Russell [legal representatives of E. C. R. Marks (deceased)]. (Riley Stoker Corporation.) Magnetic separators. (14/6/28.)
319 193 J. J. V. Armstrong (Telefunken Ges. für Drahtlose Telegraphie). Low frequency and high frequency automatic telephone systems. (9/3/28.)
319 375 S. G. S. Dicker (N.V. Philips Gloeilampenfabrieken). Resistance-coupled amplifiers. (19/3/28.)
307 329 N. V. Hengelosche Elektrische en Mechanische Apparatenfabriek and H. A. W. Klinkhamer. Asynchronous motors. (5/3/28.)
319 388 H. G. Brown and D. P. Battery Co., Ltd. Electric accumulator plates (16/6/28.)
292 476 M. Surjaninoff. Three-phase induction motors. (18/6/27.)
319 389 British Thomson-Houston Co., Ltd., S. F. Davies, L. J. Davies, and H. W. H. Warren. Devices for causing the intermittent illumination of a surface. (18/6/28.)
319 297 F. D. Pitt. Electric radiator. (18/6/28.)
319 259 Standard Telephones and Cables, Ltd. (Bell Telephone Laboratories, Inc.). Vacuum-tube oscillator circuits. (18/6/28.)
319 260 C. W. Cox and C. E. C. Shawfield. Electric fuses and busbar and circuit connections therefor, specially applicable to distribution fuseboards and the like. (19/6/28.)
319 298 J. A. Reavell. Electric heating-apparatus for heating bituminous or other materials. (19/6/28.)
319 391 J. A. Reavell. Electric heating-apparatus for heating bituminous or other materials. (19/6/28.)
319 304 J. L. Baird and Television, Ltd. Television apparatus and the like. (20/6/28.)
319 305 British Thomson-Houston Co., Ltd., and F. P. Whitaker. Mercury arc rectifiers. (20/6/28.)
319 306 British Thomson-Houston Co., Ltd., and F. P. Whitaker. Mercury arc rectifiers. (20/6/28.)
319 400 A. N. Hazlehurst. Electric storage batteries or accumulators. (21/6/28.)
319 401 British Thomson-Houston Co., Ltd., and J. C. Read. Mercury arc rectifiers. (21/6/28.)
319 418 Igranic Electric Co., Ltd., and D. Sinclair. Direction-finding radio receivers. (26/6/28.)
319 419 J. H. Buchanan and Associated Electrical Industries, Ltd. Protective gear for alternating-current electric systems. (26/6/28.)
319 421 B. Hesketh. Method of controlling variable electric condensers and like apparatus. (26/6/28.)
319 423 C. E. Fry. Prepayment-devices for use in connection with electric meters. (29/6/28.)
319 425 Oliver Pell Control, Ltd., and C. Oliver. Electromagnetic reproducers for use with gramophone and the like records. (30/6/28.)
319 429 W. H. Scott, G. J. Scott, and H. D. Wheeler. Motor-generator control for electric winches and the like. (4/7/28.)
319 431 W. T. Gray and Associated Electrical Industries, Ltd. Electric motor control systems. (5/7/28.)
294 247 Kalle and Co. Akt.-Ges. Manufacture of light-sensitive materials. (21/7/27.)
319 439 A. H. Marks and P. Russell [legal representatives of E. C. R. Marks (deceased)]. (Apex Electrical Manufacturing Co.) Clothes-washing machine. (19/7/28.)
319 454 P. J. De Wet. Apparatus for television and like purposes. (2/8/28.)
295 045 British Thomson-Houston Co., Ltd. Electric control systems and apparatus therefor. (5/8/27.)
319 456 Oliver Pell Control, Ltd., and C. Oliver. Electromagnetic-reproducers for use with gramophone and the like records. (3/8/28.)
296 402 British Thomson-Houston Co., Ltd. Electric regulators. (31/8/27.)
319 458 A. Preen. Anti-vibration wireless valve-holders. (7/8/28.)

Applications for Patents.

September 5th.

27 064 Automatic Telephone Manufacturing Co., Ltd. and F. T. Belas. Telephone systems.
27 065 Automatic Telephone Manufacturing Co., Ltd. and C. Gillings. Telephone systems.
26 979 W. A. Burns. Supply of power to wireless receiver.
27 066 Cie Lorraine de Charbons pour l'Electricite. Treating plastic materials. (19/9/28, France.)
26 964 W. R. Cox and General Electric Co., Ltd. Electric supply systems.
27 053 Electrical Research Products, Inc. Systems of control for a.c. motors. (19/9/28, U.S.)
27 049 L. Emanueli. Electric cables.
27 029 H. E. Gamble. Wireless receiving systems.
27 059 Gramophone Co., Ltd. and R. K. Spencer. Wireless receivers.
26 935, 26 936 T. M. Inman and Relay Automatic Telephone Co., Ltd. Electric signalling apparatus.
26 994 International General Electric Co., Inc. Electric switches. (8/9/28, Germany.)
26 955 J. McLean. Shade rings for lampholders.
26 956 J. McLean. Electric lampholders.
27 033 Maschinenfabrik Oerlikon. Electric drives for carding engines. (7/9/28, Switzerland.)
27 050 Soc. Francaise Radio-Electrique. Electrical measuring instruments (27/9/28, France.)
27 040 Standard Telephones and Cables, Ltd. Gas detection systems, etc.
26 951 E. Thomas. Electric switches, etc.

September 6th.

27 163 Associated Electrical Industries, Ltd. and H. H. Long. Lamp reflectors.
27 170 S. G. Brown. Megaphone attachments for telephone receivers.
27 080 W. W. Buck. Lightning switches for wireless aerials.
17 154 N. R. Campbell and General Electric Co., Ltd. Mechanisms controlled by light.
27 167 Felten and Guilleaume Carlswerk A.G. Pupin coil boxes. (2/10/28, Germany.)
27 168 Felten and Guilleaume Carlswerk A.G. Pupin coil boxes. (6/10/28, Germany.)
27 086 Ges. für Elektrische Apparate. Microphones, etc. (7/9/28, Germany.)
27 137 W. H. Grinsted and Siemens Bros. and Co., Ltd. Intercommunication between telephone systems.
27 179 W. R. Harper, W. P. Hole and H. W. Wright. Electric startors for engines.
27 149 International General Electric Co., Inc. Electric switches. (8/9/28, Germany.)
27 130 R. A. Kennedy. Wireless apparatus.
27 093 J. H. Laybourne. Hydro-electric machines.
27 192 F. W. Mayes. Accumulators, etc.
27 092 V. Powell. Electric gramophones.
27 186 E. W. Smith. Auto-control devices for electric hot water systems.

September 7th.

27 230 J. E. Allan and S. B. Freeman. Manufacture of insulated cables.
27 260 Arcturns Radio Tube Co. Photoelectric cells. (8/9/28, U.S.)
27 267 A. J. Cane and H. G. Collins. Thermionic valves.
27 245 L. E. Cotterell. Electric motors for therapeutic purposes.
27 232 C. W. Cox and C. E. C. Shawfield. Switch fuse. (9/4/29.)
27 248 G. L. Davidson. Electric trollies or carriages, etc.
27 231 E. G. H. Davies. Attachments for telephone mouthpieces.
27 268 E. Gallizia and General Electric Co., Ltd. Seals for containers of electrical discharge apparatus, etc.
27 240 E. E. Hopwood and Wardle Engineering Co., Ltd. Electric traffic signalling systems.
27 241 E. E. Hopwood and Wardle Engineering Co., Ltd. Lanterns for electric lamps.
27 269 International General Electric Co., Inc. Electric switches. (8/9/28, Germany.)
27 294 L. Mellersh-Jackson (Siemens-Elektro-Osmose Ges). Electro-osmatic purification of liquids.
27 290 A. H. Midgley. Battery charging systems.
27 207 G. Wilkinson. Electric meat storage cookers.

September 9th.

27 388 E. Banning. Polarising electrolyte.
27 324 J. Carlier and G. F. Judd. Unspillable device for batteries, etc.
27 325 J. Carlier and G. F. Judd. Production of plates for storage batteries, etc.
27 302 S. O. Cowper-Coles. Sound recording.
27 352 A. J. Garrod and Quadruple Valve Co. Thermionic valves.
27 377 Gramophone Co., Ltd., and A. S. Radford. Switching means for electromagnetic vibratory devices.
27 407 H. C. Holmes, J. A. A. Taylor and A. Warwick. Receiving, etc., systems for wireless electrical systems. (13/11/28, Belgium.)
27 425 M. Latour. Aerial systems. (20/9/28, France.)
27 344 G. A. H. Rohrbeck and D. U. Waldeck. Automatic circuit-breaker for motor car batteries, etc.
27 327 W. A. Stevens. Means of controlling regeneration in electric vehicles.
27 328 W. A. Stevens. Electric braking.
27 332 W. W. Triggs (Railway and Industrial Engineering Co.). Electric fuses.
27 379 Westinghouse Lamp Co. Vacuum electric tube devices. (15/9/28, U.S.)
27 380 Westinghouse Lamp Co. Vacuum electric tube devices. (24/9/28, U.S.)

September 10th.

27 500 Allgemeine Elektricitats Ges. Securing stator plates of electric machines (11/9/28, Germany.)
27 472 H. Bley G. Seibt. Electric glow tubes. (17/10/28, Germany.)
27 473 H. Bley G. Seibt. Electric glow tubes. (29/10/28, Germany.)
27 474 H. Bley G. Seibt. Electric glow tubes. (26/11/28, Germany.)
27 475 H. Bley G. Seibt. Electric glow tubes. (5/12/28, Germany.)
27 540 Cambridge Instrument Co., Ltd., and E. B. Moss. Measurement of light energy.
27 467 A. H. Cox and A. E. McElroy. Electric switches.
27 523 International General Electric Co., Inc. Manufacture of porcelain, etc., objects. (10/9/28, Germany.)
27 551 L. Mellersh-Jackson (American Cable Co.). Fittings for reinforced tubing.
27 518 Kienzle Uhrenfabriken A.G. Electrically driven clocks. (18/9/28, Germany.)
27 462 F. Krupp Grusomverk A.G. Lead cable covering presses. (6/8/29, Germany.)
27 460 J. McGregor. Bowl fittings for electric lamps.
27 450 G. Redmayne. Galvanic batteries, etc.
27 552 Telepanaktiebolaget L. M. Ericsson. Elimination of ripples in electron valve sets. (12/9/28, Sweden.)
27 561 Telepanaktiebolaget L. M. Ericsson. Multiple generators. (8/10/28, Sweden.)
27 439 R. T. Waite. Electric plug and socket coupling.
27 528 Ward Leonard Electric Co. Electric controlling apparatus. (15/9/28, U.S.)

September 11th.

27 594 J. M. Blackie. Lightning protectors for wireless apparatus.
27 634 British Thomson-Houston Co., Ltd. (General Electric Co., N.Y.) Transformers.
27 676 Cie Generale de Telegraphie sans Fil. Measuring at a distance temperature and salinity of sea water, etc. (11/9/28, France.)
27 613 Felten and Guilleaume Carlswerk A.G. Presses for production of cable sheathings. (22/10/28, Germany.)
27614 Felten and Guilleaume Carlswerk A.G. Coil boxes for electric cables. (20/10/28, Germany.)
27 643 R. J. Hayter. Telephone jacks or plugs.
27 571 A. O. Lloyd. Indicating devices for electric switches, etc.
27 660 Norddeutsche Diktograph Ges. Signalling systems. (24/9/28, Germany.)
27 656 Soc. Anon. Constructions Electriques Patay. Electrically driven centrifugal apparatus. (4/5/29, France.)
37 579 J. B. Tucker. Electric switches.
27 653 U. S. L. Battery Corporation. Storage batteries. (12/9/28, U.S.)
27 800, 27 801 Western Electric Co., Ltd. Exercising machines, etc. (20/9/28, U.S.)
27 689 Western Electric Co., Ltd. (B. M. A. Frebes). Extension apparatus.

September 12th.

27 794 Associated Electrical Industries, Ltd. Marine power plant. (12/9/28, U.S.)
27 783 A. Avis and Overhead, Ltd. Supporting poles for transmission lines.
27 790 J. L. Baird, and Television, Ltd. Synchronising devices.

Electricity in 1929.

ELECTRICITY finds employment in so many fields of human activity, and during the past year has made so many developments in its existing applications, not to speak of others in entirely new directions, that the task of reviewing this progress is one that cannot lightly be attempted. The ramifications of electricity are in fact so great that the large industry concerned with its exploitations is one of the most specialised and sectionalised of all the industries. Such specialisation is, of course, inevitable, though it has its disadvantages. One of the more obvious of these is the lack of knowledge that exists in one section about the developments that may be made in other branches. Those who are able to keep abreast of the mass of technical literature that is published during the year are able to gain from it a fair idea of what is being accomplished by electrical men in other parts of the industry, but there are many electrical engineers who either have not sufficient time, or think they have not, to keep in touch with these developments, though they may be well-informed on matters that are of immediate concern to them. As both classes, particularly the latter, can gain useful knowledge from a symposium of "progress reports" on the most important sections of the industry, we present, in the pages that follow, a collection of brief reviews of technical progress made in 1929 in various phases of electrical work. All of these reviews have been written by men who can speak authoritatively on their own special subjects, and the concise form in which the information is made available has made it possible for us to deal with a very wide range of subjects in an 18-page section of this, our first Annual Review Number.

THE sectionalisation of interests which we have referred to above has naturally led to the establishment of a multitude of professional and trade associations. Most, if not all, of these bodies are doing valuable work, and though we would hesitate to say that any one of them was unnecessary, we do think that there should be brought into existence, on the association side, something analogous to the "grid," in order to bring about a closer degree of interconnection, a freer exchange of knowledge, and a greater degree of co-operation in furthering industry policies. The idea of making all these bodies into one great Electrical Association is by no means new. It has been debated more than once during 1929; let us hope there may be results in 1930. If any fresh arguments were needed for the development of a central co-ordinating association for the British electrical industry they can easily be found in the section of this issue in which the secretaries and other officials of most of the existing associations give brief reviews of their work during the year. In extent and variety this work is little short of amazing, and much of it will come as news, even to those who, through membership, might be expected to be well acquainted with it. Study of the various reports will show, however, that there is a certain overlapping of interests which might be easily avoided by some form of "loose-linking" under a central body.

* * *

GENERALLY speaking, the year which is just closing has seen many interesting developments in the electrical industry. On the power station side generating plant has been more noteworthy for the rapid extension of the use of welded steel construction than for increases in the size of the plant, the largest set in operation in this country being the 50 000 kVA machine at Barton. In the boiler house there has been a distinct movement towards higher steam pressures, though little is being done over 500 lb. per sq. in. The use of pulverised fuel has progressed faster than in some recent years, but the tendency is to neglect the separate pulveriser house in favour of the unit system, as exemplified in the Hams Hall station. In switchgear there have been some radical departures from precedent, and there has been a considerable development of protective gear. In transformer manufacture marked progress has been made in the development of on-load tap-changing devices, while, on the transmission side, 1929 has seen the first employment in these islands of 132 000 V overhead lines and the manufacture, for the first time in Europe, of 66 000 and 132 000 V oil-filled cables for use underground. In line construction great interest has been

Digitized by Google

shown in the possibilities of reinforced concrete line-supports, and on rural lines the use of h.t. fuses has increased.

* * *

ELECTRICITY, as always, has continued to be associated with many innovations of public interest, notably in the "Tote" and the "talkies." On the industrial side electricity has extended its services to many processes which formerly relied on expensive and often inefficient hand labour. Perhaps the industry on which it has made the most marked impression this year has been shipbuilding. The use of electricity for auxiliary services afloat has been extending gradually for some years, but 1929 has been remarkable for the increasing use that is being made of electric propulsion.

* * *

So far we have only referred to a few of the directions in which there has been useful development during the year; many others are recorded by the authors of our technical review section. We may, however, draw attention in passing to one direction in which little, if any, useful development is visible. We refer, of course, to the electric battery vehicle, which, through apathy, has lost even the ground which it had slowly gained in the years immediately before the war. This position is the more regrettable in view of the phenomenal development of mechanical road transport and of the complete satisfaction which existing big users of "electrics" derive from their fleets. Much, though not all, of the blame is directly applicable to those supply authorities which still fail to appreciate the value of the battery vehicle as an "off-peak" load.

* * *

ELECTRICAL manufacturers can rest assured that trade during the year has in no way declined when compared with 1928. The summary of electrical overseas trade which we publish elsewhere in this issue, shows that with the exception of four months, electrical exports advanced during each of the eleven months so far dealt with by the Board of Trade returns. It is true that the favourable trade balance of exports over imports is this year £746 853 less than for the corresponding period of 1928, but it must be remembered that the reductions in prices of materials and manufactured goods which have taken place since this time last year played their part in export values. That our overseas trade this year was greater than last is shown by the fact that total exports for the eleven months of 1929 were £924 641 in advance of the 1928 figures for the corresponding period, notwithstanding the price reductions previously referred to. Shipments of electrical machinery during the eleven months of this year declined by £392 231 when compared with the return for the same months of last year, while various wires and cables, including submarine cables, improved by nearly £1 500 000. These two heads represent equipment and materials which are marketed in severe competition with foreign products, and the lower cash value in machinery exports does not necessarily mean shipments of less volume; the absence of serious unemployment in the industry suggests the reverse.

* * *

APART from overseas trading a very satisfactory position has been maintained in the home market, and during the year a large number of substantial contracts have been placed by railways, municipalities and others for electrical machinery and equipment. Probably the most important individual buyer of electrical manufactures during the year, was the Central Electricity Board, which was alone responsible for the placing of over £6 000 000 of orders. In view of the new electricity schemes being developed under the "grid," one would naturally expect the Central Board to figure as a large buyer of British products, and though the value of the orders so far placed is comforting, contracts for the North-West England and North Wales, the Mid-East England, and the North-East England Schemes have yet to be placed.

* * *

WE publish elsewhere a selection of contracts, apart from those of the Central Board, successfully tendered for during the year by British firms, and from these it will be seen that the municipalities and railways were the largest buyers, that is, their contracts were of the largest value. Other contracts placed during the year were of smaller value but in many cases were repeated two or three times, representing very often a greater total value than the larger individual contracts. The contracts referred to elsewhere represent well over £3 000 000, and this sum added to the value of the Central Board contracts plus the total value of eleven months exports gives us an aggregate of £26 867 662. This sum, large as it is, cannot be considered as even a conservative estimate of the total value of contracts placed with the British electrical industry during 1929, for in our selection, no mention is made of contracts valued at less than £30 000, and since there were literally hundreds of orders placed at values slightly under this figure the turnover of the industry as a whole, including sales apart from those by tender, must stand at a sum comfortably in excess of that attained last year. The British electrical industry has little reason for pessimism regarding the achievements of 1929, and can look forward with confidence to the coming year.

TECHNICAL PROGRESS IN 1929.

A Specially Contributed Review of Some of the Past Year's Most Important Developments in Various Spheres of British Electrical Activity.

IN an industry of the size and ramifications of that which is concerned with the development of the uses of electricity and the provision of the electrical energy and the apparatus which makes that energy available to the user, it is impossible for anyone individual to be fully conversant with the progress that is being made in all its branches. It is similarly impossible for one writer to provide this knowledge. However, with the aid of a band of contributors who are acknowledged specialists in the various branches of electrical work, we are able to present below a concise account of what has been accomplished in 1929. *British practice is normally referred to, but certain developments abroad are touched on in relation to British problems. The views expressed throughout are those of the writers, and are not necessarily in accord with our own.*

TURBO-ALTERNATOR PLANT.

By J. A. KUYSER, M.I.E.E.

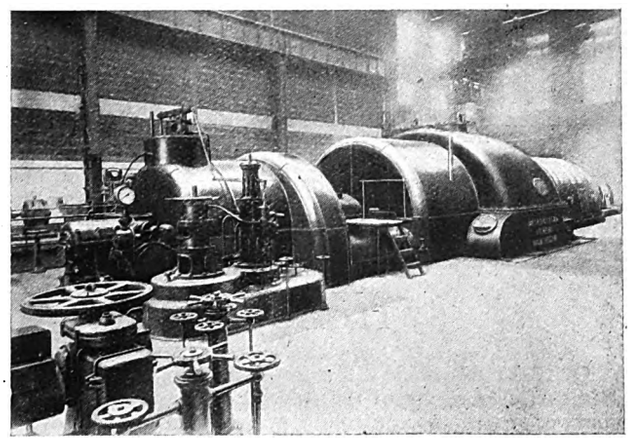
PROGRESS during the past year in the field of turbo-alternators has been particularly marked in the manufacture of the large 1 500 r.p.m. sets required for the new super power stations or extensions to existing large stations. One of the most interesting of these sets is the 50 000 kVA, 1 500 r.p.m., 6 600 V set installed in the Barton power station, Manchester, which is the largest set now in operation in this country. An interesting feature on this set—new in this country—is the provision of an auxiliary alternator mounted on an extension of the shaft end, and a double exciter which supplies current to the fields of the main alternator and auxiliary alternator from two independent armatures, which are assembled on the same shaft and mounted in a single yoke. The provision of a direct coupled auxiliary alternator supplying the current for the auxiliary motors appears to become a standard feature in large power stations. Another special feature on this set is the system of ventilation, which is partly by internal, and partly by two separate external motor driven fans. An exceedingly high efficiency at ordinary working loads is obtained by this arrangement, as one fan is shut down at 80% load, and both fans at lower loads.

Further interesting units under construction are the 62 500 kVA, 1 500 r.p.m., set for the Portishead station, Bristol, the 71 500 kVA, 1 500 r.p.m. set for the Clarence Dock station, Liverpool, and the two 80 000 kVA, 11 000 V sets for the new Battersea station of the London Power Co.

New Design Features.

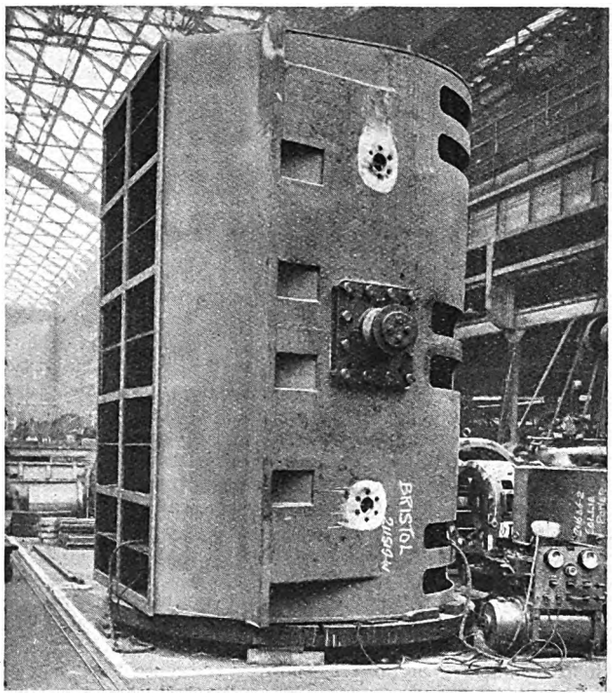
The latter sets are the largest being manufactured in this country, and some new features are incorporated in their design due to their exceptional size. The rotors exceed the maximum size desirable for one-unit forgings, and for this reason a three-part construction has been adopted, in which a hollow central cylinder and two shaft ends are assembled into one unit by means of shrink lines.

Progress in large 3 000 r.p.m. sets is marked by the 40 000 kVA single unit alternators for Battersea Borough Council, the 40 000 kVA, 10 500 V sets for the Victoria Falls Power Co., and the 37 500 kVA set for West Ham Corporation; the last-named set is of particular interest, due to the fact that it s designed for the particularly difficult conditions as regards armature reaction which are met with in two-phase machines.



The 50 000 kVA set installed at Barton power station.

An interesting feature is the continued successful operation of the 31 250 kVA, 3 000 r.p.m. alternator in the Brimsdown power station of the North Metropolitan Electric Supply Co. This set is designed for 33 000 V, and supplies current directly to the mains. It was placed in service in September, 1928. During recent years the importance of efficiency and the minimising of losses has received increased attention, and in the past year progress has been made in this respect by the more general introduction of non-magnetic high-tensile steel for the rotor end caps, and the resultant reduction in stray load losses in the inactive iron parts at the ends of the stator.



The stator for the new 62 500 kVA alternator for Bristol.

A considerable extension has taken place in the use of welded steel construction during the past year. Great advantages are obtained by the use of this construction to replace the large yoke castings, bedplates and stator end shields. The accompanying illustration shows the stator for the previously mentioned new 62 500 kVA alternator for Bristol. The reduction in weight due to the use of welded steel construction on this stator amounts to 17 tons. As a consequence it will be possible to manufacture and test the alternator completely in the manufacturers' works. Apart from the decreased weight the welded steel construction has the advantage of increased strength, elimination of defective castings, elimination of patterns, and reduced time of manufacture.

THE BOILER HOUSE.

By THOMAS ROLES, M.I.E.E.

IN so far as this country is concerned, the increase in size of generating units employed, and the demand for higher efficiencies, have resulted in considerable developments being made in connection with steam raising plant.

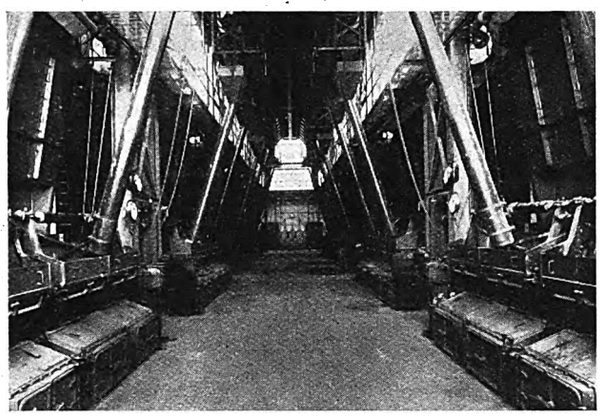
The tendency is still in the direction of higher steam pressures, chiefly of the order of from 300 to 500 lb. per sq. in. Little further development is indicated in the use of higher pressures than the latter figure. The very large boiler plant at the Synthetic Ammonia Co.'s works at Billingham-on-Tees, designed to operate at a pressure of 800 lb., has, however, been put into operation, and the erection of the 1 100 lb. boiler at

Digitized by Google

the Bradford Corporation's power station is now practically completed.

Final steam temperatures are not being increased to any extent above 750 or 800 deg. F., owing to added risk of failure when ordinary materials are used, and the high cost of special metals claimed to be suitable for higher temperatures.

On the whole, little departure has been made in the general design of the watertube boiler, apart from the development of the "Steam Generator," such as has been installed in the Brighton Corporation's Southwick power station.



View in the boiler house of Slacks Valley power station, which was formally opened on October 16th.

The tendency to increase the volume of the combustion chamber, which first became marked in connection with boilers constructed for use with pulverised fuel, has extended to boilers arranged to work in conjunction with various types of stokers. It is more and more becoming the practice to construct the boiler so that integral portions thereof enclose the furnace, rather than adhere to the practice adopted for so many years of surrounding the furnace with walls constructed of refractory material, the boiler itself forming only the roof of such furnace. As the cost of the renewal of refractories is one of the heaviest items in the boiler house maintenance bill, the aim of modern furnace design is to eliminate refractories as far as possible by the adoption of water-cooled walls of the "Murray Fin," "Bailey" or ordinary plain tube type. The additional tube surface thus exposed to the radiant heat of the furnace has greatly increased the rate of evaporation per unit of heating surface of boilers, thereby reducing their sizes for given outputs.

In some installations a portion of the furnace wall is made up of a radiant heat superheater, which under certain circumstances is preferred to, and in others used in conjunction with, a superheater of the interdeck type. The number of radiant heat superheaters in this country is increasing.

The Steaming Economiser.

The practice, which is becoming increasingly common, of raising the temperature of the boiler feed by means of stage heating, has limited the application of the ordinary type of economiser, which in some cases has been replaced entirely with the air heater. The steaming economiser has been developed to meet the new conditions, and where this is installed the boiler heating surface is consequently reduced. In the case of the steam generator mentioned, the steaming economiser is in reality an integral portion of the boiler.

Pulverised fuel firing continues to make progress, more particularly when effected on the direct or unit system. It has much to recommend it when applied to large boiler units, on the score of ease of application, flexibility in operation and high furnace efficiency, which can be obtained only with the water-cooled furnace and highly pre-heated air. Some trouble has been experienced in connection with a number of installations by reason of the amount of ash leaving the chimneys with the exit gases. Several methods of eliminating the ash from the gases have been evolved which are claimed to be effective.

The chain or travelling grate continues to be the stoker usually adopted for the firing of watertube boilers, although recently the retort type has made some headway, being regarded by some engineers as more suitable for large units. The latter type of stoker, which proved very successful in dealing with the coal used in power stations in the Eastern States of America, when introduced into this country a number of years ago, failed on the whole to give satisfaction with English and Scotch coals. It is now claimed that modifications have been made to certain makes of retort type stokers which render them at least as efficient and satisfactory as a chain grate stoker.

Modern chain grate stokers are practically all of the compartmental type, which has been developed owing to the use of balanced draught having become almost standard practice. There is perhaps some tendency to provide too many sections in the latest types of these stokers, and, taken on the whole, they suffer from the disadvantages of added complications, greater liability to failure, and difficulty to repair on account of inaccessibility.

Chain Grate Improvements.

Chain grates of improved design have been made in widths of 22 ft. and over. The suspended type of arch is necessary in connection with stokers over about 9 ft. in width, and in some cases water-cooling has been adopted to increase the life of the refractories of which the arch is built. Water boxes in the side walls have also been, with advantage, introduced to prevent the formation of clinker at the grate level.

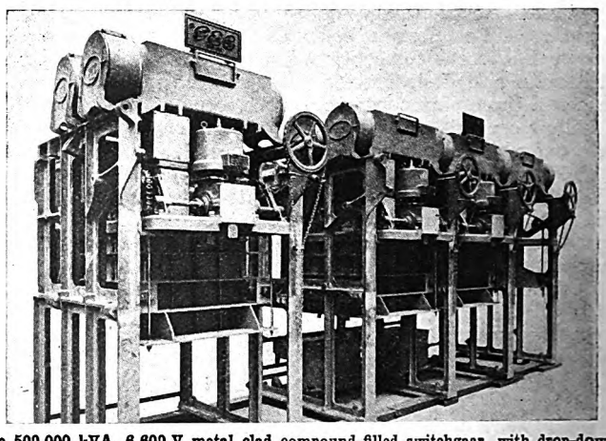
The temperature of pre-heated air which can be used in connection with chain grates is limited to approximately 350 deg. F., due to the tendency of the fuel to coke on entering the furnace, thereby retarding combustion, and increasing the ash-pit loss and maintenance costs.

Air at considerably higher temperatures can be employed with pulverised fuel firing, but the increased furnace temperature greatly reduces the life of refractories where such are used in connection with the furnace.

One method adopted in order to overcome this difficulty is the introduction of a small percentage of inert gas (flue gas) with the air for combustion. This, it is claimed, has been attended with beneficial results and improvement in furnace efficiency. In some of the latest stoker-fired plants heated air is being injected above the fuel bed for the purpose of increasing furnace efficiency and reducing the emission of smoke.

The possibilities of automatic combustion control, which is largely in use in the United States of America, continue to attract attention on this side, and several additional equipments are in the course of erection or contemplated.

It is becoming more than ever recognised that the use of evaporators for the supply of make-up, and deaerators for the removal of occluded gases from the feed water, is essential in a modern power station.



The 500 000 kVA, 6 600 V metal clad compound-filled switchgear, with drop-down isolation installed by Stockport Corporation.

As for the maintenance of efficient operation in the boiler house, reliable and robust instruments on each boiler have proved indispensable. Instrument makers have been giving much attention to such instruments, and their efforts have been attended with considerable success.

SWITCHGEAR.

By C. C. GARRARD, Ph.D., M.I.E.E.

A QUESTION which will arise in the mind of a close and impartial observer of the past year's development in the domain of switch and controlling gear is whether that development is the result of the intelligent application of scientific principles to an engineering problem, or a mere extension of rule-of-thumb methods. Consider, for example, the oil circuit breaker. The Central Electricity Board is at present installing some hundreds of gigantic oil reservoirs, each containing some thousands of gallons of oil, and passing under that name

Digitized by Google

but which differ little, except in size, from Ferranti's oil switch of thirty-five years ago. As was to be expected from reputable British manufacturers, these circuit breakers leave little to be desired in the way of strength and reliability, and in these respects they compare favourably with the products of any other country.

It is remarkable, however, that, speaking generally, no method of dealing with the rupturing of currents of large voltages and power has been evolved other than a mere increase of size of the circuit breaker.

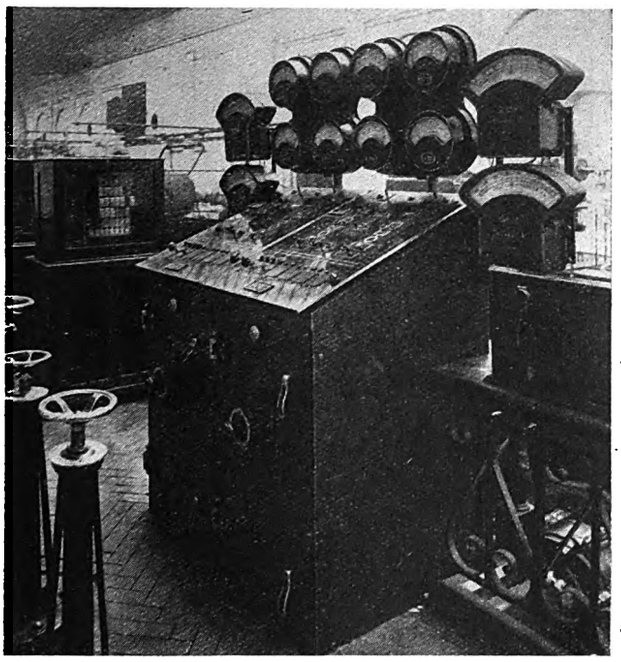
The varied designs of the respective manufacturers of the 132 000 V breakers indicate some unsolved problems, even with the apparatus as it stands to-day. Thus, circuit breakers having explosion pots are being supplied by some manufacturers, while others embody the multi-break; in some cases four breaks per phase are being used, in others six. Again, as regards bushes, various types are being installed, the paper tube condenser type being favoured by some, and the sub-divided oil-filled by others. The Central Electricity Board is in a unique position to obtain the experience which will show which is the best of these various forms of construction.

Porcelain Bushes.

As regards bushes, quite recently a new construction has appeared, made entirely of porcelain. This consists of a number of concentric tubes of porcelain fitting closely one inside the other, and fixed together by a special process. This type has not yet been used, however, in this country.

It is probable that it was a recognition of the need of some entirely different method of arc rupturing which caused the Electrical Research Association to attack that problem, as they did, from fundamentals. The wisdom of that action will, it is likely, soon be recognised. That other nations are alive to this also is shown by a recent publication of the A.E.G. describing their proposals to rupture a high tension arc by an air blast instead of its immersion in inflammable oil.

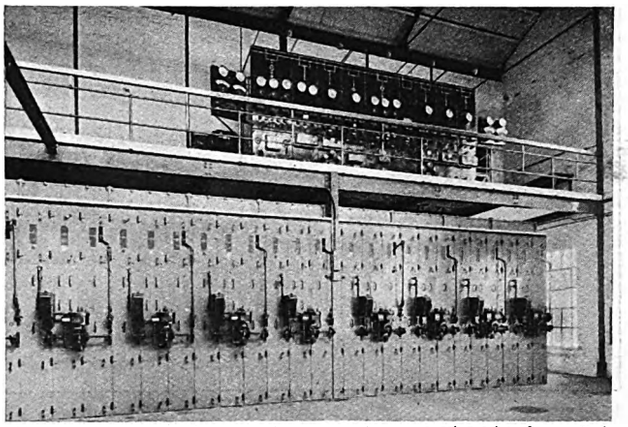
If we consider recent progress apart from the indications of radical departures just mentioned, the most marked development of indoor switchgear is the advance in the metal-clad construction. This has been applied up to 66 000 V with bus bar and other enclosures oil filled. This latter is an expensive one to build, and it will be interesting to see whether the results obtained will be better than those experienced with the indoor-open type adopted by the Central Electricity Board for their 66 000 V sub-stations in the London area. For voltages up to 33 000 V, however, metal clad compound (or oil) filled switchgear is at present the most used



A supervisory control board supplied to Southend-on-Sea Corporation for controlling two sub-stations.

system, although several large new power houses have been recently completed embodying switchboards of the cubicle design. It cannot be denied that this latter construction still has numbers of very competent defenders.

For the highest voltages, outdoor type switchgear has been adopted by the Central Electricity Board in this country and that is also the case in the Shannon scheme of the Irish Free State. This corresponds in general with the practice of other



11 000 V stonework cubicle switchgear with compound-filled busbars supplied for the Oxford Electric Light and Power Co.

countries, although in Germany there is a tendency to revert to indoor gear on account of deposits from the atmosphere on outdoor insulators.

Protective Gear.

During the past year there has been a considerable development of protective gear, chiefly in connection with overhead lines. Many improved methods of impedance protection have been evolved. What looks like being a new departure in this connection has been proposed by Carrothers and Kapp, who have suggested a differential system using a pilot wire incorporated within the overhead earth wire. Thus the advantages of pilot wire protection are obtained without the great expense of special pilot cables. An installation of this scheme is now in course of erection.

Supervisory control and carrier current communication over overhead lines have both made good progress during the past twelve months, and, in this regard, the carrier telephone system of the Shannon scheme may be mentioned. This development is of particular interest to switchgear engineers, as the extended use of differential protective gear using a carrier channel instead of a pilot cable is bound to come. In fact the work done in this country on this subject during the past year will, there is little doubt, lead to practical applications before very long.

TRANSFORMERS.

By H. W. BISKEBORN.

TECHNICAL progress in the problems met with in the manufacture of large transformers such as are being manufactured for the "Grid" has been the chief development in 1929. The largest units so far ordered in this country are the 80 000 kVA 3-phase units ordered this year for the Battersea station by the London Power Co.

It is too early to say that operating troubles have been avoided with the methods of manufacture and design that have been decided upon, but one point that has arisen recently from troubles experienced on the Continent, illustrates the necessity to design these large units with very low densities in the core.

It is interesting to note that specially treated wood is being increasingly used in this country for h.t. transformers. Experience definitely proves that treated wood is superior to bakelised paper and paper base materials. It is chemically stable, possesses greater mechanical strength, and has superior dielectric properties; an important feature is that, having a specific inductive capacity very near to that of oil, "tracking" is eliminated.

Tap Changing Devices.

During the year, considerable progress has been made with on-load tap changing gear. The equipping of transformers of such capacities as 5 000 and 10 000 kVA with on-load tap changing, is a relatively simple matter compared to the electrical and mechanical problems that are presented with the equipping of large, high voltage units, such as are being manufactured for the "Grid." It is interesting to note that there are three methods being used in this country:—

(1) The split winding method—where the tapped section

Digitized by Google

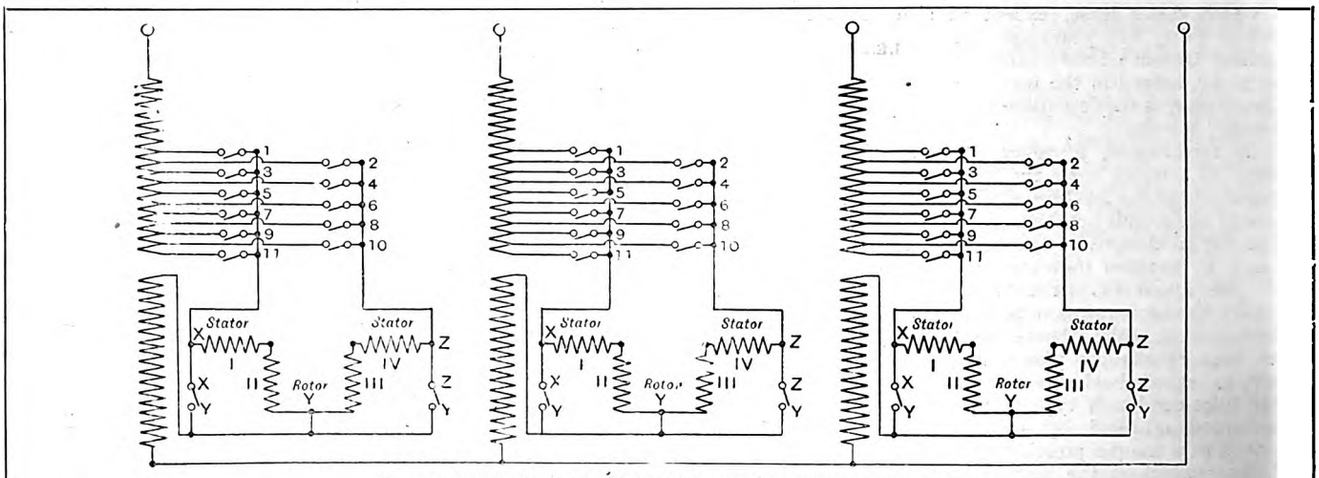


Diagram of connections of modified induction regulator tap changing members.

of the winding is wound in parallel sections, and the inherent reactance of the two windings usually provides the required reactance when changing to the next tapping.

(2) Tapped main winding with separate choke coil for carrying the load during the period of transition.

(3) Tapped main winding with a modified induction regulator for the transition. This method gives a gradual change from tapping to tapping, eliminating the sudden variation obtained with (1) and (2).

It will be extremely interesting to watch the development of the different systems, and to see if American operating experience is repeated in this country. The method most favoured in the States is system (2). System (3) proved to be too expensive, as a double wound induction regulator was used, and with high voltage units this necessitated stepdown transformers; quite a number of equipments of this type are operating very satisfactorily in the States.

In this country system (3) is being manufactured extensively by one company only—who hold patent rights for a method eliminating the stepdown transformers, and simplify the winding of the induction regulator. A number of the large units for the Central Electricity Board's schemes are being fitted with this type of gear, and four units are already operating on the North-Western "Grid."

In consequence of the "Grid" arrangement, the necessity for on-load voltage control is assuming such importance that it seems likely that in the near future, this gear will be a standard fitment to sub-station transformers. In the States there are certain operating companies who specify on-load control gear for all their units above a certain capacity.

An interesting development is being made by a German firm with a transformer having a movable core. The experiments that have been made with the first units have been satisfactory. This method also permits infinite variation between the limits.

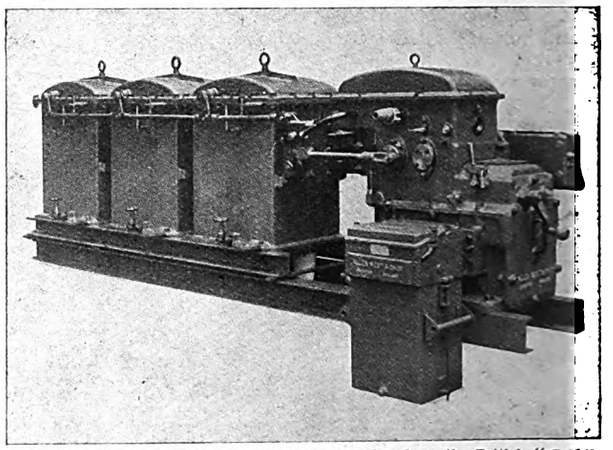
TRANSMISSION AND DISTRIBUTION.

By REGINALD O. KAPP, M.I.E.E.

DURING the year 53 consents* have been given by the Electricity Commissioners for the construction of transmission lines of major importance, apart from the consents for lines of minor importance. This figure is well in excess of that for preceding years, and is indicative of the increased activity in this field of engineering. Of these consents one half are for 33 kV lines and only 15% are for voltages below 33 kV, showing the tendency towards high transmission voltages. The remainder, about one third of the total consents, is for 66 kV and 132 kV transmission. Of the total consents about 64% are for overhead and 36% for underground lines, showing a marked tendency away from cables, and towards overhead transmission.

During the year the Electricity Commissioners' Grid Schemes for Mid-East and North-East England have been published, bringing the total number of schemes up to six, and covering all important districts except South-West England. For the first time in history 132 kV lines have been put into service in these islands. These form part of the Central Electricity Board's original transmission scheme in Scotland, where four lines are transmitting energy at this voltage. Three of them radiate from Dalmarnock generating station of Glasgow Corporation respectively to the Clydes Mill and Yoker stations of the Clyde Valley Co. and the Bonnybridge station of the Scottish Central Power Co. The fourth line in service interconnects Yoker with Greenock.

Manufacture has started during the year on oil-filled 66 kV and 132 kV cables for supplies in London. The latter are, apart from an experimental length in Italy, the first cables for this voltage to be manufactured in Europe. The year has seen marked increase in size and lowering of the cost and weight per kVA of transformers, and manufacture of 75 000 kVA three-phase transformers for 132 kV has been started. In spite of their large output these transformers are designed for road transport as well as for rail transport within the British loading gauge. They will each weigh approximately 147 tons complete, and 91 tons arranged for transport. Notable progress has been made in the design of gear for changing the voltage ratio of transformers under load, such gear being necessitated by the large voltage drops incurred when power



Another type of on-load tap changing gear employed on the British "Grid" system in 1929.

is transmitted over long distances by overhead lines. Similar progress must be recorded in the selective protection of transmission lines, both overhead and underground, to which many countries have contributed, but in which England appears now to play a leading part.

Less sensational than the very high voltage work, but of great importance, is the spade work done during the year towards facilitating rural electrification. Progress has been made in the standardisation of voltages and designs necessary to make supplies in thinly populated districts economically possible, and an intensively worked scheme has been adopted by Bedford Corporation for a district covering 100 square miles with 16 000 inhabitants and some 4 000 occupied dwellings. About 140 miles of 11 kV transmission line tapped by pole transformers varying in size from 5 to 50 kVA each are to be constructed in this district. Other municipalities have similar schemes under consideration.

* Since the time of writing this number has been increased.

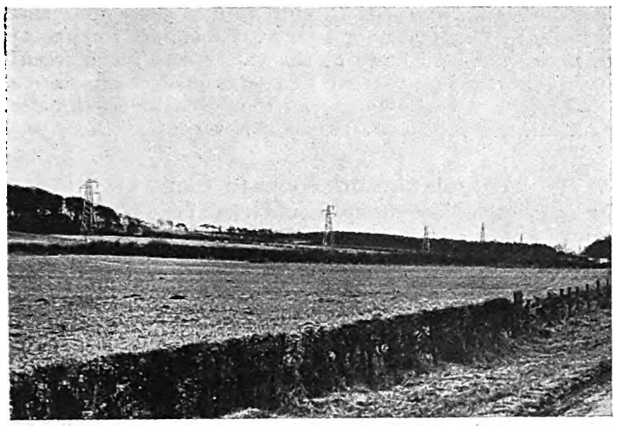
OVERHEAD POWER LINES.

By THEODORE RICH, A.M.I.E.E.

THE past year has been one of considerable activity for overhead lines. The absurd Press stunt on the subject of electricity costs in different areas has died down, and a clearer perspective is the result.



Portion of the "grid" single-circuit 132 000 V line between Yoker and Greenock.

The controversy regarding the "pylons" on the South Downs has done some harm to the overhead line movement, especially under a system by which an inspector of the Electricity Commission can act in a judicial capacity regarding the outcome of the policy of his own department, the undesirability of which system was pointed out repeatedly three years ago.

It is being grasped in many quarters that the problem of rural supplies is predominantly that of distribution, the cutting down of line costs; it is a pity that the cry of the interests of agriculture should be used as an excuse for overriding opposition to grid lines, even if misplaced, when those in authority well know that their influence in such matters is in most cases insignificant.

Some county councils still oppose overhead road crossings on the ground of danger, although the ratio of danger with them to cars or the public as compared to the public from over-speed cars, is infinitesimal; the matter becomes a *reductio ad absurdum.*

Concrete Poles.

The interest taken by Mr. Thomas regarding the use of home-made concrete posts for overhead line and telegraph work as an alternative to imported wood posts, shows that interest in problems relating to the development of home industry has to be shown, even by parties which have at times ignored such questions. Specifications demanding excessive resistance to torsion must tend to prevent the use of concrete for main transmission lines, although such use, with designs such as those to be seen in Italy, would tend to allay opposition on æsthetic grounds. The use at home of concrete for posts has now made a definite start, and for grid and other outdoor substation work its advantages are being recognised.

Regarding transmission at very high voltages, engineers at home seem to demand towers which will stand heavy torsion strains without material movement, and therefore pylons of

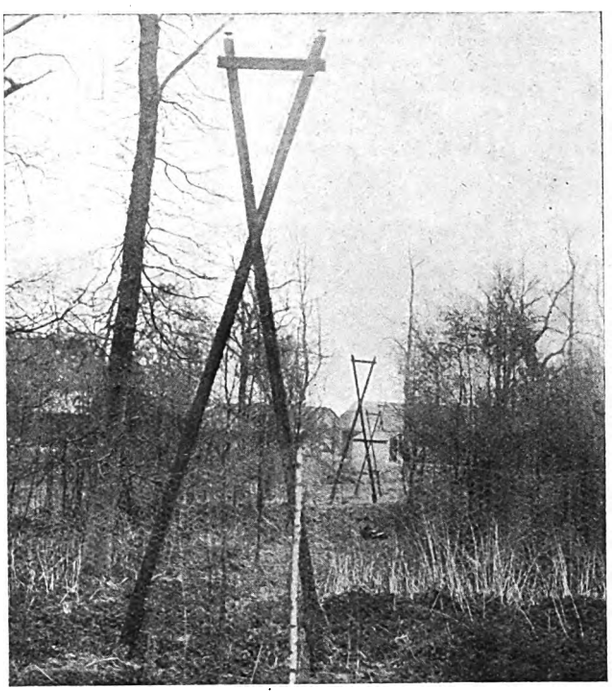
Another view on the Yoker-Greenock route, single-circuit 132 000 V line.

comparatively large base are used with heavy scantling. This tends to involve higher wayleave costs.

It is of interest that on the Continent many thousands of miles of line have been erected and run with success, with comparatively slender structures. In the case of a heavy shock, a material amount of flexibility reduces strains on fastenings and risks of line breakage. There is still a tendency to demand cross arms and pins of greater strength. Assuming a line breaks, then line fastenings will stand, thus making the line more expensive.

The development of bakelised wood cross arms abroad seems to confirm the views of Austin in the U.S.A. regarding the extra electric strains produced by grounded pins; the use of broad flange beam steel sections as posts for overhead lines or supports for railway conductors is of interest.

Regarding distribution lines, there is an increasing tendency



A novel "X"-pole line support used on an overhead line erected at Greater Felcourt during 1929.

towards the use of suspension insulators and jumpers at angles and terminals, a move in the right direction. The use of horn switches primarily as disconnecting links is increasing; the development of the Johnson and Phillips bomb fuse and switch is of interest.

H.T. Fuses.

It is being realised that for overhead line work apparatus must be simple, strong and weatherproof, and as cheap as possible consistent with such factors. The use of 11 000 V transmission is on the increase. Its flexibility, the result of its carrying capacity, is a great factor. It is now realised that simple apparatus can be adopted with it; h.t. fuses are now beginning to take the same place here regarding rural overhead lines as they do abroad.

The modification in regulations last year is a step in the right direction as tending to increase the operating radius of transformers.

The use of lightning dischargers has been abandoned to a large extent on both sides of the Atlantic, as being more risky than they are worth, although surge absorbers seem to be a more common-sense way of dealing with the problem. In France it is being realised that some areas are peculiarly liable to lightning troubles. In that country the question of the marking by lights of heavy transmission lines at night for the benefit of aircraft is receiving some attention.

WATER POWER PROJECTS.

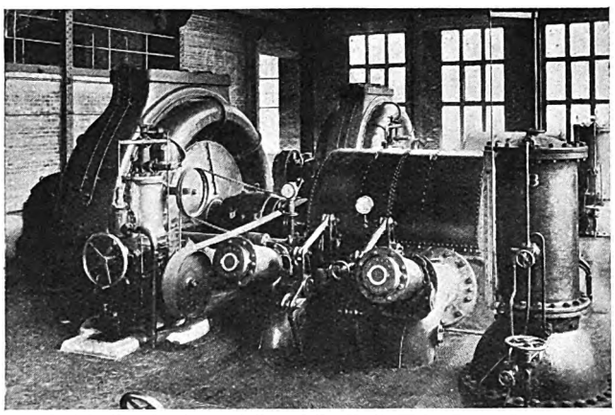
By F. JOHNSTONE TAYLOR.

SO far as Great Britain is concerned any notable progress in water power must of necessity be confined to mountainous districts with a heavy annual rainfall. Full advantage has been taken of these natural conditions by the North Wales Power Co., who now operate plants aggregating several thousand horse power, of which the latest and most modern is that at Maentwrog. Under the jurisdiction of this company

Digitized by Google

the power resources of this district have been well co-ordinated, and their interconnection with the steam station of the Mersey Power Co. at Runcorn is quite in accordance with modern ideas.

In Scotland the Lochaber scheme is a relatively ambitious undertaking where the power will be mainly utilised in the production of aluminium, but the natural conditions there may be regarded as almost ideal. That is to say the water for the most part is in lakes at considerable elevation above



Plant in the Maentwrog station of the North Wales Power Company.

the site of the power house, so that there is natural storage combined with a high working head. The principal works, therefore, apart from the power plant itself, lie in the shape of aqueducts to convey the water to the turbines, though in the present instance they involve a considerable amount of tunnelling. Yet, even then, such a scheme can be completed at a reasonable cost per kW installed, which is, in the majority of instances, a difficult matter with a low fall plant.

The *raison d'etre* for many such developments, such as those in Scandinavia, is the high cost of imported coal; then they are national undertakings, too. Similar conditions apply to some extent in the case of the much criticised Shannon scheme. It is the incidental works which become the heavy item, and principally because they must, apart from their being heavy works, be constructed to suit the ultimate capacity of the station, and a demand for this amount of power in the Free State is certainly not yet foreseen. If it cannot yet be regarded as a financially sound undertaking, it is certainly a well engineered one, but whether it will provide really cheap electricity without being subsidised by the taxpayer, remains to be seen. The turbines, built by the firms of Escher Wyss and J. M. Voith which develop 38 000 H.P. on a head of 27 ft. at 150 r.p.m. are of the vertical Francis type, as associated principally with American practice. While very efficient this is a relatively costly type of machine, and for low fall work European engineers are showing a preference for the propeller type.

While participating of the general features of the Francis, propeller type runners, those of the Lawaczeck or fixed blade class are certainly much simpler and cheaper. This is an important matter in itself, and when it is remembered that on variable falls—and low falls are prone to such variation—this type of turbine shows a better all round efficiency than the Francis, its value becomes evident. For "river" developments they are generally a very good proposition. Such schemes are comparatively rare in these islands, though the Lanarkshire Hydro Electric Co.'s plants at Bonnington and Stonebyres on the Clyde are worthy of mention.

These have falls of 189 ft at Bonnington and 97 ft. at Stonebyres, and the turbines, which are of the vertical Francis type, develop 4 000 H.P. and 7 000 H.P. respectively at a speed of 375 r.p.m. These works, which are orthodox in their general lay-out, have one or two interesting features, amongst which may be mentioned automatic tilting weirs for the control of the water.

Pelton Wheels.

High head plants of the class seen at Maentwrog are, as might be inferred, usually equipped with Pelton wheels, a comparatively simple type of turbine, which is compact and runs at high speed. Its efficiency is high, but the virtues of the high head Francis turbine must not be lost sight of. In one or two instances vertical shaft turbines of this class have been installed for very high heads, notably the 25 000 H.P. sets operating at 810 ft. head at the Kern River plant, California, and 17 500 H.P. sets recently installed by Messrs. Escher Wyss at Oslo, Norway, which work under no less than 950 ft. Such conditions call for rather special construction, such as cast steel casings, but the turbines show a high efficiency, usually higher than a Pelton under similar conditions, though the principal criterion in the case of a high power high head unit is one of cost, in which the Francis type shows up distinctly favourably, and when it is built with a horizontal shaft, preferably with an overhung runner, it combines compactness with simplicity. Turbines of this latter class were recently built by the English Electric Co—who incidentally were responsible for the Clyde plant—for the Sorocaba development, Brazil, and they develop 25 000 H.P. on a head of 650 ft. at 670 r.p.m.

Automatic and Remote Control.

In concluding, attention should also be directed to the progress which is being made, principally in America, with automatic and remotely controlled plants. When the available power from a whole watershed is being considered, there may be one or two instances where a few hundred H.P. could well be obtained from a subsidiary plant located some distance from the main station. Its value from a commercial standpoint may well turn upon the operating costs. It is then that automatic equipment and remote control at the main station proves of considerable value. The equipment, which is mainly electrical, has been virtually perfected of recent years, principally by the Westinghouse Co. of America and Messrs. Brown-Boveri and Escher Wyss in Europe. It comprises in the main an electrically operated gate system on the turbine, which is controlled by a float switch under the influence of the head water level, or is under the direct control of the operator at the main station as the case may be. Then with a special arrangement of synchronising equipment is combined a series of relays and automatic cut-outs. These come into operation if any abnormal condition such as a hot bearing, failure of excitation or loss of pressure in the governing system should become evident in the automatic station. They shut down the turbine, and in this condition it remains until it is visited, inspected, put right, and the relays, etc., are re-set.

ELECTRO-FARMING.

By R. BORLASE MATTHEWS, Wh.Ex., A.M.Inst.C.E., M.I.E.E., F.R.Ae.S.

THE present position of electro-farming in Great Britain is that 56 electricity supply undertakings have over 2 500 farmer customers, while some 600 other farmers have installed their own generating plants. It is to be regretted, however, that this means that this country has more farms and country residences out of reach of public mains than any other in Europe!

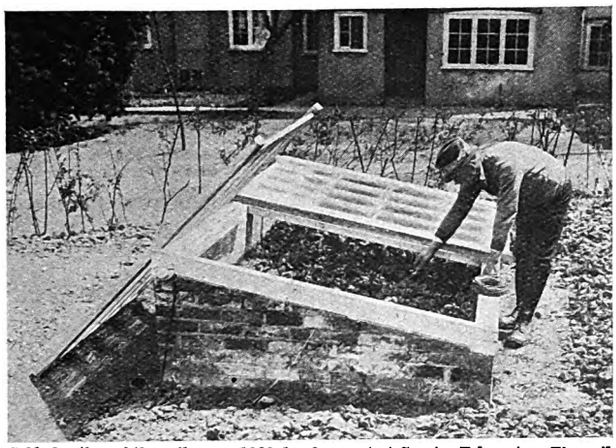
Nevertheless, supply undertakings on the whole are progressing to a more complete understanding of the agricultural problem. A number of undertakings now employ special agricultural representatives, and the Newcastle Electric Supply Co. has opened a special department to deal with the electrification of the rural areas, one of the first activities of which has been the display of electro-farming equipment at the North East Coast Exhibition where also the E.D.A. "Country Currents" cinema film proved a popular attraction.

Following the now regular practice, the Harrogate Electricity Department arranged for the provision of an electricity supply at the 1929 show of the Royal Agricultural Society of England, and themselves demonstrated the applications of electricity to agriculture on their stand. The South Wales Power Co. has done similar demonstration work at a number of agricultural shows from the highly efficient platform of a well-equipped demonstration van, which is to enliven the South Wales countryside by lecture tours this winter.

A Special Order was granted to a private enterprise in April last (subject to confirmation by Parliament) for the rural electrification of 1 249 square miles in Lincolnshire. This scheme was promoted, not only as a commercial enterprise, but also to demonstrate the great possibilities of electrifying the countryside. An extension of this Special Order to cover an additional 584 square miles in Leicestershire, Rutlandshire, Northamptonshire and the Soke of Peterborough is the object of a second application now before the Electricity Commissioners, as the total will make a more economic rural area. This has been followed by the focussing of attention on the Government's rural electrification experimental area in Bedfordshire, upon which work is expected to commence some time next year.

Digitized by Google

The Report of the Conference on Electricity Supply in Rural Areas, which was convened in 1928 by the Electricity Commission, is still in extensive use as a reference book. A further meeting of this Conference was held this summer, and another session will be held early next year when further data will be available to be put before the members of the Conference. Another activity of the Electricity Commissioners, closely connected with rural electrification, is their issue of suggestions for a standard wayleave agreement form, a subject which has also been gone into extensively and thoroughly by the Overhead Lines Association, who believe the form suggested by the Commissioners to be unduly compl-i cated and drawn up without proper regard to the best interests of tenants or of the undertakers. During the year the Electricity Commission has also appointed Committees for looking into tariffs, assisted wiring and hire purchase of apparatus, particularly with regard to facilitating supplies in rural areas.

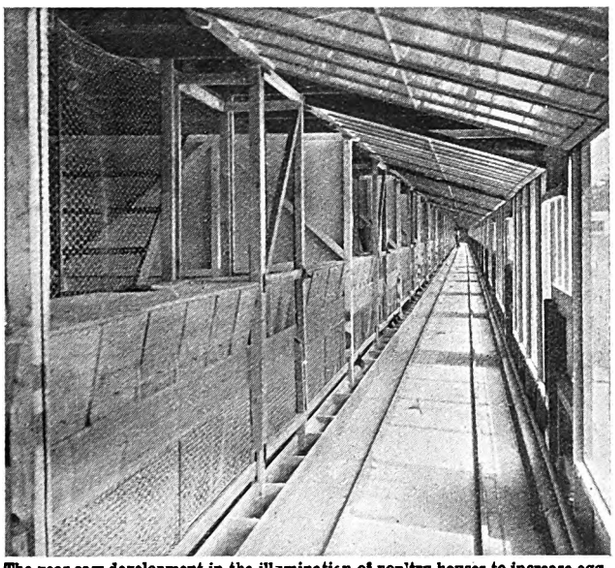


Cable heating of the soil was a 1929 development at Greater Felcourt. The coil on the side of the frame is placed there to show the type of cable which is buried beneath the soil of the frame.

The manufacturing tendencies of the year have been towards compactness and simplification in design, as witness the three different kinds of portable milking sheds on view at the Royal Show. One was fitted with dynamos for lighting and electric refrigerators for milk cooling.

An impetus is to be given to electric ploughing by the inclusion in the 1930 tests of the Royal Agricultural Society of electric ploughs at their tractor trials. Two electric ploughs were constructed in this country during the past year.

Unusual applications of electricity to agricultural operations have cropped up; for instance, much interest is being taken in the applications of ultra-violet rays to stock, particularly race-horses; keen growers of orchids have installed electric lighting in their hothouses, and widely displayed interest in soil heating for market garden frames, and the employment of so-called earth current apparatus has been a noticeable feature of the year.



The year saw development in the illumination of poultry houses to increase egg production. The pens shown here are electrically lighted, and food, etc., is brought to the pens by a battery-driven train.

TELEPHONY.

By P. E. ERIKSON, M.I.E.E.

IN the following brief survey, it has not been possible to give precise figures in every case, as at the time of going to press such figures are not available. The details given, however, are based upon the progress made to date, and such additions as are confidently expected.

National Development.—The number of subscribers' stations owned and maintained by the British Post Office at the beginning of the year was 1 727 680, and at the end of six months a net addition of over 59 000 telephones had been made. Figures to hand show that over 125 000 subscribers' stations (net) will be added during the year.

To provide for these subscribers' stations, and the resulting increase in traffic, a vast quantity of line material and exchange equipment has been installed over the same period. The line material is mostly underground, and includes over 2 260 miles of new subscribers' loop and junction cables, about 450 miles of new long distance underground cables and about 150 miles of submarine cable. These represent upwards of 516 000, 75 000 and 1 500 miles of conductors respectively. The telephone exchange equipment includes extensions to existing manual and automatic exchanges amounting to provision for, say, 10 000 additional lines, and the installation of approximately 30 new manual exchanges and 40 new automatic exchanges. The new manual exchanges provide for the handling of about 25 000 lines, whilst the new automatic exchanges provide for approximately 100 000 lines.

One of the new hand sets introduced in 1929 as an alternative to the pedestal type. The set illustrated is the "Neophone": for use with separate bell set.

The rate of progress indicated by the foregoing is such that one new public exchange, and about 1 000 new telephones are being installed for each working day throughout the year. The latter figure includes replacements.

In the London area conversion to automatic working has progressed satisfactorily, 15 of the foregoing new automatic exchanges being completed in this area alone during1929.

Of the 12 next largest towns in Great Britain, 5 have now been completely converted, and 4 more are well under way.

An Important Development.

An important development planned during 1928, and put into operation during 1929, is the installation of rural automatic exchanges. Some 90 exchanges have been installed, thus providing day and night service to outlying subscribers who could otherwise have had either no service at all, or only limited day working. Rural automatic exchanges are being installed when a minimum of eight subscribers is forthcoming.

The amplification and extension of the underground long distance network has been carried forward to meet traffic demands, the most outstanding feature during this year being the linking up of the Isle of Man with both England and Ireland by means of a submarine cable.

International connections have been extended, as far as the development on the Continent would permit. Many new districts have been added in countries to which communication was already established, particularly in Italy, where a recent installation of a carrier system provides three additional telephone channels over an existing open wire line, and has furnished the necessary circuits to make this possible. Both Poland and Finland have been brought into communication during the year. It is now possible to establish communication from any telephone in this country to nearly 90% of the telephone stations of the world.

Development in Design.—An outstanding example of design

Digitized by Google

development during the year is the introduction of the new hand set as an alternative to the familiar pedestal pattern telephone. The new instrument is largely the result of modern research, particularly in the field of speech transmission, which has made rapid strides during the last few years. Hand set telephones have been in use on the Continent for many years, but the transmission characteristics of these have been markedly inferior to those of the pedestal type, whilst the new hand set has superior characteristics.

Research work by the British Post Office and the leading manufacturers has been very active, notably in the study of speech transmission using the Transmission Reference Standard, presented by the American Telephone and Telegraph Co. to the Comité Consultatif International des Communications Téléphoniques à Grande Distance, and installed in Paris. Much work has also been done in an endeavour to perfect telephone channels over submarine cables using a carrier wave above the voice frequencies, particularly with a view to an increase of communications over the various submarine cables between this country and the Continent.

Ship-to-Shore Experiments.

Ship-to-shore experiments by radio telephony were carried out with the "Berengaria" when on her way to England, and, at the time of the experiments, about 1 000 miles out from New York. Successful two-way conversations were established by engineers of the International Telephone and Telegraph Corporation, and we can confidently look forward to the possibility of the international long distance network being extended to liners at sea throughout their voyage.

In his presidential address before the Institution of Electrical Engineers, Col. Sir Thomas Purves gave a demonstration of the important part which telephony can play in the linking up of large assemblies distributed throughout the country, and it would be fitting to mention this in conclusion, as indicative of a new field of usefulness to which the telephone network can be put. Upon this occasion the nine I.E.E. local centres were all in communication with London, so that the proceedings at any of the ten meetings could be heard by all the others. At the conclusion of the address, Manchester proposed and Glasgow seconded, the vote of thanks to the President.

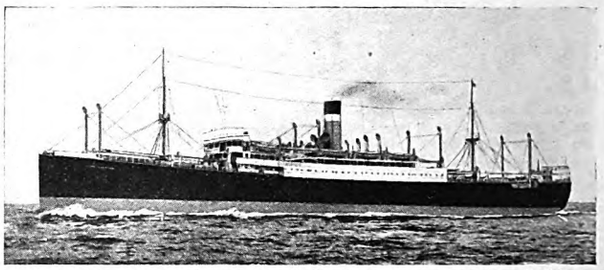
MARINE ELECTRICITY.

By A. C. HARDY, B.Sc., F.R.G.S., A.M.I.Mar.E.

A GREATER attention given to electric propulsion in this country than has ever been the case before, an improvement in the technique of auxiliary electrical machinery on board ship, a definite recognition of the possibilities of storage batteries for standby purposes and for use in conjunction with Diesel generators to ease peak loads, the placing in service of a large turbo-electric passenger liner, the placing of an order for two electric tankers and an electric cement carrier with Diesel-electric propulsion; these are events sufficiently important to justify the statement that the year 1929 has been a "banner" year for the marine side of the industry.

The "Viceroy of India" was the first big all-electric ship to be constructed in this country and she has a total power of about 17 000 H.P. on twin shafts. Her economy of operation has been well proved by the fact that she is able to maintain her scheduled speed from London to Bombay with complete ease, running part of the way on one of her two turbo-alternators. In view of her size, power and speed (some 16 knots in service and 17 knots when necessary) it might have been said with justification that the "Viceroy of India" was somewhat of a step in the dark. Almost a year's operation has proved that any criticism of this nature that might have been put forward was entirely unfounded. Not only has the "Viceroy of India" proved extremely successful in service, but also she has gone through what practically no other ship with an entirely new type of machinery could go through unless her owners were entirely satisfied with the reliability of their vessel's machinery. After one voyage in the London-Bombay mail service, she was immediately taken off this service and put on to a rigorous schedule of summer cruising with never more than 24 hours in port after each cruise, and with only one week at Tilbury between the termination of her last cruise and the beginning of her second voyage in a particularly arduous service.

This in itself, in addition to the fact that large electrically propelled passengers liners have been regularly and successfully operating between New Zealand and San Francisco *via* Panama, should be sufficient indication, even to the most pessimistic, that marine electricity has come, not only to stay, but within the next few years, considerably to develop.



The "City of Hong Kong," one of the first vessels to employ electric "supercharging."

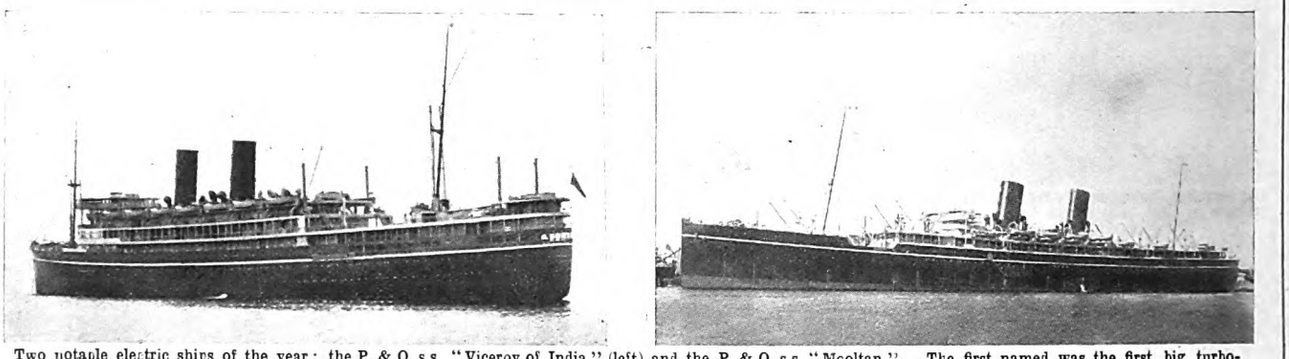
For it is not only in connection with main propulsion that development is taking place. We have got also to consider the myriad auxiliary duties for which its use is increasing on shipboard, in connection with Diesel engine generators where current can be generated and used for such a ridiculously low price per unit that it can be applied readily and quickly to almost every service that can be thought of on shipboard, from cooking to cable handling, from steering to sanitary pumps, from heating to haulage.

The storage battery is as auxiliary to the generating set as the generating set is to the power requirements of the ship. Several companies have been displaying considerable energy during the past 12 months in marketing to the marine industry, and it is now realised that the storage battery is not merely a means of getting standby power in emergencies, but a real live prime mover.

"Electric Supercharge."

One of the most constructive phases of development, too, has been electric "supercharge" or the use of an exhaust steam turbo-generator to boost the total shaft horsepower, and hence the mean speed, to a point of advantage, and at practically negligible cost in fuel consumption and a definite reduction in steam consumption.

Two ships, the passenger liners "City of Hong Kong" and "Mooltan" were converted to this type of propulsion this year by the Metropolitan-Vickers and the British Thomson-Houston Co.'s respectively, and are now in service. Other ships are in course of conversion, and the system may easily



Two notable electric ships of the year: the P. & O. s.s. "Viceroy of India" (left) and the P. & O. s.s. "Mooltan." The first named was the first big turbo-electric ship to be constructed in this country and the "Mooltan" is a recent conversion.

Two views of British overhead equipment supplied in 1929 for the electrification of the Great Indian Peninsula Railway.

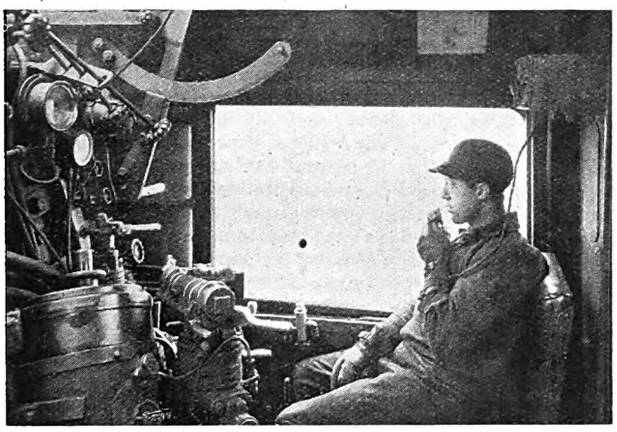
be regarded as one of the most important marine electrical developments of the year.

Finally, it is interesting to record a general awakening of interest on the part of many electrical firms of repute to the potentialities of the marine market.

RAILWAY ELECTRIFICATION.

By J. G. B. SAMS, A.M.Inst.M.E., M.Inst.Loco.E.

THIS has been a fairly progressive year for railway electrification. Perhaps the occurrence of most import with respect to the future is the appointment of a Government Committee under the chairmanship of Lord Weir, to examine the economic and other aspects of the electrification of the British railway systems, with particular reference to main lines; one would like to add: in the suburban area of Sir Ralph Wedgwood's own



Communication between the driver and guard by radio-telephony was a development introduced on the New York Central.

railway, which seems to be as far off electrification as ever, in spite of the increasing need.

Dealing with actual installations in hand, the most interesting is that of the Manchester, South Junction and Altrincham Railway (jointly owned by the L.M.S. and L.N.E. Railways), a short length of residential railway in Cheshire, whose conversion to 1 500 V d.c. working, with overhead transmission was announced in April; at the time of writing, completion is expected about September, 1930. The rolling-stock is to be of three or six-car trains in three-car units.

Balancing the above is the fact that the last a.c. overhead system train of the Southern Railway ran to Coulsdon on September 21st, all the Southern suburban lines being now 600 V d.c. third rail. It may be hoped that the Government Committee will include in its Report a pronouncement as to which system is to become standard, as it is certain that sooner or later we shall find that we cannot have both.

The Southern, surely the most progressive group of all, has the following extensions in hand: Sutton and Wimbledon, Hounslow and Windsor, Dartford and Gravesend and West Croydon and Wimbledon; the first is a new railway which was partially opened in September, the next two are short extensions, and the last is a complete branch; probably a reply to the Underground's extension to Morden. A really interesting announcement was made in September, that it was intended to convert the main line to Brighton and Worthing, together with the branch from Red Hill to Guildford, in response to the Government's remission of the Passenger Duty, the capitalised sum of which was to be expended on railway improvement.

Proposals for electrification under the Government assistance arrangement include the Wirral division of the L.M.S. and the extension of the London Underground from Finsbury Park to Cockfosters, and from Hammersmith to Northfields. Previous to this—off their own bat as it were—the L.M.S. had decided to extend their existing electrification from Barking to Dagenham; it is now said that this extension is to be continued, under the assistance arrangement, to Upminster. However, work on the former section does not yet seem to have been commenced. Looking at the question generally, an outstanding need is apparent for the immediate conversion of all suburban railways, as the steam engine has undoubtedly outlived its usefulness, and ought to be withdrawn.

INSULATING MATERIALS.

By A. R. DUNTON, A.M.I.E.E.

THERE is at the present time a pronounced feeling of unrest among insulation engineers due to a strong desire for super-insulation—some new material or combination of materials which would fulfil the essential requirements for a wide range of applications, but chiefly for high voltage work in air, such as transformer and switchgear bushings and the slot conductors of large generators.

Despite constant efforts for improvement, the insulating materials for such work have shown no radical improvement for some time. With the materials available the insulation of alternator slot conductors has been reduced to a fine art, in which the use of mica predominates, but there remains a need for a much better bonder to maintain the close adhesion of the mica laminæ between themselves, and to the conductors, after prolonged periods of severe service conditions. The most important advance in this work is probably the use of superfine woven asbestos applied to the conductors in conjunction with synthetic resin, forming a rigid, heat-resisting base over which the usual mica wrap is applied by pressure and heat.

If it were possible to proceed a stage further, and substitute for the varnish-bonded mica wrap a cell consisting of a material of great electric strength, and unaffected by high temperatures, a striking development would be achieved. An interesting material which constitutes an attempt to meet this need is a mica lead-borate compound now manufactured in Germany after original trial development in this country, and known as Micalex. Unfortunately, the material as at present available apparently requires a moulding temperature of about 400 deg. C. This makes its use very difficult, but, on the other hand, tends to give an insulation capable of service at temperatures far in excess of those at present permitted. The test results on the material are very interesting, and suggest that the problem of the application of some such material is worth serious study.

Use of Oxide Films.

Another material deserving consideration is the oxide film produced on aluminium by suitable processes. Although the actual oxide film may be only half a mil in thickness it seems quite capable of withstanding more than 100 V. Formed as an insulating film on aluminium conductors, or applied as a ribbon or strip of oxidised aluminium between conductors of copper, such insulation has met with a fair degree of success for separating the turns of field coils. A very important feature of aluminium oxide insulation is its excellent heat conductivity, which approaches that of metals.

Digitized by Google

In synthetic resin products, both laminated and moulded, there has been considerable activity, but it is disappointing to note the similarity of the products and the lack of technical improvement comparable with the remarkable improvements that have been made in appearance. The colours and finish of some of the moulded materials are exquisite.

With regard to insulation for service under oil, the most marked advance is in the production of high quality press-boards, of which a typical example is the material known as

A new type of electric run-about for invalids introduced in 1929.

Elephantide. The remarkable development of this material, brought about by research and the scientific selection of materials, has recently been described in THE ELECTRICIAN. Once despised, it has now acquired remarkable electric strength and ageing properties, and occupies a position of great importance in high voltage transformer construction.

In conductor insulation for oil-immersed work the most notable advance is in paper, another development which has been recently described in these columns. It is now possible to obtain wires down to 0·0048 in. diameter with paper insulation even less in radial thickness than d.c.c. Another feature of improvement is the fact that such fine wires can be bent double without revealing the copper conductor through failure of the insulation.

Compounds and Filling Mediums.

With the now extensive use of iron-clad switchgear the question of compounds and filling mediums assumes considerable im ortance. Refinements in manufacture of these materials are now producing more consistent results, but difficult problems still face the design engineer who has to provide for extremes of temperature, not only in service but also in shipment to site. If a compound is too soft it may flow too readily at high temperatures; if it is too hard it may crack or pull away at low temperatures. Oil is used as a filler in some instances, but plant involving its use has to be specially constructed to prevent leakage. This extra difficulty is compensated for to some extent by the fact that oil has a less steep temperature-voltage curve than most compounds. The influence of temperature on the electric strength of most filling compounds is more serious than is usually appreciated.

For the insulation of busbars and contact carrying mechanisms there seems a possibility of developing some of the new cellulose acetate products made in the form of films, sheets or tubes. The electric strength of some of these materials is excellent, but unfortunately the softening point is rather low, usually about 70 to 80 deg. C. There are, however, a number of these products now being manufactured, amongst which should be found some material capable of improvement so as to have a melting point not lower than 90 deg. C., which is about the minimum permissible for service.

STORAGE BATTERIES.

By L. W. de GRAVE.

THE year 1929 has not shown any startling developments in storage batteries, nor further activities in comparatively recent innovations.

The tendency towards the home manufacture of previously imported batteries is a step in the right direction, and should result in economy to the consumer; if not in price, at all events, in service.

The demand for wireless batteries is still well marked, the discarding of the multiple cell container being perhaps a foregone conclusion. Whilst the reduction in consumption due to greater efficiency in radio valves has created a demand for miniature cells, the demand for super cells has also increased, and shows signs of still further growth for power station and submarine use.

There are, however, two spheres where the intermediate sized cell is experiencing a growing demand. The motor car industry has for many years been a prolific market for lighting and starting batteries, but now, with the increased use of the roads for passenger traffic and the general adoption of electric starting on buses, a largely increased capacity of cell is required, reaching a figure which until recently would have been considered enormous; the general size being now 180 to 200 Ah with a tendency towards a further increase, for on the long distance vehicles doing return journeys, even this size battery requires a spare.

In railway train lighting an increased demand has been felt, as companies are converting their old gas-lighted stock, more restaurant cars are being put into service, and as many of these are being equipped with electric cookers, a considerably larger cell is required, 400 Ah not being an excessive unit for this work.

The demand for traction cells for road work is increasing slowly due to the fact that many potential users await a radical reduction in weight. Steps in that direction are represented by the thin lead plate and the improved Iron-Nickel-Cadmium cells.

The use of batteries for haulage work, such as locomotives for shunting and yard work, has increased at quite a reasonable pace. Train and vehicle lighting, once considered the perquisite of the lead cell, is now challenged on equal terms by the Nickel-Iron and Iron-Nickel-Cadmium batteries. The latter especially has reduced size below that of the lead cell, with a further reduction in weight, and there is no doubt that the inherent strength and capacity-retaining qualities of this type of cell will eventually be strongly competitive with the lead cell.

ELECTRIC BATTERY VEHICLES.

By RAYMOND J. MITCHELL.

IN spite of the almost complete apathy of the electrical engineer—and in particular the station engineer—towards electric vehicles, the type continues to receive painstaking study by a few persevering firms, and progress in design, scope of application and performance can therefore be recorded. It is—to put the case mildly—surprising that a machine which is potentially one of the most important load builders that has ever presented itself to the attention of the station engineer should be so studiously ignored by him. And that, in some cases, American petrol vans should be employed where British-built electrics could be used for general service utility in connection with central station transport duties, is not merely a reflection on the business acumen of those permitting such misuse of public capital, but is also a proof of sheer laziness on the part of many responsible engineers who ought to be better informed in regard to the possible applications of

A 1929 model one-ton electric vehicle in use for suburban milk delivery.

electric vehicles in their own service, and in that of their numerous customers who employ transport equipment operating in city areas.

A one-ton electric van will consume anything up to 150 kWh per week if kept busy on delivery work. This energy is all taken in dead off-peak night periods, and could be sold

Digitized by Google

justifiably at a fraction over coal cost. A fleet of 1 000 vehicles in a city of 200 000 population would require 20 000 kWh per night on a moderate basis of calculation: surely a load worth making efforts to cultivate, even though, admittedly, considerable effort would be required to overtake the lead which the push and energy of the petrol interests have gained for them in the field of road transport.

No thoughtful engineer who will ascertain the facts about electrics can gainsay that their extensive use in city areas would solve the problem of horse obstruction, quieten the traffic,

A two-ton low loader for refuse collection, showing operation of the patented anti-dust flaps.

abolish fumes, increase street safety, speed up the traffic flow, and very measurably improve the load factor of the supply system, without increasing appreciably the capital costs on mains or plant.

The outstanding event in the British electric vehicle industry for the year 1929 is the progress in developing the light electric van. These machines are already in use for bread and milk delivery, ideal applications where super cleanliness is vitally important, and easily provided by battery driven vehicles. Even the Post Office has at last decided to try out electrics, and may be expected, one hopes, not to use so many Ford vans in future for jobs which years ago could have been performed by battery traction.

In the following notes are described a number of original and progressive designs of electric vehicles which have been produced during the past year.

THE ELECTRICAR ONE-TON ELECTRIC VAN.—This vehicle incorporates the most advanced practice of automobile design in regard to layout, suspension, steering and braking, whilst being in no sense merely an adaptation of petrol vehicle design. The frame is a pressed steel structure, amply cross membered, and downswept in front to facilitate the driver's entrance and exit—a very important point on delivery work where stops are frequent and time is vital. Transmission is by worm gear via cardan shaft from a duct ventilated ball bearing series-wound traction motor possessing generous overload capacity to deal with hill climbing. Bishop cam and roller steering gear, compensated internal twin brakes, disc wheels, oversize pneumatic tyres and a drum controller of extreme simplicity ensure that the chassis is as nearly driver-proof as any road vehicle could be. The battery is carried in a handsome looking bonnet provided with an easily removable lid. Either 25 cell or 40 cell arrangements are standardised, depending on the nature of the service required, speed, number of stops, and mileage. For example, with an equipment of 25 cells D.P. type K.C. 15, a mileage of 47 with half load may be run without stops, or 28 miles with 160 stops, the speed being from 12 to 13 m.p.h. *average*. This is more than twice the speed of a horse on similar duty, and twice the effective daily mileage which it maintains. A weight of only 35·5 cwt. for the complete van-bodied vehicle enables the tax of £6 to be available. Insurance of this type costs only £7 per annum.

Municipal Equipment.

THE ELECTRICAR TWO AND THREE-TON LOW-LOADER.—This is a specially designed vehicle for municipal use in refuse collection. The general layout will be apparent from the illustration above. In these vehicles the frame has reinforced ash side members with tubular steel cross members. Worm transmission is employed, with dual rear brakes. Battery location is provided in panniers each side of the frame members. An oil immersed drum-type controller gives three forward and reverse speeds. A very simple twin screw tipping gear is provided to discharge the contents of the steel body at the dump. This gear is electrically operated, and provided with automatic stop gear at each end of the screw travel. The most interesting design feature of the vehicle is the dust-preventing automatic flap which opens when a bin is being emptied into the body, and shuts automatically when the loader's foot is removed from a stirrup bar. A speed of 12 m.p.h. when free running is maintained by a battery equipment varying according to service required.

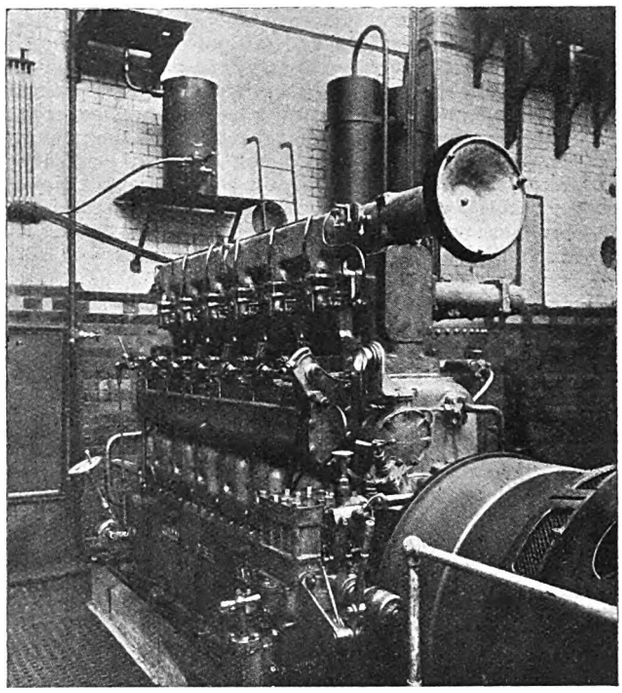
THE MURPHY-STANLEY INVALIDS' ELECTRIC RUNABOUT.—In this little car a successful attempt has been made to give the invalid a small car which will go anywhere where there is a road, and which will run at a safe yet useful speed for a considerable mileage. A tubular frame supports a very comfortable seat hung on cee springs; also a crate to contain the batteries. The rear axle is a miniature automobile worm driven affair, totally enclosed and driven by a series motor positively aligned with the worm tail shaft. All bearings are of the ball type. Three brakes are provided, one being electric in two stages for emergency. The tiller steering handle also controls the drum-type speed regulator and electric braking. Weight has been cut down to an absolute minimum, being about 400 lb. for the complete car fully equipped. A speed of 8 m.p.h. is standard, but a higher speed can be given if required. Mileage per charge varies from 40 to 75, according to battery equipment. Gradients up to 1 in 3 can be climbed with perfect certainty and safety. A voltmeter is provided, also side and rear lamps. The tax of these little vehicles is only five shillings per annum and the first cost less than £100 complete. A journey of 50 miles costs not above 6d., at 1d. per unit for charging energy.

It will be agreed that the evidence adduced shows that the electric vehicle is still making gallant efforts to obtain a real place in the sun, and the writer is confident that eventually that place will be a very prominent one.

DIESEL ENGINE PLANT.

By GEOFFREY PORTER, A.M.Inst.C.E.

IN a short summary of the progress made during 1929 in the use of the Diesel engine in power stations nothing more than a brief generalisation can be attempted. It is proposed to comment very shortly upon: (1) The effect of legislation; (2) the last return of the Electricity Commission; and (3) some recent developments in Diesel engine land-type practice.

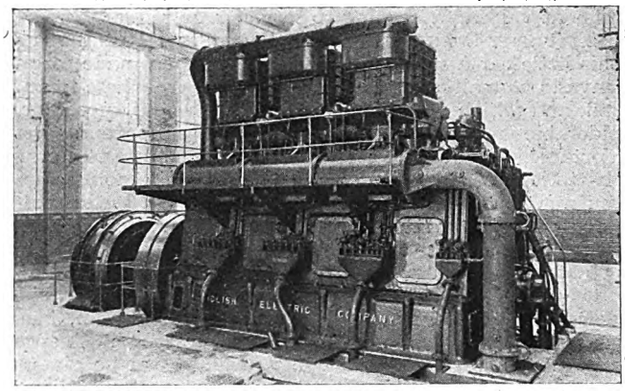


A Brotherhood-Ricardo high-speed Diesel engine, 300 b.h.p., 200 kW. It is of the four-stroke cycle airless injection sleeve valve type, and runs at 750-900 r.p.m.

In this country very little additional Diesel engined generating plant has been put into the stations of authorised undertakers. Except in a few areas where a bulk supply for recently created or normal additional requirements is not available or in sight, new Diesel engines have not been purchased. Unfortunately, the difficulties encountered by the Central Electricity Board and others have proved to be more formidable than

Digitized by Google

was anticipated, with the result that contractual obligations entered into with some local authorities have not been fulfilled in time to meet urgent requirements. The unwisdom of refusing sanction to short term loans for a bare sufficiency of added generating plant has become manifest. Local restrictions of supply have become imperative in some cases.



An English electric 1125 b.h.p. 750 kW opposed piston type two-stroke cycle Diesel engine, at 250 r.p.m.

Apart from difficulties of this kind, authorities employing the Diesel engine view with concern the prices demanded for bulk supplies, especially when a power company is the source. In different localities prices have ranged from about 35s. to 110s. per kW (the lower figure being an exception), plus a running charge varying between 0·2d. and 0·4d. per kWh. These charges have been supplemented by a line rental charge amounting to thousands of pounds per annum, with the further obligation of providing for the bulk supplier a line load factor of 50% and upwards.

When purchasing Diesel-engined generators an authority does not incur an annual capital charge much, if at all, exceeding 25s. per kW for plant alone. Although the comparable generating costs will exceed the amount of the running charge in the bulk supply contract, the difference will be overtaken by the cumulative effect of the high kW charge and the line rental. It does not comfort the Diesel engine user to tell him that the benefit anticipated is national rather than local. His estimate of the situation is local, and cannot be otherwise. It is to be presumed that the statutory oil-engined stations have now reached their maximum development as generating stations, and their future must therefore depend upon the terms on which they will be able to purchase energy from outside sources. Not the least important of the clauses of a bulk supply agreement will be that dealing with the payment of the kW charge. Unless a reasonable degree of elasticity is safeguarded, this charge may readily have a crippling effect upon the business of the purchasing supply authority. This remark applies, of course, to any purchasing authority, irrespective of the type of the existing plant.

Number of Oil Engine Stations.

The Electricity Commission's Annual Return has received editorial and other comment of a general character in the technical Press. It is not unnatural that the steam stations which furnish 95% of the aggregate output should receive 99% of attention. Of the gross total the oil engine stations generated an insignificant fraction, 0·68%. But the number of these stations was not an unimportant fraction ; it amounted to 24·3% of the whole number. Small as the individual and collective output of these stations may have been, they have shown an increased output of 61·6% since 1926. There was a small setback in output of 4·7% in 1928, but that check was followed in the year under review by an advance of 17·6%. The steam stations, it may be noted, increased their output by only 9·2% in 1928–29.

It is at least clear that the smaller undertakings where the Diesel engine is used, are by no means inactive in advancing their businesses. If left to work out their own salvation they would undoubtedly fulfil all the requirements of their local districts perfectly satisfactorily.

It is also interesting to observe that no fewer than 165 steam stations contributed no more than 4·1% to steam stations' aggregate output. In very many of these the work could have been done more easily and more economically had the Diesel engine displaced the steam equipment. It is at least arguable that, but for the 1926 Act, many of them would have abandoned steam in favour of oil as the readiest means of improving their economic efficiency.

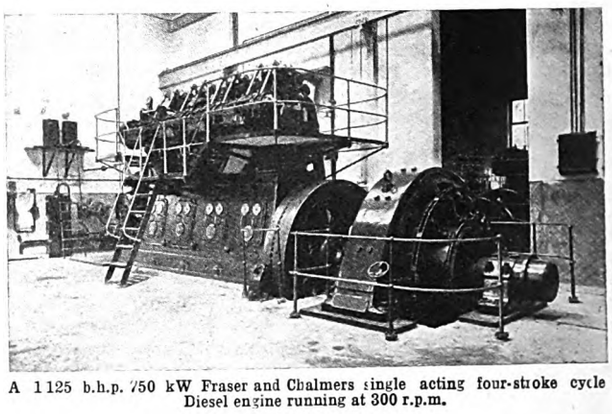
Of the new Diesel engined generating sets purchased by local supply authorities this year in this country three are of particular interest, as they represent the progress made by British manufacturers of land-type engines in the development of larger capacities. In comparison with foreign oil engine manufacturers they have still a long way to go from the point of view of size. One of the units is an 8-cylinder, opposed piston type, 2-stroke cycle Diesel engine, direct coupled to an alternator of about 1 000 kW operating in parallel with a 500 kW alternator driven by a smaller engine of the same type, though of older construction. The new engine presents an exceedingly attractive appearance, and, what is more to the point, has a high thermal efficiency, the full load fuel consumption being of the order of 0·59 lb. per kWh at full load (based upon a normal, commercial quality of fuel oil).

The equipment of a second station already containing four 500 kW Diesel-alternators and a pair of 100 kW pre-war Diesel sets, has been supplemented by an alternator of about 1 250 kW capacity, driven by a six-cylinder, Nobel type, 2-stroke cycle, single acting, Diesel engine. This engine is a modification of the 1 100 B.H.P. Nobel engine supplied to the Worthing Corporation just three years ago, and differs from it by the omission of cross-heads, and the drive of the scavenging air pumps and air compressors being derived directly from the crankshaft. The engine is not unlike the Bürgerhout engine in design. The performance is said to be good, and its future career will be followed with interest.

Adoption of Super-charging.

A third example is distinguished by the adoption of super-charging, it is believed for the first time in a British land-type engine. By this means the normal full load output may be increased by 33% on occasion without over-stressing the engine parts, a feature that is valuable for meeting peak loads and sudden emergencies. Applications of the supercharging principle are becoming common in marine practice, but for land purposes the advantage has not been so readily visualised, nor so easily adopted owing to the comparatively limited overload capacity of electric generators, at any rate when manufactured to B.E.S.A. specification.

In Germany and Switzerland the supercharging principle is finding a good deal of favour. One firm alone is reported to have on order more than 50 000 B.H.P. of supercharged Diesel engines. Such an engine, of 3 000 B.H.P. direct-coupled to an alternator of about 2 000 kW, has been supplied to the central station of a city in Spain. The continental manufacturers of the Diesel engine show a decided tendency towards a general adoption of the airless injection method of fuel supply to their



A 1125 b.h.p. 750 kW Fraser and Chalmers single acting four-stroke cycle Diesel engine running at 300 r.p.m.

engines, and are also very busy in the manufacture of the 2-stroke cycle engine.

The largest single order obtained during the year comprises a complete power station for an Australian industrial concern. There will be six Diesel engines of 3 000 B.H.P. apiece, direct coupled to alternators of about 2 000 kW in each case, and four 1 100 B.H.P. Diesel engines coupled individually to air compressors. The compressor engines have been allotted to an English firm of long standing and great experience. This station is believed to be the largest Diesel generating station in the British Empire (though not in the world), and is a significant instance of the trend of opinion at the present time.

Digitized by Google

Finally, the genuine high-speed Diesel engine of small dimensions and light weight is finding a foothold in electricity supply practice. The experience gained in the operation of the 300 B.H.P. set in the Worthing power station has been incorporated in a modified design, of which two examples have been recently put to work in private industrial establishments. The convenience, economy and excellence of this design cannot fail to commend it, and one may prophesy its wide adoption within the next few years. Unhappily, it will not be a feature of the electricity supply industry, but rather the means whereby the industrial user will generate his own energy at a price less than that at which he can purchase it.

METERS AND INSTRUMENTS.

By E. W. HILL, M.I.E.E.

IN view of the fact that the art of metering is now long past its period of infancy, it is not, perhaps, surprising that it should have settled down into a stage of stabilisation in which revolutionary changes are not to be anticipated, and are certainly not discernible, as far as ordinary electricity supply meters are concerned, within the annual period under review. More particularly does this apply to d.c. meters, the numbers of which being put into service are continually diminishing—if not absolutely, yet relatively—in comparison with the numbers of their a.c. rivals.

Generally, tendencies rather than achievements seem to be the characteristics of the situation, and these, as reflected from the files of the Patent Office, appear to be directed towards consolidating the advances of previous epochs, and to be concerned chiefly with the minutiæ of meter construction, to the end of removing some of the more recondite defects of performance, or providing more facile means of calibration adjustment.

The impulse towards designing the so-called "overload" meter—for a.c.—(i.e., one capable of sustaining two or more times its nominal current rating), although less feverish, has not yet entirely exhausted itself. The problem involved, however, is one really concerning the extension of the load range in a meter for which close accuracy is possible, conjointly with the formulation of a rational definition of a meter's full load capacity, which definition incidentally has yet to be framed.

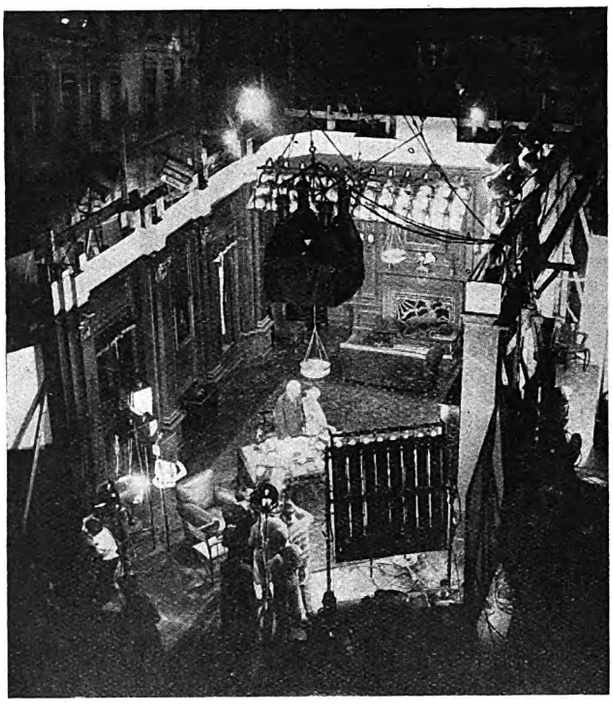
British Quality Meters.

The newly revised specification for meters, No. 37—1929, of the B.E.S.A. was published this year, and in addition to the removal of certain ambiguities and other blemishes from the previous edition, it is characterised principally by a fairly drastic narrowing of the range of accuracy tolerances, which condition of things will tend to set British meters in a quality class still more definitely above that of their Continental competitors. As a new feature, and somewhat belatedly, it also formulates, in an addendum, a complete series of standard terminal arrangements; with what success in securing adherence, however, remains to be seen.

The endeavours to stimulate consumption of electricity by the medium of multi-part tariffs have their inevitable repercussion in attempts to devise prepayment meters which shall exact "fixed charge" payments with, at one and the same time, the maximum certainty of securing all that is due, and the minimum financial inconvenience to the consumer. Much controversy has been excited on this account, and a number of prepayment devices have been developed for collecting fixed charges, either in lump sums, or in distributed payments; but a final, agreed, solution of the problem now depends less upon technical advances in prepayment meter construction than upon the possibility of arriving at uniformity of procedure among supply undertakings in respect of the basis upon which fixed charges are to be assessed and the way in which prepayments for them are to be demanded.

Apart from these particular schemes, a great deal is being done to encourage multi-part tariffs, especially in the not inconsiderable field of late shop-window lighting, by the use of time-switches of new and highly ingenious kinds, employed sometimes in conjunction with special purpose meters.

The domain in which the greatest development activity is being exhibited is that in which master metering on bulk supplies is provided for effecting on one integrating dial and on one maximum demand indicator dial, the algebraic sum of the energy registrations, and of the maximum demand indications respectively of groups of subsidiary meters, some of them perhaps located at long distances from their nearest neighbours. Much extremely interesting pioneer work is being done in this field for the several grid schemes now being installed, and it is to be anticipated that full details (which are not at present available) will be published in due course.



The year has seen developments in electric lighting applications in film studios, the one depicted being that at Elstree.

Attempts are being made—and success is claimed for them—to obviate the difficulty and expense involved in installing potential transformers on very high voltage systems, by using instead the power transformers connected thereto, and employing the artifice of injecting into the derived low tension circuits provided for energising meters, etc., voltages which simulate and compensate for the primary voltage drops occasioned by the load in the power transformers.

Recent Developments.

Among other interesting recent developments in instrument work there are improvements in a.c. relay construction, in protective gear, in current transformer design for reducing low load errors, and in testing methods for instrument transformers.

In conclusion, it may be hoped that the present steady adherence to the utilisation of known principles for achieving greater perfection in performance in meters and instruments will not necessarily preclude the possibility of early and epoch-making departures from established practice.

ELECTRIC LAMPS.

By W. J. JONES, A.M.I.E.E.

IN the paper presented at the International Illumination Congress last year, frequent reference was made to the need of standardisation, and instructive data were presented illustrating the numerous varieties and types of incandescent electric lamps, and the number of different voltages in Europe. In Great Britain some progress towards simplification has already been made, and it is hoped that this will continue, with benefit both to the quality and to the cost of lamps.

During the present lighting season, special efforts have been made to bring home to the public the advantages of the pearl internally frosted lamp and the opal lamp. It is urged that in all installations where lamps are exposed to view, the substitution of pearl or opal lamps for clear ones would do much to diminish glare and promote better diffusion of light.

Moreover, the more general adoption of such lamps would doubtless assist standardisation, and would be favourable to more efficient production. It has, for instance, been computed that by concentrating on the production of these lamps it would be possible to diminish some 60 or 70 existing types to less than one dozen.

The comparative effects of lamps with clear and internally

Digitized by Google

frosted bulbs on the light distribution and appearance of fittings (particularly for domestic purposes) is generally very favourable to the latter.

A feature during the past year has been the progress made in the manufacture of lamps of very high capacity. Incandescent electric lamps, consuming 3 to 4 kW, are now widely used for lighthouse work, and some of 10 kW, and even higher capacity, have been developed for the lighting of aerodromes.

A new field for the use of such lamps is presented by the film-making industry, where, owing largely to the introduction of panchromatic films, and to the necessity for a noiseless source of light in making " talkie " films, incandescent lamps have recently been in great demand. The use of high candle-power incandescent lamps in studios presents numerous interesting problems, and has resulted in the production of many special devices. In some Continental cities there are instances of single lamps of exceptionally high candle-power being applied to public lighting, e.g., on posts 60 ft. high or more, in large public squares.

ELECTRICAL CONTRACTING.

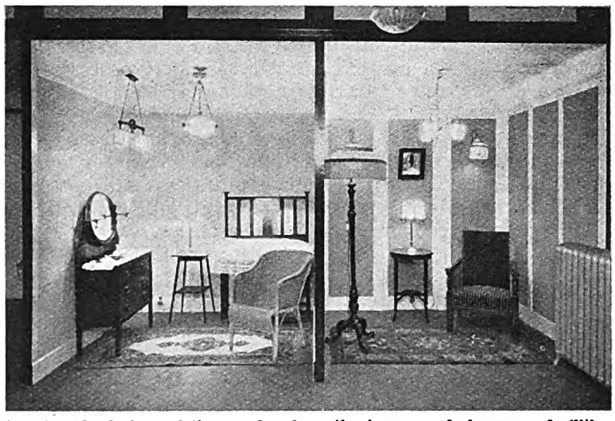
By E. H. FREEMAN, M.I.E.E.

THE wiring and installation section of the electrical industry can look back on the past year with satisfaction. Business has been good in almost all parts of the country; labour troubles have been practically negligible, and there have been no other difficulties of a serious kind.

The year has, however, not been entirely uneventful. Although no startling developments in wiring practice have taken place, attention has been given to many questions that affect the safety and convenience of electrical installations.

Of these the most prominent is that of earthing or insulating apparatus. The subject has been debated on many occasions, including informal meetings of the Institution of Electrical Engineers. The supporters of each point of view have tried to convince their opponents, but so far without success. On the one hand the impossibility of obtaining all-insulated apparatus has proved the necessity of earthing quite conclusively to the advocates of earthing. On the other hand, the fact that manufacturers make little or no attempt to enable earthing to be carried out, and the consequent difficulty of ensuring effective earthing makes the supporters of all-insulated systems sure that their principles are right. The matter is likely to form the subject of many more discussions before uniformity is reached.

The lack of more satisfactory co-operation between supply

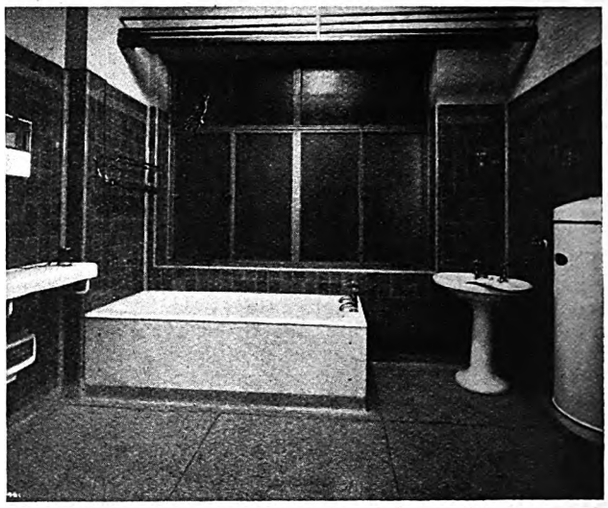


A noticeable feature of the year has been the increase of showroom facilities provided by electrical contractors, some of the new showrooms being based on the model E.L.M.A. system shown above.

authorities and contractors is an occasional cause of trouble. Tariffs in many areas are too high to attract consumers, except for the bare lighting requirements of the smaller houses, and some districts even definitely discourage heating and cooking loads. The addition of an appreciable demand for cooking would overload the mains now existing, and fresh capital outlay would be undesirable. Such conditions generally occur where there are rights to purchase undertakings at unfair terms to the existing suppliers, but that they should exist at all is deplorable.

Another constant source of trouble is the many complicated systems of tariffs. No two authorities seem to adopt the same system, and the need for explanation of alternative tariffs is a frequent difficulty for the contractor trying to persuade a prospective consumer to adopt electric cooking and heating. It would be a great incentive to the obtaining of this extra load if all tariffs could be simplified and standardised, and particularly if they could be reduced to a basis that could be understood by the ordinary layman.

The comparative failure up to date of the development of



Progress has been made in 1929 in developing the use of electricity for water heating, and all-electric bathrooms are included in many new houses.

electricity supply in outlying districts is also a source of complaint from the country user. This is probably due to the politicians rather than to the Electricity Commissioners, but the prospects held out a year or two ago of rapid rural development and the comparative failure to give results have led to many bitter criticisms from prospective customers on the outskirts of urban areas.

On the whole, however, the electrical contracting industry has not much cause for grumbling. Business has been generally good during the last year, and fresh opportunities for business are opening out in many directions. The prospects for the future are also good, and there is so large a field for development that contractors can anticipate satisfactory business for some time to come.

ELECTRIC WATER HEATING.

By H. AMBROSE CARNEY.

DURING the past twelve months there has been a greatly increased interest on the part of supply authorities in the development of the electric water heating load. The general publicity of manufacturers, and especially the national advertising campaign of one firm, together with the efforts of the E.D.A. in April last, have served to direct attention to the excellent results already obtained by those enterprising authorities who first took up electric water heating on correct lines. These results have shown conclusively that not only does the general public want efficient electric water heating equipment, but that the demand is a very valuable one owing to its effect on the load curve.

Experience has shown that to ensure rapid development an attractive hire scheme is of first importance. A relatively high price per unit will be paid cheerfully if the hire charge is attractive, while a cheap unit price with an inflated hire rate will discourage progress.

Supply undertakings have shown a gratifying recognition of the fact that, for hiring out purposes, only the best is good enough. Provided the equipment is sound electrically and mechanically there is no difficulty in recovering the capital cost, with interest, over a period of seven to fifteen years, and with practically no cost for maintenance.

One of the points which has become generally recognised is the superior earning capacity of the electric water heater as compared to the electric cooker. Assuming 100 kW of plant available, the output per annum, if reserved exclusively for electric cooker supply, would approximate to 100 000 kWh. If used for water heating only, the consumption would be 250 000 kWh.

Not only is this great increase in consumption obtained, but the nature of the demand for hot water is such that quite 75% of the plant capacity is released during peak hours, thereby effecting a further important saving.

The capital expenditure on current-consuming equipment for hiring out is incurred solely to sell more electricity. An

Digitized by Google

outlay of £1 000 on electric cookers will increase the annual sale by approximately 100 000 kWh, but the same expenditure will purchase efficient electric water heaters which will add over 200 000 kWh per annum to the output—and without the attention of a maintenance department. Adding the latter expense to the cost of the cookers would make the expenditure approximately £1 000 per 50 000 to 75 000 kWh per annum. Regarded from a nett revenue standpoint, therefore, the expenditure on water heaters is likely to be from two-and-a-half to four times as productive.

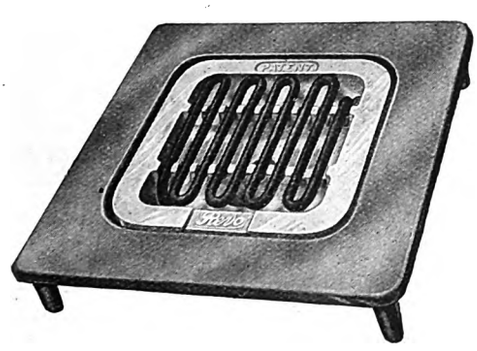
Another welcome sign is the general appreciation of quality in electric water heaters. Bitter experience has at last convinced supply authorities and users that cheap production, with thin sheet tanks, soldered or brazed and roughly tinned, will not stand up to the work. One does not find such flimsy construction in ordinary hot water systems—their defects were found out years ago by hot water engineers! The more one considers the problem, the more one realises that the standard of construction must be maintained, and even improved upon, where electricity is employed as the source of heat. Sound mechanical construction with a liberal—but efficient—use of highest grade raw material necessarily costs more, but the money paid for the "cheap" product is too often but the initial payment of a much heavier total expenditure which in the end will succeed only in discouraging consumers.

The third gratifying mark of progress is the recognition that the correct application of electric water heaters is a most important matter, and one which calls for long specialised experience. The successful development of the water heating load is determined by the skill with which the first 100 heaters are installed. If these are of sound design, and properly fitted, the results will bring further consumers without effort. If the installations are bad, the cause of water heating will be set back as it was in the past, when immersion elements attached to unlagged tanks afforded the only means by which the electrical industry could express itself in water heating.

ELECTRIC COOKERS.

By STANLEY F. BICKELL, A.M.I.E.E.

THE year 1929 may be considered as the beginning of the age of reliability in the electric cooker world. Prior to this the cooker industry was undoubtedly supported by the loyalty of supply engineers to the cause of electricity, and to the demand of a certain section of the community for novelty. Maintenance charges in the early days would surely have turned an economist grey, for 20s. to 30s. per year service costs per cooker were far from uncommon. These charges were



The high-speed transformer-operated boiling plate.

due primarily to the imperfections of boiling plates, and secondarily to weaknesses of wiring and connections.

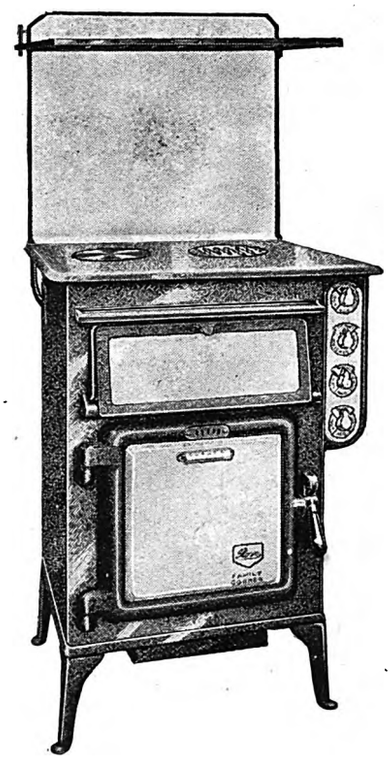
The change has been rapid and decisive. Opinions have become more or less consolidated in favour of the enclosed type of plate, and, with the advent of the cement-filled pattern, reliability of the order of 98% over 2 years' service is the rule rather than the exception.

The removal of the wiring from the lagging material and the substitution of Steatite insulation for mica, together with the standardisation of lock nuts and copper of sufficient cross section has practically eliminated entirely all failures of wiring.

Switches have improved in reliability, although their design is too reminiscent of the old days of surface mounting. A dust-proof rotary switch designed especially for recessed mounting on an electric cooker has still to be evolved.

General durability has received its share of attention, and the vitreous enamelling of *all* sheet metal portions is now the rule with the large manufacturers. This is a tremendous step forward, and enables the supply engineer to hire cookers with some assurance of seeing a return for his capital outlay before the appliance crumbles with rust, as has frequently occurred in the past, during a period of only two or three years.

The vitreous enamelling of the hobs of cookers is, of course, a feature which appeals mostly to the user of the stove, and in this connection the new single coal-mottled enamel has been almost generally adopted on account of its hard wearing and non-chipping properties. There is a strong tendency amongst supply engineers to purchase all-vitreous enamelled cookers as illustrated on this page, and in the not distant future this finish is likely to become standard practice. A cooker so finished is readily and cheaply renovated for rehire purposes to another consumer, and maintenance costs are thereby greatly reduced.



The use of vitreous enamel finishes for cookers has increased in 1929.

The grilling space between the hob and the oven has been made to function as a useful hot cupboard by the fitting of a drop door, although this very obviously desirable change has been slow in coming. The three-heat grill also is an attribute which has only recently become general, although it is a necessary adjunct to the hot cupboard.

In the matter of ovens there is very little standardisation amongst manufacturers. This is due largely to the necessity of following precedent, and to the variation in the class of cooking throughout the country. Whilst side heating alone has given place to side and bottom, there is still controversy concerning the relative merits of this and the top and bottom method. The former undoubtedly takes first place in general popularity, but the latter finds devotees who certainly cannot be overlooked. Whether the joint committee of the I.M.E.A. and B.E.A.M.A. will succeed in forcing a settlement remains to be seen. In the meantime a manufacturer is faced with the alternative of either making two distinct models or losing certain business to a competitor.

More attention has been given of late to the effective earthing of all metal portions of the cooker excepting the conductors, and this is greatly to be commended.

"Plug-in" Elements.

The question of "plug-in" elements is still flirted with, and it would seem that its adoption, which certainly would be desirable, is dependent upon the invention of a plug and socket connection which will provide a good contact continuously under the effect of considerable heat. The common split brass connection is useless for the purpose; it either loses its temper, overheats and open circuits, or it corrodes in the course of time and renders the element practically immovable. The "plug-in" type of oven element undoubtedly improves the space factor of an oven and thereby increases its efficiency, besides avoiding undesirable crevices into which dirt and grease may percolate. It also renders possible a thorough scouring of the oven by the housewife.

In regard to "plug-in" boiling plates and grills, service costs are obviously reduced when the infrequent need of replacement arises; but it all hinges upon the evolution of a suitable plug and socket contact before these advantages may be enjoyed.

The transformer-operated low-voltage boiling plate, as

Digitized by Google

illustrated on page 799, is growing steadily in popularity, its greatest attribute being freedom from failure arising from damage to the resistor, and to the rapidity with which it will heat small quantities of liquid.

The fact that cheap, common utensils give the best results weigh heavily in its favour.

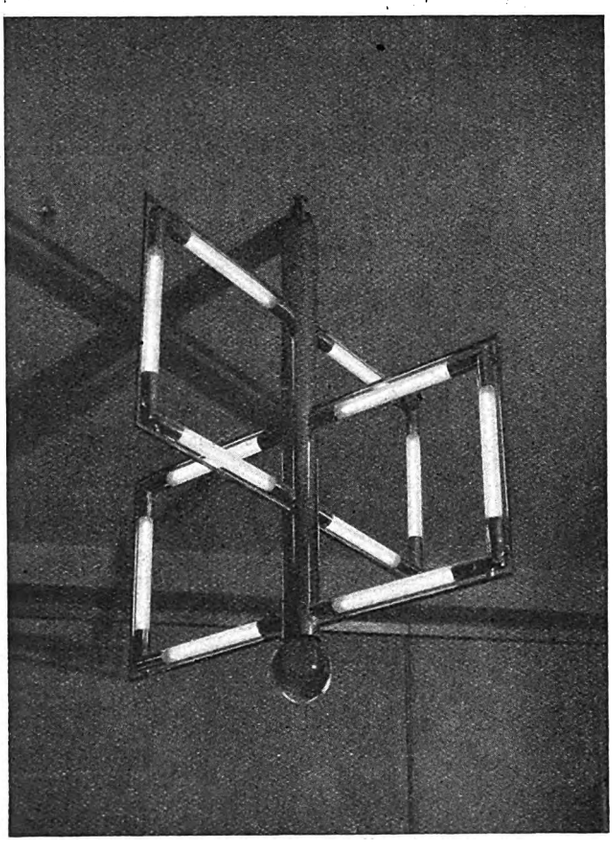
In reviewing recent developments it is interesting and gratifying to note how little the design of electric cookers in this country has been influenced by foreign or competitive practice. English cookers to-day have an efficiency and reliability second to none in the world, and have fitted themselves for inclusion in the big future for domestic electrical appliances which is pending.

LIGHTING DESIGN.

By A. B. READ, A.R.C.A.

MODERN design has evolved in two distinct ways in England, and this fact is vital to an understanding of its manifestation to-day.

To many, the Paris Exhibition of 1925 was the beginning of a development of modern design in these islands, and with its sudden break away from recognised forms and traditions



A pendant of extreme modern design, by Adnet. It is composed of striplite lamps, with highly polished silver-plated metalwork.

has not only drawn attention to itself, but has created fresh standards and values in design and decoration.

In many cases designers and firms immersed in tradition have realised that, as there seems to be a demand for modern treatments, they must look into the matter, and after a hurried study of illustrations of contemporary Continental work have felt fully capable of offering a satisfactory solution to any inquiry they may have for modern work; in fact they feel that the whole thing is much simpler than designing period interiors and fittings. With no breadth of vision and perspective, they fail to see that the whole spirit of modern design is creation, and not a reshuffling of ideas culled from various sources.

Sound Principles.

Side by side with this superficial movement has grown up a school of design based on sound principles of simplicity, sense and suitability for purpose, quite distinct from the mushroom growth of the imported Continental variety. For years past there have been architects, decorators, furniture makers, printers and craftsmen of all kinds who felt that there could be beauty in sane honest design; not imitative, but creative, and meaning for them, not a fashionable pursuit, but a faith and standard of life.

These two movements must be fully realised if we are to cultivate a standard of criticism of design to-day, especially in matters of illumination, as the design of lighting fittings has changed more than anything else in the last few years.

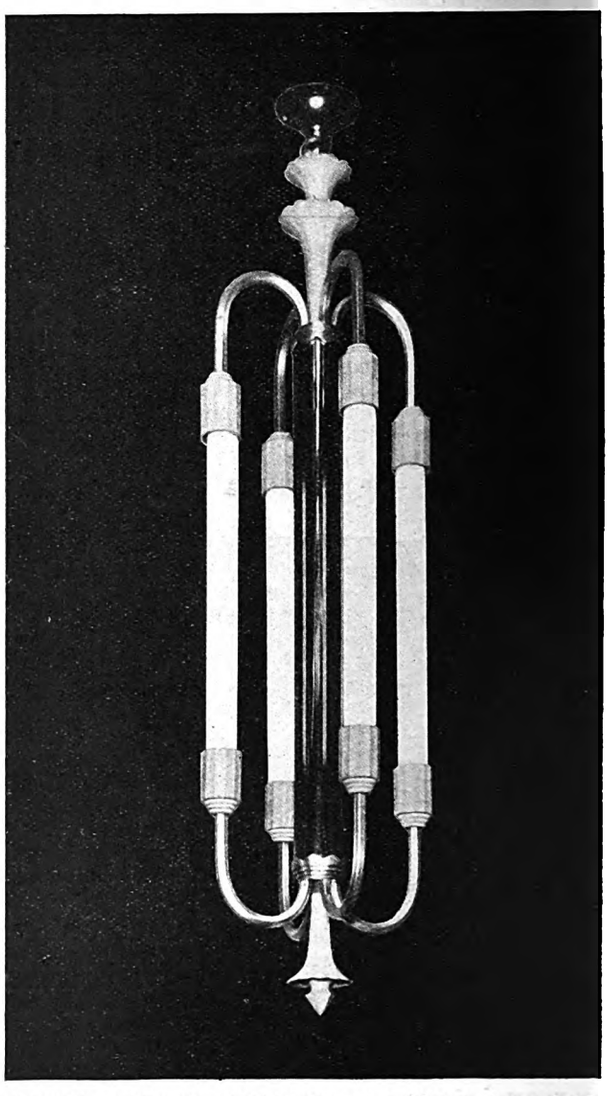
We must learn to differentiate between the work of sincere designers who are thoroughly conversant with modern tendencies on the Continent and elsewhere, and believe in what they are doing, and the other designers who regard the modern movement as merely a passing craze, and whose work fully expresses their incompetence and insincerity.

No Passing Craze.

That this reaction against reproductive forms is a passing craze is a fallacy, for we are only yet on the fringe of a world-wide change in outlook that will eventually convince us of the beauty of truth and sincerity in design for any purpose.

It would be stupid to suppose that modern design, as exemplified in lighting fittings illustrated in this article, will remain as it is, and that the last word has been said. Changes are normal and healthy, but we can assure ourselves that whatever setbacks this modern movement may have, it must go forward; it cannot go back.

Lighting fittings have evolved their own forms and cannot again revert to the shapes and characteristics of other illuminants. It would be just as unlikely that motor cars should



A Troughton and Youngf our-light tubular pendant with black mirror centre tube and with silver-plated metal arms and green bronze caps.

be designed like hansom cabs, or electric liners like eighteenth century frigates.

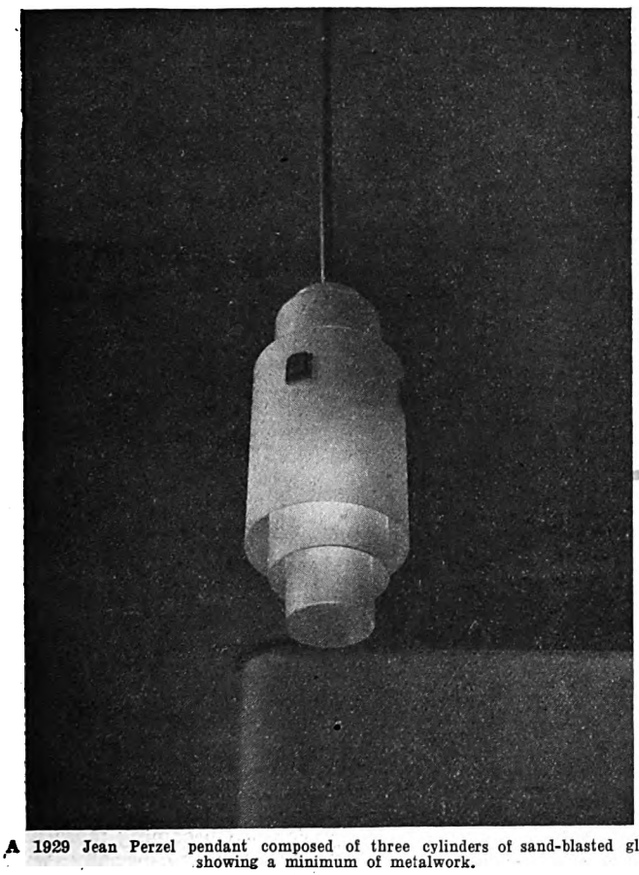
Whereas three and two years ago lighting fittings took rectangular and angular forms, so the most recent characteristic of design in 1929 is the tubular form. Satisfactory and sincere in design, these tubular forms are a normal develop-

Digitized by Google

ment of the use of tubular and "striplite" lamps, and there is obvious beauty of line in these designs.

The greatest use has been made of this form of lighting in Germany, where fittings of one tube, long lines of tube and groupings of tubular shapes, have been employed with, in some instances, outstanding success. Double ended "striplite" lamps of large diameter and satined surface are common in Germany, and these, used frankly, without any glass surround, produce a pleasing effect, and can be mounted cheaply.

The charm of these fittings will appeal most to those who have an appreciation for abstract form as distinct from form which is derived from, or resembles, some natural shape. Obviously the person who feels that an electric light fitting should be made to look like a flower could not live with fittings of such a simple and direct design. However, the general public are becoming accustomed to abstraction as exemplified by modern cinematograph practice, stage decoration and



A 1929 Jean Perzel pendant composed of three cylinders of sand-blasted glass showing a minimum of metalwork.

architecture, and are attracted more and more by simple, straightforward design.

Should some new method of producing light be invented, the design of fittings would outwardly express the form of the light source. For example, neon lighting might be introduced as a method of lighting interiors; in fact it has been used abroad for this purpose, and naturally this would entirely change the characteristics of lighting fittings design.

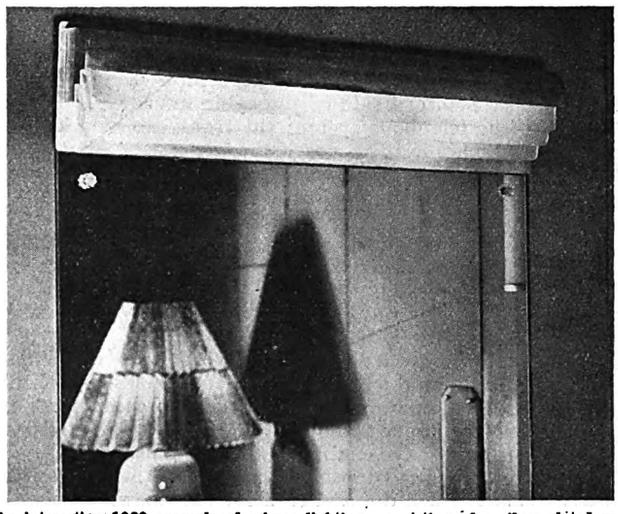
As at the present time "striplite" lamps are obtainable in various wattages, the best possible use should be made of these, and fittings designed embodying them and making their long straight lines of light of decorative value.

The use of light as decoration has scarcely been realised, and surely there is an opportunity for decorators and architects to dispense with a great deal of surface treatment, and decorate rooms and buildings with light.

After all, rooms are not decorated to last for a lifetime, and the money spent on re-decoration might easily be used for effective decorative lighting, which could also be changed at the end of, say, ten years.

Lighting from large surfaces and panels has been used fairly extensively during the year, but generally speaking a good deal of interest is lost by dispensing with a fitting, which is obviously the source of light, and which gives a definite interest to an interior.

Evenness of illumination is not necessarily our object, and indirect lighting and lighting from "laylights" and large surfaces often fails to achieve the charm and intimacy given to a room by pleasantly designed lighting fittings.



An interesting 1929 example of mirror lighting, consisting of a silver-plated metal cover and three suspended flashed opal glasses. By Troughton and Young.

We may be certain that in all decorative schemes of note that may be carried out in 1930, the lighting will play a more and more important part.

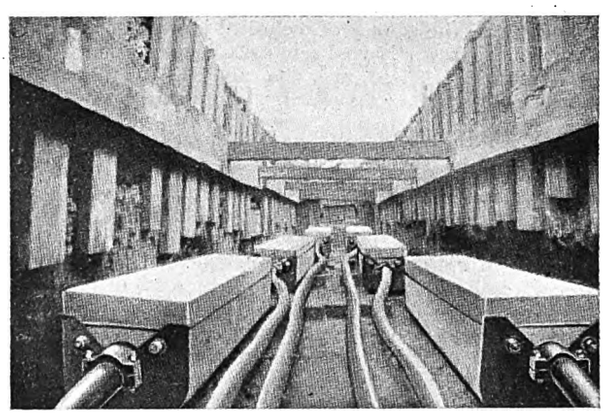
ELECTRIC CABLES.

By LLEWELYN B. ATKINSON, M.I.E.E.

THE Editor of THE ELECTRICIAN has asked me to write a few words as to the progress of the electric cable industry in 1929, and the outlook for the future. There has been in 1929 no special feature calling for comment, either technically or commercially. The growth of electrical distribution is continuing at about the normal rate of the last few years, that is, about 15% per annum, and as this means a larger addition each year, so the total output of distributing networks and of installations increases.

This year a good deal of the work has been concentrated on the Central Board's overhead line programme. The position dealing with the connecting lines between generating stations has not, so far, led to any great effect in new regional output, with its accompanying cabling and internal wiring requirements. These may be expected to follow.

The use of cables for 33 000 V and over is extending, and the Central Board is laying about eight miles of oil pressure fed cables at 132 000 V in connection with the London supply. This is stated to be experimental. The original idea of this (Emanueli) cable which was to have a complete circulation of oil, has been modified to the point of keeping the space inside the lead sheath and the dielectric filled with oil during the



Joint bay, showing six joints constructed on 66 000 V oil-filled cables.

expansions due to heat, and subsequent contraction during cooling.

In smaller cables and wires for house-wiring, the tendency to the use of special wiring systems has continued. These systems in effect mean that a good deal of what used to be work done by the wireman on the job is being done in the factory, with an advantage in the cost of installation. Unfortunately a great deal of low grade wire in small sizes is being

Digitized by Google

used, and large quantities of thinly insulated flexible cord nominally intended for wireless apparatus, is, either in ignorance or culpable dishonesty, being used for lamps and portable apparatus. Neither the supply authorities nor the fire insurance companies seem capable of handling the situation. Presently will come a crop of accidents, and then the authorities named will be surprised at Government " interference."

The least satisfactory side of the cable industry is in the extension of the telephone system, the trunk cable work being almost at a standstill. The Post Office cannot be blamed for not laying trunk lines when those in existence are not fully loaded, but this raises the whole question of whether a department of a Government Department is the most suitable form for an organisation which has a service to sell. In the opinion of many, both inside and outside of the electrical industry, a more up-to-date form of organisation is necessary. The scope for expansion to bring the telephone usage up to the level of other countries is remarkable.

Export cable trade has held up well. The companies interested in cable production have, on the whole, done fairly well. Profits are lower on the turnover, for competition is very keen, but the larger turnover and improvements in some productive methods have enabled this to be met.

The prospects for 1930 depend naturally very much on what industry generally will do, and that has a somewhat obscure outlook. But apart from psychological factors, which count for much, the world is gradually recovering from the war and the uncertainties of ten years' peace, a good deal of rubbish has been cleared away, and we may look forward with confidence to 1930.

TECHNICAL ADVERTISING.

By J. S. SIMMONS.

A CAREFUL study of technical journal advertising for the year which is just ending leads one to the definite conclusion that, generally, technical advertising in Great Britain is better than it has ever been, both from a theoretical and practical advertising viewpoint.

To carry this survey back further, say, for the last ten years, one is forced to the conclusion that no specific advertising has made greater advances than electrical technical advertising.

But there is, as there always will be, much room for improvement. There are advertisements appearing which are fundamentally bad, possess no psychological human interest, and can achieve no success. Unless the value of the space is apportioned to the cost per square inch, the full value of black and white—of the space which the illustration takes, of the space the text matter occupies, of the white space itself left unfilled—will not be realised.

At present there has not been any introduction into technical advertising of the Americanised freak copy which has found its way into " periodical " advertising in this country. This " freak " copy will not last. In America, I believe, they have already seen the futility of it, and are turning back to the more solid advertising; the few who have adopted it in this country will follow suit.

To return to the gallery of technical journal advertising, let us see what classes have been conspicuous during the last twelve months. These may be divided roughly into the following :—Pictorial; goodwill; humorous; testimonial; instructional; educational; propagandist. Each of these has its own particular part to play, and each type in its place is supreme. Yet who shall say which is most effective? Experience must be our guide.

Perhaps the most " popular " form of advertisement has been the pictorial. Yet it is to this particular class that constructive criticism can be most easily levelled. Many advertisements which have appeared are reproductions of photographs or drawings. Such an advertisement loses much of its effectiveness when the photograph has been the work of a quasi-amateur, or the artist has been stinted in the time he has been allowed to spend on his picture. An artist is human, and if he is given a job to do at a definite cost he will cut his cloth to suit; but know your man and give him *carte blanche*, and it will pay in the added power brought to the advertisement.

Oil for the Machinery.

Goodwill advertisements come second, and the only criticism is that sometimes these are reproduced without any definite linking up with the main campaign. Goodwill advertising is but the oil for the advertising machinery—the gears and bearings being the instructional, educational and propagandist advertisements which " put over " the selling talk.

One or two highly successful humorous advertisements have been seen in the technical press. This type is so rare that when such does appear it attracts a good deal of attention—but a funny " ad " must be cleverly funny; its humour must not be heavy or bilious, but just palatable so that it is digested and enjoyed. Humorous advertising is, without doubt, the most difficult type to undertake, yet one of the most successful, and has more endurance than many other forms.

Testimonial advertising has been to the fore a good deal, but, here again, unless there is constant alteration of " copy " one is apt to look on the repetition with a quizzical regard. A reproduction of the actual testimonial should be used in the advertisement, otherwise a " fake " may be suggested.

Finally, we come to the instructional, educational and propa-

An example of humorous technical advertising in 1929.

gandist forms of advertising, which are becoming more and more popular with technical advertisers, especially with electrical technical advertisers. Usually these take the form of series advertisements, either half or full page. Instructional advertising goes all out to impart to the user the way to get the most out of the product advertised, or the best way to handle it.

Educational advertising is something akin to instructional, but differs from it in that the aim is largely in the direction of the general public, more popularly designated " the consumer," who, in the case of technical journals, is the industrial user.

Lastly, there is the propagandist campaign the purpose of which is to further some set policy with a broader and deeper ideal at the back of it. For example, there is the recent campaign advocating looking to the future by the adoption of the 60 ampere service, installation, which has received such support that it has even been taken up in the editorial columns of certain electrical journals.

So much for a review of the receding year's efforts. What of the future? I believe that the technical advertising profession is getting into its ranks men who are able to raise the status of specialised advertising still higher. I believe that co-operation and collaboration between the advertiser and the journals will raise the status of the journals themselves. Already we see signs of progress in certain directions. The adoption of " colour advertisements," the willingness of the press to consider the suggestion made by the I.S.B.A. for the standardisation of page sizes, both show that the press and the advertiser find by working together how much can be achieved by common endeavour.

SOME PERSONAL NOTES OF 1929.

Movements of Power Station, Tramways and Other Engineers—Manufacturing and Other Personalities—New Year and Birthday Honours Awards.

A NUMBER of interesting movements have taken place among well-known personalities in the electrical industry during the year, and among these may be mentioned the following :—

Power Station Engineers.

Mr. J. N. Waite, chief assistant engineer, Stoke-on-Trent, assumed duties as city electrical engineer at Hull.

Mr. J. W. Fawcett, electrical engineer to Holmfirth U.D.C., resigned to become resident engineer with the South East Yorkshire Power Co. He was succeeded by Mr. H. C. Spence, of the Yorkshire Electric Power Co.

Mr. Ralph Lomax resigned from the position of borough electrical engineer at Stockport.

Mr. S. E. Fedden, general manager and engineer of Sheffield electricity department, was appointed district engineer for the Mid-East England Electricity Scheme under the Central Electricity Board. He was succeeded by Mr. E. Morgan, of Wolverhampton.

Mr. F. Hayes resigned from the position of deputy engineer and station superintendent at Plymouth electricity works in consequence of ill-health.

Mr. S. M. Hill was appointed by Bristol Corporation, station superintendent at the Portishead power station.

Mr. William Beavis, manager of the Newhaven and Seaford Electricity Co.'s works at Newhaven, disappeared during the gales on December 8th. Fragments of the car in which he was travelling were found in such a position as to lead to the conclusion that he was blown into the sea.

Mr. G. Tough, electrical engineer and manager, is shortly retiring from the service of the Coventry Corporation after occupying the position since 1908.

Mr. H. F. G. Woods, borough electrical engineer and manager, Torquay, resigned to take up the general managership of the Exe Valley and East Devon Electricity Supply Companies. He was succeeded by Mr. G. J. Hollyer, borough electrical engineer of Loughborough.

The West Ham Undertaking.

Mr. F. W. Purse resigned his position as chief engineer and manager of the West Ham electricity undertaking to become chief engineer of the London and Home Counties Joint Electricity Authority. He was succeeded by Mr. J. W. J. Townley, chief electrical engineer of the L.C.C. tramways department.

Mr. A. J. Waring, borough electrical engineer, Newark, was appointed borough electrical engineer to Felixstowe B.C. He was succeeded by Mr. R. E. Livesley, chief electrical assistant to Aylesbury Corporation.

Mr. H. McNaul, electrical engineer to Gelligaer U.D.C., resigned to take up a position in the Midlands.

Mr. J. B. Hood, of the South Shields electricity department, was appointed electrical engineer to Richmond Corporation in succession to Mr. W. L. Wickwar, who accepted an appointment at Bingley.

Mr. Wm. Arden Royle was appointed engineer and manager of the Blackburn undertaking in succession to Mr. P. P. Wheelwright.

Mr. W. Holmes resigned his position of electrical engineer to Barking U.D.C. on account of ill-health, and Mr. W. E. Kidner was promoted to fill the vacancy.

Mr. R. A. Chattock, city electrical engineer, Birmingham, is due to retire under the age limit at the end of the year and Mr. F. Forrest, chief assistant electrical engineer, will succeed him. The title of Mr. E. J. Jennings has been changed to secretary and commercial manager, the chief electrical engineer being responsible for the engineering side of the department.

Mr. S. E. Monkhouse was appointed chief assistant to the general manager of the Newcastle-upon-Tyne Electric Supply Co., Ltd., and Mr. H. E. Woodward technical assistant.

Mr. J. H. Parker, borough electrical engineer and transport manager of West Hartlepool, was recommended for appointment as electrical engineer in the L.C.C. tramways department, in succession to Mr. J. W. J. Townley.

Tramway and Transport.

There were also many changes among tramway and transport managers and engineers, past issues of THE ELECTRICIAN showing that :—

Mr. R. L. Horsfield, late manager of Cardiff tramways, took over the management of Leeds tramways and omnibuses department.

Mr. D. E. Bell, manager of St. Helen's Corporation tramways, was appointed to succeed Mr. F. J. Chapple as manager of the Yorkshire (Woollen District) Electric Tramways, Ltd., Mr. Chapple having resigned to take up an appointment at Harrogate.

Mr. W. Forbes, general manager and engineer, Aberdeen tramways, was appointed manager of Cardiff Corporation tramways.

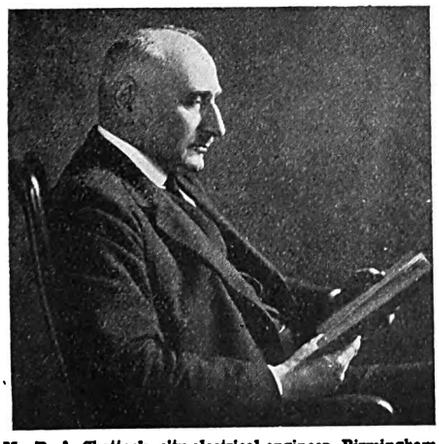
Mr. F. A. Fitzpayne succeeded Mr. R. Stuart Pilcher as transport manager of Edinburgh Corporation tramways, following Mr. Stuart Pilcher's appointment to a similar position at Manchester.

Mr. J. Aldworth retired after 30 years' service as manager of Nottingham Corporation tramways. Mr. G. W. Marks, of Chesterfield, succeeded him.

Mr. Frank Buckley, general manager of Bury tramways department, was appointed to a like position at Norwich.

Mr. R. A. Fearnley became manager of Southend Corporation tramways, resigning the managership of Keighley Corporation tramway department.

Mr. H. P. Stokes, engineer and manager of Plymouth tramways department, resigned in order to join the British United



Mr. R. A. Chattock, city electrical engineer, Birmingham, who is due to retire at the end of the year. Mr. F. Forrest was appointed his successor.

Mr. F. W. Purse resigned his position as chief engineer and manager of the West Ham undertaking to become chief engineer of the London Joint Authority.

Mr. J. H. Parker, who was, during the year, recommended for appointment as chief electrical engineer of the L.C.C. Tramways.

Digitized by Google

Automobile Services, Ltd. He was succeeded by Capt. C. Jackson, manager at Oldham.

Mr. H. W. Laing, of Lytham St. Annes tramways department, resigned after 23 years' continuous service as general manager.

In the Manufacturing World.

On the manufacturing side of the industry a number of personal changes were also recorded, as for instance :—

Mr. R. Dumas, works manager at Rugby for the British Thomson-Houston Co., Ltd., retired from that position after 21 years. Mr. R. C. Clinken, chief of the engineering laboratory, also retired, Mr. H. W. Warren succeeding him.

Mr. D. A. S. Porteous was appointed works manager of the Enfield Cable Works, Ltd.

Capt. P. Dunsheath was appointed research and technical manager of the Holborn office of W. T. Henley's Telegraph Works Co., Ltd.

Sir Felix Pole became chairman of Associated Electrical Industries, Ltd.

Mr. W. H. Peak resigned his appointments as managing director of the Marconiphone Co., Ltd., the Sterling Telephone and Electric Co., Ltd., and the Relay Automatic Telephone Co., Ltd. Messrs. B. B. Johnson and Major W. Burningham White were appointed joint managing directors.

Mr. S. R. Mullard relinquished his position as managing director of the Mullard Wireless Service and Radio Valve Companies.

Mr. M. J. Railing became joint managing director of the General Electric Co., Ltd.

Mr. H. Wynne Roberts, sales manager, and Mr. F. Winstanley, manager of the illuminating and domestic appliances departments of the General Electric Co., Ltd., were appointed directors.

Mr. Bernard D. F. Dudley Docker and Sir Edmund Wyldbore-Smith resigned from the Board of Associated Electrical Industries, Ltd.

Mr. T. R. Martin resigned his position as joint managing director of J. H. Tucker and Co., Ltd.

There were many personal items of interest throughout the year, which were neither strictly engineering nor manufacturing, but which nevertheless warrant their remembrance. Among these it will be remembered that :—

Mr. W. J. Jones was appointed manager of the E.L.M.A. Lighting Service Bureau, in succession to Mr. W. E. Bush.

Mr. J. T. Mould was elected chairman of the R.M.A. and Mr. R. B. Weaver vice-chairman.

Dr. C. E. Guillaume was awarded the 1928 Duddell Memorial Medal of the Physical Society.

Mr. W. J. Jones, who succeeded Mr. W. E. Bush as manager of the E.L.M.A. Lighting Service Bureau.

Sir Basil P. Blackett was appointed chairman and the Earl of Clarendon a director of the Imperial Communications Co.

Signor Guido Semenza was awarded the 8th Faraday Medal of the Institution of Electrical Engineers.

Miss B. J. Lanfear resigned the secretaryship of the I.M.E.A. after occupying the position nine years, and Mr. J. W. Simpson, formerly town clerk of Thornaby-on-Tees, succeeded her.

Ald. and Mrs. H. J. Galliers celebrated their silver wedding. Ald. Galliers was, during the year, Mayor of Brighton, and is believed to be the first electrical contractor to become a mayor.

Mr. T. A. Edison attained his 82nd birthday this year.

Mr. Owen Young, chairman of the General Electric Co. of New York, was chairman of the Expert Committee on Reparations which sat in Paris.

Mr. Allen Bertram Field was awarded the first Lamme Medal of the American Institute of Electrical Engineers.

Sir John R. Brooke became an Electricity Commissioner, and on his resigning the position of secretary to the Central Electricity Board, Mr. R. H. Fox was appointed his successor.

Sir James Devonshire resigned from the position of chairman and managing director of the North Metropolitan Electric Power Supply Co., having reached the age limit.

Prof. E. V. Appleton was awarded the Morris Liebmann Memorial Prize for 1929 by the American Institute of Radio Engineers.

Mr. James C. Besly succeeded the late Mr. C. W. Schaefer as electrician-in-chief to the Eastern Telegraph Co., Ltd.

Mr. A. P. M. Fleming was, during the year, appointed hon. secretary for England for the American Institute of Electrical Engineers.

Mr. T. Trimwell resigned from the position of solicitor and secretary of the National Register of Electrical Installation Contractors and was succeeded by Mr. A. Montgomery.

The Kelvin Medal of the Institute of Civil Engineers was awarded to Mr. Andre Blondel.

Mr. E. S. Evans, district engineer of the E.L.M.A. Lighting Service Bureau for the North-East Coast, resigned in order to take up an appointment in South Africa.

Prof. D. W. Richardson was awarded the 1928 Nobel Prize for Physics.

Sir William McLintock, who took a prominent part in the cable and wireless merger, was engaged to advise the Government in the London traffic problem.

Dr. Yasujiro Niwa, chief engineer of the Nippon Electric Co., Ltd., was awarded the Asano Prize of the Institute of Electrical Engineers of Japan.

Dr. W. E. Sumpner, principal and head of the physics department of Birmingham Central Technical College, is retiring at the end of the present year. He has held the position of principal for 35 years.

Mr. F. E. Smith, F.R.S., Director of Scientific Research at the Admiralty, was appointed Secretary to the Committee of the Privy Council for Scientific and Industrial Research on the resignation of Mr. H. T. Tizard, F.R.S.

Messrs. Owen Young, Gerard Swope, Clarke Mirior, Arthur Baldwin and J. Edmonds, were elected directors of the Allgemeine Elektricitäts Gesellschaft, of Berlin.

Sir Austen Chamberlain and Sir Laming Worthington-Evans accepted invitations to join the board of the Greater London and Counties Trust, Ltd., which controls a number of electricity undertakings in the South of England.

Honours List.

The official list of New Year Honours issued on February 28th, the publication having been delayed two months by the illness of the King, contained the following :—KNIGHTS : Prof. J. A. Fleming, F.R.S., Emeritus Professor of Electrical Engineering, University College, London ; Lt.-Col. C. B. Levita, chairman of London County Council ; Col. T. F. Purves, engineer-in-chief, Post Office. ORDER OF ST. MICHAEL AND ST. GEORGE : Mr. M. F. Headlam, chairman, Pacific Cable Board. KNIGHTS BATCHELOR : Mr. G. A. Julius, chairman of the Council for Scientific and Industrial Research, Commonwealth of Australia. ORDER OF THE BRITISH EMPIRE : Sir W. S. McCormick, F.R.S., chairman of the Advisory Council of the Department of Scientific and Industrial Research ; Major J. A. Sadd, Mr. P. A. Theis, assistant secretary, Pacific Cable Board ; Mr. J. A. B. Jones, assistant electrical engineer, Sudan Government Railways and Steamers ; ORDER OF THE INDIAN EMPIRE : Mr. E. E. Gunter, director, Persian Gulf Telegraphs, Indo-European Telegraph Department (retired).

Amongst the Honours conferred by the King on the occasion of his 64th birthday were the following :—KNIGHTS : Mr. William Jarratt, Comptroller-General of the Patent Office : Mr. R. T. Nugent, director of the Federation of British Industries ; Mr. Chandrasekhara Venkata Raman, Professor of Physics, Calcutta University. ORDER OF THE BRITISH EMPIRE : Capt. Richard A. H. Lewin, instructor, School of Electric Lighting, Gosport ; Mr. A. C. Hayes Statham, assistant engineer, Wireless, Indian Imperial Posts and Telegraphs Service. COMPANION OF THE IMPERIAL SERVICE ORDER : Mr. A. L. de Lattre, assistant engineer-in-chief, General Post Office.

Photographs of some of the personalities mentioned in these notes are reproduced on the opposite page. Other personal paragraphs, but dealing with happenings of more recent date, appear on page 834.

Signor G. Semenza, past President of the International Electrotechnical Commission, who died on Nov. 7th, aged 61 years.

The late Mr. A. H. Allen, technical editor of the "Electrical Review."

Sir J. M. Gatti, managing director of the Charing Cross Electricity Supply Co., Ltd., and past President E.D.A., who died Sept. 14th.

OBITUARY, 1929.

DURING the year under review the electrical industry suffered the loss of many well-known engineers and others, chief among whom may be mentioned the following :—

MR. F. HARDING, aged 71 years, one time manager of Derby Corporation tramways.

MR. CHARLES BRUSH, aged 80 years, the inventor of the Brush arc light. He completed his first dynamo in 1876.

MR. DAVID FULTON. He played a prominent part in the transfer of the National telephones to the Post Office.

MR. ROBERT HENRY BENSON, aged 79 years. He was chairman of the Anglo-American Telegraph Co. and was on the board of the St. James's and Pall Mall Electric Light Co., and a director of the London Electric Supply Corporation.

DR. RICHARD VERNON HANSFORD, aged 41 years. He had been attached to the engineer-in-chief's office at the Post Office. He was prominently connected with the introduction of the Transatlantic wireless telephony service, and was especially concerned with the design of transmitters for short-wave work.

MR. EMILE BERLINER, aged 78 years. Soon after his migration to the United States from Germany in 1870 he was attracted by the possibility of transmitting speech by telegraph wire. He set to work using for a receiver an apparatus as shown in the Bell patent of 1876. In 1878 he joined the Bell Telephone Co. In 1881 he paid a visit to Europe and laid the foundation for a telephone factory in Hanover. After considerable discussion between Edison, the U.S. Patent Office, and others about the priority of invention of loose contact transmission, Berliner was granted complete letters patent for this principle. Other inventions of electrical interest were his molecularium and secondary battery. Berliner was also the first (1877) to discover that an electric contact connected to a membrane would act as a reproducing telephone instead of a Bell instrument.

Mr. STEPHEN PAGET LUKE, on January 1st, aged 83 years. One time deputy Director-General Indian Telegraphs, a director of the Telegraph Construction and Maintenance Co., Ltd., and for some years chairman of the Calcutta Electric Supply Corporation.

SIR HENRY TRUEMAN WOOD, secretary of the Royal Society of Arts, on January 7th. He had been associated with the Society since 1872, when he became editor of its "Journal." He was appointed secretary in 1879. He was one of the organisers of the Paris Exhibition in 1889.

MR. A. H. ALLEN, on February 13th, in his 57th year. He was technical editor of the "Electrical Review."

MR. F. HILL, on February 13th, aged 54 years. He was manager and engineer of Hammersmith (London) electricity department.

MR. W. R. SPAVEN, on March 1st, for 24 years manager of Portsmouth Corporation tramways.

SIR JOHN DENISON-PENDER, on March 6th, aged 73 years, chairman of the Eastern Telegraph Co., Ltd., and associated companies.

DR. PAUL DVORKOVITZ, on March 16th, aged 72 years. He was the originator of the system of low temperature carbonisation which bears his name.

MR. VALERE A FYNN, on March 20th, aged 58 years. He contributed largely to the development of the single-phase motor and to other inventions relating to motors, among which is the Fynn-Weichal motor. He obtained his early engineering experience with Brown, Boveri and Co., in Switzerland, and with Easton, Anderson and Goolden in London, and subsequently he established offices in London as a consulting engineer. His single-phase motors were manufactured by the Elektricitäts-Gesellschaft Alioth of Switzerland, France, Germany, Italy and Spain, and the General Electric Co. of England. In 1909 he transferred his interest to the United States, and from that year until 1921 he was retained by the Wagner Electric Manufacturing Co. as consulting engineer.

MR. ARTHUR ERNEST ANGOLD, on April 10th, aged 56 years, for 37 years with the General Electric Co., Ltd.

MR. WILLIAM WORBY BEAUMONT, on April 14th, aged 80 years, vice-chairman of the London Electric Vehicle Committee.

MR. G. D. MALCOLM, on April 29th, aged 39 years, chairman of the Meter and Instrument Section of the I.E.E.

MR. C. T. BRISCOE, on July 23rd. He was head of the firm of C. T. Briscoe and Son, Ltd., electrical engineers and contractors, Blackburn, and a former chairman of the Blackburn sub-Branch of the Electrical Contractors' Association.

MR. J. P. THOMPSON, on July 30th, engineer and manager of the Fife Electric Power Co.

MR. KARL AUER RITTER VON WELSBACH, on August 4th, aged 70 years. He invented, among other things, the osmium filament lamp, in 1897.

MR. WILLIAM SHARMAN TOPLIS, on August 25th, aged 52 years. He was largely responsible for the electrification of the Burma oilfields.

SIR JOHN MAURICE ÆMILIUS GATTI, on September 14th, aged 57 years, chairman of the L.C.C. in 1927-28, managing director of the Charing Cross Electricity Supply Co., Ltd., and a past-President of the E.D.A.

MR. WILLIAM BANNISTER, on October 1st, aged 81 years, an original director and 27 years chairman of the Chloride Electrical Storage Co., Ltd.

MR. ALFRED BAKER, on October 25th, for 24 years general manager of Birmingham tramways department.

PROF. G. F. CHARNOCK, on November 7th, professor of engineering at Bradford Technical College.

SIGNOR GUIDO SEMENZA, on November 7th, aged 61 years, past-President of the International Electrotechnical Commission.

MR. CHARLES ALBERT BLASCHECK, on November 26th, aged 55 years, chief engineer of the Canterbury electricity undertaking.

SIR R. A. LISTER, on December 6th, aged 84 years, founder and chairman of R. A. Lister and Co., Ltd.

ADMIRAL OF THE FLEET SIR HENRY JACKSON, on December 14th, aged 74 years. In 1895 Sir Henry began experiments and trials under sea-going conditions, inclusive of the use of balloons and kites, with the view of utilising the effect of Hertzian oscillations for naval signalling purposes. In 1901 the Royal Society elected him into its fellowship. From 1901 to 1929 he was chairman of the Radio Research Board.

POWER STATION DEVELOPMENT IN 1929.

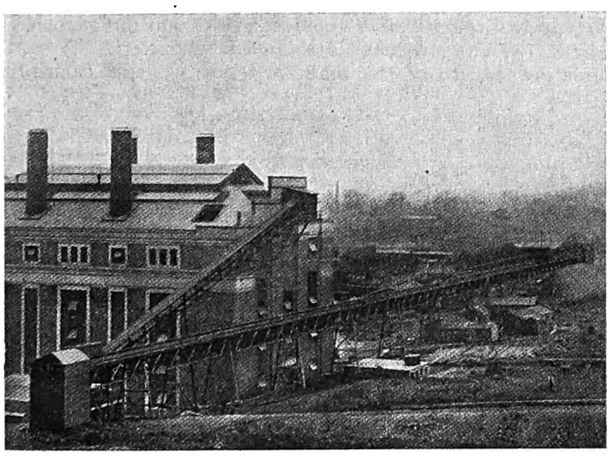
Opening of "Selected" Stations in Central and North-West England and North Wales Electricity Schemes—Extensions at Torquay, Stoke-on-Trent and Portishead.

POWER station activities in the year under review included, in order of retrospection, the opening of the first section of the Birmingham Corporation's new station at Hams Hall, which, included in the Central England Electricity Scheme as a selected station, has a present installed capacity of 60 000 kW. Under the provisions of the Central England scheme an addition of 30 000 kW will be made by the winter of 1933–34, while further additions aggregating 150 000 kW will be made by 1940–41.

The principal plant at present installed includes two main turbines and two house turbines. The main machines have a continuous rating of 30 000 kW and run at 1 500 r.p.m., while the house turbines have a maximum rating of 1 875 kW at 3 000 r.p.m., and drive their respective generators through speed reduction gears. In all cases steam is supplied at 350 lb. and 700 deg., and the turbines are designed for 1 lb. per sq. in. absolute pressure at the exhaust. The main turbines are of the single casing type fitted with impulse blading throughout. The steam expands in a velocity stage with two rows of moving blades, which are followed by three drums, of small to medium diameters, carrying 30 rows of blading. Both the moving and stationary blades in the high-pressure and intermediate pressure portions are completely machined, whereas in the low-pressure portion the moving blades are machined all over and the stationary blades cast into the diaphragms. The two main alternators are capable of a continuous output of 37 500 kVA at 0·8 power factor. The machines generate at 11 000 V three-phase 25 cycles and run at 1 500 r.p.m.

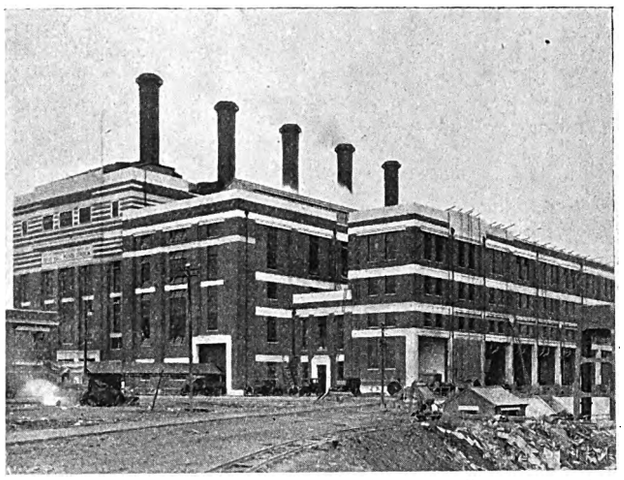
Driven direct from the end of an alternator rotor are an exciter and auxiliary generator, and though these machines are electrically separate they are mounted in a common shell. Excitation is at 220 V, while the auxiliary machine is of sufficient capacity to supply one main circulating water pump and one main extraction pump at 440 V.

There are two circulating pumps and two extraction pumps per set, one of which is normally supplied from the auxiliary generator, and the other from the d.c. board, so that two separate and distinct electrical systems have to fail simultaneously before the set is shut down due to absence of power from the condenser auxiliaries. The d.c. switchboard can, moreover, be supplied from three separate sources, namely, by two 1 875 kW, 460 V d.c. generators, two 500 kW generators direct coupled to 750 H.P. motors supplied from 11 000 V busbars, and by a 440 V, 2 000 Ah battery.



The conveyor plant at the Portishead station belonging to the Bristol Corporation.

The switchgear section includes a large 11 000 V stonework cubicle switchboard, electrically remote controlled, a d.c. flat back switchboard which is also electrically controlled, together with the control boards. In addition there are several electrically operated auxiliary switchboards, a low-tension a.c. board of the metal clad type controlling the house supply from two 1 750 kVA transformers, and a 33 000 V isolating link cubicle board on the e.h.t. side of the main transformers. The whole of this switchgear is contained in the switch house, on the top two floors of which are installed the 11 000 V stonework cubicle board and the control board, the former occupying the greater portion of the two floors, while on the two lower floors are situated the d.c. and a.c. boards, auxiliary panels, and the 33 000 V isolating link cubicles. The 11 000 V cubicle board is divided into 21 main panels, control being provided for the two 37 500 kVA turbo-alternators, six trunk feeders supplying power direct to various sub-stations, two 500 kW motor generator sets and two 1 750 kVA works supply transformers. There are also several cubicles containing busbar couplers, section switches and such necessary gear. Main and transfer busbars are each provided with their own sets of isolating links, etc. The equipment of the cubicles—which is practically the same for all the circuits controlled, with the exception that each alternator is supplied with a potential transformer and two oil circuit breakers, one for connecting to the main busbars and the other for the transfer bars—consists of an oil circuit breaker, isolating links and instrument transformers. For all the circuits controlled the breakers have a rupturing capacity of 750 000 kVA.



Hams Hall, which was opened during November, is a "selected" Central England station.

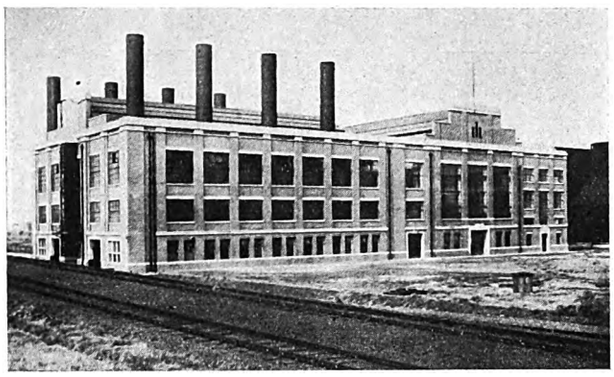
The control room contains the necessary controls, the a.c. board, controlling the alternator cubicles, six trunk feeder cubicles, bus section switch, bus coupler, works supply cubicles, and two motor generator cubicles.

Each alternator control panel is equipped with two two-way control switches for operating the oil circuit breakers, red and green signal lamps indicating the position of the breakers. A further control switch operates a single-phase oil circuit breaker installed in the neutral earthing circuit of each alternator. Each feeder control panel possesses an oil switch controller, ammeter, single pole leakage relay and a triple pole inverse time overload relay. The d.c. board is equipped with panels controlling the two auxiliary generators, the d.c. sides of the two 500 kW motor generator sets, battery and booster, trip circuit master control, works lighting and power, and the two house turbo-generators. Several blank panels are left unequipped for future extensions. The positive and negative boards controlling the same circuit are separated from each other so that the board is split into positive and negative sections. Most of these panels are equipped with a new type of d.c. circuit breaker known as the line contact circuit breaker, which is said to give a greatly improved form of laminated contact. The laminations are in the form of standard vee-edged blades, bedding into corresponding grooves formed in the contact block. By using any number of these blades any capacity of circuit breaker may be constructed up to 20 000 A without overheating.

In the basement of the switch house are located the main 12 000 kVA feeder transformers, together with three 1 750 kVA works supply transformers, one of which functions as a spare. Each of these latter transformers is supplied with three-phase 25 cycle current at 11 000 V, stepping down to 440 V. The cables from the secondaries of the two tranformers in use are taken to two incoming units of the low-tension metal-clad switchboard situated on the same floor. This switchboard, which supplies power to the various boiler

Digitized by Google

house drives, comprises 12 units, two incoming and ten outgoing, each unit being equipped with an oil circuit breaker of 150 000 kVA rupturing capacity. The 33 000 V isolating link cubicles are also housed in the basement, together with the liquid earthing resistances for earthing the neutral points of the two main turbo sets, and the six main feeder transformers. Each of the latter is situated in a separate room, the six rooms running the length of the switchhouse. With



The Slacks Valley power station which will form a unit in the North-West England and North Wales Electricity Scheme.

each transformer is associated one of the 33 000 V isolating link cubicle switchboards previously mentioned, and the appropriate earthing switch.

Another interesting development in power station progress during the year was at Portishead where the Bristol Corporation brought into operation two 20 550 kW turbines, each direct coupled to a 25 000 kVA alternator. The main turbines are designed to operate with steam at a pressure of 300 lb. per sq. in. gauge, and superheated to a total temperature of 727 deg. F. The high-pressure cylinder, which contains twenty expansion stages, is of cast steel, symmetrical in design, while the diaphragms are built up of mild steel with machined nozzles. The low-pressure cylinder is of the divided flow type. The steam, after expanding through two stages, is divided, one half being diverted to the second half of the cylinder, from which it proceeds through three expansion stages to the condenser, while the remainder of the steam is expanded through one ordinary and one multi-exhaust stage to the common exhaust. The high- and low-pressure turbine shafts are connected by means of a "Bibby" type flexible coupling, while the low-pressure turbine shaft is coupled to the alternator shaft by means of a semi-flexible coupling. In the latter type the degree of flexibility desired is obtained by means of a steel shell of corrugated section bolted between the ends of the respective shafts. To each turbine is direct connected an alternator of 25 000 kVA capacity, 11 000 V, three-phase, 0·8 p.f., 50 cycles, with a house service alternator of 600 kVA, 550 V, 0·9 p.f. on the same shaft, together with a house service exciter. The excitation of each main alternator is provided by two motor-generator sets, each capable of supplying the whole of the excitation current. Each set is supplied from a separate source. The stator winding of the main alternator is of the basket or involute type, the coils being former wound and placed in open slots. Each generating unit is connected to the 11 000 V terminals of a 25 000 kVA bank of transformers, stepping up to 33 000 V. The transformer equipment comprises six 8 333 kVA single-phase units and one spare. All switching and synchronising is arranged on the 33 000 V side. The main e.h.t. switchgear is of the metal-clad, compound-filled, draw-out type incorporating full interlocking features, the oil circuit breakers having a rupturing capacity of 750 000 kVA. The main busbar system as an initial installation consists of two sections with provision for extending up to six or eight sections. Each section of busbars will be interconnected by means of a synchronising busbar through suitable reactors, the whole forming a star reactance scheme. The two bus sections each control the output of one 20 000 kW alternator. The third section now under construction will control a 50 000 kW set.

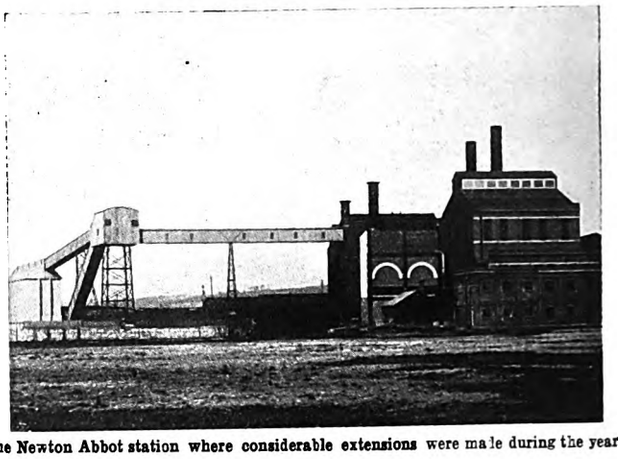
E.H.T. Switchgear.

The e.h.t. switchgear is of the remote electrically operated type. All auxiliaries essential to the running of the station have been duplicated, and at least two entirely separate sources of supply are available for each motor. Auxiliary switchgear principally consists of one 20-panel 550 V main switchboard and two 10-panel 550 V "unit" switchboards. The former is the distribution board for station auxiliaries not intimately associated with the turbine and is supplied through two 800 kVA. three-phase, 33 000/550 V transformers, and, in addition, by an emergency house service set of 550 kW capacity. The 10-panel "unit" boards each control the turbine auxiliaries, each board being fitted with double busbars, one set of bars being supplied from the 550 kW auxiliary alternator on the main alternator shaft, the other set of bars being supplied by a feeder from the main distribution board. The oil circuit breakers have a rupturing capacity of 35 000 kVA.

Slacks Valley.

A new station put into operation by Oldham Corporation as part of the North-West England and North Wales Electricity Scheme is that at Slacks Valley, the present generating plant of which is 37 500 kW; the whole site, however, is capable of ultimate extension to accommodate a total of 150 000 kW of plant.

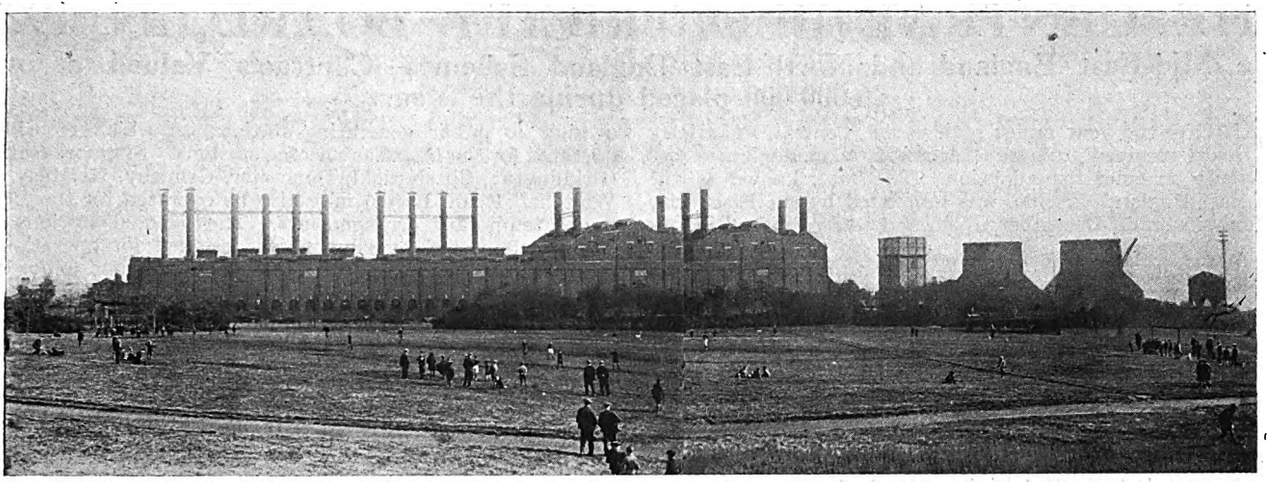
The turbine house has an initial installation of three turbo-alternator sets, each running at 3 000 r.p.m., and each capable of giving a normal output of 12 500 kW at 6 600 V. The normal conditions for which the turbines are designed are 250 lb. steam pressure at stop valve; 650 deg. F., total temperature of steam at stop valve; and 28·2 in. vacuum. Each turbine is of the two-cylinder type, designed so that only steel is exposed to high-temperature steam. Four comparatively small diameter pipes provide a flexible connection from the steam chest to the turbine cylinder, and pipes with corrugations are arranged on each side of the machines, to give flexible connections between the two cylinders. The low-pressure cylinder is made of cast iron and incorporates a number of rateau impulse stages and "Baumann" multi-exhaust. The alternators are each capable of a continuous normal full load output of 12 500 kW at 0·8 power factor. The exciter is direct coupled to its alternator and is of the overhung type. The switch and control rooms are arranged so that the operator in the control has a complete view of the turbine house, which obviates the necessity of installing signalling apparatus. The switch room is equipped with 6 600 V duplicate busbar electrically operated draw-out metal-clad switchgear controlling the three 12 500 kW turbo-generators and six group feeders, so interlocked that it can be correctly handled with perfect safety. The main units have two distinct triple-pole oil circuit breakers (having a rupturing capacity of 1 500 000 kVA), one for each set of busbars. These switches are motor operated. A rather interesting feature of the main switchgear is that each phase



The Newton Abbot station where considerable extensions were made during the year

has a complete non-magnetic earthed metal enclosure throughout, so that should any faults develop they will be earth faults only, the fault current being limited by the neutral earthing resistance. The smaller units controlling the outgoing feeders have two triple-pole oil circuit breakers (rupturing capacity 750 000 kVA) in the one tank, which allow the feeders to be put on either set of busbars as desired. These switches are solenoid operated. The generators are fitted with the self-balanced type of protective gear, which is so interlocked with the field suppression pillar that the latter equipment only functions when the breaker opens under an internal fault condition. Stand-by definite time limit overload protection is also provided. Over the feeder panel board is fixed an automatic indicating line diagram. The supply of energy

Digitized by Google



The station belonging to the Stoke-on-Trent Corporation was also extended during 1929. This station, like Hams Hall, is one of the "selected" stations of the Central England Electricity Scheme.

for auxiliary power and for lighting is obtained from three 1 000 kVA 6 600/400 V transformers. These transformers are connected to a low tension ironclad switchboard arranged on the switch room side of the turbine house at floor level. The supply to the boiler house switchboard is also controlled from this point. An 800 Ah battery is provided to operate the switchgear and to provide stand-by lighting when required.

Extensions made during the year also include the starting up of a 7 500 kW turbo-alternator with surface condensing plant at the Newton Abbot station of the Torquay Corporation, making the total maximum continuous rating of the station 18 000 kW. The new machine has a power factor of 90 per cent., runs at 3 000 r.p.m. and delivers 11 000 V at 50 cycles. For the purpose of withstanding accidental short-circuit, the alternator has been designed to have an inherent protective reactance of 15 per cent. The inherent regulation of the machine at 90 per cent. power factor is 35 per cent. and the unit power factor 24 per cent.; the voltage is maintained constant within 1·0 per cent. plus or minus by means of an automatic voltage regulator of the "Tirrill" type. The turbine is of the "Curtis" impulse type and the alternator closed circuit air cooled. An exciter of the shunt connected commutating pole type is directly coupled to the end of the alternator shaft by means of a flexible disc coupling.

The e.h.t. switchgear is of the cellular type, duplicate busbars are provided and the oil circuit breakers, which are fitted with welded boiler plate tanks for each phase, are electrically operated from a vertical type control board installed in the control room gallery. The generator equipments include circulating current protective gear, together with definite time limit overload relays, also automatic field suppression switches. The d.c. switchboard is of the vertical flat back type and is arranged to control the d.c. side of the rotary convertors, the town supply and various auxiliary circuits of the station.

Extensions were also made at the central station of the Stoke-on-Trent Corporation, this unit being another of the selected stations in the Central England Electricity Scheme. The extensions comprised a 12 500 kW turbo-alternator, boilers, pumps and auxiliaries. The turbine is a single cylinder machine of the impulse type designed to operate at 3 000 r.p.m. with steam at 250 lb. per sq. in. gauge pressure, superheated to a total temperature of 650 deg. F. No cast iron parts are exposed to high-temperature steam, the high-pressure end of the cylinder and the valve chest being of steel throughout. The steam inlet is controlled by automatic valves controlled by oil pressure from an automatic governor. The governor valve is provided with motor-driven mechanism by which the turbine can be regulated from the switchboard.

The alternator is designed for a load of 12 500 kW at 0·8 power factor, three phase, 50 to 51½ periods, at 6 600 V. The stator windings are protected by the "Merz-Price" balanced current system, and in the event of any fault on the machine windings the Merz-Price relay will open the main 6 600 V switch and also an automatic field switch mounted against the exciter. The e.h.t. main switchgear has been extended by the addition of six metal-clad circuit breaker units with remote control, one of the new units connecting the output of the new turbo-alternator to the busbars, one serving as a busbar coupling switch, one controlling the high-tension supply to a transformer for the station auxiliaries, and three control the supply to outgoing feeders. The circuit breakers are of the totally enclosed metal-clad double busbar type, with oil immersed isolator switches and provided with interlocks. The busbar coupling switch has a continuous rating of 1 800 A, the alternator switch a capacity of 1 500 A and the transformer and feeder units 300 A each. Each switch has a rupturing capacity of 350 000 kVA. A further addition to the equipment is an earthing cubicle fitted with an electrically operated oil circuit breaker by means of which the neutral point of the alternator is connected to earth through a resistance. The circuit breaker is operated from the control board, which also carries a drop type relay with flag indicator and lamp, which signals if any earth fault current flows in any part of the e.h.t. system. The station service transformer is an 800 kVA three-phase unit taking 6 600 V and giving a supply at 415 V for operating the auxiliary motors of the new equipment. The l.t. switchgear has been extended by the addition of a busbar sectionalising panel and one transformer panel, both with a rating of 1 500 A and a breaking capacity of 100 000 kVA. Four 400 A feeder panels with a breaking capacity of 25 000 kVA have also been installed to control the supply to cables feeding power distribution boards in various parts of the power house.

SWITCHGEAR EQUIPMENT.

B.E.S.A. Specification for Three-Phase A.C. Circuit Gear.

PUBLICATION No. 195–1929, dealing with switchgear equipments for three-phase a.c. circuits, which has just been issued by the British Engineering Standards Association, is a companion specification to No. 194, published in 1926, which dealt with switchgear equipment for d.c. circuits. These schedules for three-phase a.c. circuits have been drawn up with a view to specifying the least amount of apparatus which will control the machine or circuit, and yet avoid fire hazards, discontinuity of supply and danger to the operator. In many cases, according to the nature of the service, size of plant, and other circumstances, additional apparatus will be required or desired, and to this end the appropriate additions to the various equipments are separately scheduled as "Optional extra Equipment" from which a selection should be made after consideration of the requirements of the individual case. The necessary apparatus for earthing the neutral point of a three-phase system, either solidly or through a resister, is scheduled, and certain requirements are laid down regarding the accessibility of switchboards for cleaning and examination. As in the case of B.S. Specification 194, the schedules are accompanied by a series of diagrams illustrating each type of circuit for which standard equipment is specified. Incidentally, these diagrams afford an excellent illustration of the manner in which the British Standard symbols for electrical purposes may be employed on schematic diagrams.

Copies of the Specification, No. 195–1929, may be obtained from the Publications Dept., British Engineering Standards Association, 28, Victoria Street, London, S.W.1: Price 2s. 2d. post free.

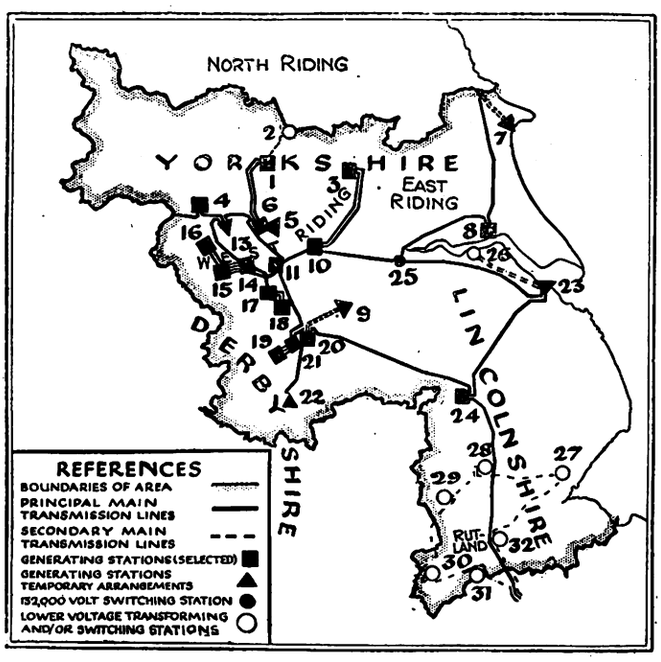
THE CENTRAL ELECTRICITY BOARD IN 1929.

The Mid-East England and North-East England Schemes—Contracts Valued at over £6 000 000 placed during the Year.

DURING the year under review the Central Electricity Board received from the Electricity Commissioners two electricity schemes for adoption. The first, known as the Mid-East England Scheme, was submitted by the Electricity Commissioners in December, 1928, and was published by the Board in its adopted form in March of this year. The scheme is now being carried into effect and covers about 7 545 square miles, including the East and West and part of the North Ridings of Yorkshire, the counties of Lincoln and Rutland and part of the counties of Nottingham and Derby. The area had a population at the last census of approximately 4 666 500. The scheme embraces the area of 73 authorised undertakings owning 40 public generating stations, of which 16 will be operated for the Board as selected stations. Six more stations (Bridlington, Chesterfield, Doncaster, Grimsby, Keighley and Whitehall Road, Leeds) may also be operated for the Board under temporary arrangements. The selected stations will be interconnected by ring mains designed for operation at 132 000 V, and capable of transmitting not less than 50 000 kW. Secondary main transmission lines will also be erected, operating at 33 000 V.



Illustrating the Mid-East England Electricity Scheme as adopted by the Central Board in the current year, the "selected" stations being :—(1) Harrogate, (3) Foss Islands, (6) Kirkstall, (8) Hull, (10) Ferrybridge, (11) Wakefield, (13) Valley Road, (14) Thornhill, (15) Huddersfield, (16) Halifax, (17) Barugh, (18) Barnsley, (19) Blackburn Meadows, (20) Prince of Wales, (21) Neepsend, and (24) Lincoln. The "temporary arrangements," switching and transformer stations, main and secondary transmission lines are indicated, the numbers representing :—(2) Boroughbridge, (4) Keighley, (5) Leeds, (7) Bridlington, (9) Doncaster, (22) Chesterfield, (23) Grimsby, (25) Readness, (26) Barton-upon-Humber, (27) Boston, (28) Sleaford, (29) Grantham, (30) Oakham, (31) Peterborough, (32) Stamford.

The second scheme, to be known as the North-East England Electricity Scheme, was transmitted by the Electricity Commissioners to the Board in June, 1928, and at the time of going to press was still under consideration. The scheme deals with about 5 050 square miles covering Northumberland, Durham and a part of the North Riding of Yorkshire, The area had a population at the last census of approximately 2 674 800 and embraces coal-mining, shipbuilding, iron and steel, engineering and the chemical trades. It also covers wide tracts of agricultural territory which, with a few isolated exceptions, are at present unprovided with any system of supply. At present there are 32 authorised undertakers in the area, owning between them 15 public generating stations. The consumption in 1927-28 was about 247 kWh per head of population and it is estimated that this will increase to an average of 410 in 1935-36. Under the proposals, six existing stations will be selected and operated for the Board, namely, Carville (A), Carville (B), Dunston, North Tees, Darlington and Sunderland. It is not anticipated that any new stations will be required, but the scheme provides for five further stations to be worked under temporary arrangements for a few years. There are several waste-heat and private generating stations connected up to the system of undertakers in the area, and it is assumed that these undertakers will continue the arrangements already entered into with the owners of these sources of supply. Broadly speaking, four of the selected stations, namely Carville (A) and (B), Dunston and North Tees, will supply the base load, while the remainder will be used for meeting the peak load in the area. The stations will be interconnected by high pressure main transmission lines designed in a series of ring mains. These are not necessarily completed in the present scheme, but the primary transmission system has been laid out so as to permit of later amplification under schemes for adjoining areas. The main transmission system will comprise 102 route miles of line and five transforming stations.

During the year the Central Board placed a number of contracts in connection with schemes already in hand and among these may be mentioned those given below, representing in cash value no less than £6 044 836.

SOME CONTRACTS PLACED BY THE CENTRAL BOARD DURING 1929.

Material.	Name of Firm.	Scheme.	Value.
132 kV transformers	Ferranti, Ltd. Fuller Electrical & Manufacturing Co., Ltd.	S.E. England	£400 000
Filter plant	Stream-line and Filter Co., Ltd.	Central Scotland	£20 000
66 kV cables	British Insulated Cables, Ltd. Callenders Cable and Construction Co., Ltd. Pirelli General Cable Works Co., Ltd.	S.E. England	£3 250 000
66 kV switchgear	British Thomson-Houston Co., Ltd.	S.E. England

SOME OUTSTANDING CONTRACTS PLACED DURING THE YEAR.

A Selection from the Many Large Contracts which were Placed with British Firms During the Year, for Works Both at Home and Abroad.

WE give below a selection from the large number of contracts which were successfully tendered for during the year by firms in this country, many of which were secured in the face of strong foreign competition. These contracts are only a selected few of the many secured, and are also exclusive of those placed by the Central Electricity Board, but, notwithstanding these facts, they represent well over £3 000 000 in cash value.

Cable, etc.

AUCKLAND POWER BOARD: Johnson and Phillips, Ltd., about 13 miles of 22 000 V, 0·25, three-core underground transmission line.

SOUTHERN RAILWAY: Johnson and Phillips, Ltd., h.t. cable for Dartford-Gravesend and Twickenham-Windsor sections.

ANGLO-BELGIAN TELEPHONE CABLE: Siemens Bros. and Co., Ltd., 7-quad cable from Canterbury and Dumpton Gap to La Panne.

EGYPTIAN GOVERNMENT: Pirelli-General Cable Works, Ltd., trunk telephone line between Alexandria and Cairo, £193 000.

ST. PANCRAS (LONDON) BOROUGH COUNCIL.—Standard Telephones and Cables, Ltd., supply of l.t. cable required for extension work, services, etc., and main e.h.t. lines.

Steam Raising Plant.

LONDON POWER CO., LTD.: Babcock and Wilcox, Ltd., six water-tube boilers, each evaporating 250 000 lb. of water per hour (normal rating), economisers, superheaters, etc., for new Battersea station.

BRISBANE CORPORATION: Babcock and Wilcox, Ltd., three boilers, £74 266.

VICTORIAN ELECTRICITY COMMISSION: John Thompson Water Tube Boilers, Ltd., eight boilers, superheaters, pipework, etc., for Yallourn power station, £223 288.

BRIGHTON CORPORATION: Yarrow and Co., Ltd., two boilers, each of 75 000 lb. evaporation, £46 130.

SHEFFIELD CORPORATION: Stirling Boiler Co., Ltd., three 120 000 lb. boilers and accessories, £140 206.

HALIFAX CORPORATION: Babcock and Wilcox, Ltd., two boilers, with auxiliaries, £83 411.

HACKNEY (LONDON) B.C.: Stirling Boiler Co., Ltd., three boilers, each with maximum evaporative capacity of 150 000 lb. per hour, coal handling plant, etc., £310 679.

CROYDON CORPORATION: Babcock and Wilcox, Ltd., £101 712.

HACKNEY (LONDON) BOROUGH COUNCIL.—Simon-Carves, Ltd., additions to boiler plant at Millfields Road generating station, including installation of three water-tube boilers each having evaporative capacity of 125 000 to 150 000 lb. of steam per hour, travelling grate, mechanical stokers, economisers, superheaters, mechanical draught plant, and independent chimney to each boiler, foundations and civil engineering work, steel-framed brick boiler house, and coal handling and storage plant. Total valueo f boiler plant contract (£250 000 approximately).

Generating Plant.

ROTTERDAM MUNICIPALITY: Metropolitan-Vickers Electrical Co., Ltd., two 42 000 kW turbo-generators.

HACKNEY (LONDON) B.C.: C. A. Parsons and Co., Ltd., 30 000 kW turbo-alternator and condensing plant, £104 052.

SHEFFIELD CORPORATION: English Electric Co., Ltd., 25 000 kW turbo-alternator, etc., £94 413.

SWANSEA CORPORATION: British Thomson-Houston Co., Ltd., 10 000/12 500 kW turbo-generator, £34 476.

LIVERPOOL CORPORATION: Metropolitan-Vickers Electrical Co., Ltd., 50 000 kW turbo-alternator, with accessories, £193 370.

CROYDON CORPORATION: Metropolitan-Vickers Electrical Co., Ltd., turbo-alternator, etc., £76 851.

LONDON COUNTY COUNCIL.—Metropolitan-Vickers Electrical Co., Ltd., provision of rotary convertor, with supervisory control. British Thomson-Houston Co., Ltd., supply of six rotary convertors. Metropolitan-Vickers Electrical Co., Ltd., two rotary convertors.

Switchgear, etc.

HACKNEY (LONDON) B.C.: A. Reyrolle and Co., Ltd., £62 200.

IRISH FREE STATE ELECTRICITY SUPPLY BOARD: Metropolitan-Vickers Electrical Co., Ltd., switchgear, in connection with Shannon power scheme.

ROTTERDAM MUNICIPALITY: British Thomson-Houston Co., Ltd., 25 000 V switchgear, comprising 39 isolated phase equipments, with oil circuit breakers of 1 500 000 kVA interrupting capacity.

SHEFFIELD CORPORATION: General Electric Co., Ltd., £55 067.

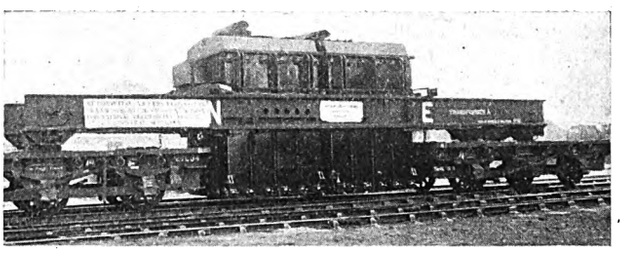
VICTORIAN ELECTRICITY COMMISSION: Australian General Electric Co., Metropolitan-Vickers Electrical Co., Ltd., and Gibson, Battle and Co., switchgear and feed pumps, for Yallourn station; total £50 000.

CROYDON CORPORATION: English Electric Co., Ltd., £44 227 10s.

LIVERPOOL CORPORATION: British Thomson-Houston Co., Ltd., main auxiliary switchgear section at Clarence Dock station, £72 651.

Electric Lighting Equipment.

LONDON COUNTY COUNCIL: Charing Cross Electricity Supply Co., Ltd., General Electric Co., Ltd., and Pirelli-General Cable Works, Ltd., improvement of Victoria Embankment lighting.



A 60 000 kVA transformer bank leaving the works of the Metropolitan-Vickers Electrical Co., Ltd., for the Central Scotland Electricity Scheme.

DUNOON U.D.C.: Johnson and Phillips, Ltd., complete lighting scheme.

Transformers.

PRESTON CORPORATION: English Electric Co., Ltd., transformer plant, £35 100.

Miscellaneous

GREAT INDIAN PENINSULA RAILWAY: Metropolitan-Vickers Electrical Co., Ltd., 21 electric locomotives.

LONDON COUNTY COUNCIL: Dorman, Long and Co., Ltd., tramway track rails, etc., £55 381.

CENTRAL ARGENTINE RAILWAY: Metropolitan-Vickers Electrical Co., Ltd., 20 000 V transformers and switchgear for power stations, complete equipment for five new sub-stations, extension equipment for four sub-stations and electrical equipment for 145 coaches.

FERRO-CARRIL CENTRAL DE BUENOS AIRES: Westinghouse Brake and Saxby Signal Co., Ltd., electro-pneumatic signalling between Federico Lacroze and Callao.

MANCHESTER SOUTH JUNCTION AND ALTRINCHAM RAILWAY: Metropolitan, Cammell Carriage Wagon and Finance Co., Ltd., 24 motor cars, 22 trailer cars and 22 driving trailer cars; total £200 000 (approximately).

BOMBAY, BARODA AND CENTRAL INDIA RAILWAY: Westinghouse Brake and Saxby Signal Co., Ltd., power signalling material for Bombay Central Station.

LONDON COUNTY COUNCIL: Hurst, Nelson and Co., Ltd., 100 double deck electric tramcar bodies, £172 200. English Electric Co., Ltd., 100 car sets of electrical equipment, assembly of bodies with trucks, etc., £83 750.

SWEDISH TELEGRAPH BOARD: Marconi's Wireless Telegraph Co., Ltd., equipment for new 60 kW broadcasting station near Stockholm, Kr. 400 000 (approximate).

ELECTRICAL OVERSEAS TRADE IN 1929.

Brief Summaries of Overseas Trade during Each Month of the Year—Eleven Months Trading Shows Exports to be £10 334 440 in Excess of Imports—This Year's Returns Compared with those for 1928.

THE latest figures dealing with this subject were published by the Board of Trade on December 12th, the returns at that date being for the month of November. For the purposes of this review we are therefore perforce to confine our observances to the first eleven months of the year, January to November, and, taking each month in turn shows that, on the whole, the electrical industry has maintained its reputation in the overseas markets.

During January, for instance, electrical exports at £1 614 301, were £67 610 in advance of the value credited to the same month of 1928, and while imports also increased by £25 341 during the month when compared with January of the previous year, the favourable balance for the month of exports over imports was £1 016 206, an increase of £42 269 on the position at the same time last year. The increase in imported goods was largely due to telegraph and telephone instruments, and wires and cables, excluding submarine cables. The export position was improved by shipments of motors and generators, other than railway and tramway motors, rubber insulated wires and cables and glow lamps. Submarine cables, an item which invariably shows an improvement, declined during January by £11 464 when compared with the same month of 1928.

Though during February our overseas trade did not maintain the improvement of the previous month, the position was better than it at first appeared. Electrical exports for the month were valued at £1 462 365, or £19 837 less than the return for February, 1928. On the other hand, the total electrical exports for the first two months of the year were valued at nearly £50 000 more than for the corresponding months of 1928. Imports during the month also increased, the amount being £28 292, or for the two months £53 633. This increase was due mainly to larger importations of telegraph and telephone instruments, which item alone, when compared with February, 1928, advanced by £56 931. The favourable trade balance of exports over imports was, however, as high as £953 549, or £1 969 755 for the two months.

The First Quarter.

The falling off of trade during February was again in evidence during March, for exports at £1 372 691, were £372 233 less than during the same month last year, while for the quarter a similar comparison showed a decline of £324 460. Electrical imports on the other hand advanced during the same month and period by £56 527 and £110 160 respectively. Export items which contributed to the fall in values were chiefly various motors and generators, which between them accounted for £100 352, and submarine cables with a decline of £50 995. Exports during the month were, however, well in advance of imports, the favourable trade balance standing at £800 667, or, for the three months of the year, £2 770 442.

An improvement set in during April and the returns for the month valued electrical exports at £1 674 234, an advance of £244 743 on the figures for the same month last year. Imports for the month increased by £89 225, but the balance of exports over imports was, nevertheless, £1 130 997. The improved position was assisted by larger shipments of electrical machinery, which increased by £57 315 when compared with April, 1928, and various wires and cables with an advance of £55 196. Importations of rubber covered wires were higher in value by £15 424, and telegraph and telephone instruments by £45 666. The excess of four months' exports over imports was, however, still satisfactory at £3 901 419.

A Further Improvement.

The favourable trade movement indicated in April still showed signs of existence in May, electrical exports being valued at £1 850 244, or £250 994 more than during May, 1928. This improvement was largely accounted for by shipments of wires and cables, other than submarine, which advanced by £176 174, and various electrical goods by £114 395. Imports during the month, when compared with the same month of last year, increased by £150 672, electrical machinery showing an increase of £37 000, and telegraph and telephone instruments £52 439. For the five months of the year the total electrical exports were £7 973 835, or £171 277 more than for the same period of 1928, and total imports at £2 840 857 showed an increase of £350 057. The favourable trade balance for the five months stood at £5 132 978, and for the month £1 123 559.

A setback in overseas trade was recorded in the returns for June, and electrical exports at £1 383 752, declined by £191 199 when compared with June, 1928. Electrical machinery exports alone showed a decrease of £116 365, and various wires and cables, including submarine, a further £61 449. Imports of electrical machinery and apparatus also increased by £147 544, telegraph and telephone instruments again being responsible for a considerable percentage of the total with an increase of £76 164. The favourable trade balance for the month was £761 604, and for the six months £5 894 582.

A recovery was made during July, the export return at £1 703 316 showing an improvement of £592 336 against the figures for July, 1928, and for the seven months at £11 060 903 an advance of £272 414 on the return for the same period last year. July imports were again in advance of the July, 1928, figures, the amount being £103 464, or for the seven months £601 065. With the exception of switchboards, various motors and generators, and batteries and accumulators every export item showed an improvement during the month, the largest being telegraph and telephone instruments with an increase of £100 749, when compared with last year's return of the same goods for July. Imports of electrical machinery by the same comparison declined during the month by £12 205. The excess of exports over imports for the month reached the more satisfactory figure of £1 114 247, making the favourable trade balance for the seven months £7 008 829.

(*Continued on page* 814.)

SUMMARY OF ELECTRICAL OVERSEAS TRADE, 1929.

Month.	Imports.	Increase (+) or decrease (−) on previous month.	Increase (+) or decrease (−) on same month, 1928.	Exports.	Increase (+) or decrease (−) on previous month.	Increase (+) or decrease (−) on same month, 1928.	Balance of exports over imports for month, 1929.

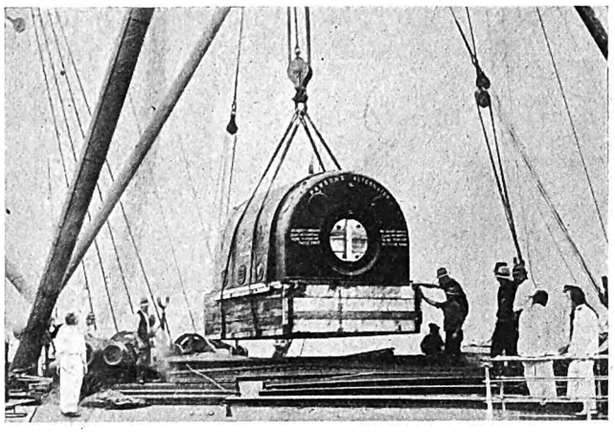
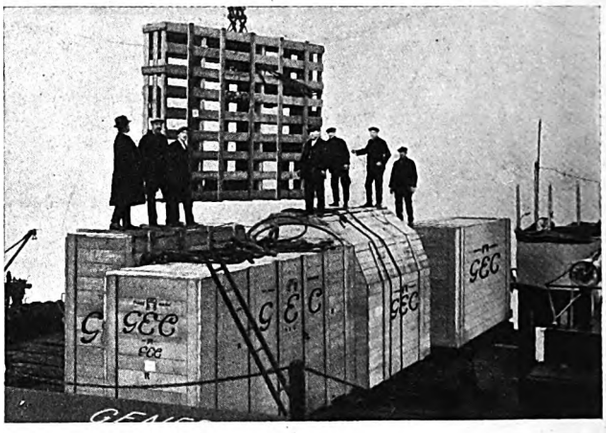
MORE BRITISH EXPORT PICTURES.

Left—A shipment of 100-ton electric locomotives manufactured by the English Electric Co., Ltd. Bottom left—A large alternator by C. A. Parsons & Co., Ltd., being unshipped overseas. Bottom right—A consignment of machinery by the General Electric Co., Ltd., bound for Canada.





Shipments of British electrical goods during August again recorded an increase, the total amounting to £1 678 755, or £242 356 more than during August, 1928. Similar exports for the eight months amounted to £12 738 658, an increase of £513 770 when compared with the same period of 1928. Imports during August were valued at £748 286, or £172 302 more than during August, 1928, making for the eight months an advance of £773 367 on the total for the corresponding months of last year. Shipments of various wires and cables strengthened during the month, the increase over last year's return for August being £73 585, and, in the case of telegraph and telephone instruments, £87 494. Importations of electrical machinery during the month were £18 325 in advance of August last year, while telegraph and telephone instruments increased by £125 328. August exports were, however, £930 469 in excess of imports, and for the eight months £7 938 298.

September Figures.

A slight decline in export trade was again experienced during September, when electrical exports, valued at £1 330 540, were £148 038 less than for the corresponding month last year. For the nine months similar exports amounted to £14 070 198, an improvement of £366 732 on the return last year for the same period. Imports were again higher during the month, the increase over September, 1928, being £303 613, and for the nine months an increase of £1 076 980 over the total for the same period of 1928 was recorded. Though the export values for the month were generally lower than for the same month last year, various motors and generators improved by £34 653, and various wires and cables by £73 117. Imports of electrical machinery were again higher in value when compared with September, 1928, the increase being £40 218; the largest increase, however, appeared under the item telegraph and telephone instruments, the amount being £146 497. In spite of the increased value in imports, exports showed an excess of £547 609 for the month, and for the nine months £8 486 907.

An improvement was recorded during October, when exports, returned at £1 925 580, were £380 458 higher than for the same month of last year. Similar exports for the ten months of 1929 amounted to £747 190 more than for the corresponding months of 1928. Imports for the month were higher than for October, 1928, by £356 625, electrical machinery having increased by £40 130, telegraph and telephone instruments by £160 901, glow lamps by £47 344, and batteries and accumulators, £27 169. During the ten months of this year imports, by comparison with the corresponding months last year, increased by £1 433 605. The improved position in exports was largely brought about by increased shipments of various wires and cables, which, by comparison with October, 1928, increased by £205 836. The excess of exports over imports was for the month, therefore, £918 157, and £9 405 064 for the ten months.

Eleven Months.

Export trade during November amounted to £1 827 048, or £177 451 more than during November, 1928. Imports of similar goods during the same month were £237 889 in excess of those for the corresponding month of last year. For the eleven months of this year exports were £924 641 in advance of those for the same period of 1928, while imports for a like period and by the same comparison showed an increase of £1 671 494. Exports for November exceeded imports by £929 376, while for the eleven months the excess was £10 334 440. During the month shipments of various wires and cables, when compared with November, 1928, improved by £85 014, submarine telegraph and telephone cables by £16 903, telegraph and telephone instruments by £55 443, and various apparatus, £88 505. The increased value in imports was mainly due to electrical machinery, increase £25 202; various wires and cables, £12 096; telegraph and telephone instruments, £72 476; and electric glow lamps, £37 290.

It will be seen from the summary on page 812 that during the eleven months under review exports showed improvement during seven of the months when compared with the corresponding months of 1928, while imports for the same period and by the same comparison increased during each of the eleven months.

PROFESSIONAL & TRADE ASSOCIATIONS IN 1929.

A Concise Symposium of Reviews of the Year's Work and Progress.

THE multiplicity of technical and trade organisations in the British electrical industry prevents all but the most diligent and inquiring minds from acquiring full knowledge, not only of the aims but of the achievements and progress of those in which he is not directly interested through personal membership. There are also cases where pressure of work or other circumstances prevents electrical people from obtaining an adequate view of the work that is being done by the bodies of which they are members. In order to provide concise and authoritative information of the work that has been done by electrical institutions and associations during 1929 we have obtained from the secretaries or other officials of practically all of the bodies concerned a series of specially written and signed reviews of the year's work. Space limitations have militated against detailed development of quite a number of useful activities, but on the whole the statements which we print below will be found to give a true perspective to the picture.

THE BRITISH ELECTRICAL AND ALLIED INDUSTRIES RESEARCH ASSOCIATION.—The steps initiated in 1928 to secure more adequate support from all sections of the industry for the work of the Electrical Research Association are now beginning to bear fruit. As the result of many discussions between representatives nominated by the interested bodies, recommendations have been made as to the contributions which might be expected from different sections of the industry. The railway groups have already agreed their quota. A marked increase in membership and contributions received from the authorised undertakings has taken place, and favourable replies have been received from the manufacturers' associations.

Whilst during the present year the Association has had to retain many important researches on its waiting list, there is every prospect that this list will be reduced to reasonable proportions during 1930.

An outstanding feature in the year's work was a conference in the summer, which was attended by leading investigators into the properties of steam, from the Continent and America, to discuss methods of test, and existing differences in experimental results. As a result it has already been possible to prepare agreed tables subject to tolerances which will doubtless be reduced in the near future.

Important contributions were made to the proceedings of the 1929 Paris Conference, on circuit breaking, overhead lines, three-phase single conductor cables and impurities in insulating oils; and these were well received.

The I.E.E. awarded the Kelvin Premium to the authors of an E.R.A. Report on the Phenomena of Circuit Breaking, in which a gas blast switch was described, anticipating a design now receiving wide attention on the Continent.

Methods of estimating the heating of electric cables exposed to the sunshine in racks have been completed, and good progress made in the evaluation of the heating of multiple cables in ducts, and of deeply buried cables.

The issue of a novel report on the resistance of earth to the movement of bodies embedded in it will go far to put the design of pole foundations on a sound footing.

Results of researches on the transfer of heat from tube to water in steam condensers have been brought into commercial use, and apparatus is being developed for dealing with the problem of heat transfer from steam to tube.

Important work has been done for the Central Electricity Board on interference with communication circuits, and valuable reports prepared, at the request of the Electricity Commission, dealing with the arrangement and carrying capacity of high voltage cables and overhead lines. Good progress has been made in the study of vibration in overhead lines and the elimination of breakdown from this cause. The numerous researches on properties of materials which have contributed so largely to standardisation in this field have been maintained.

Increased facilities for fundamental research on the properties of dielectrics have been arranged with the N.P.L., and good progress made elsewhere in the elucidation of the phenomena of plastic yield and brittleness.

The printed schedule of headings under which researches are now being carried on runs to 18 pages.—E. B. WEDMORE.

* * *

THE BRITISH ENGINEERING STANDARDS ASSOCIATION (ELECTRICAL INDUSTRY SECTION.)—The reorganisation of the work of the Association consequent upon the granting of a Royal Charter has not influenced the work of the Electrical Section to any appreciable extent, since the working of this Section has, from its reorganisation in 1913, been along the lines now adopted for the other industry sections.

The thirty-one technical committees and some seventy subcommittees of the Electrical Industry Committee cover a very extensive field, ranging from rules for the performance of large steam and hydraulic turbines for electrical plant, and specifications for steel forgings for use in their manufacture, on the one hand, to the details of electrical lampholders and the components of wireless receivers on the other hand.

The Committees have widely different functions, which may be classified broadly into three groups, viz.: (1) Specifications for the testing and performance of machinery and apparatus; (2) Dimensions to secure interchangeability and to reduce the number of designs. (3) Specifications for the testing and performance of materials.

During the year under review, specifications falling into these three categories have been issued as follow:—(*a*) Specifications for the Testing and Performance of: Distribution Boards (B.S. Spec. 214); Electricity Meters (B.S. Spec. 37, revision); Ceiling-type Electric Fans (B.S. Spec. 367); X-ray Transformers (B.S. Spec. 326); Hydraulic Turbines (B.S. Spec. 353); Instrument Transformers (B.S. Spec. 81, revision); Indicating Instruments (B.S. Spec. 89, revision); Recording Instruments (B.S. Spec. 90, revision); Electrical Protective Relays (B.S. Spec. 142, revision); Flame-proof Enclosures for

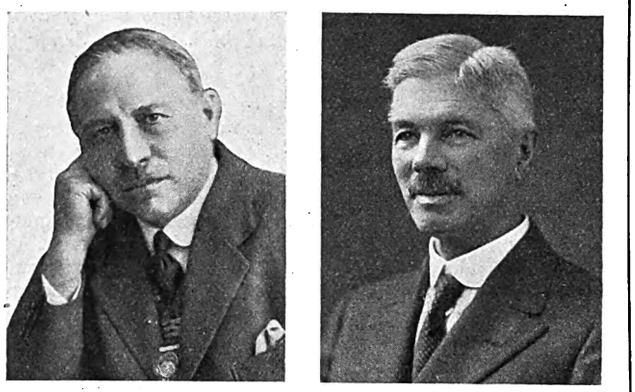
Electrical Apparatus (B.S. Spec. 229, revision); Traction Motors (B.S. Spec. 173, revision).

(*b*) Specifications to secure interchangeability and to reduce the number of designs have been prepared and issued for: Ceiling Roses (B.S. Spec. 67); Three-pin Plugs and Sockets (B.S. Spec. 317).

(*c*) A Specification for the testing and performance of varnish-paper boards and tubes (B.S. Spec. 316) has been published. This was based on the work of the Electrical Research Association.



Two presidents of the I.M.E.A.
Left: Mr. A. Nichols Moore (1928-29); right: Mr. J. K. Brydges (1929-30).

(*d*) In addition to the above, a specification covering rules for the measurement of voltages with sphere-gaps (B.S. Spec. 358), which is applicable to the testing of machinery and apparatus, and also to the testing of insulating materials, has been published. This also was based on the results of work of the Electrical Research Association.

Among the specifications at present in preparation, those for the following apparatus and materials are nearing completion:—

Clear Baking Oil Insulating Varnish; Leclanché-type Primary Cells; A.C. Switchgear Equipments; Desk-type Electric Fans; Steels for Electrical and Allied Machinery; Standards of Resistance of Aluminium; Mains Supply Apparatus for Radio and Acoustic Reproduction; Graphical Symbols for Railway Signalling Purposes; Lampholders (revision); Steam Turbines (revision); Oil-immersed Switches and Circuit-breakers (revision); Hard-drawn Aluminium Conductors for Overhead Lines (revision); Porcelain Insulators for Power Lines (revision); Ebonite (revision); Bare Annealed Copper Wires (revision).

Specifications dealing with the following are also in preparation, but the work is only in its early stages:—

Accumulators; Railway Signalling Apparatus; Ball and Roller Bearings for Electrical Machinery; Graphical Symbols for Electrical Purposes (revision); Telegraph and Telephone Material (revision); Methods of Testing Permanent Magnets; Yellow Varnished Cotton Cloth.

International Standardisation.

International electrical standardisation is carried out under the ægis of the International Electrotechnical Commission, and during the past year international meetings were held in London for the purpose of preparing international ratings of electrical machinery, traction motors and steam turbines. Delegates from the principal foreign countries attended these meetings, which lasted over a fortnight. The delegates to the meetings were appropriately entertained by the British Committee, in association with the Institution of Electrical Engineers, the British Electrical and Allied Manufacturers' Association and the Cable Makers' Association.

As a result of the meetings, it is hoped that the I.E.C. will be able to publish international rules for the rating of electrical machinery at an early date, and to secure approval at the Plenary Meetings, which will be held next year in Scandinavia, to the international standards for both steam turbines and traction motors.

International discussions covering a wide range of electrical subjects, including acceptance tests for steam turbines, are in process, and the technical committees of the Electrical Section have during the past year spent a good deal of time in preparing proposals for discussion in the international committees.—P. Good.

* * *

The Incorporated Municipal Electrical Association.—The past year has been an exceptionally busy one, and the Association's activities have increased considerably. The total membership is now 252, which is equivalent to 82% of the municipal electricity undertakings in the country.

The Council of the Association during the past year have dealt with very many important matters affecting municipal electricity undertakings, and in many of these matters they have sought the co-operation of other kindred associations, such as the Association of Municipal Corporations, the Institute of Municipal Treasurers and Accountants, the Municipal Tramways Association, and other bodies. It is felt that by close co-operation with all associations representing local authority interests, greater benefits accrue to local authority electrical undertakings.

Co-operative Work.

The Association is constantly in touch with the Electricity Commissioners, Central Electricity Board, and various Government Departments, upon vital matters affecting the municipal electrical industry. The Association is officially recognised as representing municipal supply. There are five Standing Committees of the Council and many Special Committees, in addition to which, the I.M.E.A. is represented on many other bodies such as the E.D.A., B.E.S.A., E.R.A., Committees of the I.E.E., etc.

The Council are constantly being consulted in legal, administrative, and technical matters, and it is impossible in a short note fully to expound upon the valuable work done by the Association on behalf of municipal electricity undertakings.

The Annual Convention of the Association is looked upon as an important event in the electrical year, and the Association has many times been congratulated upon the excellence of the various technical papers which have been read at these Conventions. This year's Convention was held in June at Torquay, when the attendance of delegates was nearly 1 000.—J. W. Simpson.

* * *

The British Electrical Development Association, Inc.—During the past twelve months considerable progress has been made by the E.D.A. in all directions. Some 35 new members have joined the Association, and the reorganisation of the Association's Area Committees in all parts of the country has been successfully completed. Area Committees, fully representative of all sections of the electrical industry, have been formed in the nine provincial areas into which the

Lt.-Col. W. A. Vignoles (left), director of the E.D.A., and Mr. V. W. Dale, the Association's business manager.

kingdom is divided, the names of the areas and the towns at which they are centred being as follows:—South West, Bristol; South Wales, Cardiff; South Midland, Birmingham; North West, Manchester; North Midland, Leeds; North East, Newcastle-on-Tyne; East of Scotland, Edinburgh; West of Scotland, Glasgow; North of Ireland, Belfast.

Digitized by Google

Arrangements have been made for all E.D.A. Circles to be represented on the appropriate Area Committees, and as the latter in turn have representation on the E.D.A. Council ample facilities are available for local and area opinions to receive the fullest consideration.

The Area Committees have effectively carried out propaganda work in the form of conferences, lectures and participation in exhibitions, and they form, in addition, a means for co-operation with individuals in places where E.D.A. Circles are now being formed. In each area there is an E.D.A. representative who is anxious to assist and co-operate with all those who are interested in development work.

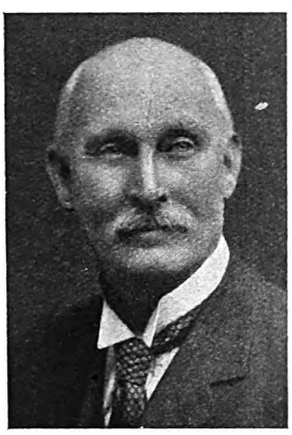
Among the more important Area Committee activities during the past year may be mentioned the E.D.A. Stand at the North East Coast Exhibition. The E.D.A., through its Area Committees, also took part in the British Industries Fair, and the Smoke Abatement Exhibition.

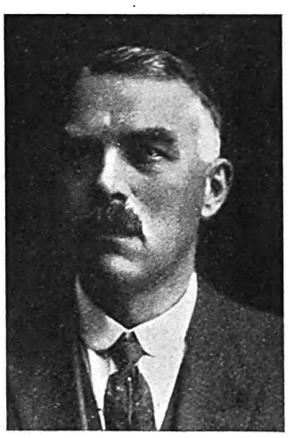
Several Sales Conferences similar to those held in London each month have also been arranged in provincial centres, and have attracted large audiences.

The Association has given advice and assistance in connection with the organisation of many local electrical exhibitions all over the country, notably at Brighton in October.

The Factory and Workshop Lighting Campaign, conducted by the E.D.A. last winter, was brought to a successful conclusion by circularising in October, to a carefully prepared list of factory owners, a booklet containing photographs of lighting installations which had been brought up-to-date as a result of the campaign.

The National Campaign for 1929–30 is the E.D.A. Electric Homes (Outlet) Campaign, which is designed to secure a larger number of plug points for the convenient use of electricity in houses that are being built, and in existing houses. An attractive booklet entitled "The House You Want" has been prepared, and will, it is hoped, be widely distributed.





Mr. L. B. Atkinson, director of the C.M.A. and Mr. A. C. Cramb, hon. secretary of the I.M.E.A.

A Home Wiring Specification has also been drawn up, which is designed to assist both the house buyer and the electrical contractor to stipulate a minimum standard number of points to be installed in the various rooms of a house.

A number of posters dealing with domestic applications of electricity have been produced, and increasing use is being made of this effective and economical method of publicity.

A large number of lectures has been given by the Association's official lecturer and others, the more important audiences addressed including the Architectural Association, the Smoke Abatement League, and the Royal Sanitary Institute, while a series of lectures has been given in Leeds, Newcastle and London, to teachers and students of domestic science. The latter class of audience is keenly alive to the possibilities of electricity in domestic service, and it is hoped that manufacturers and supply undertakings will co-operate by arranging for electrical apparatus to be available for practical use in schools.

Last March the production of a cinema film, entitled "Country Currents," showing the use of electricity on the farm and in rural industries, was completed, and it has since been shown with great success to audiences in rural areas, and at agricultural shows. Continuous use has been made of other E.D.A. films.

A large number of propaganda booklets dealing with a wide range of applications of electricity, such as refrigeration, industrial heating, electricity on the farm, and in schools, have been produced.

This winter the Association is continuing to circulate each month, to the whole of the electrical industry, booklets describing current advertising material available for local advertisements, and suggestions for effective window displays, the material for which can be obtained at small cost.—W. A. VIGNOLES.

* * *

THE TELEPHONE DEVELOPMENT ASSOCIATION.—Definite progress has been made by the Association during 1929 in its task of inoculating the British public with the telephone habit, and of increasing, not only the number of telephones in use in Great Britain, but also the average user per station or instrument.

The number of telephones on the Post Office system on October 31st, 1929, was 1 822 990, and though the complete figures for the year are not yet available, it seems very probable that the official estimate of a "record" increase of 128/129 000 nett new stations during the year will prove to be confirmed.

Sir Alexander Roger, chairman of the T.D.A.

In August, 1924, when the Association came into existence, the number of telephones was 1 205 102; the nett increase, therefore, in something over 5 years has been 617 888 and is equivalent to a percentage growth of 51·27%. This rate of growth is only exceeded in Australia, where telephones have more than doubled their number since 1920.

So far, so good. But the position is still not one that can be viewed with anything approaching complacency. We are making some progress, but nothing like enough, as the Engineer-in-Chief to the Post Office pointed out recently in his presidential address to the Institution of Electrical Engineers, to enable Great Britain to retrieve its arrears of telephone development in a reasonable time.

Joint Salesmanship.

The telephone industry, by virtue of the multiplicity of its sections, lends itself admirably—more so, perhaps, than almost any other industry—to the general idea of joint salesmanship and collective publicity, which finds expression in the work of the Development Association. It is a fact that Post Office orders for telephone plant affect over 50 trades, and it is equally a fact that any movement designed to stimulate the demand for telephone service benefits, both directly and indirectly, all those engaged, whether as masters or men, in every one of these 50 trades and industries. The result is that there is to-day hardly a firm that ranks for anything at all in the telephone supply industry itself or in its collateral industries that is not a supporter of the T.D.A. and its work. In these days when pessimism and "defeatism" are all too prevalent in industrial and financial circles, it is both refreshing and encouraging to note the single-mindedness of an industry which sets out, courageously and optimistically, to create a larger demand for its own product, especially when, as in the case of telephone service, the success of the effort spells increased employment in a large range of trades as well as an all-round enlargement of the facilities of communication, so essential in modern business and social conditions.

This is not the time to cry halt, for very much remains to be done. People are still too ready to believe ill, rather than good, of the telephone, and there is still a surprisingly large amount of uninformed criticism of the telephone service, which is from time to time made vocal in the columns of the lay Press. Nobody wants to muzzle legitimate criticism or to pretend that no improvement is possible in our telephone system. But it is worth while to remember that British

Digitized by Google

telephone and cable and battery manufacturers do business abroad as well as at home: these constant criticisms are apt, it has been proved, to give the impression abroad that there is something wrong with the plant itself, as distinct from—or as well as with—the service, an impression which, of course, is entirely incorrect, but which makes it all the more difficult for British manufacturers—not only of telephone plant—to get orders abroad at the precise moment when they are most urgently needed.

The Association can therefore continue its good work with the assurance that it carries with it the goodwill of all concerned.—H. E. Powell-Jones.

* * *

The Electric Lamp Manufacturers' Association of Great Britain, Ltd.—The Electric Lamp Manufacturers' Association during the past year has taken steps to encourage two important ideas which affect the industry as a whole.

The first is the standardisation of types, by the elimination of various types in the same wattage, and encouraging the use of fewer wattages.

Its efforts in the past to minimise the disadvantage of glare, by advocating the use of suitable shades with lamps, have only met with partial success. Its latest effort to replace the numerous lamps with clear bulbs by glareless lamps is rapidly meeting with success owing to the lamps with inside frosted bulbs being marketed to-day at a cheaper price than the corresponding lamps with clear bulbs.

Mr. C. W. Sully, director of the E.L.M.A.

This occasion has also been utilised for popularising a 25 W lamp in the place of the old 20 and 30 W lamps, thus reducing the more popular demand from five to four different wattages.

The other and still more important idea promulgated by E.L.M.A. during this year is in the matter of voltage standardisation. A committee of the I.E.E. approached E.L.M.A., and other trading bodies, with the request that the manufacturers should do all they could to encourage the standardisation of supply voltage to the domestic consumer throughout the country.

After careful consideration, E.L.M.A. decided to take the long view, and to market their most popular types of standard voltage lamps at cheaper prices than any others. At the same time they offered the authorities who have to carry out the conversion of their systems special terms on all 230 V lamps when purchased by them in wholesale quantities for the definite purpose of replacing lamps of other voltages on their customers' premises.

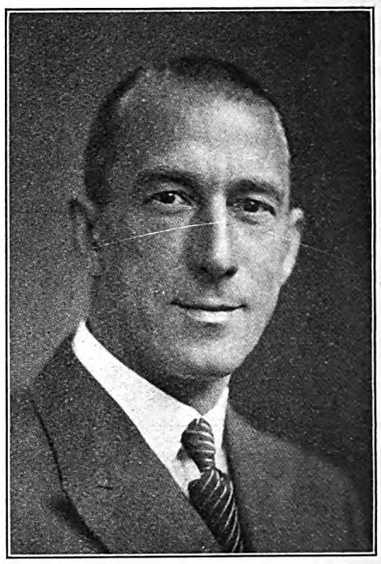
Standardisation in this latter direction has the full support of the B.E.S.A., the I.E.E., and the Government, through its Electricity Commissioners, as it will eventually prove advantageous to the manufacturer, the dealer, the user, and, by no means least, to the supply authorities throughout the country.

Therefore this Association, throughout the year, has played its part in assisting the electrical industry to maintain its reputation as being one of the most progressive in this country.—C. W. Sully.

* * *

The Electric Light Fittings Association.—This Association, which was established in 1926, has as its main aims and objects the regularisation of the trading principles of manufacturers and distributors in the marketing of electric light fittings. The Association is working in close co-operation with electrical contractors in an endeavour to arrive at trading conditions which will give full protection to the electrical contracting industry. Trading principles have, from time to time, been discussed with the representatives of the E.C.A., and the decisions arrived at have undoubtedly had an influence upon many manufacturers engaged in similar lines of business, although not members of the E.L.F.A. The E.L.F.A. has direct representation on the Electric Fittings Statutory Committee responsible for the administration of Clause 48 of the 1926 Electricity Act. It has representatives also on the Fair Trading Committee, a body representative of manufacturers, wholesalers, electrical contractors and municipal electrical engineers, and charged with the duty of framing a Fair Trading Agreement.

In addition to these activities the Association is represented on the E.D.A. Electric Homes (Outlet) Campaign on B.E.S.A. Committees for the standardisation of fittings, and on a committee of the Electrical Research Association which is investigating the question of connections for large gasfilled lamps. A special section of the Association is dealing particularly with industrial lighting fittings, and has rendered active and financial assistance to the E.D.A. in connection with that Association's Factory and Workshop Lighting Campaign. The Association has more than justified its existence by the results of its collaboration with various authorities and associations with the object of securing the most satisfactory working conditions not only for manufacturers but for distributors, electrical contractors, and other branches of the electrical industry.



Mr. F. Winstanley, chairman of the E.L.F.A.

In the membership of the Association the following firms are included:—Benjamin Electric Ltd.; Galsworthy, Ltd.; C. Harvey and Co.; Metro-Vick Supplies, Ltd.; Peyton, Hoyland and Barber, Ltd.; Osler and Faraday, Ltd.; Best and Lloyd, Ltd.; Falk Stadelmann and Co., Ltd.; General Electric Co., Ltd.; John A. Harry Hunt; W. McGeoch and Co., Ltd.; Siemens Electric Lamps and Supplies, Ltd.—F. Winstanley.

* * *

The National Register of Electrical Installation Contractors.—This organisation, which was set up six years ago by association representatives of the entire electrical industry, is an independent body which exists for the protection of the public and in the interests of good electrical installation work. It maintains a register containing the names of such electrical installation contractors as can satisfy its Executive Committee of their ability to carry out sound installation work with good materials, and grants to contractors meeting its requirements a certificate of registration and a license to use the mark of the National Register. Complaints of shoddy workmanship by registered contractors are carefully investigated, and, if substantiated, result in the deletion of the offending contractor's name from the Register.

During the past year the Register has taken energetic steps to acquaint architects, builders, municipal engineers, consultants and others likely to have the placing of installation orders, of the usefulness of the Register to them, and of the desirability of employing contractors who are pledged to do sound work, and an educational advertising campaign was undertaken in appropriate professional journals.

Efforts have also been made to warn the general public of the unwisdom from many points of view of entrusting unqualified contractors with wiring work, and over 100 000 copies of a simply worded pamphlet prepared by the Register have been bought by contractors and supply authorities for distribution to members of the general public. In the public press and in other directions the desirability of employing properly qualified installation contractors has been emphasised.

During the period from October 31st, 1928, to October 31st, 1929, the number of electrical installation contractors on the roll of the National Register has increased from 1 185 to 1 315, a net increase of 130 after taking into account deletions

Digitized by Google

from the Register of the names of 44 contractors for various reasons.

The year has also seen a further increase in the number of municipal and company electricity undertakings, consulting engineers and architects and other authorities which make a practice of restricting orders for installation work to contractors on the roll of the National Register.

During the year the National Register has issued for the information of contractors a list of practices which the Executive Committee feel would justify them in cancelling the registration of a contractor found to be offending in this manner. This list which has come to be known in contracting circles as the Register's "Nine Commandments," has definitely helped to raise the general standard of installation practice.—A. MONTGOMERY.

* * *

THE INSTITUTION OF RAILWAY SIGNAL ENGINEERS, INC.—The 17th year of this Institution's incorporated existence has been as satisfactory as any. It has been marked by the appointment of a signal and telegraph engineer for the whole of the London Midland and Scottish Railway, a Past President, Mr. A. F. Bound, being selected for the position, which is probably the most important of its kind in the British Empire.

During the year the membership has increased to more than 750, applications being received from all over the world.

In June the Summer Meeting was held in Holland, when the signalling on the Netherlands Railways was inspected by the courtesy of the Dutch railway authorities.

The annual dinner, held in London in October, was attended by a much larger company than ever before, 180 ladies and members being present.

Ten representatives of the Institution are serving on Committees of the British Engineering Standards Association, and the National Illumination Committee also includes an institution representative.

The bequest of £1 000 by the late Mr. W. J. Thorrowgood, past president and at one time signal and telegraph superintendent of the Southern Railway, will result in the Thorrowgood Scholarship being available for student members after the necessary conditions of its award have been worked out. The ultimate advantage to the signalling profession from an educational standpoint will be undoubted.

The Institution possesses a unique railway signalling library, and members may borrow these books free of charge. An up-to-date catalogue is published twice yearly in the Proceedings of the Institution.

As a technical Institution it probably represents as completely as any the profession for which it stands, its council including the leading men of the day on both the railway and manufacturing sides.—M. G. TWEEDIE.

* * *

THE ASSOCIATION OF CONSULTING ENGINEERS (INCORPORATED).—As the work of the Association is confined solely to matters affecting the professional side of engineering and the practice of its members, it is difficult to deal with the progress made during any one year.

Mr. P. V. Hunter, chairman of the National Register, and Mr. V. Watlington, chairman of the B.E.A.M.A.

The Association has now been established nearly twenty years, and includes in its ranks the majority of those engineers who confine themselves solely to professional consulting work. It affords a medium by which the public may learn the rules governing the practice of a "consulting engineer," one of its primary objects being to secure that persons undertaking to advise public and private bodies on engineering matters shall be fully qualified technical engineers, unconnected, directly or indirectly, with any manufacturing or contracting interests likely to prejudice their position as independent professional advisers. The Association does not in any way encroach on the functions of the Councils of the other leading engineering institutions.

Whilst ensuring that each of its members shall, as evidence of his technical skill and scientific knowledge, be either a corporate member of the Institution of Civil Engineers or a full member of the Institution of Electrical Engineers or the Institution of Mechanical Engineers or the Institution of Civil Engineers of Ireland, it recognises that the main purpose of these larger institutions is to deal with the science and problems of engineering which are of common interest to all engineers. The Association, on the other hand, confines itself strictly to matters affecting the status, professional conduct, emoluments and welfare of those practising in the consulting branch of the profession of engineering.

Mr. S. B. Donkin, president of the Association of Supervising Electrical Engineers.

Amongst the matters to which attention has been given during the past year has been the question of the collaboration of engineers with architects and with engineers practising in other branches of consulting work than their own. In view of the increasing complexity of modern architectural and structural work, it is obviously advisable that there should be the closest possible collaboration between the architect and the engineer on all large and important buildings, and it is hoped, as the result of the discussions which have taken, and are taking place, satisfactory arrangements will be arrived at.

The Committee have also been actively engaged in preparing a standard set of Conditions of Contract for use in connection with civil engineering contracts, as an addition to its standard conditions of contract for use in connection with contracts for electrical and mechanical work.

A large number of matters arising in connection with the position of members of the Association who have sought the opinion and counsel of the Committee on questions of difficulty have also been dealt with.—A. H. DYKES.

* * *

THE OVERHEAD LINES ASSOCIATION.—During the second year of its existence the membership of the Overhead Lines Association has doubled, both at home and abroad.

Ten other associations and bodies have co-operated in co-ordinating economy to consumers of electricity, amenities and mutual interests. The revised regulations have been given a year's trial in practice without criticism.

The simplest and most comprehensive wayleave forms have been put in the hands of all interested parties and after the lapse of twelve months the Association has again analysed all comments, all other proposed forms, held an open meeting to discuss same, and submitted to the authorities its considered opinion. Allotments are no longer claimed to come under "pleasure grounds."

For the information of all, but particularly for those members who cannot attend all meetings, more complete "Proceedings," papers and discussions have been issued monthly during the year.

The report of the Councils for the Preservation of Rural England and Wales has had consideration.

With a desire to inspire farmers to make full use of electricity for increasing output and minimising labour, the O.L.A. :—

(*a*) Is compiling a full record of the electricity consumed on every farm now electrified, and of the specific uses made of electricity on each farm.

(*b*) Has published a map of the British farm which is best equipped electrically, showing its existing three-phase power

Digitized by Google

line throughout the axis of the farm, designed for electric ploughing and cultivating every arable field, using an equipment the individual farmer can afford to own (so that his work is independent of the inconvenience of waiting for contracting power ploughing companies), and that can be operated by one ploughman; also for grinding and cutting food crops, crop- loading, water pumping, etc.

Mr. W. Fennell, president of the O.L.A. in 1929.

The Association has also summarised, from Bulletin No. 5 of the Institute of Research into Agricultural Engineering, the electricity consumed and the cost of eight applications of electric power on eight British farms which vary from 70 acres to 380 acres (average 260 acres).

Papers read before this Association, within the year under review, included "Economic Rural Electrification," which mapped in an area of 72 000 acres within 12 miles of Aylesbury, Bucks (46 miles of 11 000 V three-phase distribuotin; 60 miles of 11 000 V single-phase branch lines) with a prospective demand from 175 farms and 30 villages, giving full details of capital cost involved and of revenue expected; and an able analysis of the "Hydro-Electric Power in Ontario," showing how Ontario has solved the problem of a cheap and abundant supply in an area devoid of coal, by transmitting power even 240 miles and there supplying it in bulk at less than a halfpenny. Appreciation of the value of this contribution has been demonstrated by its re-issue in the form of a pamphlet by The Royal Society of Arts.*

The Overhead Lines Association meets, by courtesy of the Council of I.E.E., at the Institution of Electrical Engineers on the third Wednesday each month at 5.30 p.m.—THEODORE STEVENS.

* * *

THE ASSOCIATION OF PUBLIC LIGHTING ENGINEERS.—The 1929 Conference of the Association of Public Lighting Engineers had been arranged to take place at Bournemouth, Mr. Noah Wright, the Lighting Superintendent of that borough, being President-Elect. In spite of his regretted death last winter, the co-operation of Bournemouth Corporation made possible the retention of the arrangement to meet there. Mr. S. B. Langlands, the first President of the Association, was unanimously chosen to fill the chair of the Association for 1929-1930.

Opportunity was taken of the British Industries Fair at Birmingham in February to hold an extra meeting. Some useful Association business was done, and the President, Mr. J. F. Colquhoun, gave a talk, illustrated by lantern slides, describing his experiences as leader of the Street-Lighting Sub-Committee of the British delegation at the meetings of the International Commission on Illumination in America last year.

Mr. Langlands, in his Presidental address at Bournemouth, mentioned that the Association, now about six years old, had four honorary, 104 ordinary, 35 junior members, and 26 associates. Future activities outlined included a Research Committee, an organised effort to obtain more uniform and encouraging tariffs for the supply of electricity for public lighting, and a watch on provisions for the lighting of thoroughfares in any enactments concerning control of vehicular traffic on roads.

The papers read at Bournemouth discussed "Lighting and Rating"—not technical but financial difficulties hinder the improvement of street lighting, "Compromise in the Use of Illuminants for Public Lighting," the lessons from America for British street-lighting, and the possibilities of supplementing public by private lighting.

The exhibition of public lighting appliances showed many novelties.

Reference was made at Bournemouth to the growing recognition of the A.P.L.E. by kindred Associations and by public authorities. During the year the President of the Association was invited to be a Vice-President of the Public Works, Roads and Transport Congress, and the authoritative position of the A.P.L.E. in public-lighting matters at the Congress is now being recognised. The President is also, ex officio, a member of Council of the Illuminating Engineering Society.

The Association is being affiliated to the National Safety First Movement.

Largely as the result of the demonstration of the British Standard Specification for Street Lighting arranged by Mr. Colquhoun at the Sheffield Conference in 1928, the Street-Lighting Sub-Committee of the B.E.S.A., on which the A.P.L.E. is represented, is now engaged on the revision of that specification.

The A.P.L.E. is also represented on the Sub-Committee dealing with Traffic Control Signals.

The Association has representatives on the National Committee already preparing for the visit of the International Commission on Illumination in 1931. The A.P.L.E. is merging its annual conference for that year into the series of meetings to be held during the tour, and will arrange for the street-lighting sessions at Edinburgh. The prospect of the "invasion" ought to prove a healthy stimulus to the betterment of British public lighting.

Meantime, arrangements are in hand for the programme of the 1930 conference to be held at Leicester under the presidency of Mr. T. Wilkie, Superintendent of Public Lighting there.—E. T. STEWART.

* * *

THE ASSOCIATION OF MINING ELECTRICAL ENGINEERS.—The membership is keeping up, and the activities of the branches are maintained, papers read at the different meetings having led to valuable discussions.

The President at the present time is Capt. S. Walton-Brown, a prominent coal-owner in the North of England. The Treasurer is Mr. Roslyn Holiday, who is an active coal-owner in the Yorkshire District, and took the place of Mr. Alexander Anderson, of Flemington Electrical Works, Motherwell, as Treasurer,

Numerous meetings have been held to discuss the various current problems in connection with electricity applied to mining. The various publications of the British Engineering Standards Association have received the attention of both the branches and the General Council, and the Association's opinions have been communicated to that Association upon the different points.

Evidence was given by a representative of the Association before the Departmental Committee with reference to the qualifications of colliery officials, and the question of the Association's examinations has also received careful attention with regard to present-day requirements; also the question of the necessity for considering advanced education on the part of those who have the handling of the colliery electrical plant.

The annual meeting of the Association was held on July 5th, 1929, at Newcastle-on-Tyne, and was one of the most successful ever held, the attendance being considerably above the average. Numerous excursions and other functions had been arranged, and were fully appreciated by all those present; an official reception being given by the Lord Mayor on that occasion.—C. St. C. SAUNDERS.

Mr. L. B. Langlands, president of the A.P.L.E. for 1929-30.

* * *

THE DIESEL ENGINE USERS' ASSOCIATION.—Meetings have been held during 1929 at Caxton Hall, Westminster. Mr. Percy Still, Hon, Secretary since 1913, resigned and his place was taken by Eng.-Capt. J. Hope Harrison, R.N., on January 1st. In consequence of Mr. Still's resignation the offices of the Association were moved to 307, Abbey House, Westminster.

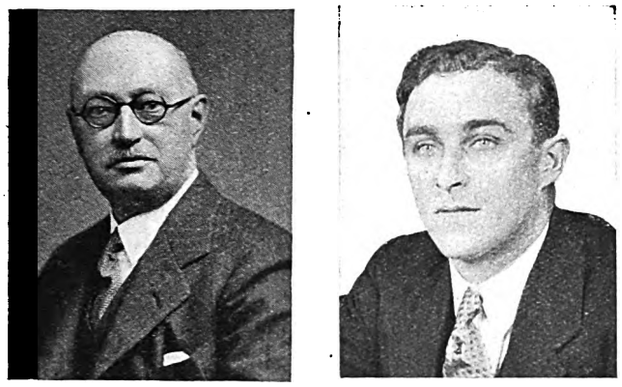
In accordance with the usual practice, an annual report on

* Journal R.S.A., Vol. 77, No. 4 013, October 18th, 1929. (Price to Non-Fellows, one shilling).

Digitized by Google

Heavy Oil Engine Working Costs has been prepared for 1929, and it is proposed to publish the report early in the new year.

The increasing favour which heavy oil engines are finding with electrical engineers for generating power in small stations and for peak loads, as well as for a number of other purposes, particularly water pumping stations, has considerably increased the numbers of members and subscribers, in spite of the fact that a number of small generating stations have been, or will be, closed in the near future.



Mr. W. H. Walton, president of the E.C.A. (1928-29), and Mr. L. C. Penwill, the general secretary.

In issuing the Report for 1929, the Committee will again refer to the operation of oil engine installations for peak load and stand-by services in conjunction with bulk supplies of electricity.

Members of this Association are scattered over the whole world, and a special feature is the report of proceedings which is circulated to all members and subscribers as soon as possible after each meeting, thus keeping those who find it difficult to attend meetings informed on matters discussed.

The Association is frequently consulted on matters connected with the purchase and maintenance of heavy oil engines, and is represented on British Engineering Standards Association Committees.

A standard insurance policy for the insurance of heavy oil engines against breakdown has been prepared by the Committee, and a standing Sub-committee on this question is maintained to deal with any questions that may arise.

The importance of such an Association has been recognised in America, where a similar society has recently been formed under the name of the American Diesel Users' Association.

Diesel users are at present interested in the problem of obtaining suitable fuel near home, and arrangements are now being made to carry out tests of fuel oils obtained from coal.—J. Hope Harrison and C. O. Milton.

* * *

The Electrical Contractors' Association.—It is impossible to give an adequate picture of the "progress" of such an organisation as the E.C.A. in a few hundred words. For example, to say that the membership of the E.C.A., the N.E.C.T.A. and the National Federated Electrical Association has been increased, during the past year, by the inclusion of seventy to eighty new individuals or firms, means nothing at all—or a very great deal—depending entirely upon one's personal conception of how many, or how few, installation engineers there are in the country who are eligible for membership, and yet remain outside the organisation. If we believe, as those within the Association certainly do, that the bulk of the sound installation men and firms in the country are already members of the E.C.A. and Allied Associations, then the membership "progress" already indicated is certainly very satisfactory, death and other wastage being taken into account. In other directions, however, the "progress" of the E.C.A must be singularly apparent to those who follow the work and activities of the organisation with any degree of real attention. During the past year, for example, the E.C.A. Bournemouth Conference attracted larger numbers and achieved a higher standard of business and social excellence than ever before. The best and most dependable electrical contractors in the country are, through the E.C.A., closer together to-day than ever before, and the consequence of that solidarity is exhibited, not only in the growing importance and success of the annual conferences, but also in the growing vigour of the Association's team work in many other directions.

In discussing the "progress" of the Association it is impossible to ignore the negotiations that take place with many Government Departments, while the work of the Association in connection with the administration of the Electricity (Supply) Acts represents a lengthy, but vital service, in the interests of ordered electrical trading. The story can be duplicated in many other directions. The negotiations that take place between the E.C.A. and the other organised sections of the electrical industry, from organised manufacturers to organised labour, involve the Association in an immense volume of work, and exhibit possibilities of very real good to all concerned. For another outward and visible sign of the "progress" of the Association, it is certainly permissible to refer to the publication of "Electrical Security," the new E.C.A. guide and handbook to better installation work; while yet another example of progressive team work is provided by the projected "Electrical Trading Register" which represents a constructive, forward movement of the greatest possible importance to all electrical traders.

To conclude, and to sum up in my opening words, it is wholly impossible to exhibit a picture of E.C.A. progress within the limit of five hundred or five thousand words. An adequate impression of its progressive labours is obtained only by those trade and public spirited men who come inside the organisation and carry on the good work.—L. C. Penwill.

* * *

The Electrical Wholesalers' Federation, Ltd.—The work of the Federation during 1929 has been directed to maintain the status of the wholesaler.

Knowing that the wholesaler is the legitimate channel and the most economical and efficient unit for the distribution of electrical supplies, our Council and Committees have fought strenuously for the "rights," not only of our members, but of the wholesale trade generally—and each section of the industry has been covered.

Our labours have had excellent effects, and many important concessions have been obtained. At any rate, the future holds out great hopes for our wholesalers. Issues such as hire purchase, preferential discounts, sale or return, and National Trading Register are some of the many subjects which have, and still are, being faced.

This much can be said with certainty. Between manufacturers (electrical and radio) and kindred associations there exist with our Federation the very best and helpful relations. We have fought hard and in unison with the manufacturers for clean trading, and to run the price-cutters to earth.

For 14 years the Federation's work has gone on. Its members include most of the leading wholesalers throughout Great Britain, and the Electrical Wholesalers' Federation has become utterly indispensable to the profitable success of the industry.—James W. McKay.

* * *

The Radio Manufacturers' Association.—The R.M.A. was brought into being on September 6th, 1926, and the first general meeting of members was held on December 8th, 1926, at which date 44 firms were on its membership roll. To-day, the R.M.A. claims the adherence of 152 members, and the Association has received general recognition as an organisation truly representative of the manufacturing side of the British radio industry.

Mr. J. W. McKay, secretary of the E.W.F.

Constituted on the principle of non-interference in the domestic trading policy of its members (which policy has been strictly adhered to) the R.M.A. has directed its attention to matters affecting the interests of radio manufacturers as a whole.

In such connection, the outstanding activity of the Association during the past year has been its negotiations with the Marconi Wireless Telegraph Co., Ltd., in the matter of royalty chargeable on receiving sets. Those negotiations have resulted in a new form of licence being agreed, to be known as

Digitized by Google

the A.3 Licence, which the Council of the R.M.A. recommends the trade to accept as a standard form of licence. Holders of such licence will now pay a royalty of 5s. per valve holder as against the former charge of 12s. 6d. per valve holder—the reduced rate being effective as and from August 28th, 1928.

Sir William Bull, president of the R.M.A.

Through special Committees the Association is in close touch with the B.B.C. and the B.R.V.M.A., thus securing co-operative action in matters affecting the interests of the general body of radio manufacturers.

Friendly relations exist, also, with such bodies as the I.E.E. and the B.E.S.A., the R.M.A. being represented on several Committees set up by the B.E.S.A. for standarisation work.

As regards its Exhibition activities, the R.M.A. was the sole promoter, as in former years, of the National Radio Exhibition at Olympia in September last, the most successful show yet held, the paying attendance during its run of ten days reaching the figure of 140 627. The Association was connected also with the Manchester Radio Exhibition, and, further, is now arranging a Radio Section in the "Ideal Home Exhibition" at Olympia in the early part of next year.

Reverting to general matters, it may be stated that, as elected by members at the Annual Meeting, an Executive Council controls the activities of the Association, which are given effect to by Committees appointed by the Council, and acting under the chairmanship of a member of the Council.

In conclusion, it can safely be said that the Association's progress during the past year has been uninterrupted. Its membership roll includes the great majority of well-known radio manufacturers, its financial position is strong, and it faces the future with every confidence that its past success will be maintained.—D. Grant Strachan.

* * *

The Wireless Retailers' Association of Great Britain.—The remarkable progress that marked the preceding year has been repeated in 1929, so that in place of 500 the W.R.A. now voices the wishes of upwards of 1 000 organised radio retailers.

Various branches have been formed during the year; the South Wales W.R.A. has abandoned its independent status and become a branch of the W.R.A. of Great Britain; and other branches are in process of formation. The policy of encouraging the formation of branches has been justified by the highly satisfactory results obtained in dealing with local problems.

One of the principal objects for which the Association was formed, and towards which it has steadily worked, namely, co-operation with other sections of the industry, was realised during the past year, a period of careful negotiation resulting in the reciprocal understanding between the R.W.F. and the W.R.A.

It has long been evident to the administrators of the W.R.A. that improved trading conditions were to be attained only by the co-operation of the leading wholesalers, among themselves and with the W.R.A. Accordingly, the understanding embodies, amongst other provisions, the principle that in return for retailers confining their purchases as far as possible to members of the R.W.F. that body will supply only bona fide retailers.

The foregoing arrangement constitutes only one item in a large programme of co-operation which the Association hopes to carry out, and already overtures have been made to the R.M.A., which, it is hoped, may ultimately result in agreements having far-reaching results.

Anti-price-cutting and anti-dabbling schemes are in operation, and the stronger the membership of the W.R.A. the more effective they become. Additional schemes are under consideration.

Official certification of the Association as a Trade Union was obtained during the year.—A. H. Clifford.

* * *

The Radio Wholesalers' Federation.—It is common knowledge that the number of firms purporting to be radio wholesalers is excessive for the requirements of the industry, and one of the chief objects of the Federation, in conjunction with the manufacturers, is to secure that a list of wholesalers shall be compiled which can ultimately be regarded as authoritative. As a step towards this the Federation has issued a list of wholesalers comprising nearly 200 establishments, and this has been very well received amongst those manufacturers who are desirous that this matter shall be regulated. This list is considered to constitute an excellent guide to a manufacturer in organising his wholesale distribution.

Owing to the excessive number of firms claiming to be wholesalers, a pernicious system has arisen of competing for the favour of retailers by giving extra discounts, and that has had a deleterious effect on the whole industry, by the retailers in turn making equivalent concessions in price to the public, resulting in no benefit to either entity concerned, but only loss to the industry as a whole. The R.W.F. consider that if wholesalers maintain the proper terms this undesirable system will be checked, if not entirely eliminated.

Apart from these two main considerations the Federation exists to assist its members in many other circumstances of business. With the Wireless Retailers' Association of Great Britain, it has established an understanding aimed generally at defining the relative status of wholesalers and retailers, and at securing that this comparatively young industry shall operate on the lines proved successful in older industries.

In the short period of its existence—since March 1928—the Federation has succeeded in creating an atmosphere favourable to the attainment of its objects.—J. Macfarlane.

* * *

The Electrical Power Engineers' Association.—During the year the E.P.E.A. has continued to make steady progress; its membership has increased, and at the moment of writing has attained the figure of 4 400, whilst its financial position, with invested funds of £22 000, indicates a strong and substantial standing.

Of its activities during the past twelve months, the most important relate to its proposal for a revised schedule of salaries and conditions of employment. These were submitted to the employers' side of the National Joint Board in the early portion of the year, and have received close consideration by the Board. It is interesting to note that the revision has been brought about by, and is designed to meet the change of conditions in the electricity supply industry at the present time, as compared with the circumstances which obtained in 1923, when the schedule was last revised. At the same time the new schedule has been designed so as to cater, as far as can be foreseen, for the development which is likely to take place in the industry during the next few years.

Mr. A. G. Beaver, a prominent worker in the Electrical Manufacturers' and Merchants' Association.

On its technical side the association has met with great success with the scheme of technical groups which it instituted towards the latter end of 1928. Three groups—viz., London, Manchester and Birmingham are in active work, and, encouraged by the success of the previous session, have arranged programmes of technical lectures for the present session, which will be instructive and beneficial to both sections of the members of the groups—viz., the electrical manufacturing engineer who is responsible for the design and manufacture of electrical machinery and apparatus; and the supply engineer upon whom falls the burden, or otherwise, of operating such machinery. The lectures which have been held or are pro-

Digitized by Google

jected, have been arranged to cover all spheres of activity in the industry.

In addition, the National Technical Group has organised many technical lectures to sections of the Association where a Local Technical Group has yet to be established.

On the protective side of its activities the Association has been energetic on behalf of certain of its members who have been displaced consequent upon the operation of the Electricity (Supply) Act, and its latest success in this direction is that recently it has been able to secure the sum of £2 500 in one case, and £450 in another, for members who had lost their employment as the result of a shutting down of a generating station. This award, which was officially given by the referee appointed by the Ministry of Labour, was the result of a mutual agreement arrived at after protracted negotiations between the company concerned and the Association. The expenditure of time and money caused by such negotiations emphasises very strongly the value to the member concerned, of such transactions being sponsored and conducted by an organisation, rather than individually.

It might also be mentioned in connection with this particular sphere of activity, that the Association has continued its vigilant watch upon all legislation introduced into Parliament, and has been able to secure in various Bills affecting the electricity (supply) industry, suitable clauses safeguarding the compensation clauses of the principal Acts, and thus protecting the interests of members who might otherwise be adversely affected by local legislation.

The social side of the Association's activities has also been well looked after, and in nearly every section of the Association it is now customary to hold annual dinners, smoking concerts, whist drives, etc.—W. ARTHUR JONES.

* * *

THE ASSOCIATION OF SUPERVISING ELECTRICAL ENGINEERS.—The records for 1929 will show a period of solid progress, not only for the A.S.E.E., but for the electrical industry as a whole. We have always appreciated that the success of the industry reflected on the position of the Association, and in our efforts to assist all movements for the good of the industry we have realised that we were really helping ourselves.

One of the outstanding points during 1929, as far as the Association is concerned, has been the great difficulty which we have experienced in supplying men for vacancies notified to the Association by employers and members. In fact, in a number of cases we have been unable to put forward nominations for various positions, which is a tribute to the standing of the Association and the exceedingly busy time experienced in the industry during the past months. It is therefore gratifying to report that the Association has not at the present time a single unemployed member, while it is also pleasing to record a greater recognition of the policy of employing fully experienced and qualified engineers in executive positions.

There has been a greater readiness on the part of employers to pay adequate rates of remuneration for such men, which is at least a realisation of the Association's policy, namely, that the employment of efficient men at adequate rates of remuneration is a good business proposition. The new Schedules of Minimum Salaries and Designations issued by the A.S.E.E. this year have no doubt played their part in this respect.

The need for lectures of a practical nature is shown by the ever-growing numbers attending the lectures of the Association, while such audiences are evidence that the supervising electrical engineer of to-day is more fully alive to the necessity of keeping himself *au fait* with everyday developments. Keener interest in educational matters has been one of the outstanding features of 1929.

The Association has naturally felt the benefit of this electrical liveliness, and its membership returns are well in advance of previous years.

The demand for efficient workmanship has been more insistent, and it would appear that employers and employees are paying more attention to the question of good materials, while there is a greater desire, so far as installation work is concerned, to recognise and to understand the Institution of Electrical Engineers Wiring Regulations for the Electrical Equipment of Buildings. The continued sales of "The Employees' Guide to the I.E.E. Wiring Regulations," published by the A.S.E.E., bears evidence in this respect, although some may interpret the sales of the booklet as a desire for more concise regulations. That greater interest is being taken in such regulations is all to the good and will reflect, in the long run, to the credit of the industry as a whole.

The progress in connection with the Suggested Scheme of Apprenticeship put forward by the A.S.E.E. has not been so rapid as many expected. This is not due to lack of effort on the part of the A.S.E.E., but our investigations have shown

Mr. H. Willoughby Ellis, the 1929-30 President of the E.C.A., and Mr. W. Finlay, Secretary of the E.C.A. of Scotland

that while all parties are alive to the need for some scheme of co-operation which will ensure a steady flow of skilled men to the industry, there are difficulties, which are not insurmountable, in connection with certain sections of the industry. Negotiations are, however, still proceeding, and we have every hope that by the end of the year further substantial progress will be secured. A number of Associations have already signified their support, but those experienced in committee work will appreciate how slow-moving this machinery is.

The emblem presented to the Association in October by the President, Mr. S. B. Donkin, crystallises our ideal by its inscription "Ease the Path to Progress," and there is reason to believe that this slogan is one to which the industry as a whole would subscribe.

To sum up, the year 1929 has been one of continuous success for the A.S.E.E., if by success we mean no unemployed members, the greater recognition of the principle of adequate remuneration for efficient labour, increased membership, increased attendances at educational and social gatherings, and an expressed desire on the part of all concerned to improve not only their individual progress but that of the electrical industry generally.—A. BRAMMER.

* * *

THE ELECTRICAL ASSOCIATION FOR WOMEN.—Undoubtedly the outstanding feature of the E.A.W. work during 1929 was the Conference arranged at the North-East Coast Exhibition, Newcastle-on-Tyne, during July, when, in addition to the women present from different parts of Great Britain, interesting papers were given by representative women from the United States, Holland, and Germany. This is the first time in the history of electricity that there has been an international platform expressing the woman's point of view on matters electrical. The Conference was opened by the President, Mrs. Wilfrid Ashley, and in the unavoidable absence of the Rt. Hon. Margaret Bondfield, M.P., a message from her was read by Dr. S. Z. de Ferranti. Not only did the exhibition authorities support the Conference, but the Lord and Lady Mayoress of Newcastle-on-Tyne were present at practically all the functions, and gave the delegates a civic welcome. The success of the Conference was very largely due to the splendid co-operation of the electrical engineers on the North-East Coast.

The number of E.A.W. Branches has been steadily increasing throughout the year, the total at the end of 1929 being 20, with a membership running into several thousands. It is a matter for congratulation that at each of these Branches a woman of outstanding eminence has been secured as the President, and on all the committees there are women representing such interests as Domestic Science, Girl Guides, Women's Institutes, National Council of Women, Smoke Abatement, Medicine, etc. In addition, women of all shades of political opinion are to be found in the ranks of the E.A.W., and in London the officers include all three of the political parties.

The work of organising the local Branches is carried out

Digitized by Google

by women interested in the district, with, in most cases, the co-operation of the local electricity supply engineer, contractors and manufacturers.

The Association has continued to pursue its interest in the Outlet Campaign, although this has been largely merged this year in the E.D.A. Campaign. The E.A.W. have co-operated throughout the country in connection with E.D.A. in this campaign.

An outstanding feature of the year has been the educational work in connection with school teachers. A deputation was arranged to the Board of Education on June 24th, led by Mrs. Hammer, when the speakers included Miss Haslett for the E.A.W., Dr. Ferranti for the industry, and Miss Clarke and Miss Shaw from the teachers' point of view. Great interest has been aroused as a result of the deputation, and there are indications that a Summer School for Teachers will be held in 1930. In addition, the Headquarters of the E.A.W. has sent out a suggested Syllabus of Lectures for Teachers all over the country, and has also arranged for a number of conferences in London.

Miss C. Haslett.

While the Association does not set out to be an Employment Bureau, it is more and more being recognised as the authority for looking after the interests of women demonstrators and saleswomen for the electrical industry. Many employers have been put in touch with suitable applicants during the year, and advice has been given to applicants re training.

During the year the Association has expressed the woman's point of view on matters electrical in many ways, including a Deputation to the Committee set up by the Electricity Commissioners on "The Uniformity of Electricity Charges and Tariffs."

To attempt to give a complete outline of the work of the E.A.W. would occupy more space than the Editor has allowed, but suffice it to say that the organisation is daily answering queries and questions, and is acting as a general clearing house for women's interests in regard to electricity.—CAROLINE HASLETT.

* * *

THE ELECTRICAL CONTRACTORS' ASSOCIATION OF SCOTLAND.—The Association continues to progress, and may be truly said to represent the electrical contracting trade in Scotland. The membership is 270. During the past year, owing to the extension of supply to the smaller districts, a considerable number of small new businesses have been started in these districts, and quite a large proportion of these new starts have applied for admission as members.

The whole membership of the Association is comprised in four branches, located at Glasgow, Edinburgh, Dundee and Aberdeen, and country members are joined to the Branch that is nearest and most convenient to them. There are local secretaries in each of these four districts. The Association is governed by a Central Board, elected by branches according to their membership, and this Board meets once a month alternately in Glasgow and Edinburgh. At these monthly meetings reports from each of the branches are submitted. The central office of the Association is at 55, Frederick Street, Edinburgh.

During the past year no question has arisen which was of burning interest. In Scotland there is no sliding scale for the regulation of wages, with the result that for a good many years now the rate of pay has stood fixed at a standard sum.

The Association has always felt that more might be done in the industry to avoid trading differences which arise between the different sections of the industry as to their respective interests. The Association continues to impress on the other sections the desirability of setting up a Fair Trading Agreement which will provide machinery for the adjustment of disputes without unnecessary friction.

The relations existing in Scotland between contractors and the supply section of the industry have been most cordial, and throughout the whole four areas steps are always taken to co-operate in every scheme that will tend to extend the uses of electricity.—WALTER FINLAY.

* * *

THE ELECTRICAL TRADES BENEVOLENT INSTITUTION.—The year 1929 will surely go down to history as that which marked the real awakening of this Institution, and it is but right that it should, for next year marks the twenty-fifth anniversary of its inception; the child will become the man.

Last year the Executive Committee decided that the time had come when the affairs of the Institution called for the full-time services of a secretary, and the writer was chosen to fill this position.

Several new ideas have been introduced, and have proved most satisfactory. A competition was organised during the summer months, which instantly caught on and also kept the Institution before the industry during that part of the year when hitherto it has been content to slumber peacefully. This is but one of the many innovations which have been introduced during the year. The real stroke of genius which the Committee achieved, however, was in persuading Mr. Howard Marryat to become the president of the Institution.

Mr. Marryat, having accepted the position, threw every ounce of his well-known enthusiasm into his task; he brought his vast experience to bear on the matter, and he used to the full the affection and respect which every member of the industry bears to him. This cannot better be illustrated than by the way the members of the Electrical Contractors' Association rallied to his aid (incidentally, this Association already stands as a monument to Mr. Marryat's energies and abilities in the past) and organised functions and collections throughout the country.

The results achieved by Mr. Marryat are literally astounding; more than £9 000 was raised, the greater part of which will go to swell the capital fund of the Institution.

Perhaps a better idea of the benefit that this huge sum can confer may be gained from the fact that it represents eighteen pensions. Eighteen people who have hitherto existed in the precarious state of mind that is conveyed to them by the words "temporary relief" can now be told that their income for the remaining years of their life is assured; their terrible anxieties of the past can be put to rest by the word "Pension."

To a no less degree are the thanks of the whole industry due to those who have taken up a vice-presidency of the Institution by subscribing a sum of £500 or more to its funds—Sir Hugo Hirst, Mr. Dane Sinclair, Sir George Sutton, Sir T. Callender, Mr. J. A. Crabtree, Mr. M. Frankenburg—to these, and to the many others who have subscribed smaller amounts must the heart-felt thanks of these new pensioners be given.

Mr. Howard Marryat, 1929 President of the E.T.B.I.

There are, of course, others who give just as unstintingly to this good cause, who give all the year round of their time, their brains and their energy to ensure that the wheels of the Institution may continue to work smoothly and that its funds may be utilised to the best advantage. These are the members of the Executive Committee—Mr. E. A. Gatehouse (chairman), Mr. Justus Eck (vice-chairman), Mr. J. Y. Fletcher, Mr. A. G. Beaver, Mr. J. N. Stephens, Mr. J. M. Sim, Mr. S. D. White, Mr. E. E. Sharp, Mr. E. F. Johnson, Mr. L. C. Penwill, and Mr. J. E. Edgecombe—to these, in a no less degree than to those previously mentioned, must the thanks of the whole electrical industry be given.

One final word; a record has been made this year, but this money was very badly needed, and, in spite of this result, more is still needed to ensure that the Institution may continue its good work unrestricted. It is therefore hoped that readers will join in using every endeavour in the future, and help to place the finances of this very worthy cause on a safer and surer basis.—J. T. KEEPING.

* * *

THE ELECTRICAL TRADES' COMMERCIAL TRAVELLERS' ASSOCIATION.—The year 1929 has proved to be one of excep-

Digitized by Google

tional progress in this Association, and at the end of this, its fifth year of existence, it can be said fully to have justified the cheery optimism of its founders.

Sociability, charity and mutual assistance have sufficiently appealed to electrical travellers to produce, during the past twelve months, an increase in membership of over 30%.

This sociability was amply demonstrated at the Association's annual dinner at the Connaught Rooms in February last, when a large assembly was presided over by the President, Mr. Arthur Chamberlain. But more recently their capacity for enjoyment was proved at the dinner dance, the second of the series, which took place at the Hotel Cecil on December 11th. The company, which numbered about 200, included several vice-presidents and well-known trade figures, and from start to finish everything went with a swing. The entire absence of speeches and the introduction of music during dinner proved a very welcome innovation.

The cause of charity, always warmly supported by this Association, has benefited in increased measure, contributions having been sent to the Electrical Trades' Benevolent Institution, the Royal Commercial Travellers' Schools, and the Commercial Travellers' Benevolent Institution.

Fortunately, calls for benevolence within the Association have been few, and the benevolent fund has been ample to provide timely assistance.

Cases of unemployment have been remarkably scarce, and here again the Association has been able to render valuable service through its Employment Bureau. This has in preparation a unique scheme, details of which will be published shortly. Suffice it to say, that it aims at being of as much service to employers as it should be to members.—J. W. WARD.

* * *

THE BATTI-WALLAHS' SOCIETY.—Founded in 1906 by the electrical engineers of the P. & O. Steam Navigation Co., Ltd., This society exists to promote social and friendly relations among the members, and to provide opportunities for meeting and entertaining.

The Society in 1922 revised its rules and, with a remnant of its former membership, decided that new members must be electrical engineers, who have, or have had, close association with the sea, either through the Royal Navy, the Mercantile Marine, or a recognised yacht, motor boat or sailing club. Every member is subject to re-election annually.

The new Society has gone on steadily growing, and the membership includes a number of eminent electrical engineers. Luncheons are held at intervals when a notable chief guest can be secured to address the company.

The Batti-Wallahs' Annual Ladies' Night and Ball is now one of the chief social events of the electrical engineer's year, and tickets are in great request. The next function of this kind is to be held at the Hotel Cecil, London, on Friday, March 21st, 1930.

The President for 1929-30 is Mr. H. L. Howard, and Mr. W. McClelland is vice-president.—M. WHITGIFT.

LIGHTING THE BODLEIAN.

FOR over three hundred years from its foundation in 1602 no artificial light of any kind was allowed to be introduced into the famous Bodleian Library at Oxford, though in 1913 the use of electric torch lamps was permitted for staff purposes. On account of this lack of artificial lighting, it was necessary in winter to close the reading rooms at 3 p.m., and this had always been a great inconvenience to scholars. The proposal to instal electric lighting into the Bodleian building was brought forward in 1926, and finally approved in the summer of 1929.

The contents of the Bodleian Library being of priceless value, quite irreplaceable and uninsurable, the most important point was to make the electrical installation perfectly safe, and also to convince the jealous guardians of this magnificent library that such could be done.

A scheme was therefore devised by which no flexible cords are used. The highest quality electric lighting wires enclosed in steel tubing are used, and these are conveyed to every lampholder, whether it be of a portable fitting, pendant, or other similar device.

All switches, lampholders and fittings of all descriptions are metallically and electrically connected to the conduit, and the whole system carefully earthed at many points, so that in the event of any improbable damage to an insulated wire, the only effect would be that the fuse protecting that circuit would "blow," and cut off the circuit from the supply until it was repaired. Under this system it is claimed that there is no possible chance of fire.

The system has been carried out throughout the reading rooms and the picture gallery, and very little conduit is visible, in spite of the fact that no walls have been chased and no tubing sunk or hidden anywhere, except under the floor boards.

In the Upper Reading Room and Picture Gallery, which are full of readers' desks and catalogue stands, as well as bookcases, two schemes were proposed :—

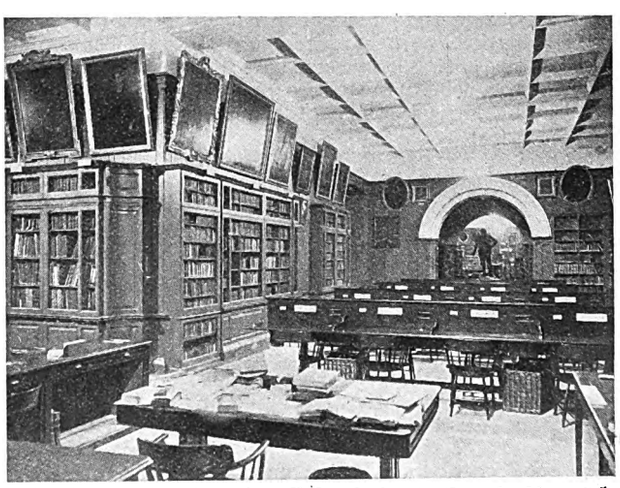
(1) To light each individual reader's desk strongly, and to provide a low general illumination.

(2) To provide a general illumination of high intensity, and no local illumination at all.

After discussion it was decided that the second arrangement was best, as it permitted the rearrangement of the desks, catalogue stands or bookcases without any alteration to the electric wiring.

After experimenting with many types of fittings it was found that the Holophane reflector refractor fitting was the most suitable, and each of these rooms, which are 172 ft. long and 26 ft. wide, is illuminated with nine reflector refractor units with 300 W lamps. The illumination from these is approximately 7 foot candles over the whole of the table surfaces throughout the two galleries.

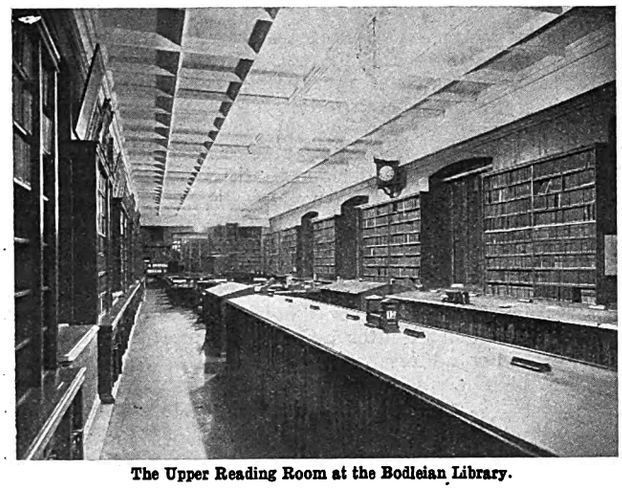
These fittings are unobtrusive by daylight, and the shape



TWO views inside the famous Bodleian Library in which artificial illumination has just been installed. Owing to the valuable nature of the contents no lights of any kind were permitted until it was shown that electrical illumination would be perfectly safe.

Digitized by Google

of the glassware and lines of the four supporting chains blend with the architectural features of the room. Each light is controlled by its own switch, the switches being grouped at the fuseboards, and under the control of the janitor.



The Upper Reading Room at the Bodleian Library.

One special feature of these fittings is that the circuit wires are continued down to the lampholder from the junction box in the ceiling, and are protected by a flexible metallic tube which is metallically connected both to the conduit and to the lampholder.

In the older part of the building, the Duke Humphrey's Library, with the Arts and Selden Arts, are treated in an entirely different manner. Here the ceiling is painted, and of great beauty. It was, therefore, decided that no work was to be done on these ceilings at all. At the same time their beauty made it desirable that they should be shown up at night by illumination.

The final design evolved was to put standards with wooden columns and heavily frosted enclosed bowls upon the tops of the projecting bookcases in the Duke Humphrey's Library, and on the tops of the gallery rails at the two ends. The effect is very beautiful, the ceiling being lightly illuminated; the floor area and bookcases also receiving a moderate general illumination.

This illumination, however, is not sufficient for the readers. Therefore, in each alcove in the Duke Humphrey's Library, short brackets with metallic reflectors are clipped to the book shelves, and certain of the desks in other parts of the Old Reading Room also have standards with metal reflectors. Thus the readers' and staff desks are brightly illuminated without the light straying from these lamps to the upper part of the Library and spoiling the general illumination by strongly marked lines of shadow.

The bookcases under the galleries are illuminated by a number of lamps with metal shades hidden under the mouldings.

In every case the circuit wires are taken direct into the lampholder, and each lampholder is connected metallically to the conduit.

The illumination and electrical specifications for this interesting installation were prepared by Messrs. Dolby and Williamson, consulting engineers, of 8, Princes Street, Westminster, S.W.1, whilst the entire electrical work has been carried out by Messrs. Hill, Upton and Co., George Street, Oxford.

A.C.E.C. ANNIVERSARY.

We have received from the A.C.E.C. of 56, Victoria Street, London, S.W.1, a copy of the company's quarterly review for July-September, 1929, No. 123. This number has been specially prepared to commemorate the 25th anniversary of the existence of the company under its present name, although the firm was originally founded under another name in 1886, that is 53 years ago. This publication, with its 117 pages and 130 illustrations, describing as it does the progress and development of the company's activities, should prove of considerable interest. The aerial photograph on page 29 of the review gives some idea of the extensions which have been recently built to cope with demands and machines of increasing size and it is interesting to note, in this connection, that the new extension of the heavy engineering shops is provided with a 150 ton overhead travelling crane of A.C.E.C. manufacture.

COAL HANDLING.

Demonstration of New Coal Wagon Introduced by the L.M.S.

REPRESENTATIVES of the Press, electricity authorities and undertakings, colliery officials, and coal transporters and users visited the London, Midland and Scottish Railway Co.'s generating station at Stonebridge Park on December 20th to inspect a new type of coal wagon and the coal conveying, steam raising and electricity generating plant in the station.

The new type of coal wagon is a great improvement upon those in general use, as it has a capacity of 40 tons and is discharged instantaneously without any appreciable manual labour.

The coaling arrangements at the station provide for the entire absence of any handling of the coal by hand. The coal is delivered from the sidings adjacent to the main line on to the gantry above the coal store in hopper-bottomed wagons which discharge the coal into concrete hoppers extending the whole length of the gantry. Beneath these storage hoppers are two continuous tray conveyors, each of 40 tons per hour capacity. These tray conveyors deliver the coal to bucket conveyors, which elevate the coal to the bunkers above the boilers. From these bunkers, which are capable of holding 2 500 tons of coal, the coal is fed through automatic weighing machines to the mechanical chain grate stokers of the boilers. Labour saving appliances are also installed for dealing with boiler ashes.

The boiler house contains 20 Babcock and Wilcox water-tube boilers, having an evaporative capacity of 25 000 lb. of steam each at a pressure of 210 lb. per sq. in. and 200 deg. superheat.

The generating plant in the engine room consists of four Westinghouse-Siemens turbo-alternators, each having a normal capacity of 5 000 kW and one Metropolitan-Vickers of 10 000 kW. The maximum steady demand over a period of half an hour has reached 21 000 kW, with peaks rising to 24 000 kW. The station has a load factor of nearly 50%, with a coal consumption of less than 2 lb. of coal per kWh generated and a thermal efficiency of over 16%, and it has for many years held the record as one of the most efficient and economical power stations in the country. The station was designed by the company's electrical engineer, Lt.-Col. F. A. Cortez Leigh, assisted by the late Mr. George Broughall.

Current is generated at 11 000 V, three-phase, 25 cycles, and is transmitted to 11 sub-stations, where it is converted to d.c. at 630 V for the traction supply. In addition to its employment for traction purposes, current is supplied to the Euston station and hotel for lighting, heating and cooking, and working lifts, to St. Pancras station and hotel, for working hydraulic pumps at Camden and Broad Street goods stations, and for numerous lighting and power installations in the London district.

COPPER WIRE.

Issue of Revised B.E.S.A. Standard Dimensions and Resistances.

A REVISION of British Standard Specification No. 128 has just been issued, and is intended to meet the needs of users of bare annealed high-conductivity copper wire for winding electric machinery and apparatus.

One of the principal differences between the new and the 1922 editions is that the tolerances permitted on the resistivity of the copper and on the diameter of the wire are smaller in the new edition. A further difference between the new and the old edition is that in the latter specification the tables showed the standard resistance corresponding to the standard maximum and minimum permissible diameters of the wires, whereas the tables in the new specification give the standard resistances of a wire of standard diameter, and show the *actual* maximum and minimum permissible resistances of all wires, irrespective of the variation in diameter from the standard diameter within the tolerance provided. In other words, the maximum and minimum resistances take account of both the tolerance on specific resistance of copper and the tolerance on standard diameter of wire, no further tolerance, therefore, being allowed on the values given in the tables in the specification.

Copies of this Specification, No. 128-1929, may be obtained from the Publications Department, British Engineering Standards Association, 28, Victoria Street, S.W.1, price 2s. 2d. post free.

CABLE RESEARCH.

Plant for Testing Behaviour of Super-tension Cables when Laid in the Ground—The Cable Testing Trenches—Measuring Devices.

SPECIAL plant and apparatus has been installed at Prescot by British Insulated Cables Ltd., for testing the behaviour of super-tension cables when laid in the ground, drawn into pipes, or disposed in any other manner required in service.

The principle involved in the tests is that of subjecting a cable to cyclic loading with superimposed voltage. By cyclic loading is meant the heating of the cable by means of current for a definite period to a predetermined temperature, followed by a definite cooling period without current, this process being repeated for a length of time depending on the nature of the test. The voltage is applied continuously during both heating and cooling periods.

It was considered of prime importance when laying out the plant that the cables to be tested should be laid as under working conditions, and no less important that the lengths under test should be at least full drum lengths. To this end a site of 3½ acres of ground was chosen and the building to house the plant was placed at one side. The length of the building is 160 ft., and in this length on one side nine concrete openings suitably protected from rain and surface water are provided. Through these openings the ends of the cables enter the building, where they are connected to terminals, and on the ground side of the openings the trenches containing the cables are arranged (Fig. 1). It is possible comfortably to accommodate in the space available 18 cables, each 220 yd. in length, without getting serious mutual heating effects. It is possible, however, to test lengths up to ½ mile.

Inside the building there are nine bays, each fenced with expanded metal sheeting, corresponding to the nine openings. For convenience of description these will be referred to as the first three, second three, and third three bays respectively. Each of the first three contains a 70 kVA single-phase voltage transformer which will supply any required voltage up to 25½ kV to earth, and three single-phase loading transformers whose secondaries are insulated for 25½ kV. The second three bays each contain a 100 kVA single-phase voltage transformer suitable for voltages from 19 kV to earth up to 47½ kV to earth. Also two of these bays are each provided with three

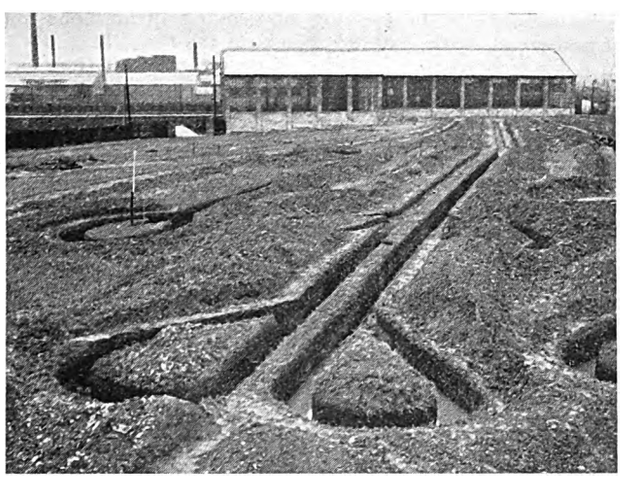

Fig. 1.—The cable testing trenches which have been made for use with apparatus for observing the behaviour of cables at the Prescot works of British Insulated Cables Ltd.

single-phase loading transformers, while the third has a three-phase loading transformer, part of an older plant used for this same purpose. The secondaries of all the loading transformers are insulated for the highest voltage.

All the voltage transformers, although connected to a three-phase supply, are separately controlled. This is a very great advantage when dealing with the three-core screened-type cable, as it is unnecessary with this type to apply three-phase voltage to the conductors. It is possible, therefore, in these bays to run six cables under six different voltages, instead of only the two which would be the case if three-phase were required. As, however, three-phase is sometimes necessary—overhead lines have been provided so that this may be done.

So far only the first and second three bays have been considered. The remaining three each contain one single-phase loading transformer only. The secondaries of these transformers are insulated for 200 kV, and have been put in with a view to future developments. In front of these third three bays, and separately fenced off, are three 400 kVA, 200 kV single-phase transformers (Fig. 2). The secondary windings

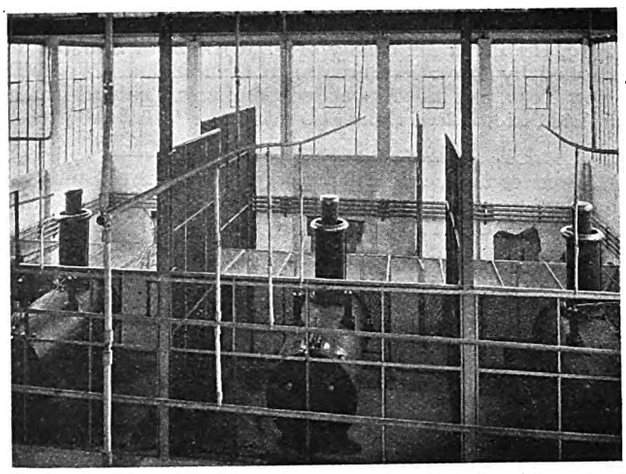

Fig. 2.—The 400 and 200 kVA transformers used for cable testing at the works of British Insulated Cables Ltd.

are arranged for series parallel connection, and the full output can, therefore, be obtained at 100 kV. These transformers are supplied from a 4-unit motor generator set consisting of 3 400 kVA single-phase sine-wave alternators driven by a synchronous motor. Excitation is from a separate exciter set with potentiometer regulators and each alternator can be separately controlled. The alternator stator windings are also arranged for series parallel connection, so that stability at low voltages with a cable load on the transformers is assured.

Adjacent to the three 200 kV transformers, ample floor space has been left where electrical breakdown tests and other special tests on short lengths of cable can be carried out. Although the transformers give only 200 kV to earth, it is, of course, possible by connecting two transformers to the same machine, or, alternatively, by adjusting the coupling between two of the generators, to apply 400 kV to a length of cable suitably insulated from earth.

One of the most important measurements made on a super-tension cable is that of dielectric loss and power factor. This is effected by the Schering bridge. Two reference air condensers of negligible loss are employed: one of 0·0001 μF capacity can be used for voltages up to 100 kV and one of 0·0003 μF capacity for voltages up to 50 kV. These condensers are fixed each in a screened chamber and by means of overhead lines, also screened by expanded metal cages, and connection can be made to any cable. Cables of low capacity connect the earth side of the transformers and condensers to the Schering bridge. For resistance measurements the Kelvin double bridge is employed; and cables of heavy copper section connect the bridge to the cables under test.

All high voltage connections are made by overhead lines of extruded seamless aluminium tubing made at the Prescot works. Two sizes are in use, one of 2 $\frac{3}{16}$ in. external diameter for the 200 kV plant and the connectors for the Schering bridge condensers, and one of 1 $\frac{3}{16}$ in. diameter for the remaining plant. Corona effects are thus made negligible.

For the measurement of voltage, some of the transformers have separate windings, while the older ones have tappings on the high voltage winding. It is necessary, however, to have a reference standard, and this consists of eight oil-immersed resistances, some or all of which can be placed across the voltage to be measured. The current through the resistances is then measured. Each resistance is in a galvanised iron tank mounted on insulators. The tanks are connected to tappings from a condenser potential divider, so that errors due to capacity between the resistances and earth are reduced to a negligible quantity. The maximum voltage which can thus be measured is 80 kV to earth. For higher voltages the sphere gap will be used.

SCIENTIFIC DEVELOPMENTS IN STEAM-DRIVEN POWER STATION PRACTICE.*

Combined Low-temperature Carbonisation and Combustion with Coal in the Pulverised Condition—Some Interesting Tests at Worcester.

(*Concluded from page* 526.)

By DAVID BROWNLIE, B.Sc.

IN the field of combined low-temperature carbonisation and combustion with coal in the pulverised condition, much the most important process is the "M'Ewen-Runge," originated in 1919, the invention chiefly of S. M'Ewen, of London, and controlled by Messrs. International Combustion Corporation of New York, and the Associated Company, Coal Oil Extraction, Ltd., of London, along also with the "K.S.G." process.

Early Investigations.

M'Ewen commenced his investigations in 1919, and after several years experimenting in London the work was transferred to the United States, partly because of the difficulty at that time of obtaining properly pulverised coal in Great Britain, and continued by International Combustion Engineering Co., under the superintendence of Dr. Walter Runge. An experimental retort, consisting essentially of a single cylinder 30 ft. high and 12 in. diameter, the plant being about 48 ft. high overall, was erected in 1924 at the Lakeside power station, Milwaukee. With this installation much valuable work was undertaken, and in 1925 there was commenced the erection of a very large plant of 210 tons of coal per twenty-four hours throughput. This consisted of two cylinders, one above the other in series, and the complete installation with necessary accessories in the shape of condensing and by-product equipment, was started up in August, 1926.

All the finely divided low-temperature carbonisation fuel is burnt under the power station boilers instead of pulverised coal, and the tar and the light oil recovered in the usual manner with the gas stored in a gasholder and available for any desired use, including, of course, burning under the boilers.

It is stated to be the intention to run the whole of the Lakeside station on this principle of combined low-temperature carbonisation and combustion with pulverised fuel firing, amounting to over 2 000 tons of raw coal per twenty-four hours. Many thousands tons of coal have been put through the retorts at Lakeside, up to 270 tons of coal per twenty-four hours, and finally, in 1928, the plant was closed down for considerable alterations in the design as the result of the above experience.

In this pre-1928 plant the two cylinders were each 30 ft. high and 6 ft. 9 in. diameter, the upper being a pre-heating unit and the lower a carbonising unit proper. The coal is carbonised as usual for pulverised fuel firing, say, equivalent to 90% through a 100-mesh screen, and falls down in a continuous shower at the rate of 200-270 tons per twenty-four hours. In the upper cylinder the duration of the travel of each particle was 35 seconds, whilst heated combustion gas with excess air entered at the bottom at 850 deg. F., all the steam and low-grade gas being discharged from the top at 500 deg. F., the main object of this being to prevent undue expansion of the coal particles on carbonisation by slight oxidation and pre-drying.

In the second and lower cylinder the heating is also on the internal principle, by means of combustion gases with 35 seconds travel, the gases entering at about 1500 deg. F., and all the mixed gases and vapours leaving the top for the cooling and condensing plant at about 650 deg. F., the rich gases and vapours being mostly driven off at 1000 deg. F. or below.

So far as can be ascertained in the reorganised plant at Lakeside, the two cylinders have been converted into one very large cylinder, 70 ft. high, since two-stage heating is now regarded as unnecessary. Also alterations have been made in the arrangement at the bottom of the setting for heat interchange between the very hot coked particles and the incoming cold air for the combustion setting. Further, the exact operation can be modified, as desired, and, for example, if it is a better proposition to sell the gas, then the heating is carried out with re-circulated gas and a gas-fired regenerator setting to eliminate the bulk of the nitrogen.

In regard to low-temperature carbonisation by means of plants adjoining but not integral with the boiler settings, the processes at the present time under active investigation upon a large scale are the "Salerni" or "Salermo," and the "Wisner" or "Carbocite Dual Carbonisation." At the present time there is being operated at the Langebrugge power station, Ghent, a large "Salerni" retort of 75 tons of coal per twenty-four hours capacity, in conjunction with travelling grate stokers, following upon two small experimental retorts, but no details are available. The "Salerni" process is controlled in Great Britain by Messrs. Salermo, Ltd., of London, and a considerable number of other plants are at work, although not in conjunction with steam-power plant, such as d'Aubervilliers (Seine), near Paris; at Heinitz, in the Sarre; at Konjscina (Jugo-Slavia); and at Resiutta (Italy).

Just recently some interesting eight-hour tests have been carried out by Messrs. Salermo, Ltd., in connection with Messrs. Babcock and Wilcox, Ltd., at the Corporation of Worcester electricity station, using raw coal on chain grate stokers, and then, under identical conditions, the low-temperature fuel from the same coal, made in a "Salerni" retort. The net result is that with the actual boiler plant, as installed and operated at Worcester, the low-temperature fuel gives 14·5% increase in equivalent evaporation as compared with the raw coal.

[A large-scale experimental "Carbocite Dual Carbonisation" plant, believed to be of about 50–75 tons of coal per twenty-four hours capacity, is now in operation at the Philo Station, Ohio.]

In the matter of combined low-temperature carbonisation and partial gasification, it will perhaps be permitted to include a reference to the "Midlands Coal Products" process, because a power station plant on these lines has been operating at Nottingham for a number of years past, although using gas engines and not steam boilers. Essentially the process consists in briquetting non-coking bituminous coal dust and smalls with, say, 8% pitch on the usual lines, up to 30% coking coal being included if necessary, and then submitting the briquettes to combined low-temperature carbonisation and partial gasification in a vertical continuous retort by means of a regulated blast of steam and air.

This process is controlled by the Butterley Co. They have operated at the Kirkby colliery a number of different low-temperature carbonisation retorts, and, because of the lack of success, finally evolved their own process, forming eventually for the purpose a separate company, the Midland Coal Products Co., Ltd., of Nottingham. The intention was to erect in this area a large power station and to sell electricity, utilising all the small coal in a plant of twenty standard retorts, on the above principle of combined low-temperature carbonisation and partial gasification after first washing and briquetting. The gas was then to be used in vertical gas engines, direct coupled to generators with recovery of low-temperature tar and sale of a high-grade smokeless fuel for domestic and similar use.

Commercial Obstacles.

However, I understand the Electricity Commissioners refused to allow the station to be erected, and, as the town's gas monopoly also prevented the sale of the gas for town's supply, the firm, like many others, were up against a blank wall when trying to make low-temperature carbonisation and utilisation of low-grade coal a practical and commercial proposition.

However, they got round these obstacles to some extent by erecting a power station on private land, that is the Colwick Estates, Nottingham, and supplying electricity to industrial establishments on this estate only, since in such a case the Electricity Commissioners have no control.

Accordingly in 1922 there was erected a plant of four standard Midland Coal Product retorts, each of 25 tons of briquettes per twenty-four hours throughput, that is, 100 tons for the complete installation, along with two 750 kW gas engine and generator sets, to which was afterwards added

* Extracts from a paper read before the Glasgow and West of Scotland Branch of the Institution of Mechanical Engineers.

Digitized by Google

a 1 500 kW set, comprising a total plant of 3 000 kW. This operated very well and ran from 1922 on partial load until July, 1927, when it was almost entirely shut down because of the lack of a sufficient demand for electricity. For this reason also the plant has never run at its full capacity, but otherwise the operation and general results are excellent, and the only trouble is to be allowed to use the gas to advantage.

Finally, a long consideration of the problems of low-temperature carbonisation, especially for bituminous coal, whether combined with power station practice or not, has led me to the conclusion that scientific methods of this description are vital to our existence as an industrial nation of the first rank, but that nothing of primary importance will be accomplished until we regard the development of the resources of our own country as of vital necessity.

THE NEED FOR RURAL ELECTRIFICATION.

Proposals for Expediting Development—An Additional Electricity Commissioner—Long-term Loans for Rural Line Construction.

By R. BORLASE MATTHEWS Wh.Ex., A.M.I.C.E., M.I.E.E. F.R.Ae.S.

IT is proposed to deal with rural electrification very briefly on the basis (*a*) that it will mean immediate work for many of the workless;* (*b*) that it will cause many of the town toilers to go back to the land and health; and (*c*) that it will convert farming from a pleasant pastime into an important business which plays a primary part in the nation's needs.

These objects, it must be admitted, are sound; the present question is, how are they to be attained? A careful examination of the subject shows that rural electrical development in the past has been hindered by the existence of artificial restrictions, and the removal of such unnatural hindrances is an easier matter than if they had arisen, say, through the physical configuration of the country.

One of the most important of these artificial restrictions is due to the development of electricity supply on ineffective lines, and the selfish restrictions of those suppliers within the boundaries of large towns; whereas, since each town depends to a large extent upon the rural area around it, the supplier should therefore attempt to meet the electrical needs of the neighbourhood.

In other words, the area supplied by the electricity mains of each town should be extended until they meet the areas supplied by the mains of the adjoining towns. The towns would of course raise many objections to this procedure, the most specious of which would be that it would not pay, and the writer would certainly agree with them if they were content with their present antiquated methods of management and entire lack of knowledge as to the best methods of supplying a rural area.

As a matter of fact, hardly any of these town suppliers are giving an adequate supply to their own residents. In one case, the chief engineer of a town pointed out to the writer a collection of three thousand signed applications for electricity supply which he was not seriously tackling in the way he should, bearing in mind that these were not possible, but rather, actual consumers if only they could get connected to the supply mains.

A practical remedy for the above is:—(1) that a survey of the electrical distribution of the country should be undertaken, with a view to the allotment of rural areas to the adjoining electricity suppliers who, technically and commercially, are best able to serve them; (2) after allotment, to see that arrangements are made, and the responsibility undertaken, adequately to supply each rural area with electricity. It is not sufficient to colour a section of a map and state that this is an area of supply, without taking more effective steps to ensure that this supply is actually available.

Education.—As has previously been indicated, it is to be feared that the management of most urban electricity supply undertakings has little practical knowledge as to how to develop rural electrification. To this end existing experience (of which there is a considerable amount available) should be collated and analysed, and then put into such shape as to facilitate the acquisition of the necessary knowledge by the above management. The educational policy, however, must be carried still further, in fact the general attitude of the greater part of the industry, from the Electricity Commission downwards, is to view the problem of rural electrification with some little interest, but to adopt a too cautious policy, which of course means that only in isolated cases is any headway made.

Considering the importance of the question, it does not seem to be too much to ask that one new member should be appointed to the Electricity Commission who is qualified by a special knowledge of the problem of rural electrification. Appointments to the Commission up to the present have been made from the ranks of those eminent gentlemen who are highly expert in urban electrical work.

It may not be out of place at this point to suggest that a Committee of Inquiry should be appointed to look into the procedure of the Electricity Commissioners. The delay which now takes place in getting Special Orders through is very serious, and it would appear that the Commissioners are nearly 200 Orders behindhand now, which is an absurd position when workless want work, and people are pressing for power.

Many supply undertakings have long since held the view that a Committee of Inquiry should be appointed, but they rather hesitate to express the view publicly, since so many of the Regulations under which they work have to be interpreted by the Commissioners. The work of the Commissioners is not under the control of any Department, as Parliament has given them full control, hence it is very difficult to get at them through Parliament. In fact it would appear that the control of Parliament is purely the somewhat negative one of objecting to any Order by way of "Prayer"; but as the Orders are now so voluminous, in practice it amounts to very little control indeed.

The writer is sure no one appreciates better than the Electricity Commissioners themselves, the enormous handicap under which they have to work, and, in fact, if they were permitted to do so, they could give most valuable advice on the reorganisation of their department and report upon the legislation which is hampering them at every turn.

Rural electrification is not entirely a rural question, but is, in fact, a national matter. No effort towards the economic reconstruction of rural England can be successful unless a supply of electricity is available. In industrial areas it has long since been realised that electricity provides the cheapest and most convenient form of power, and the time has arrived when similar facilities should be offered to those dwelling in the countryside. Rural electrification is no new problem, for it has been faced by many countries, and there are in the world to-day over a million farmers using electricity. The main advantages to be obtained from the use of electricity on the farm are:—

(1) The substitution of electricity for horse and manual labour will lower the cost of production. It will make it easier to bring under cultivation half-cultivated land, and so give employment and increased production.

(2) The use of electricity will have a direct bearing on increasing the production of the farm worker. The number of uses to which electricity can be put on a farm is very large; in fact, the writer has compiled a list of over 300 uses that he has actually seen in operation on farms, while on his own 600-acre farm at East Grinstead he uses it for 67 different purposes.

The part which a supply of electricity will play in the development of rural industries is indeed great, whilst a supply would also attract a large number of industries from the town into the countryside. Many of these industries should, from an economic point of view, be situated in the countryside if an ample supply of power was available. Not only would this give the farmer more labour to draw from, but would also remove one of the greatest tragedies of modern life, namely, the herding together of a large number of people in unhealthy industrial areas.

A supply of electricity would also raise the standard of living

* The actual work of equipment will give employment in both town and country.

Digitized by Google

of the rural dwellers. This is especially true in the case of agricultural labourers. Their homes could be lighted by electricity, and many of the amenities now enjoyed by those residing in urban areas could be theirs by the use of small appliances operated by electric power.

The labourer's wife to-day has to do her work at night by the use of a miserable candle or evil-smelling oil lamp, which the children can knock over, and set the whole place on fire. It is estimated that it costs an agricultural labourer about £2 12s. per annum for paraffin oil to light his home. Electric light could easily be provided at this cost; in fact, in some cases the cost would be considerably lower. Then also all children, especially those of school age, are all the better for a good light in the early darkness of winter. Incidentally it must not be forgotten that water supply is largely facilitated if electric power is available to pump it.

The Electricity Commissioners and Unemployment.

It is of little avail discussing the question with farmers and power supply undertakings, if those in authority are not keenly interested in the problem. The Electricity Commission recently issued a Memorandum on Schemes for the Relief of Unemployment, in which they report on their discussion with representatives of the electricity supply industry, in regard to the amount of employment which could be provided by the industry. The Commissioners' comments, however, refer exclusively to urban development. They state that in built-over areas in urban districts it is proper to lay mains in any street in which there is reasonable prospect that within three years the annual revenue will defray the actual additional outgoings, that more undertakers should provide schemes of assisted wiring, etc., and that larger mains should be laid in residential areas to cope with the larger demand, but there is *not one word about rural development*. Here is an opportunity for schemes of work, and if loans, guarantees and grants are to be made, the rural dwellers have at least as much, if not more, right to consideration as their urban neighbours. In a speech Mr. Lansbury once stated that "Miles and miles of the best land in the world (referring to England) cries out for cultivation." Electricity will make that possible.

In conclusion, the writer would say that, as this question is of such wide national interest, the Government should consider the following recommendations, and where possible introduce some form of legislation to deal with them:—

(1) Some form of long term loans at low rates of interest in the initial years should be arranged for the construction of rural lines, for until a load is developed as a result of educational work it is difficult to make the lines remunerative.

(2) Those authorities who obtain such loans should be compelled to undertake educational publicity campaigns in the use of electricity in rural areas, and start repaying the loan as soon as the revenue permits.

(3) Those undertakings now holding Orders to supply in rural areas should be compelled to prepare schemes which will fit in with the national programme of development of the rural areas.

(4) Vested interests, from wayleaves upwards, should not be allowed to hold up such schemes of public service.

(5) Overhead lines should be erected with no more restrictions than are considered necessary with any other public utility service.

(6) An inquiry should be held into the procedure of the Electricity Commissioners.

(7) At least one member of the Electricity Commission should be an expert on rural electrification, and he should be given sufficient authority to take such action and employ such civilian staff as may be deemed necessary to produce effective results as quickly as possible.

A NEW HOUSE ORGAN.

MESSRS. WALKER BROS., electrical engineers, Temple Row, Birmingham, have started the publication of a house organ, "The Electrical News," which is distributed gratis by post. No. 2, just issued, is a special Christmas shopping number, and contains interesting chapters on "Coal or Imitation Coal," "Safety First Rules," "Litlux Comfort," "Radio News," "Our Employees" and "Ourselves," all of which are presented in an attractive form and are calculated to give the householder a livelier interest in electricity for domestic purposes. There is a brightly illustrated feature on Christmas and New Year presents and a useful electrical information bureau. The journal is extremely popular and has been the means of bringing the firm increased business. It is well printed on art paper.

CONDENSER TUBE CORROSION.

Progress in Manufacture of Tubes which are Immune from Attack.

A TROUBLE with which many power station engineers are faced is the liability of condenser tubes to corrode. One of the anxieties attaching to this phenomena is the fact that its occurrence can never be anticipated, and frequently it occurs at times when it is most inconvenient to shut down the plant for a temporary isolation of the affected tubes.

Engineers who suffer from this trouble will be interested to learn of the progress which tube manufacturers are making in the production of tubes which are immune from corrosion attack. Amongst the manufacturers whose efforts have been successful in this direction is the firm of Allen Everitt and Sons, Ltd., of Smethwick, who are the producers of the "AE" super nickel condenser tubes, and the pioneers of cupro-nickel for this purpose.

So satisfactory have cupro-nickel tubes proved themselves in service, that the British Admiralty has entirely abandoned the use of brass tubes for warships, and the specification now calls for cupro-nickel containing not less than 30 per cent. of nickel. All new British warships built within the last two or three years have had their condensers fitted with cupro-nickel tubes. The lead given by the British Admiralty has been followed by all the principal Continental navies.

A more recent development in the production of corrosion-resisting tubes is that of aluminium bronze tubes, or, to be precise, aluminium brass tubes. These tubes contain approximately 76 per cent. copper, 2 per cent. aluminium, and the remainder zinc. The alloy is one which has been produced as the result of research by the British Non-Ferrous Metals Research Association, being produced under licence from that Association, which holds the patent rights.

It cannot be claimed that the aluminium brass tubes are as good as cupro-nickel for their corrosion resisting properties, yet they have proved themselves to be far superior to either 70/30 brass or Admiralty alloy, and both the laboratory and service tests indicate that they can be safely adopted for use under conditions which render the use of brass tubes undesirable but which are not sufficiently severe to necessitate the use of the more expensive cupro-nickel tubes.

COAL MINE LIGHTING.

The Relation of Output to Good Illumination Conditions Below the Surface.

DR. W. Zwanzig read a paper on "Coal-face Lighting," at the Midland Institute of Mining Engineers on December 12th. He said attempts to light coal-faces in safety lamp pits efficiently were brought to a standstill by the Coal Mines Act of 1911, which prohibited lighting circuits with semi-permanent lamps within 300 yards of the coal-face. A minimum of 10 ft. candles on the coal-face was necessary, but the ordinary safety lamp only gave from 0·2 to 0·5 ft. candle. In a mine in Lower Silesia the use of 70 W lamps showed an increased output, and 150 W lamps gave a further increase. Mr. G. F. F. Eagar said the prohibition of semi-permanent lamps within 300 yards of the coal-face was not a part of the Act, but was a regulation under that Act, which could be varied by an Order of the Mines Department. Dr. G. Allsop, of the Safety in Mines Research Board, said there was the possibility of a broken lamp glass exposing a hot filament. It would also seem that the flexible cable was a source of danger. The Safety in Mines Research Board had devoted considerable attention to the problem of providing an automatic switch that would cut off the power should a lamp glass be broken, and to devising means of protection for flexible cables. Such progress had been made with the cable that an experimental length had been installed underground. In order to prevent the cutting of the rubber insulation from exposing live cores in a trailing cable, light pilot wires had been incorporated in the insulation surrounding the cores. In the event of the cable being damaged, the pilot system was severed, and the main switch was tripped before the cores were exposed or severed.

Imports into the Irish Free State in September, 1929, included electrical goods valued at £61 571, compared with £52 020 in September, 1928. Exports from the Free State during the same month included machinery and electrical goods valued at £24 876, against £7 800. During the nine months ended September, 1929, imports amounted to £448 768, against £337 941.

STEADYING FREQUENCY.

New Instrument for Use on Large Power Systems.

[CONTRIBUTED.]

THE tendency in up-to-date power stations to have bigger and bigger units and to adopt all sort of devices to promote efficiency and reliability means also that, though the cost per kW installed is perhaps decreasing, the cost of each individual unit and of the whole station is rather on the increase.

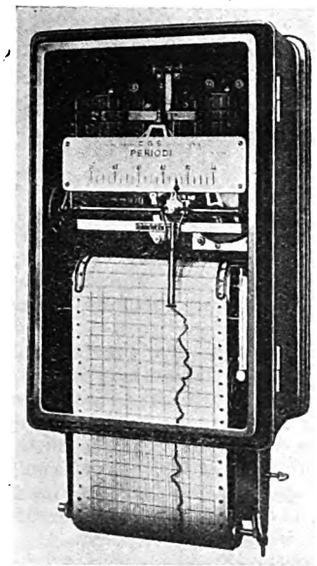

Fig. 1.—The new Frequencygraph.

Every precaution should, therefore, be taken so as to ensure smooth running of the plant, and so reduce to the minimum the risks of losses through stoppage and breakdown.

One of the precautions, however, generally neglected, is to ensure a steady frequency. This omission is probably due to the widespread opinion that, in large plant due to the use of very large generators, the frequency is obviously steady. Though this is so when under normal conditions, it cannot be so during some critical periods. For instance, during the switching on and off of heavy loads, partial breakdown of cables or of units, accidents, etc.

It is then that the machines are subjected, though only temporarily, to enormous mechanical stresses which each time bring nearer the risk of a final breakdown.

The importance of watching closely these abnormal variations of frequency during the whole of the 24 hours is therefore apparent.

The electric clock system as introduced during the last few years, though useful for other purposes, cannot properly fulfil this task. It gives no indication of the rapid variations of frequency, and the fact that the clock shows the correct time does not necessarily mean that the frequency has been correct all the time. The attendant is inclined to compensate any deviation from the correct time simply by tampering with the machine speed. So that, with this device the machines may, strictly speaking, practically never be running at the correct speed; the percentage of variation being dependent on the attendant amount of care.

A new type of C.G.S. Frequencygraph (see Fig. 1) patented and manufactured by Messrs. Istrumenti di Misura "C.G.S." of Monza, Italy, seems particularly free from imperfections generally connected with frequency recorders.

Its torque and sensitivity are considerable, and, as all important causes of mechanical friction are overcome by the motor-relay system, its accuracy, robustness and reliability are quite remarkable without the necessity of placing a heavy burden on the instrument transformers.

The scale is well spread out, two cycles being made to occupy the whole 6 in. width. Even small variations in the frequency are, therefore easily detected, measured and recorded.

Fig. 2 shows a diagram of the working principle. A sort of Kelvin balance arm is balanced on B and carries a contact arm C free to close an auxiliary circuit, either at E or at E'. But, while one circuit consists mainly of an ohmic resistance R, the other is made up chiefly of a fixed inductance L', and of a variable inductance L.

Both are connected in parallel to the line, and are so arranged as to balance each other for a given frequency. Should this vary, the equilibrium is then broken, the contact arm C will close one of the circuits and the motor F will turn in such a direction (through gear G, endless screw H propelling the block I carrying both pen and pointer) as to readjust the inductance L, and therefore re-establish the equilibrium in the balance arm.

This specimen is made for 110 V 50 cycle supply (both for the measuring portion and for the motor-relay system) with a scale arranged for the interval 49-51 cycles, the divisions being uniform.

A few points of interest are: The contact system is designed so as to allow, not only easy inspection (both contacts can be taken out and replaced exactly at a pre-determined position within a few seconds), but to allow also, whenever desired, the suppression of the very small variations on the graph.

An effective spark-absorbing device is used, so that cleaning of the contacts is required only at very long intervals. The instrument is independent, up to 20% of voltage variations, and, in practice, is not influenced by wave-form or by temperature changes. Its sensitivity and its sustained accuracy are rather astonishing, especially considering its extraordinary torque, its robustness and the fact that it is not meant to be a scientific instrument, but only a really serviceable Frequencygraph for power station use.

The chart is 120 ft. long, is of the straight co-ordinate type, and is driven by an 8-day clock, supplied with a change-over lever for two speeds. To facilitate readings the chart is timed so as to correspond to millimetres per minute. Any speed from 15 up to 300 millimetres per hour can be selected.

The ink is brought to the paper through a sharp steel-blade drawing pen fed from a totally enclosed ink-holder. Ink refilling is required only about every three weeks. The whole instrument is quite compact and takes up little room. An automatic switching device can also be built in to operate speed regulators, signals, etc.

It is understood that a specimen instrument will be demonstrated at the coming annual exhibition of the Physical Society in London next month.

The diagram on the right (Fig. 2) illustrates the working principle of the new Frequencygraph described in the accompanying notes. A specimen of the instrument will be demonstrated shortly.

BOOK REVIEWS.

Estimating. By T. H. Hargrave. (London: Sir Isaac Pitman and Sons.) Pp. viii+120. 7s. 6d. net.

Described as a manual for engineering students, draughtsmen, cost clerks, foremen and works managers, this book is mainly intended to give to young engineers an insight into the commercial side of the business, and particularly that section that deals with the preparation of estimates. The compilation of estimates is essential to practically every establishment, and no matter what the type of manufacture, whether light or heavy, simple or complicated, an analysis of the various items along the general lines indicated in the book should enable the young engineer to produce an estimated cost to a very close degree of accuracy. L. B. T.

Kurzes Lehrbuch der Elektrotechnik. By Prof. Adolf Thomalen. Tenth Edition. (Berlin: Julius Springer.) Pp. viii+359. Price: M. 14·5.

It is scarcely necessary to praise a book that has reached its tenth edition. Published first in 1903, this work has now become one of the standard textbooks on electrical technology in Germany. Since, in the space of 359 pages, practically the whole range of heavy electrical engineering is reviewed, it will be understood that to do more than "touch upon" many of the branches would be out of the question. This is not intended to convey that the treatment is in any way superficial, but rather that the book is not a treatise. It is also doubtful whether many parts would be intelligible to a beginner without a teacher. For example, Kirchhoff's laws are dismissed in a page and a half, while eight pages only are given to electro-chemistry, no attention being paid to the nickel-iron cell. Commutator windings are dealt with on orthodox lines, but in view of what may now be regarded as standard practice, subjects of this kind in a general work might well be given a simpler and more up-to-date treatment. The same remark might also be applied to the treatment of direct-current machines. Voltage regulation, static balancers, speed control of motors are among the subjects which call for fuller treatment, while such matters as the series generator can be dealt with rather more summarily when space is limited.

Networks are treated both analytically and graphically, and our pleasure increases as we reach alternating currents. The student is soon introduced to realities in the form of harmonics. He may possibly resent the introduction of the symbolic method (or complex method, as it is now called in Germany), but he will soon appreciate its powerful aid in solving problems on complicated circuits, distributed inductance and capacitance, current load inversion, etc. Unbalanced three-phase loads are treated graphically, while transients and travelling waves receive attention. The sections on alternating-current machines have been kept up-to-date by the insertion of such matters as the double-cage rotor. The economical speed control of induction motors is rarely dealt with satisfactorily. The treatment is usually incomplete, while the subject is seldom handled in a critical manner. An inexperienced reader might well conclude that certain methods or devices are widely used, though actually they are scarcely referred to outside of textbooks. The same remark applies also to alternating-current commutator motors and variable-speed sets. A section on the mercury-arc rectifier has been added.

The book is well made, the text, illustrations and binding being of the high standard associated with Springer. As an introductory textbook and for those desirous of improving their knowledge of technical German, the book can be heartily recommended.

S. Parker Smith.

Theory and Practice of Alternating Currents. By A. T. Dover. (London: Sir Isaac Pitman and Sons.) Pp. xv+539. 18s. net.

The author explains in the preface to the second revised edition that his original intention to write a single-volume general text book dealing with the theory and practice of alternating current engineering proved too wide a matter for adequate treatment in that form. Consequently, the present volume is devoted to general principles, circuits, polyphase systems, non-sinusoidal wave-forms, the magnetisation of iron, instruments, measurements, and an elementary treatment of the initial condition in the simpler electric circuits. As a thorough grounding in the principles of alternating currents is a desirable preliminary to the study of alternating current machines and apparatus, this portion of the subject is treated on a broad basis.

Special features included in the volume comprise an extended application of the circle diagram to series, parallel series, parallel circuits, the reduction of the general circuit to its equivalent series—parallel form and the development of a locus diagram therefor; the calculation of currents in unbalanced polyphase circuits and the determination of the neutral point potential in the case of unbalanced star connected three-phase circuits; the theory of the principal types of a.c. measuring instruments; and a large number of worked examples in the text. For these examples, analytical, graphical and complex algebraic methods of solution have been employed, and in some cases alternative methods of solution are given so as to show the student the steps involved in the application of the alternative methods. Over 300 illustrations are included.

L. D. B.

ELECTRIC BATTERY VEHICLES.

Revision of British Standard Specification for Charging Plugs and Sockets.

In view of the increasing use of electric battery vehicles and the more adequate provision of charging facilities, particular interest attaches to the revision of B.S. Specification No. 74, dealing with charging plugs and sockets, which has just been issued.

The new specification differs from the previous edition mainly in the fact that the plugs and sockets are rated for use on circuits up to 250 V, whereas in the old specification the plugs were suitable for use on circuits up to 120 V only.

Considerable attention has been paid to the means for securing interchangeability, and the gauges have been redesigned for this purpose. The specification does not attempt to lay down a rigid design, and only the dimensions essential to ensure interchangeability are rigidly standardised.

Tests are laid down to ensure the employment of satisfactory insulating material, and the means for gripping the cable are also referred to.

Copies of this specification (No. 74—1929), may be obtained from the British Engineering Standards Association, Publications Department, 28, Victoria Street, London, S.W.1, price 2s. 2d., post free.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Standardised Page Sizes.

[To the Editor.]

Sir,—I am pleased to see our good friends the I.S.B.A. are again pressing upon publishers the advantage of a standardised page size.

It is also pleasurable to note that since last I corresponded with you on the subject, no fewer than three existing journals have come into line with a page of standard proportions.

Further evidence of the beneficial value of the I.S.B.A. propaganda may be gathered from the following:—

A new monthly paper, to be called the "Municipal Review," will make its appearance next month, with a page size of 10 in. by 7¼ in. Following my usual custom I am using standard 10 in. by 7 in. advertising blocks in its pages, thus tying up with the considerable majority of papers, amongst which is your own, which recognise the standard measurements.

I may say that when considering the proposals of a new journal for advertising purposes, its dimensions have a somewhat important bearing on the question, in that the acceptance of the standardised page by its proprietors, indicates to me that they are, in that respect at any rate, up to date.—I am, etc.,

W. McWilliam,
For The British Electric Transformer Co., Ltd.

Physics has become more and more incomprehensible.—*Prof. O. W. Richardson.*

* * *

The English market is the foreigner's excursion traffic, and electrical manufacturers can no more live on the basis of foreign prices than can English railways live by carrying all their passengers at excursion rates.—*Sir Felix Pole.*

NEWS IN BRIEF.

Manchester and Hired Cookers—Poplar's Electrical Burglars—British Telephone Progress —The Alexandria Power Station—Electrical Women.

A MAINS superintendent is wanted by Barnes Urban Council. In the Hull electricity department an engineering assistant for sub-stations is required.

The annual dinner of the Western Centre of the I.E.E. will be held at the Royal Hotel, Cardiff, on January 13th.

The number of hired cookers connected to Manchester Corporation's mains during October was 96, making a total of 5 701.

The official inauguration of the new X-ray installation at the Colwyn Bay and West Denbighshire Hospital, by Lord Colwyn, took place recently. The installation cost £1 300.

Walsall Watch Committee has decided to instal automatic traffic control signals, at an estimated cost of £170, at the junction of Lichfield Street, Denmark Road, and Littleton Street.

Stoke-on-Trent Housing Committee has decided that a provisional rent of 18s. 8d. per house per week, exclusive of rates and water charges, be fixed for eight all-electric houses at Hanley.

Burglars recently entered Poplar Borough Council's main electrolytic depot, Violet Road, and removed platinum wire from a number of electrodes. The loss amounts to between £80 and £90.

Burnley Electricity Committee has authorised the purchase of an amplifying apparatus, or public address equipment, for use on public occasions, from the Standard Telephones and Cables, Ltd., at a cost of £129.

The late Sir James K. Caird left £200 000 to be held in trust for the foundation of travelling scholarships in engineering, electricity, aeronautics and music. There will be junior and senior scholarships in each subject, the minimum and maximum of each junior scholarship being £50 and £100 and of each senior scholarship £250 and £600.

A paper on "Petrol-Electric Vehicle Characteristics" will be read by Mr. H. K. Whitehorn before the South Midland Centre of the I.E.E. on January 13th, and before the North Western Centre on January 22nd.

Tynemouth Electricity Committee has agreed that a shop at the corner of the Town Hall buildings, with the room above, be taken over for demonstration and lecture purposes and for receipt of payment of electricity accounts.

St. Pancras (London) Electricity Committee recommends the provision of office accommodation on a site in Pratt Street. The committee is of opinion that the most suitable scheme is to erect a building three storeys high, estimated to cost £9 660.

A large party of London members of the Electrical Association for Women visited the showrooms of Berry's Electric, Ltd., on December 18th, where a short talk on electric cooking was given by Mrs. A. Mole, and a lecture on water heating by Mr. Painton.

Bedford Electricity Committee is to adapt and equip premises in High Street for a showroom and offices, at a cost of £3 000.—The Committee recommends that the electric standards in various roads be equipped with a new and improved type of lantern, at an estimated cost of £200. In due course it is proposed to improve the lighting equipment throughout the remainder of the town.

Clitheroe T.C. has agreed to the new school in Chatburn Road being heated by electricity.

Demonstrations of lighting and cooking by electricity were given recently in St. John's Hall, by Preston electricity department.

All shops and offices in Lisbon, except banks, recently closed their doors for 24 hours as a protest against the increase of prices by the electricity supply company.

Bedford Education Committee has decided to instal at the Ampthill Road School the tubular electric heating system, at a cost, including wiring, switches, etc., of £761 18s.

Eston Electricity Committee has received a report from the Electrical Engineer with regard to wireless eliminators, but has decided that the time is not opportune to institute a service in connection with them.

At Manchester last week a large crowd watched the new device, operated by pedestrians, for the control of road traffic. There was at first little inclination to use it. At last a schoolboy pressed the button, brought the traffic to a standstill, and then disappeared in the crowd. After that the signal was brought into regular use.

The number of telephone stations in the Post Office system at September 30, according to the "Telegraph and Telephone Journal," was 1 814 263; increase for the month, 10 336. Of the total, 161 623 were in Scotland, and 22 448 in Northern Ireland. London's share was 647 967. increase, 3 527 for the month Inland trunk calls dealt with in July numbered 10 653 433, an increase of 1 150 626, or 12% over the total for the corresponding month last year. Outgoing international calls in July numbered 46 774, and incoming international calls 49 742, increases of 11 031 and 11 236, respectively, over July, 1928.

The Metropolitan Carriage, Wagon and Finance Co., has been given a contract for enlarging the electricity generating station at Alexandria, the amount of the contract being £E67 000.

As a consequence of the recent gales, the Western Union Telegraph Co. announces that it is improbable that the New Year greeting traffic between this country and America can be handled as expeditiously as in a normal year.

Shipley Libraries Committee has received from the District Council's electrical engineer schemes with estimates of cost, for the lighting of the Victoria Hall. The committee will visit various halls where modern schemes of lighting have been installed, before coming to a decision on the matter. In the meantime, the Electrical Engineer will arrange for the temporary additional lighting at the hall.

In a paper on "Engineering from Cape Town to Kenya," submitted to the Edinburgh branch of the Scottish Centre I.E.E. last week, Prof. F. G. Baily, of the Heriot-Watt College, said in East and South Africa electricity was produced entirely from coal, the Rand alone absorbing 200 000 kW. The Victoria Falls Co. had no connection with the Victoria Falls. Although probably a minimum of a quarter of a million horsepower could be obtained from the Falls, there was no market for it, except at so great a distance that coal was the cheaper method.

L

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *dated December 27th, 1879:—*

Electric lighting was being used in the Christmas decoration of shops, and the Bridge House Estates Committee was considering "the practicability and advisability of lighting London Bridge by the electric light."

The perfection of an electric divining rod was reported from America.

An electrically-operated organ was being built for the Cathedral at Garden City, Long Island. A feature of the building was to be a large window which could be opened or shut by electrical means.

* * *

FIFTEEN years ago THE ELECTRICIAN *of December 25th, 1914, recorded that:—*

The use of any lights whatever for outside advertising or for the illumination of shop fronts in London was prohibited.

The Electric Vehicle Committee was endeavouring to secure a uniform rate of 1d. per kWh for charging vehicle batteries during off-peak periods.

* * *

TEN years ago, it was reported in THE ELECTRICIAN *for December 26th, 1919, that:—*

Mr. C. G. Robertson was to succeed Sir Oliver Lodge as Principal of the University of Birmingham.

A 220 000V transmission scheme was projected in California.

A commercial lamp renewal process was being established.

Several electricity undertakings were restricting supplies during peak hours owing to shortage of generating plant.

Digitized by Google

PERSONAL.

MR. W. M. Selvey has been elected a member of the Institution of Electrical Engineers.

Mr. J. C. Lewis has been appointed temporary outside representative and canvasser to Fulham electricity department.

Mr. A. C. Johnson, formerly chief assistant, is the new borough electrical engineer of Southend in succession to Mr. Robert Birkett.

Estate of the gross value of £1 788 with net personalty £1 724 was left by the late Mr. John Oldham Tucker, formerly associated with J. H. Tucker and Co., Ltd.

Ald. W. Walker and Coun. J. Binns have been elected chairman and deputy chairman respectively of Manchester Electricity Committee and Audit Sub-Committee.

The vacant majority in the Tyne Electrical Engineers (T.A.) has been filled by the promotion of Captain H. Sherlock, T.D., who has held the rank of captain since 1916.

Shoreditch (London) Lighting Committee has elected Ald. W. Hebden as chairman, and Coun. T. J. Sillitoe as vice-chairman during the Committee's term of office.

Fulham (London) Electricity and Lighting Committee has appointed Ald. F. R. Flew as chairman, and Coun. F. H. Barber as vice-chairman for the ensuing year.

Estate of the gross value of £17 185 with net personalty £15 790 was left by the late Mr. Alfred Baker, for many years general manager of the Birmingham tramways department.

Mr. C. Furness, borough electrical engineer and transport manager, Blackpool, has been re-elected president of the Blackpool and District Branch of the National Association of Local Government Officers.

Estate of the gross value of £3 217 with net personalty £3 011 was left by the late Sir Henry Alexander Kirk, late director in chief of the Indo European Telegraph Department, who died on November 9th, aged 81 years.

Obituary.

MR. EDWARD RUELL, aged 72 years. He was largely instrumental in the acquisition by the Durban Corporation of the local electrical undertaking and tramways.

MR. GILBERT ARCHER, on December 13th, deputy city electrical engineer to Dublin Corporation and a past Chairman of the Dublin Branch of the Institution of Electrical Engineers.

MR. A. J. HUBER, aged 51 years. After severing his continental associations, Mr. Huber was on the staff of Ferranti, Ltd., Hollinwood, which appointment he relinquished in 1920 to join the British Electric Transformer Co., Ltd., in charge of their export work.

Mr. SHADRACH FERRIS, aged 65 years. He was in business as an electrical engineer at Swindon. At the age of five years he lost his sight owing to an accident, but, after being educated at the blind schools at Bath and London, he attended evening classes at Swindon Technical Institution and succeeded in obtaining the City and Guilds' Certificates in electrical engineering.

MR. JAMES HARRIS ROGERS, a specialist in multiplex and rapid printing telegraphy. He was credited with the discovery of visual synchronism, and methods of secret telephone and underground and submarine wireless communication, which latter system, it is claimed, enabled the United States Government to maintain uninterrupted communication with the Allied Governments during the war.

ELECTRICITY SUPPLY IN CORNWALL.

Mr. L. A. Hards, manager of the Cornwall Electric Power Co., read a paper to the Cornish Institute of Engineers recently on "Recent Electrical Development in the West. He said the great antagonism to overhead lines had seriously impeded the extension of electricity supply in Cornwall. Although the cost of production was small, the expense of distribution over the sparsely-populated county was heavy, and for this reason overhead wires had to be used. In spite of these difficulties, however, he predicted great developments. In West Cornwall alone no fewer than 33 towns and villages were supplied with electricity. A number had adopted electric street lighting, and there was likelihood of a considerable extension in that direction. In addition to the Western area, they now controlled a number of towns and villages in Eastern Cornwall, including Saltash, Torpoint, Looe, Bodmin, Padstow, and Wadebridge. Eventually, the local plant in all those places would be shut down, and they would be connected up to a system of mains which would extend throughout Cornwall.

BUSINESS ITEMS.

MR. E. INGER, electric light and power engineer, has commenced business at 1, Bank Chambers, Roushill, Shrewsbury. He has a branch concern at 50, Watling Street, Church Stretton.

A manufacturers' agent in London, Ontario, desires to obtain British agencies for electrical goods, etc., throughout Canada. The Department of Overseas Trade will supply further information. (Reference No. 614.)

Marconiphone apparatus has been chosen for installation in the Neath Cottage Hospital. The equipment consists of a "Marconiphone Model 47" receiver, operated from The Supply mains, and six of the new type "60" cone loudspeakers.

B.B.C. Revenue.

The net revenue of the BRITISH BROADCASTING CORPORATION for 1928 was £141 409, of which £134 167 was transferred to capital account to cover capital expenditure on regional stations and for other purposes, and £7 242 was carried forward.

A merchant firm in Krugersdorp, Transvaal, desires to obtain the representation, on a purchasing basis of a British firm manufacturing high-grade electrical fittings and supplies. The Department of Overseas Trade has further particulars. (Reference No. 647.)

On account of increased business, the HART MANUFACTURING CO., LTD., makers of "Diamond H" heater switches and appliances, has had an additional telephone line installed. The old number has now been superseded by the two new lines Victoria 2087 and 2088. Additional stock rooms have also been acquired situated above the company's premises at 76 and 76b, Rochester Row, London, S.W.1.

The North Metropolitan Electric Power Supply Co. are proud of the fact that this year up to December 3rd they have, for the first time in their record, exceeded 10 000 new consumers. This is no small number and reflects credit upon their business getting organisation and general vigour in contact with the public through newspaper advertising and other channels. The total number of consumers at the date mentioned was 58 000.

HOLOPHANE, LTD., of London, have recently been successful in obtaining the contract for the complete lighting installation at the New Egyptian University at Ghizeh, Cairo. The fittings include some large and special units and the installation is one of the biggest of this type during recent years. It is gratifying to know that a British firm has been successful in obtaining this important order, particularly in view of the strong competition met with from continental firms.

Arrangements have been made to transfer, as from January 1st, 1930, the pyrometer and temperature measurement department of SIEMENS BROTHERS AND CO., LTD., to the associated company, ELLIOTT BROTHERS (LONDON), LTD., of Lewisham. The technical and commercial staff, which has been dealing with these matters at the Woolwich works, is being transferred to Lewisham, together with all stocks of apparatus, records, drawings and patterns. All further inquiries and correspondence on temperature measurement matters should be addressed to Elliott Brothers (London), Ltd., Century Works, Lewisham, London, S.E.13.

The R.100.

The Airship R.100, just completed by the Airship Guarantee Co., Ltd., Howden, Yorkshire, and now about to undergo its trials, has been provided with specially designed electrical cable and equipment. The complete wiring installation of the airship, including the lighting, heating, wireless cabins and power control cars, has been carried out to suit the special conditions by W. J. FURSE AND CO., LTD., of Manchester, London and Nottingham. It is also interesting to note that this firm has provided lightning conductors for the protection of the sheds in various parts of the world where airships of this type are to be eventually housed, including one recently erected at Karachi, India.

In reviewing the year's work so far, the LONDON ELECTRIC FIRM, of Croydon, states that, in addition to the largest searchlights in the world, made for practically the smallest State in the world, the company has had the usual run on searchlights for navigating the Suez Canal, with increasing favour for the super type, which does not require trimming of the carbon during the voyage, and beyond the usual demand for Army, Navy, Air Force, Mercantile Marine, and other types, good business has been done in a large number of pilot house patterns, all brass non-magnetic types, fire brigade and life saving searchlights.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

LEEDS GUARDIANS, December 27th.—Supply of electric lamps until March 31st, 1930. Specification, etc., from the clerk, Mr. J. H. Ford, 11, South Parade, Leeds. Stamped, addressed envelope to be sent.

BRADFORD CORPORATION, December 31st.—Electric passenger and good lifts in block of shop and office premises in Leeds Road, Bridge Street and Hall Ings. Specifications, etc., from the City Architect, Town Hall, Bradford.

NORTH-WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, December 31st.—Supply and erection of extra high pressure and low pressure overhead transmission lines. Specification from the clerk, Mr. H. Battle, Stoke-on-Trent; deposit £2.

METROPOLITAN ASYLUMS BOARD, January 2nd.—Re-plating 500 Ah storage battery at St. Luke's Hospital, Lowestoft. Specification, etc., from the Office of the Board, Victoria Embankment, E.C.4; deposit £1.

METROPOLITAN ASYLUMS BOARD, January 2nd.—Alterations of electric lighting installation at South-Western Fever Hospital, London Road, Stockwell, London, S.W.9. Specifications, etc., from the office of the Board, Victoria Embankment, London, E.C.4; deposit £1.

CENTRAL ELECTRICITY BOARD, January 6th.—Supply and erection of 132 kV overhead transmission lines (special crossings and high spans), in connection with North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.—P.L. 2) and form of tender from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

WHARFEDALE RURAL DISTRICT COUNCIL, January 6th.—Electrician's work in connection with erection of 10 non-parlour houses, in three blocks, on housing site at Mill Lane, Pool. Bills of quantities, etc., from the Surveyor, Council Offices, Menston; deposit £1 1s.

ISLINGTON (LONDON) GUARDIANS, January 9th.—Supply and erection of five full-automatic push-button electric lifts at the Infirmary, Highgate Hill, N.19. Specification, etc., from Mr. Albert King, Guardians' Offices, St. John's Road, Upper Holloway, N.19; deposit £2.

CAMBERWELL (LONDON) BOROUGH COUNCIL, January 13th.—Maintenance of electric lighting, heating and power installations, telephones, etc. (tender form H), and supply of electric lamps (form S). Forms of tender from the Borough Engineer.

ISLINGTON (LONDON) BOROUGH COUNCIL, January 17th.—One year's supply of cables, electricity meters, cable terminal and other boxes, switches, wires, lamps and sundries. Specification, etc., from the Town Clerk, Municipal Buildings, Upper Street, London, N.1.

CENTRAL ELECTRICITY BOARD, January 20th.—Supply and erection of 3·3 kV, 6·6 kV, and 11 kV switchgear, for connecting the Board's supply to undertakers' busbars. Specification (N.W.E.—G.S.1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

METROPOLITAN WATER BOARD, January 21st.—Supply and erection of four steam turbines, with pumps, and two electric generators, for Surbiton pumping station. Specification, etc., from the Chief Engineer (Room 173), 173, Rosebery Avenue, London, E.C.1; deposit £3 3s.

GRIMSBY CORPORATION, January 23rd.—Manufacture, supply and erection of 10 000 kW three-phase turbo-alternator, with condensing plant. Specification, etc., from Mr. S. R. Windle, Electricity Offices, Moss Road, Grimsby; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

SOUTH AFRICAN POSTS AND TELEGRAPHS, December 27th.—Telegraph material, including g.i. tubular arms, insulators, upper tubes for poles, etc. (tender No. 175). (Reference A.X. 8 734.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, December 28th.—Supply and erection at site of Mankabad Barracks of three Diesel engine driven electric generators, and sinking of two wells. Specifications (£1 0s. 6d., not returnable) from Chief Inspecting Engineer, 41, Tothill Street, Westminster, S.W.1.

LOURENCO MARQUES TENDERING DEPARTMENT OF THE TREASURY, January 3rd.—Supply of oil-engine driven d.c. generator and battery. (Reference B.X. 5 961.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 13th.—Supply of four-point jacks (P. and T. 151/1897). (Reference B.X. 5 840.)

VICTORIAN ELECTRICITY COMMISSION, January 13th.—Supply of 2 200 V switchgear and accessories (specification No. 30/2). (Reference B.X. 5 827.)

Telephone Material for Australia.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 14th.—Supply of ringing motor-generator sets, for automatic telephone exchanges. (Reference B.X. 5 839.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 14th.—Supply of telephone indicators (schedule C. 518). (Reference B.X. 5 822.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 14th.—Two air compressors (capacity not less than 800 cu. ft. of free air per min.), and two electric motors. (Reference A.X. 8 784.)

TENERIFFE (CANARY ISLANDS) MUNICIPALITY, January 14th.—Supply of tramcars, rails and tramway equipment. (Reference A.X. 8 872).

CAPE TOWN MUNICIPALITY, January 15th.—Supply of direct-coupled, electric motor driven, centrifugal pump for sewage works (specification No. 475/1 829.) (Reference A.X. 8 836.)

INDIA STORE DEPARTMENT, January 15th.—Supply of wood separators for train-lighting cells. Form of tender (5s.) from the Director-General, Belvedere Road, Lambeth, London S.E.1.

NEW ZEALAND GOVERNMENT RAILWAYS, January 15th.—Supply of automatic telephone exchange equipment for new station at Auckland. (Reference B.X. 5 841.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 16th.—Plug covers for telephone switchboard plugs. (Contract P. and T. 151/1 943.) (Reference B.X. 5 879.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 28th.—Supply of induction coils and register plates (schedule No. C. 533). (Reference B.X. 5 899.)

EGYPTIAN MINISTRY OF THE INTERIOR, February 1st.—Centrifugal well pump and direct-coupled electric motor, with piping and accessories. (Reference A.X. 8 811.)

NEW ZEALAND POSTS AND TELEGRAPHS, February 3rd.—Supply of protector blocks (carbon and porcelain). (Reference B.X. 5 948.)

VICTORIAN ELECTRICITY COMMISSION, February 3rd.—Electrically-driven mobile coal-trimming machine, for Yallourn power station. (Reference A.X. 8 681.)

NEW ZEALAND POSTS AND TELEGRAPHS, February 5th.—Supply of indication alarm fuses. (Reference B.X. 5 947).

VICTORIAN ELECTRICITY COMMISSION, February 10th.—Supply of sine wave generating equipment and accessories (specification No. 30/3). (Reference B.X. 5 844.)

NEW ZEALAND POSTS AND TELEGRAPHS, February 13th.—Supply of opal lamp caps (P. and T., 151/2 025). (Reference B.X. 5 955.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 18th.—Telephone jacks and number plates (Schedule No. C. 541). (Reference B.X. 5 940.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 25th.—Jumper rings and terminal strips (schedule C. 543). (Reference B.X. 5 941.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, February 27th.—Supply and erection of h.t. three-phase, overhead transmission lines in the Northern Delta of the Nile. Specifications, etc., from the Chief Inspecting Engineer, Egyptian Government, 41, Tothill Street, London, S.W.1 (£10 5s., not returnable).

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Switchgear and controlling equipment. (Reference B.X. 5 798.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 110 kV switchgear, for interconnecting auto-trans-

Digitized by Google

formers, for Waitaki power scheme, section 76. (Reference B.X. 5 797.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 66 kV switchgear and protective system for Lyttelton, Lake Coleridge, power scheme, section 217. (Reference B.X. 5 796.)

VICTORIAN RAILWAY COMMISSION, March 30th.—Supply of d.c. neutral relays for power signalling purposes (contract No. 43 457.) (Reference B.X. 5 793.)

SOUTH AFRICAN IRON AND STEEL INDUSTRIAL CORPORATION, LTD., April 12th.—Electrical and other equipment for the various departments of the company's iron and steel works to be erected at Pretoria. Further information from the Committee of Consulting Engineers of the South African Iron and Steel Industrial Corporation, Ltd., c/o the International Construction Co., Ltd., 56, Kingsway, London, W.C.2.

Tenders Accepted.

CARLISLE CORPORATION.—R. M. Hill and Sons, electric light wiring of 250 houses.

STEPNEY (LONDON) BOROUGH COUNCIL.—Whipp and Bourne, Ltd., supply of 22 circuit breakers, £107.

GLASGOW CORPORATION.—C. Raine and Son, Ltd., dust extraction plant at Coplawhill car works.

BELFAST CHILDREN'S HOSPITAL.—J. Dowling and Son, electric wiring, including telephones and bells.

DONCASTER CORPORATION.—Callender's Cable and Construction Co., Ltd., low pressure cable, £859 5s. 9d.

PORTLAND URBAN DISTRICT COUNCIL.—Evershed and Vignoles, Ltd., supply of a Megger, £24 12s. 6d.

SUNBURY URBAN DISTRICT COUNCIL.—Heenan and Froude, Ltd., construction of refuse destructor, £1 502 10s.

BRAINTREE GUARDIANS.—East Anglian Electric Supply Co., Ltd., electric light installation at the Institution, £98.

PORTRUSH URBAN DISTRICT COUNCIL.—Blackstone and Co., additional plant for generating station, £2 956 13s. 3d.

METROPOLITAN WATER BOARD.—W. Lucy and Co., Ltd., supply of switchboard at Kempton Park works, £99.

STOKE-ON-TRENT COMMITTEE.—R. M. Catterson-Smith, electric kiln, for Burslem School of Art, £110 less 10%.

GLASGOW CORPORATION.—Telegraph Condenser Co., supply of power factor improvement plant at Dawsholm gasworks, £405.

MANCHESTER CORPORATION.—Barber and Colman and Forest City Electric Co., supply and fixing of automatic control signals.

LONDON COUNTY COUNCIL.—E. Showell and Sons, Ltd., and Power Equipment Co., Ltd., controller segments, finger tips, etc.

GLASGOW CORPORATION.—A. and P. Steven, Ltd., overhauling lift at Govan town hall and changing over to push-button type, £73.

G. W. SMITH AND CO. (1925), LTD. (STOCKPORT).—McClure and Whitfield, electrical work in connection with reconstruction of premises.

BARNSLEY EDUCATION COMMITTEE.—Corporation electricity department, electrical equipment of Grammar School Laboratories, £240.

HENLEY-ON-THAMES CORPORATION.—S. Bennett, electric light installation at Kenton Hall, including footlights, £83 11s. 6d.

BURTON-ON-TRENT.—Metropolitan-Vickers Electrical Co., Ltd., supply of apparatus for a metering sub-station, £834, and £50 for erection.

Overhead Line Equipment.

OLDHAM CORPORATION.—W. F. Furse and Co., erection of overhead line equipment from Oldham sewage works to Chadderton sewage works.

FRAMLINGHAM PARISH COUNCIL.—C. Garrard, Ltd., supply and fixing of electric pump and gearing to Jeaffreson's Memorial Well, £127.

WIMBLEDON CORPORATION.—Pneumatic Conveyance and Extraction, Ltd., provision of soot and grit prevention plant, at the power station, £2 400.

DEWSBURY.—Corporation Power and Lighting Cables, Ltd., supply of cable, £2 035 5s. (difference between British and German tenders was 12%).

HOLYWOOD URBAN DISTRICT COUNCIL.—Bromford Tube Co., Ltd., supply of 24 steel lighting standards, with bracket ladder arms and c.i. bases.

CITY OF LONDON CORPORATION.—W. J. Furse and Co. (London), Ltd., provision of electric lighting at crematorium buildings, £563. (Recommended.)

SHOREDITCH (LONDON) BOROUGH COUNCIL.—Stirling Boiler Co., Ltd., extension of boiler plant at Whiston Street power station, £21 174. (Recommended.)

SOWERBY URBAN DISTRICT COUNCIL.—J. Harrison and Co., electrician's work in connection with erection of 16 houses on Beechwood housing site, Sowerby.

BEDFORD EDUCATION COMMITTEE.—Young, Osmond and Young, tubular electric heating installation at Ampthill Road Council Schools, £761 18s. (Recommended.)

EAST HAM CORPORATION.—Hart Accumulator Co., Ltd., supply of control battery and switchboard for remote control and emergency lighting, £265 7s. (Recommended.)

MANCHESTER CORPORATION.—S. H. Heywood and Co., Ltd., supply of electrically driven overhead travelling crane; Equipment and Engineering Co., Ltd., supply of two rail planers.

PLYMOUTH CORPORATION.—Bromford Tube Co., Ltd., £125, supply of electric lamp columns, £125; English Electric Co., £561, supply of sub-station l.t. isolating link and fuse panels, £561.

CHESTERFIELD CORPORATION.—British Thomson-Houston Co., Ltd., supply of truck type cubicle, £132 4s. 6d.; Brush Electrical Engineering Co., Ltd., supply of a 150 kVA transformer, £110.

GLASGOW CORPORATION.—W. F. Dennis and Co. (for Felten and Guilleaume, Carlswerk, Germany), supply of copper trolley wire, £1 204. (Recommended.) Lowest of four British tenders was £1 327 4s.

STOKE-ON-TRENT CORPORATION.—E. Holloway, overhead service lines on Horwills estate Trentham, £275; Barnett and Soans, overhead wiring and services at Etruria Vale housing estate, £99 15s.

CHELTENHAM CORPORATION.—F. H. Bastin and Sons, wiring houses to be erected at Pilley, including provision of lighting points in each room and one power point in the living room, £443 12s.

Transformers, &c.

HASTINGS CORPORATION.—Ferranti, Ltd., supply of 5 000 kVA transformer, £1 495; W. T. Glover and Co., Ltd., overhead and underground cables to Battle, estimated at £7 435. (Both recommended.)

BRIGHTON CORPORATION.—Ferranti, Ltd., supply of one 200 kVA transformer, £184 16s.; Brighton Lighting and Electrical Engineering Co., Ltd., provision of traffic signalling system at Old Steine, £764.

COLWYN BAY URBAN DISTRICT COUNCIL.—Macintosh Cable Co., Ltd., supply, erection and laying of e.h.t. and l.t. overhead lines and cables in connection with Glan Conway and Llysfaen electricity supply, £2 578.

ESSEX COUNTY COUNCIL.—Electrical equipment for Black Notley sanatorium: switchboard, £101 10s., Christy Bros. and Co., Ltd.; electric light fittings, £42 5s. 7d., F. Thomas and Co., Ltd., and £13 2s. 6d., Benjamin Electric Co., Ltd.

BARKING URBAN DISTRICT COUNCIL.—Derby Cables, Ltd., supply of 2 000 yards and 1 200 yards of four-core cable, £202 and £149; Hackbridge Electric Transformer Co., Ltd., supply of 400 kVA transformer, £186. (Both recommended.)

SALFORD CORPORATION.—General Electric Co., Ltd., supply of equipment for private automatic branch telephone exchange, estimated, £668; Whitehead and Poole, Ltd., supply and erection of electrically driven balancing and operating gear for sludge delivery pipe, £140. (Both recommended.)

CROYDON CORPORATION.—General Electric Co., Ltd., spare motor for use in connection with London service tramcars, £203; British Electric Transformers Co., Ltd., supply of two 1 000 kVA three-phase transformers, £924; J. and T. Robinson, electric wiring at the sewage works, £385 5s. (All recommended.)

HAMMERSMITH (LONDON) BOROUGH COUNCIL.—British Electric Transformer Co., Ltd., supply of three 1 000 kVA three-phase transformers, £1 177 10s. (Recommended.) Alternative tender £1 095 19s. 6d. Also tendered: General Electric Co., Ltd., £1 009 10s.; Hackbridge Electric Construction Co., Ltd., £1 020; English Electric Co., Ltd., £1 065; C. A. Parsons and Co., Ltd., £1 095; Brush Electrical Engineering Co., Ltd., £1 110; Yorkshire Electric Transformer Co., Ltd., £1 155; Johnson and Phillips, Ltd., £1 185; Metropolitan-Vickers Electrical Co., Ltd., £1 191; Ferranti, Ltd., £1 206; Bruce, Peebles and Co., Ltd., £1 275; British Thomson-Houston Co., Ltd., £1 338; Fuller Electrical and Manufacturing Co., Ltd., £1 491.

WORK IN PROSPECT.

ABERGAVENNY.—Cottage Hospital extensions. Particulars, the Secretary.

NORTHALLERTON.—Post office. Particulars, Mr. D. Oakley

NORTHAMPTON.—School (1 200 places). Particulars, Mr. W. R. Kew.

NORTHOLT.—Ten shops and flats. Particulars, T. P. Bennett and Son, 41, Bedford Row, W.C.1.

OXFORD.—Residential quarters for Undergraduates of Balliol College. Particulars, Mr. George L. Kennedy, Chenil Galleries, Chelsea, London, S.W.3.

OXTED.—Cinema and shops. Particulars, Messrs. H. F. Murrall and R. Piggott, 44, Bedford Row, London, W.C.1.

PETERBOROUGH.—Reconstruction of theatre. Particulars, Mr. J. A. Campbell, Grantham.

POULTON LE FYLDE.—School. Particulars, the Director of Education, Preston.

PRESTON.—Sunday schools. Particulars, Rev. W. Newton.—Houses. Particulars, Pius A. Baines and Sons (228), and Mr. A. Swarbrick (22).

RAINHAM (ESSEX).—Church and Sunday schools. Particulars, the Secretary.

READING.—Reconstruction of "Four Horse Shoes" public house. Particulars, Mr. F. Sainsbury, architect, 154, Free Street, Reading.

ROCHFORD.—Central school. Particulars, Director of Education, Chelmsford.

ROMFORD.—60 houses. Particulars, Mr. P. H. Evans.

SKEGNESS.—Shops, museum, reading room, etc. Particulars, the Surveyor.

SOHO (LONDON).—Block of showrooms and offices. Particulars, Mr. A. S. R. Ley, 214, Bishopsgate, London, E.C.2.

STROUD.—Central school. Particulars, the Director of Education, Gloucester.

SWINDON.—School. Particulars, the Secretary, 22, Regent Circus.

TOLWORTH.—Roman Catholic Church. Particulars, the Priest in charge.

UCKFIELD.—Houses (12). Particulars, Mr. T. Burdett, Beacon Road, Crowborough.

WANDSWORTH (LONDON).—36 flats. Particulars, Messrs. J. Lovell and Son.

WELWYN GARDEN CITY.—Additional 200 houses. Particulars, the Surveyor.

WINCANTON.—Additional 100 houses. Particulars, the Secretary to Rural Council.

WITHAM.—Housing scheme (40). Particulars, Mr. D. Jenkinson.

WOKINGHAM.—Girls' secondary school. Particulars, the Director of Education, Reading.

WOLVERHAMPTON.—Reconstruction of locomotive repair shops. Particulars, Architect to G.W.R., Paddington Station, London.

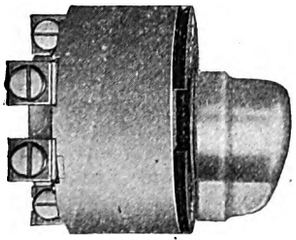
WOLVERHAMPTON.—Schools and extensions. Particulars, the Director of Education.

WORKINGTON.—School (500 places). Particulars, the Director of Education.

WORTHING.—Reconstruction of old Theatre Royal. Particulars from Messrs. Yates, Cook and Derbyshire, architects, London.

YORK.—Houses (100). Particulars, Mr. John Sawdon, Bridlington.

A NEW SWITCH.



The new heater switch of the Hart Manufacturing Co.

The HART MANUFACTURING CO., LTD., of 76–76b, Rochester Row, London, S.W.1, have recently produced a new heater switch particularly designed for use on electric cookers, etc., being of the special back connected type for panel mounting. Our illustration shows the new switch, which has a totally enclosed mechanism of new design and is dustproof. The connections are all made externally at the back of the switch. A new style clock spring mechanism is incorporated, prolonging considerably the life of the switch and giving an ease of control that, the makers claim, cannot be accomplished in any other way. This type is, we understand, standard on a large number of modern electric cookers.

TRADE PUBLICATIONS.

THE ELECTRIC CONSTRUCTION CO., LTD., Ingersoll House, Kingsway, London, W.C.2, has issued a new catalogue relative to rotary convertors. The reference is B. 626.

A catalogue just available to the trade is list No. 513, by the SUN ELECTRICAL CO., LTD., 118/120, Charing Cross Road, London, W.C.2, dealing with electric fires.

An attractive window display in connection with the sale of "Nife" hand lamps, issued by Batteries Ltd.

"Prismat" bulkhead lighting fittings form the subject of a new publication of the WARDLE ENGINEERING CO., LTD., Elcinore Road, Old Trafford, Manchester.

Publication No. 6 493 issued by the IGRANIC ELECTRIC CO., LTD., 149, Queen Victoria Street, London, E.C.2, deals with the No. 190 automatic starting panel.

"The Art of Fault-Locating on Lighting and Power Mains" is the title given to a new issue by PRICE AND BELSHAM, LTD. 52, Queen Victoria Street, London, E.C.4.

Messrs. DE BRUNNER AND LANG SIMS, 3/4, King Street, London, W.C.2, have issued a number of blotters illustrating "Marco" boiling rings, domestic water heaters, fires, hotplates and geysers.

BROOKHIRST SWITCHGEAR, LTD., Northgate Works, Chester, have published leaflet No. 301, dealing with the Dutch motor liner "Johan van Oldenbarnveldt," and the company's equipment on board.

Stage spotlights suitable for theatres, cinemas, concert halls, etc., are described and illustrated in leaflet No. SL 4986 published by the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2.

The ORMOND ENGINEERING CO., LTD., Ormond House, Rosebery Avenue, London, E.C.1, has sent us a well-produced catalogue dealing with the company's portable and other wireless receivers, components and accessories.

A new catalogue, No. 243, of electrical heating appliances has been published by the WHOLESALE FITTINGS CO., LTD., of 23/37, Commercial Street, London, E.1. The catalogue, comprising over 30 pages, is well illustrated and highly descriptive.

The latest publications of the A.E.G. ELECTRIC CO., LTD., 131, Victoria Street, London, W.1, include leaflet No. X 1108E, dealing with "Furniculus" fires; No. X 1108E describing 1 and 2 kW fires; and a special booklet devoted to the "Vampire" vacuum cleaner and the "Hobby" floor polisher.

We have received from the ENGLISH ELECTRIC CO., LTD., Queen's House, Kingsway, London, W.C.2, copies of publication No. K. 43 describing the company's power factor compensator, No. K. 62 dealing with trolley 'buses and No. K. 66 relative to the company's air-operated controller for electric trolley 'buses.

A new catalogue covering the whole range of "Osram" valves has been published by the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2. The new issue gives all details as to normal ratings, characteristic curves, grid bias voltages, etc. Each type of valve is illustrated and approximate dimensions are indicated. The reference is O.V. 5189.

MARCONI'S WIRELESS TELEGRAPH CO., LTD., Marconi House, Strand, London, W.C.2, has issued leaflet No. 1097, relative to types M.C.8a and M.C.8b, 500 W telegraph transmitters, and leaflet 1101, describing type X.M.C.2, 500 W fixed wavelength telephone set, has also been published. Type X.M.B.1a fixed wavelength telephone sets, and type M.C.13 1·5 kW telegraph sets are described in leaflets 1082/2 and 1103, respectively.

ELECTRICITY SUPPLY.

Further Brighton Extensions—Portrush to Continue Generation—New Plant for Torquay—Chester's Change-over Scheme—Approval of Abersychan Supply Scheme—New Hydro-Electric Station at Inverness.

GLASGOW Electricity Committee has authorised mains extensions at a cost of £9 765.

Weymouth Electricity Committee has decided to lay mains in Bowleaze Coye Road, at a cost of £750.

Peterborough T.C. has applied for a loan of £25 000 for the provision of l.t. mains, cookers, and meters.

Brighton Electricity Committee has obtained sanction to borrow £50 000 for electricity mains and services.

East Grinstead U.D.C. has applied to the Commissioners for a loan of £10 000 for mains, services, and meters.

Bristol Corporation seeks powers to extend the limits for supply of electricity to Henbury and Bishopsworth.

Hastings Electricity Committee has obtained sanction for loans of £7 000 for mains and services and £450 for sub-station equipment.

Brierfield U.D.C. is to apply to the Unemployment Grants Committee for financial aid in speeding up the electricity conversion scheme.

Colwyn Bay U.D.C. has received sanction to borrow £9 628 for mains and services; £2 032 for transformers, switchgear, etc.; and £469 for meters.

The Electricity Commissioners have agreed to the linking up of the Burnley and Nelson electricity undertakings, as an additional safeguard in case of emergency.

Perth Electricity Committee has received a suggestion from the Electricity Commissioners that further schemes for the relief of unemployment should be considered.

Bedford Electricity Committee is to seek sanction to borrow £20 000 for house services and £15 000 for apparatus for hire. —Mains are to be extended at an estimated cost of £641 6s.

The Twickenham and Teddington Electric Supply Co. has intimated that, subject to a satisfactory price being reached by agreement, it would be prepared to sell its Hampton Wick undertaking.

Through the agency of Messrs. Bannister Bros., cotton manufacturers, Bee Mill, Ribchester, electricity is to be supplied to the village. The cable will be laid to the firm's mill by Preston Rural District Council.

Fulham (London) Electricity Committee has voted £350 for an extension of the mains in Kinnoul Road for affording a supply to prospective consumers in that road, under the rental wiring schemes.

The County of London Electric Supply Co., Ltd., has acquired a site on the St. Helier estate at Morden for a sub-station in connection with the supply to the London County Council housing estate.

Portrush U.D.C. has decided to take no action on the Antrim Electricity Co.'s offer of a bulk supply, and has accepted a tender for the supply of additional plant for its own generating station.

Torquay T.C. has decided upon the expenditure of nearly £100 000 on its electricity undertaking. The Electricity Commissioners have sanctioned the installation of additional plant at a cost of £98 780.

Swansea Electricity Committee has decided to change over from d.c. to a.c. in the Wassail Square district, and is to instal the necessary a.c. mains at a cost of £780.—Other mains are to be extended at a cost of £1 122.

Birkenhead T.C. has received sanction to loans of £2 100 for overhead extensions to Saughall, Massie and Ledsham, £5 966 for similar extensions to Burton and Puddington, and £900 for a supply to Great Sutton.

The Isle of Wight County Council has received a notice from the Isle of Wight Electric Light and Power Co. of intention to apply for sanction to erect overhead lines between Ventnor and Niton. The Council has decided not to raise any objection.

The promoters of the Ringmer and District Special Order have agreed to withdraw the parishes of Wilmington, Folkington, Jevington, Friston, and East Dean from their application, and these parishes will be included in Eastbourne Corporation's Extension Order.

A proposal for a bridge across the Tamar is occupying public attention at Plymouth, and in connection therewith Mr. F. J. Coles, a local trader, suggests that the bridge should also serve the purpose of a barrage by means of which electricity could be generated.

An electricity supply system carried out by Mr. J. Herbert Edwards, of Gloucester, was inaugurated at Ponterwyd on December 10th by Miss Olwen Rhys, daughter of Sir John Rhys, resident in the district. Any profit on the undertaking will be devoted to village improvements.

Dronfield U.D.C. has accepted the offer of Sheffield Corporation to supply electricity direct to Dronfield consumers at 20% above the Sheffield prices. The Council has also decided to support the Corporation's application to take over the Council's rights under the Dronfield Electricity Order, 1928.

Chester Electricity Committee recommends the adoption of a scheme to change over the Corporation's electricity supply system from d.c. to a.c. at an estimated cost of £70 000, and proposes to apply for a grant under the Development Act of 50% of the interest on the expenditure.

Kensington (London) Works Committee states that the substitution of electricity for gas lighting in streets in the borough has been extended and additional lamps have been provided. The Committee has in course of preparation a scheme for further improvements in the street lighting.

Dorchester Lighting Committee has decided to defer consideration of the question of lighting the town electrically until it can be ascertained what the developments under the recent Electricity Acts are likely to be, and what the council's position thereunder will be. The question of instituting a sliding scale for large consumers has also been deferred.

A deputation from Abersychan U.D.C. Council waited on the Electricity Commissioners to obtain authority for a loan for the construction of an electricity supply undertaking. The Commissioners approved the project, and the Ministry of Health and the Unemployment Grants Committee are to be approached in connection with the matter.

Manchester Corporation has refused to approve the recommendation of the Electricity Committee that the basis for arriving at the fixed charge under the all-in tariff for domestic users should be altered from 20% on pre-war values up to £100 to 15% on present values up to £130. An amendment that the new figure should be 12½% has been passed.

Dartford Electricity Committee recommends work being commenced at the earliest possible date in connection with the provision of the second instalment of the ring main scheme which comprises the laying of a h.t. cable from the sub-station in Princes Road to Temple Hill, and the construction of a sub-station in Princes Road at an estimated cost of £6 500.

Croydon Electricity Committee has considered reports of the Borough Electrical Engineer and the Borough Accountant with regard to the advantages to be derived from a system of continuous meter readings, in lieu of the readings on or near the quarter days. The Committee recommends that the suggested new system be adopted.—Mains are to be extended at a cost of £1 300.

Colchester Electricity Committee has arranged an interview with the engineer to the Frinton-on-Sea and District Electric Light and Power Co. to discuss terms for a bulk supply by the Corporation, and also as to further generating plant.—The Borough Electrical Engineer has submitted particulars of the lengths of cables which it will be necessary to lay in various streets in the borough within the next twelve to eighteen months, the approximate total cost being £5 462.—It has been decided to apply for permission to erect an overhead line to Ardleigh.—The Electrical Engineer estimates the cost of completing the e.h.t. ring main within the borough at £19 430.

Inverness Corporation's new hydro-electric power station at Bught and refuse destructor at Riverside Street, Inverness, were opened on December 11th by Sir Murdoch Macdonald, M.P., who said the new electricity station was able to produce electricity at a halfpenny a unit. The hydro-electric station has cost about £15 000, and the plant consists of a vertical turbine coupled direct to a vertical generator. The switchboard is entirely automatic. Preliminary tests have shown that the plant will produce something like 600 000 kWh per annum. The refuse destructor has cost about £10 000, and tests indicate that the plant is capable of burning the whole of the daily collection of town refuse and supplying a considerable proportion of the daily requirements of steam for the Corporation's adjacent electricity works.

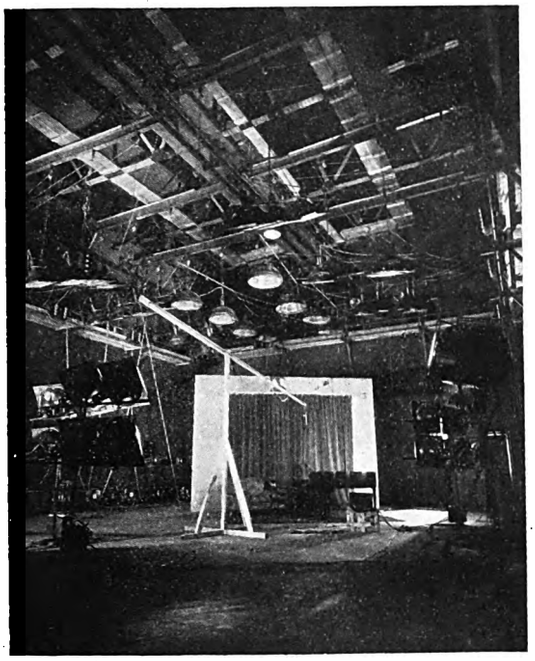
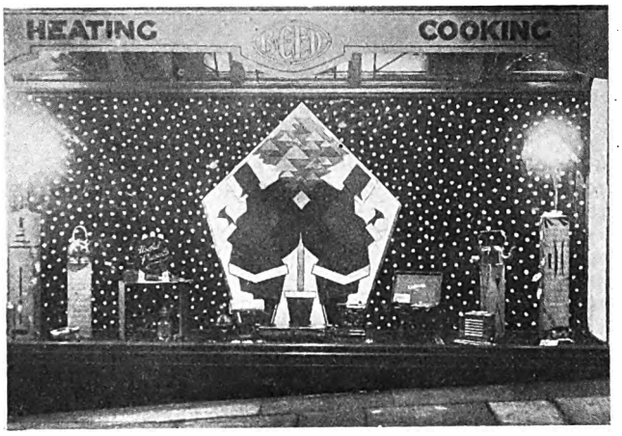
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

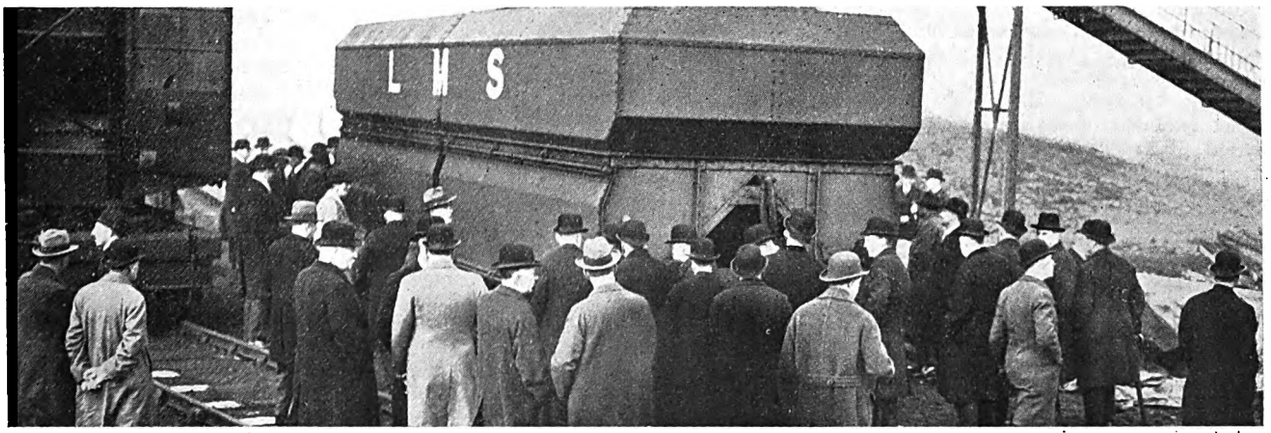


One of the latest studios at Elstree, where the British film industry is making steady progress in face of American competition. The amount of electrical equipment involved in the successful "shooting" of a film is more than the average person realises, and even in this small "set" the number of reflectors used in the lighting scheme approaches fifty.

America, with the thermometer standing at —30 deg., is experiencing the first real cold this winter. Snowdrifts have disorganised travelling facilities in many cities, but the Utah Power and Light Co. gets over transportation difficulties by using dog teams and sleighs. Curiously enough the apparatus seen in the picture is an electric refrigerator being delivered to one of the company's consumers. (Photo: "Electrical Merchandising.")



A contrast in Christmas window displays. That on the left is a window designed by J. S. Rambottom and Co., Ltd., of Keighley, featuring a snow house and Father Christmas surrounded by electrical gifts, while on the right is a futuristic impression in the window of Bradford Corporation electricity department.



A new type of 40-ton coal truck introdnced by the London Midland and Scottish Railway, which can be discharged instantaneously. The purpose of these trucks is to eliminate manual labour, and a fleet of them is being employed to carry coal direct from the collieries to the company's electric power station at Stonebridge Park. A description of the trucks and coal handling plant is given on page 826.

SWEDISH GENERAL ELECTRIC CO.—The company has acquired majority of shs. in Finska Elektriska Aktiebolaget Gottfried Stroemberg, the sh. cap. of which is 12 300 000 Finnish marks.

MARCONI'S WIRELESS TELEGRAPH CO., LTD.—Transfer books in respect of 7% cum. participatg. pref. shs. are closed until Dec. 31, inclusive, for purpose of preparing warrts. for div. for year ended Dec. 31, 1929.

BRITISH ALUMINIUM CO., LTD.—Transfer books of 5% prior lien debs. are closed until Dec. 31, inclusive, for paymt. of six months int. on Jan. 1. Coupons to bearer are payable at the Westminster Bank, 52, Threadneedle Street, London, E.C.

CONSTANTINOPLE TELEPHONE CO.—Coupon No. 32 on 6% obligatns. and coupon No. 20 on 6% certs. due on Jan. 1, will be payable on and after that date at the Ottoman Bank, 123, Old Broad Street, London, E.C.2, where listg. forms can be obtained.

VICTORIA FALLS AND TRANSVAAL POWER CO., LTD.—Coupon No. 35, representg. half-year's int. due Jan. 1 on series "A" and "B" 5½% 2nd mtge. debs. and debs. drawn for redemptn. will be paid on that and succeeding days at the offices of Erlangers, Ltd., 4, Moorgate, London, E.C.2. Coupons and drawn debs. must be left three clear days.

LIMA LIGHT, POWER AND TRAMWAYS CO.—Coupon No. 14, representg. int. for six months ended Dec. 31, at rate of 8% p.a. on 8% cum. participatg. con. pref. shs. will be payable on Jan. 1. Coupons may be presented at the offices of J. H. Schroder and Co., 145, Leadenhall Street, London, E.C.3. Coupons due on Jan. 1 in respect of 6% 1st mtge. debs. may also be presented at the offices of J. H. Schroder and Co.

Company Meetings.

VENEZUELA TELEPHONE AND ELECTRICAL APPLIANCES CO., LTD.—Mr. H. S. Bennett, presiding at the meeting on December 17th, said their revenue from subscriptions, rentals, etc., increased during the past year by £15 368, and expenses in Venezuela were greater by about £9 000, and the charges in London had also risen. The net result was that their profit for the year amounted to £38 387, against £35 742. They were adding the substantial sum of £30 000 to the reserve for renewals and depreciation. Capital expenditure during the year was approximately £85 000. They saw every encouragement to go ahead and widen their field of development. When the 2 000 automatic lines now undergoing installation in Caracas were completed they would have 8 000 automatic lines all told connected to the Caracas Exchange, which was the company's largest exchange, accounting for over 62 per cent. of the total number of subscribers. The introduction of the automatic system had been a pronounced success, and further development of the Caracas and other neighbouring areas was anticipated and planned for. They expected to extend the automatic facilities to the towns of Maracay, Valencia, La Guaira, and Puerto Cabello. In recognition of the company's enterprise in developing the automatic services in those areas the authorities had consented to an increased tariff. Their subscribers numbered 9 465, a gain of 750 during the year. With the provision of additional plant facilities and by means of propaganda they believed a much larger rate of growth would be possible in the future. The report and accounts were adopted and the dividends approved.

CAPE ELECTRIC TRAMWAYS, LTD.—Mr. L. Breitmeyer presiding at the meeting on December 18th, said it was disappointing to have to announce that during the period under review no change for the better had taken place as regards motor-bus competition—the number of opposition buses running had considerably increased—in fact, more than doubled. The profits transferred to London were reduced to £40 083 15s. 6d., against £45 752 os. 9d. in the preceding year. No change as regards the control of passenger transport by the authorities had taken place, and the company was still subject to unfair competition. Licences were granted without limit, permitting competitors to run over routes more than sufficiently supplied with means of transport. The Provincial Council had, however, recently passed legislation giving wider powers to municipalities for the control of transport, and a Commission had been appointed by the Government to inquire and report upon the best means of dealing with the present uncontrolled road competition. This Commission had practically finished its investigations, and was expected to place its report before the Government before the end of the present year. The profit and loss account showed after charging London expenses, income tax, etc., and depreciation on motor-buses, a credit balance of £32 755 5s. 3d. Against this was charged the interest and redemption of debentures £19 441, leaving a balance of £13 314 5s. 3d., making, with the balance of profit brought forward from last year, £41 939 18s. 3d., out of which £5 000 was allocated to reserve, which left a balance of £36 939 to be carried forward. It was a matter of much regret to the directors that they were again unable to recommend a dividend. He thought, in view of the legislation that had been passed, the outlook for the company was more encouraging than it had been for some time past.

NEW COMPANIES.

H. CRUTTENDEN AND SON, LTD.—Cap., £6 000. Contractors, electricians, etc. Reg. Office: 5, Ashford Road, Maidstone.

BELL-RADIO CO., LTD.—Cap., £3 000. To acquire the business of Bell-Radio Co., wireless specialists, 33, George Street, Edinburgh.

BARNES AND BARROW, LTD.—Cap., £1 000. Mechanical and electrical engineers, etc. A director: W. A. S. Barnes, 59, College Road, Handsworth, Birmingham.

ELECTRICAL REPRODUCERS, LTD.—Cap., £100. Electrical, radio, and consulting engineers, etc. Reg. Office: 102. West Regent Street, Glasgow, C.2.

BEL-CANTO RADIO REPRODUCER CO. (N.S.), LTD.—Cap., £1 100. Manufacturers of and dealers in apparatus for wireless transmission and reception, etc. Solicitors: Simpson, Curtis, Dixon and Burrill, Leeds.

FRANK HAYTOR (JUNIOR), LTD.—Cap., £100. Advertising contractors, manufacturers of, and dealers in, advertising signs, electric and other signs, etc. Solicitors: Pearson, Son and Co., 438, Corn Exchange, Manchester.

PODMORE'S, LTD.—Cap., £5 000. To acquire business of manufacturers of gas and electric heating and lighting and cooking apparatus, etc., now carried on at 34, Charles Street, Hatton Garden, E.C.1, as "A. E. Podmore and Co."

CHRONOLARM, LTD.—Cap., £100. Advertising agents and contractors, manufacturers of, and dealers in, clockwork machines, gas and electrical apparatus and machinery, etc. Reg. office: Buchanan Buildings, 24, Holborn, London, E.C.1.

A.-P. SPRINGS, LTD.—Cap., £500. General manufacturers and engineers, manufacturers of and dealers in tension and compression springs for the engineering, electrical or other industries, etc. Reg. Office: British Mills, Redditch, Worcester.

BARRI THERAPEUTIC INSTITUTE (HULL, 1929), LTD.—Cap., £1 000. Medical and general electricians, masseurs, radiologists, actino-therapists, hydro-therapists, electro-therapists, etc. Reg. Office: 21, Story Street, Hull.

RIGBY AND PARTNERS, LTD.—Cap., £500. Electrical engineers and contractors, dealers in and erectors of electrical plant, equipment, apparatus and accessories, etc. Reg. Office: 53, Victoria Street, Westminster, London, S.W.1.

ELECTRIC SERVICE CO. (BIRMINGHAM), LTD.—Cap., £2 500. To carry on business of electrical service and accumulator specialists formerly carried on by P. H. Jones and Nancy Jones, at 125, Bristol Street, Birmingham.

RAY-BEAM, LTD.—Cap., £100. Importers and exporters of and dealers in motor accessories, electrical specialities, etc. A director: J. F. Holland, 22, Esmond Road, Cheetham Hill, Manchester, J. Smith, 18, Rochester Street, Manchester, warehouseman.

STANLEY F. BALDRY, LTD.—Cap., £1 000. Advertising agents, manufacturers and producers of and dealers in advertising signs, electric and other illuminated devices, etc. A director: S. F. T. Baldry, 64, Hamilton Terrace, St. John's Wood, London, N.W.8.

J. N. BOYES, LTD.—Cap., £500. To acquire business of electrical engineering, etc., carried on by J. N. Boyes, at 10, William Street, London, to carry on the business of electrical, wireless and general engineers. etc. Reg. Office: 10, Serjeant's Inn, Temple, London, E.C.4.

JOHN BROWN (DENTON), LTD.—Cap., £2 500. Wire drawers, manufacturers and merchants, smelters and manufacturers of, and dealers in, iron, steel, copper and other metals, mechanical and electrical engineers, etc. Reg. office: Victoria Works, Two Trees Lane, Denton, Lancs.

RUNBAKEN MOTOR AND ELECTRICAL ACCESSORIES, LTD.—Cap., £8 000. To acquire the business of makers, inventors, patentees and sellers of, and dealers in, motor and electrical accessories and commodities now carried on by J. H. Runbaken and S. W. Lewis, at Tipping Street, Ardwick, Manchester, as "Runbaken Magneto Co."

ELM MANUFACTURING CO., LTD.—Cap., £1 000. To manufacture and deal in metal, ebonite or composite parts, pressings, stampings and resistances, condensers and parts, wireless, telegraph and scientific instruments or component parts, electrical gramophones, television and synchronising apparatus, etc. Reg. office: 131, Brixton Hill, London, S.W.2.

ENGLISH ALABASTER MARBLE AND LIGHTING CO., LTD.—Cap., £1 000. Manufacturers of and dealers in alabaster bowls, vases, table stands and brackets and other receptacles, ornaments and wares; electrical and wireless engineers and experts, designers and manufacturers of and dealers in lamps, globes, brackets, shades, etc. A director: H. H. D. Duncan, 144, Boleyn Road, Forest Gate, London, E.7.

ARMAFLEX PARENT, LTD.—Cap., £25 000. To acquire from Relative Engineering Co. patent rights under provisional No. 2 046/29 for improvements in, or relating to, cable making and light machines in the name of F. J. Humphrey, and Letters Patent when granted, both in Great Britain and abroad, to carry on the business of cable manufacturers, engineers, etc. Reg. office: 27, Queen Victoria Street, London, E.C.4.

BARROCK INVESTMENT TRUST, LTD.—Cap., £35 000. To carry on business as a general investment trust company, to invest and raise and borrow money for investment in purchase or acquisition of stocks, bonds, debentures, shares, scrip or securities of any electricity or other public undertaking or company, in Great Britain, India or elsewhere. Solicitors: Markby Stewart and Wadesons, 5, Bishopsgate, London, E.C.

COMMERCIAL INFORMATION

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

BRITTAIN, J. V., 146, Lichfield Street, Walsall, electrical engineer (trading as WALSALL RADIO CO.) £12 16s. 4d. November 14th.

EMMS AND CO., Connaught Street, Northampton, wireless engineers. £31 1s. 9d. November 13th.

HEALD, S., 39, Steeley Lane, Chorley, wireless dealer. £12 13s. 11d. October 24th.

JACKSON AND CO., 54, Broadway, Leigh-on-Sea, electrical engineers. £15 15s. November 12th.

J.D. WIRELESS CO., 195, Breck Road, Liverpool. £43 13s. 4d. November 4th.

RADIO SERVICES, 585A, Wilbraham Road, Chorlton-cum-Hardy. £14. October 19th.

Bankruptcy Proceedings.

GASCOIGNE, Harry, 40, Cricklade Street, Cirencester, Glos., wireless dealer, etc. The public examination was held on December 18th at the County Court Buildings, Clarence Street, Swindon, when a statement of affairs was filed showing gross liabilities of £746 against assets of £138. It appeared that the debtor was out of employment for ten months after being demobilised, and he then obtained a situation but left to go into partnership as a toy, cycle and wireless dealer. He subsequently bought his partner out but he soon became aware that the business was not a success, and he got into financial difficulties after a three months' illness. It was reported that the debtor's books had been kept satisfactorily. The hearing was adjourned for closing.

WESTBURY, Leslie William, 383, Birmingham Road, Walsall, lately trading as L. W. WESTBURY AND CO., and also as the WALSALL RADIO CO., 146, Lichfield Street, Walsall, wireless goods dealer. The public examination of this debtor was held on December 12th at the Court House, Lichfield Street, Walsall, when a statement of affairs was filed showing liabilities of £1 308 and there was a deficiency of £1 289. The examination was adjourned for closing.

London Gazette, etc.

Notice of Dividend.

RADCLIFFE, Harold Howe Delmé, and HADDLETON, Frank, 51, Islington Row, Birmingham, trading as "CITY ELECTRIC SERVICES," electrical engineers. First and final dividend, 2 7/16d. per £, payable December 31st, Official Receiver's Office, 191, Corporation Street, Birmingham.

Partnership Dissolved.

WESTERN ELECTRIC LAMP CO. (John Massey FAIRHURST, Harry Barton GOBLE, and Rowland Clegg RUSDEN), factors of electric fittings and equipment, 2, Imperial Arcade, Oxford Road, Manchester, by mutual consent as from November 15th, 1929. Debts received and paid by H. B. Goble and R. C. Rusden.

ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by GEE AND CO., Patent and Trade Marks Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.

AUTOREX

507 512. Class 8. Wireless telegraphic and telephonic instruments and apparatus and parts of such instruments and apparatus. Marcel Tavernier, 71, rue Francois Arago, Montreuil-sous-Bois; manufacturer. November 5th, 1929.

ALPHA. 502 003-6 740 S. Class 13. Flat irons, kettles, saucepans, steamers, coffee percolators, curling tongs, shaving pots, glue pots, soldering irons and immersion heaters, all for use with electricity, and electric switches and contacts, all being metal goods. Wright, Bindley and Gell, Ltd., North British Steel Works, Penistone Road, Sheffield; and Premier Works, Percy Road, Greet, Birmingham; manufacturers. April 20th, 1929. To be associated with No. 502 004-6 741 S. (2 693) xviii.

LIMPET. B505 610. Class 50. Adhesive textile tapes impregnated with bitumen or resin, and electrical insulating tapes impregnated with india-rubber. Connolly's (Blackley), Ltd., Blackley Vale Mills, Blackley, Manchester; cable manufacturers. August 28th, 1929. User claimed from October, 1909. The applicants undertake that this mark, when registered, and the mark No. B496 270 (2 659) shall be assigned or transmitted only as a whole and not separately.

METCOSITE. 505 449. Class 50. Compositions made from vegetable fibres and pulps and sold in sheets, slabs, rods, tubes and the like for industrial purposes, and articles, not included in other classes, made from such compositions, namely, electric insulators, electric junction boxes; lamp holders, lamp shades, reflectors and similar fittings for electric lighting; panels, bases and cases for electrical and radio instruments. The Merchant Trading Co., Ltd., 52, Bishopsgate, London, E.C.2; merchants. August 21st, 1929. To be associated with No. 505 448 (2 690).

BEXITE.—503 217. Class 50. Battery cases and parts thereof, electric light standards, electrical insulators, loud speaker bases, switch plates, switch covers, all being goods made wholly or chiefly of synthetic resin and not included in other classes. The British Xylonite Co., Ltd., Hale End, London, E.4; manufacturers. May 30th, 1929. To be associated with No. 394 493 (2 170) and another.

SEMISCURE. 506 711. Class 13. Electric lamps (ordinary). The Lunar Electrical Co., Ltd., 3 to 7, New Street Square, London, E.C.4; merchants.—October 8th, 1929.

Digitized by Google

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications when accepted, may be obtained from the Patent Office, 25 Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

314 416 Siemens-Schuckertwerke Akt.-Ges. Heat power plant working with a back pressure machine. (27/6/28.)
295 636 British Thomson-Houston Co., Ltd. Automatic control equipments for electric motors. (15/8/27.)
319 463 A. Levy and M. Levy (trading as Soc. Electro-Technique Appliquee). Supply of current to thermionic valves for wireless apparatus and the like. (14/8/28.)
296 990 A. Sismanopol. Secondary electric cells. (10/9/27.)
319 479 Siemens-Schuckertwerke Akt.-Ges. and M. Dieterlen. Cooling of dynamo-electric machines. (10/9/28.)
319 487 Alloy Welding Processes, Ltd., and E. J. Clarke. Electrodes for electric arc welding or soldering. (20/9/28.)
319 491 S. G. S. Dicker (Naamlooze Vennootschap Philips' Gloeilampenfabrieken.) Wireless receiving sets. (24/9/28.)
313 870 British Thomson-Houston Co., Ltd. Condenser microphones. (18/6/28.)
319 495 W. Stirling. Safety switch-operating device. (26/9/28.)
297 749 I.G. Farbenindustrie Akt.-Ges. Electrical insulation. (26/9/27.)
297 775 Marconi's Wireless Telegraph Co., Ltd. Thermionic valves. (27/9/27.)
319 502 R. C. Graseby. Electric reciprocating mechanism or motors. (3/10/28.)
319 504 H. B. Prentice. Distribution-board, switch, or fuse-box. installations for electric supply systems. (5/10/28.)
298 645 Siemens-Schuckertwerke Akt.-Ges. Arrangement for preventing the corona on the slot-sleeves of high-tension electric machines. (13/10/27.)
299 308 L. Siegl. Electric switch for operating the light and sound signals of motor-driven vehicles. (22/10/27.)
319 520 H. H. Berry. Spinners or fans, such as those used in imitation fires. (18/10/28.)
299 063 Associated Electrical Industries, Ltd. Adjustable mountings for supporting lighting-units, electric fans, or the like. (20/10/27.)
319 527 H. V. Higgitt and Eastern Telegraph Co., Ltd. Means for picking up submarine cable. (25/10/28.)
299 857 International General Electric Co., Inc. Electron discharge devices. (2/11/27.)
301 040 F. Marti. Electrical time-pieces. (23/11/27.)
301 047 British Thomson-Houston Co., Ltd. Apparatus for handling fragile articles. (23/11/27.)
311 727 S. Ruben. Electric condenser. (15/5/28.)
301 319 S. Hermont. Incandescent lamps of the multi-filament type. (27/4/28.)
301 424 Telefonaktiebolaget L. M. Ericsson. Impulse-senders of the finger-disc type. (29/11/27.)
302 163 Associated Electrical Industries, Ltd. Voltage regulators. (9/12/27.)
302 183 E. G. O. Pressler, A. E. M. Pressler and K. E. H. Pressler (trading as Pressler Thuringer Vakuumrohrenfabrik und Fabrik Wissenschaftlicher Apparate.) Photo-electric cells. (9/12/27.)
302 247 International General Electric Co., Inc. Speed-controlling means for alternating-current motors. (12/12/27.)
302 930 F. R. Dietrich. Electrically driven colour-spraying apparatus. (22/12/27.)
317 034 Scintilla Akt.-Ges. Ignition-coils for battery ignition-apparatus. (9/8/28.)
319 556 J. Neu and J. Neuberger (trading as Enn-Werke Neu and Neuberger, [firm of]), and C. Flamm. Electric hand-lamps. (2/1/29.)
307 907 C. Baumann. Electromotive driving- means for gas compressers. (16/3/28.)
319 570 H. Martin. Apparatus for electrically-measuring fluid flow. (13/8/28.)
319 578 G. Bozek. Instruments for measuring electric resistances. (28/2/29.)
308 347 Magnet-Werk Ges. Eisenach Spezialfabrik Fur Electro-Magnet-Apparate. Disintegrating-machines. (22/3/28.)
319 307 J. L. Baird and Television Ltd. Television apparatus and the like. (20/6/28.)
312 364 International General Electric Co., Inc. Windings for dynamo-electric machines. (25/5/28.)
288 144 Tammerik, J. Electric time switching systems. (23/3/28.)
319 798 W. H. Fordham. Magnetometers for magnetic surveying. (26/3/28.)
319 802 V. Stobie. Electric furnaces. (31/3/28.)
290 987 G. Kemmann. Automatic train-control for railways. (20/5/27.)
319 674 G. A. Mathieu. Automatic current limiting and regulating devices for use in electrical signalling. (22/5/28.)
297 812 Landis and Gyr Soc. Anon. Counting-mechanism for two-rate electricity meters. (30/9/27.)
319 809 G. M. Wright. Picture and the like facsimile telegraph transmitters. (31/5/28.)
319 595 W. Shaw G. Heptonstall and B. L. Myer. Metallic conduits for electrical conductors. (15/6/28.)
319 598 Igranic Electric Co., Ltd., and G. F. Dandridge. Variable resistance devices. (19/6/28.)
319 600 H. S. Cowx. Electric signalling and indicating apparatus and the like. (20/6/28.)
292 522 Akt.-Ges. Brown, Boveri, et Cie. Arrangement for synchronising the selectors in long-distance control systems. (20/6/27.)
319 634 C. J. Ward and S. E. Hillman. Electric accumulators. (21/6/28.)
292 539 Bamag-Meguin Akt.Ges. Electrically operated closing means for vertical chamber ovens. (29/6/27.)
294 641 Soc. Nouvelle de Constructions Telephoniques Brevets Tchoubritch-Derval. Electro-magnetic relays for controlling electric circuits. (29/7/27.)
296 978 Soc. de Paris et du Rhone. Electric cleaner. (10/9/27.)
319 637 A. Reyrolle and Co., Ltd., H. Leben and N. Cooke. Electric protective systems and relays for use therein. (25/6/28.)
319 639 Brandes, Ltd. (Federal Telegraph Co.). Loud-speaker system. (25/6/28.)
319 645 Medway's Safety Lift Co., Ltd. and B. A. Siden. Electric control apparatus for use in lift installations. (25/6/28.)
319 647 Carborundum Co., Ltd. (Carborundum Co.). Electrical resisting bodies. (25/6/28.)
319 813 H. Pearce and Associated Electrical Industries, Ltd. Electrical power-distribution systems. (26/6/28.)
319 712 Standard Telephones and Cables, Ltd. (Western Electric Co., Inc.) Compensation for phase variations on telegraph and telephone transmission lines. (27/6/28.)

Applications for Patents.

September 12th.

27 737 J. Christie, J. Mirrey and A. Reyrolle and Co., Ltd. Joints, etc., for high voltage cables.
27 760 S. E. Covo. Automatic telephone dials, etc.
27 712 E. and W. J. Daniels. Electric cigarette lighter, etc.
27 698, 27 699 V. A. Foot. Telephone apparatus for the deaf.
27 719 General Electric Co., Ltd., and F. J. Keeley. Electric switchgear.
27 798 R. Hunt. Cartons for electric lamps.
27 799 Marconi's Wireless Telegraph Co., Ltd. Piezo-electric crystals, and apparatus for use therewith. (2/10/28, U.S.)
27 753 E. W. C. Russell. Piezo-electric devices. (12/9/28, U.S.)
27 762 Siemens-Schuckertwerke A.G. Semi-conductive coating for electric conductors. (13/9/28, Germany.)
27 791 Siemens-Schuckertwerke A.G. Localising leaks in oil-filled cables. (22/9/28, Germany.)
27 789 P. B. Healey, and Telephone Manufacturing Co., Ltd. Communication means for use in aircraft, etc.

September 13th.

27 837 Associated Electrical Industries, Ltd. Electrical switches. (13/9/28, U.S.)
27 838 Associated Electrical Industries, Ltd. Electric rectifiers. (13/9/28, U.S.)
27 839 Associated Electrical Industries, Ltd. Recording meters. (13/9/28, U.S.)
27 836 N. R. Blanch. Electric conductors.
27 835 J. Christie, F. Coates, and A. Reyrolle and Co., Ltd. Electric conductors.
27 850 R. Costigan. Electric torches, etc.
27 916 Coventry Automatic Telephones, Ltd. Electric signalling systems.
27 862 F. Hodgson. Electric wire connectors.
27 866 International General Electric Co., Inc. Electric switches. (19/9/28, Germany.)
27 877 A. Nielson. Electric heaters. (14/9/28, Norway.)
27 856 E. Potter (J. Pintschakt Ges.). Magneto for voltage regulating apparatus.
27 880 Raytheon Production Corporation. Photoelectric cells. (23/11/28, U.S.)
27 846 Siemens-Schuckertwerke A.G. Electric motors. (27/12/28, Germany.)
27 920 Siemens-Schuckertwerke A.G. Electric trucks. (18/4/29, Germany.)
27 921 Western Electric Co., Ltd. (Bell Telephone Laboratories, Inc.). Speech transmission.
27 916 C. W. Wilman. Electric signalling systems.

September 14th.

27 997 American Cable Co., Inc. Metallic conduit. (15/9/28, U.S.)
27 956 J. L. Baird and Television, Ltd. Synchronising devices.
27 977 British Thomson-Houston Co., Ltd. Switch-operating mechanism. (14/9/28, U.S.)
27 988 Chloride Electrical Storage Co., Ltd., and B. Heap. Accumulators.
28 001 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken.). Circuit arrangements for thermionic devices.
28 002 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken. Wireless receivers.
27 925 Electrolux, Ltd. Absorption refrigerating systems. (15/9/28, U.S.)
27 958 G. Fleischer. Device for manipulating dials of telephone apparatus.
27 978 International General Electric Co., Inc. Electric switches. (14/9/28, Germany.)
27 945 A. Muratori and L. Valeri. Electric generator.
27 944 Rainbow Light, Inc. Luminous discharge tube. (14/9/28, U.S.)
27 983, 27 984 S. Ruppel. Electric switches.
27 968 E. J. Timberlake. Electromagnets for loud speakers.

September 16th.

28 083 R. S. C. Balls and Read and Partners, Ltd. Electrically heated kettles, etc.
28 058 British Thomson-Houston Co., Ltd. Balancing rotors. (17/9/28, U.S.)
28 045 A. G. G. Cadman. Sound-box for wireless loud speakers, etc.
28 104 Electrical Research Products, Inc. Signalling cable. (23/3/29, U.S.)
28 067 Etablissements Idaufix. Electric switch. (15/9/28, Germany.)
28 047 E. V. Hayes-Gratze. Electro-deposition of chromium.
28 113 E. Haefely et Cie Akt.-Ges. Electric condensers. (5/10/28, Switzerland.)
28 119 J. W. Hofmann. Clamping devices for steel aluminium conductors.
28 057 International General Electric Co., Inc. Electric switches. (14/9/28, Germany.)
28 103 H. T. Logan. Electric switches.
28 087 Maschinenfabrik Oerlikon. Electric rectifiers. (15/10/28, Switzerland.)
28 097 R. Mather. Electric heating appliances, etc.
28 089 G. Spratt. Electric switches.
28 121 O. Sturner. Electrically controlled apparatus for producing changing inscriptions. (15/9/28, Germany.)

September 17th

28 198 Arcturus Radio Tube Co. Photoelectric cells. (17/9/28, U.S.)
28 102 C. W. Bloomfield. Insulated cables, etc.
28 202 G. Brion and J. Krutzsch. Passing electric current through gases. (17/9/28, Germany.)
28 179 J. H. Broome. Electric totalisators.
28 217 Brown, Boveri et Cie, Akt. Ges., Abt. Installationen. Refrigerator cabinets, etc. (27/8/29, Germany.)
28 142 C. Day. Parelleling a.c. dynamos.
28 166 A. N. Hazlehurst. Electric accumulators.
28 128 L. C. Ratcliffe. Accumulator.
28 191 Siemens-Schuckertwerke Akt. Ges. Means or protecting electrical installations. (18/9/28, Germany.)

September 18th.

28 339 Associated Electrical Industries, Ltd. Electrical protective systems. (19/9/28, U.S.)
28 319 British Thomson-Houston Co., Ltd. Mounting filaments. (18/9/28, U.S.)
28 318 British Thomson-Houston Co., Ltd. (General Electric Co., N.Y.) Electric switches.
28 341 W. R. Bullimore. Cathode for thermionic devices.
28 342 W. R. Bullimore. Aerial wireless circuits.
28 343 W. R. Bullimore. Wireless receiving apparatus.
28 350 Electrical Research Products, Inc. Regulator systems. (20/9/28, U.S.)
28 351 Electrical Research Products, Inc. Frequency setting fork. (4/10/28 U.S.)
28 335 J. Feigelson. Regeneration of lead plates of accumulators.
28 232 E. E. Hopwood and Wardle Engineering Co., Ltd. Electric radiators, etc.
28 324 G. H. Lucas. Telephone mouthpiece disinfector.
28 340 E. S. Newland. Moving coil loud speakers, etc.
28 362 H. O'Connell. Apparatus for supplying current to wireless receivers, etc., from mains.
28 313 Patent Treuhand ges fur Elektrische Gluhlampen. Electric rectifiers (21/12/28, Germany.)
28 286 T. R. Scott and Sterling Telephones and Cables, Ltd. Electric cables.
28 285 Sterling Telephones and Cables, Ltd. and J. R. Vezey. Loading system for signalling cable.

September 19th.

28 452 Associated Electrical Industries, Ltd. Gear wheels. (19/9/28, U.S.)
28 391 Birmingham Electric Furnaces, Ltd., and A. G. Lobley. Electric furnaces.
28 373 W. Bullen. Wireless signalling apparatus.
28 471 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Soft iron measuring instruments.
28 472 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Alarm devices.
28 424 C. Farrar and R. A. S. Hoare. Gramophone amplifiers and radio receivers.
28 431 General Electric Co., Ltd., and J. W. Ryde. Mercury vapour rectifiers.
28 404 Ges fur Elektrische Apparate. Ships' telegraph. (17/10/28, Germany.)
28 396 T. and T. R. Hollis. Ceiling plates for electric light fittings.
28 439 International General Electric Co., Inc. Artificial networks. (19/9/28, Germany.)
28 432 H. L. Jones. Adjustable fittings for electric lamps.
28 478 C. Leven. Manufacture of electric lamp holders, etc.
28 385 C. Marshall. Amplifying electric impulses.
28 437 G. Nott. Cooling systems of generating sets.
28 470 Siemens Schuckertwerke Akt.-Ges. Electrical switch installations. (19/2/29, Germany.)
28 372 T. F. Wall. Alternating current rectifiers.

DEPENDABILITY

ENAMELLED WIRE

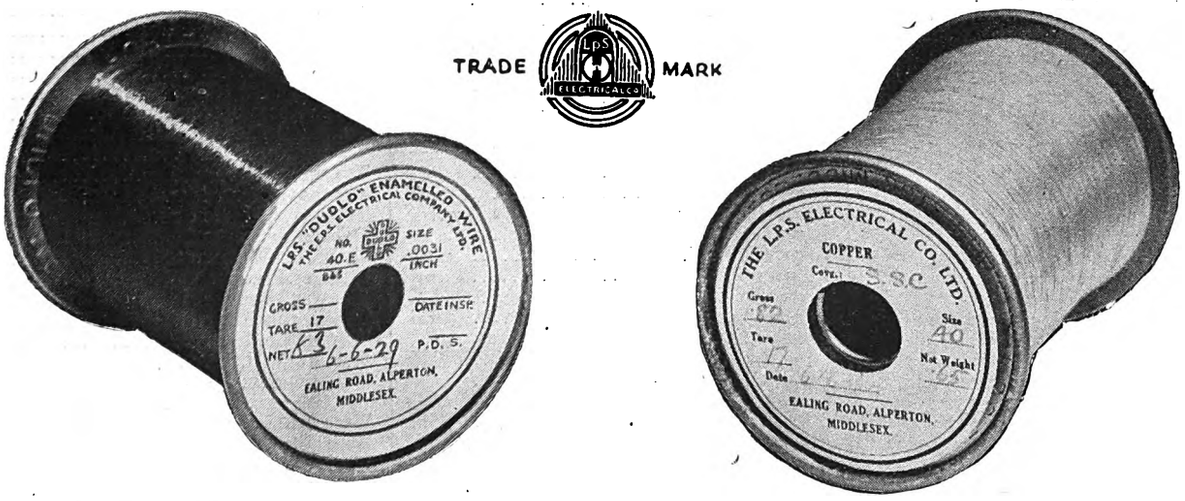
L.P.S.-Dudlo Enamelled Copper Wire is celebrated for its unique qualities of excellence and dependability. There are few commodities which are at the same time so easy and yet so difficult to make satisfactorily in commercial quantities as Enamelled Copper Wire. The test it is customary to adopt of inspecting 50-ft. taken from a few selected reels of wire can obviously prove very little in a case of this kind where continuity of insulation must necessarily be taken on trust.

This is why so many discriminating users specify L.P.S.-Dudlo Enamelled Copper Wire for safety.

OTHER L.P.S. PRODUCTS

The same regard for quality and dependability distinguishes the manufacture of our other products: **Silk and Cotton covered, plain and Enamelled Copper Wires and Strands. "Supronic" (Cupro-Nickel), "Haetanic" (Nickel-Chrome) Resistance and Heating Wires and Tapes. Cords, Flexibles, Aerial Wireless and other strands. Insulating Varnished Silk, Cloth, Paper and Tapes, Insulating Flexible Cotton and Silk Tubing, in sizes from ½ mm. to 30 mm. bore. Tungsten Contacts and Universal Test and Battery Clips.**

TRADE MARK



The L.P.S. ELECTRICAL CO., LTD.

EALING ROAD, ALPERTON, WEMBLEY, MIDDLESEX.

Telegrams: "Engineyor, Phone, London." *Telephones: Ealing 5322-3.*

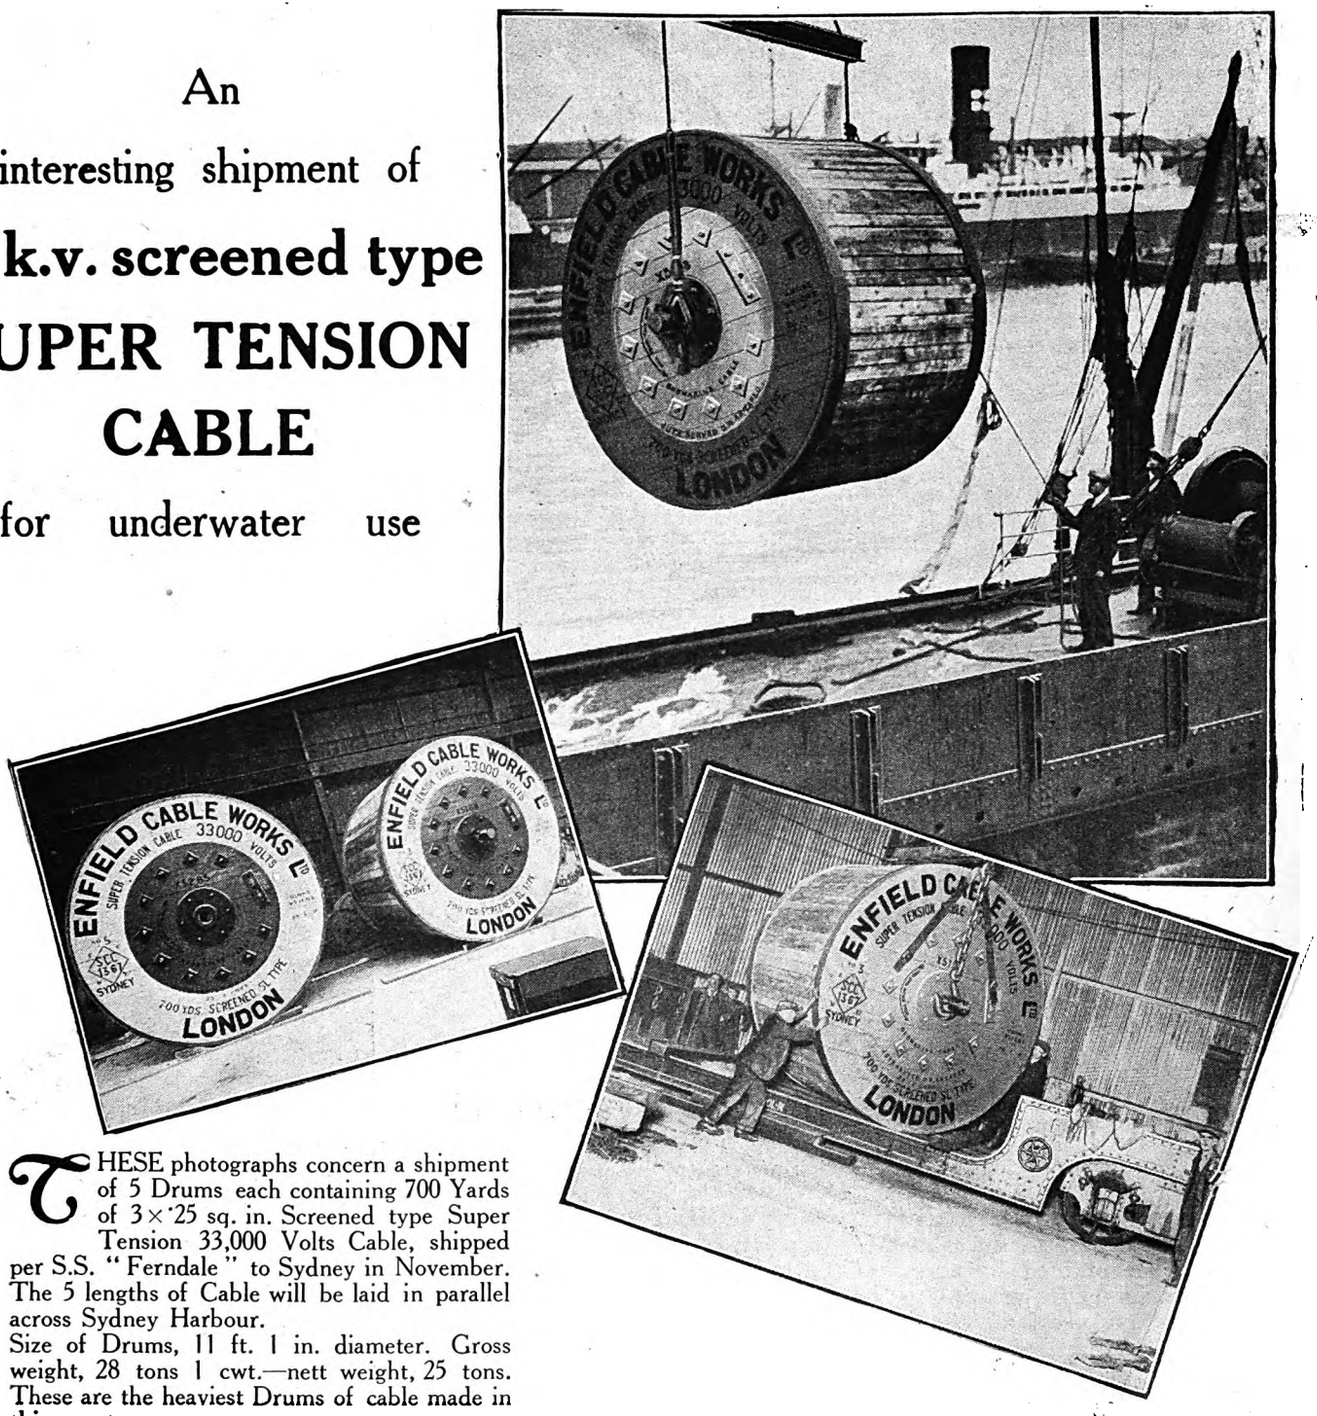
ANOTHER ENFIELD ACHIEVEMENT

An

interesting shipment of

33k.v. screened type SUPER TENSION CABLE

for underwater use



THESE photographs concern a shipment of 5 Drums each containing 700 Yards of 3×·25 sq. in. Screened type Super Tension 33,000 Volts Cable, shipped per S.S. "Ferndale" to Sydney in November. The 5 lengths of Cable will be laid in parallel across Sydney Harbour.

Size of Drums, 11 ft. 1 in. diameter. Gross weight, 28 tons 1 cwt.—nett weight, 25 tons. These are the heaviest Drums of cable made in this country.

S. & C.
Internal Isolation Switchgear

(British, Dominion and Foreign Patents granted and pending)

Here is a Switchboard with each unit built up of metal-clad, self-contained components and so original in principle as to eclipse all previous efforts in switchgear design and construction.

A non-drawout, non-dropdown circuit-breaker-on-the-floor switchboard, new and exclusive in all its details, from circuit breaker to small wiring.

Heralding the beginning of real switchgear satisfaction, this board with its unique Isolating Principle produced through constant effort to improve and perfect, inaugurates new standards of safety, simplicity and economy in switching operations.

The World's only Complete-on-the-Floor Internal Isolation Switchgear exclusively developed by S. & C., and acknowledged the most notable advance for many years in Switchgear Principle, Design and Construction.

PLACE YOUR INSTALLATION WORK WITH FIRMS ON THE NATIONAL REGISTER OF ELECTRICAL INSTALLATION CONTRACTORS.

REGISTERED ELECTRICAL INSTALLATION CONTRACTORS

THE National Register is an independent institution representing all bodies connected with the Electrical Industry, and grants to contracting firms satisfying its requirements the right to use this sign.

Particulars on application to Secretary, 1, Lincoln's Inn Fields, London, W.C.2.

TENDERS INVITED.

COUNTY BOROUGH OF GRIMSBY.

ELECTRICITY DEPARTMENT.

THE Corporation of Grimsby are prepared to receive Tenders for the manufacture, delivery and complete erection of ONE 10,000 KILOWATT, THREE-PHASE TURBO ALTERNATOR WITH CONDENSING PLANT.

The Specification and Form of Tender can be obtained from Mr. S. R. Windle, Electricity Offices, Moss Road, Grimsby, upon payment of a deposit of £2 2s. (Two Guineas).

The deposit will only be returned after a *bona fide* Tender has been opened by the Committee, and after the Specification and Form of Tender has been returned intact.

Sealed tenders, endorsed "Tender for Works Plant," must be delivered to the undersigned not later than noon on Thursday, the twenty-third day of January, 1930.

The Corporation do not bind themselves to accept the lowest or any Tender.

S. R. WINDLE,
Borough Electrical Engineer.

Electricity Offices,
Moss Road,
Grimsby.
December 16th, 1929.

COUNTY BOROUGH OF DEWSBURY.

THE Corporation of Dewsbury invite Tenders for the supply, delivery and erection of Rotary Converter Plant (1 500 kWt and 500 kWt).

Specification and Form of Tender may be had on application to R. W. Grubb, Esq., M.I.E.E., Borough Electrical Engineer, Bradford Road, Dewsbury.

Tenders, endorsed "Rotary Plant," and addressed to the undersigned, must be delivered not later than 12 noon, on Monday, January 13th, 1930.

The Corporation does not bind itself to accept the lowest or any tender.

HOLLAND BOOTH,
Town Clerk.

Town Hall,
Dewsbury.
December 19th, 1929.

ELECTRICAL INSTALLATION.

THE Committee of Visitors of the Mental Hospital, Barming Heath, Maidstone, invite Tenders for an electrical installation for lighting, heating, etc., at the above-mentioned hospital.

Electrical energy will be supplied from the mains of the Maidstone Corporation.

Specification, conditions of contract, and tender form may be obtained on application to the Consulting Engineer, Mr. E. E. Hoadley, Corporation Electricity Works, Maidstone.

Plans of the Mental Hospital may be inspected at the office of the Consulting Engineer by appointment.

Applications for specifications must be accompanied by a cheque for two guineas, payable to Mr. E. E. Hoadley.

This sum will be returned on receipt of a *bona fide* tender.

Tenders, in a sealed envelope endorsed "Tender for Electrical Installation," are to be delivered to Mr. H. J. Bracher, 44, Earl Street, Maidstone, before 11 a.m. on Thursday, January 16th, 1929.

The Committee does not bind itself to accept the lowest or any tender.

H. J. BRACHER,
Clerk to the Committee.

44, Earl Street, Maidstone.

NOTICE.

ELECTRICAL POWER ENGINEERS' ASSOCIATION.

SCARBOROUGH CORPORATION.

NOTICE is given of the existence of a difference between the above Corporation and the Association relative to the dismissal of a member, which difference has been referred to the National Joint Board.

CONSEQUENT UPON this Dispute, and pending a settlement, MEMBERS OF THE ASSOCIATION ARE ENJOINED TO REFRAIN FROM APPLYING FOR OR ACCEPTING ANY APPOINTMENT WITH THE ABOVE CORPORATION.

W. ARTHUR JONES, A.M.I.E.E.,
General Secretary.

102, St. George's Square,
London, S.W.1.

APPOINTMENTS VACANT.

WANTED.—Skilled Instrument Makers.—Apply in writing, stating experience and wages required, to W. G. PYE AND Co., Granta Works, Newmarket Road, Cambridge.

REQUIRED.—WIRELESS ENGINEER with good experience (in professional capacity) of short wave transmission.—Write, giving full particulars, to Box 158, c/o KNIGHTS, 55, Chancery Lane, W.C.

ASSISTANT Technical Engineer wanted for well-known company in the electrical industry. Good technical knowledge and practical experience necessary. State experience and salary required.—Box A.T.V., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

Digitized by Google

ELECTRICAL TESTERS for Trunk Telephone Cable Installation work required shortly by large firm. Starting salary £3 to £4 per week; living allowance 35s. per week home and liberal rate abroad. Write giving qualifications, experience and age.—Box A.T.U., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

TELEPHONE ENGINEERING.—Junior Engineer, with sound training in the fundamental principles of electrical engineering, required for compiling and using designing data on new apparatus. Preferably familiar with telephone circuits.—Apply Box A. T. T., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, E.C.4.

TRAVELLERS wanted to sell the new Fenbo Anti-Dazfo-Electric Car Bulbs. Marvellous seller, good commission. —Apply, FENN, LTD., 3, Great Chapel Street, London, W.1.

ELECTRICAL ENGINEER (qualified) wanted, to take charge of Welwyn Garden City Supply Undertaking, including Transformer Station, distribution and installation work. Rapidly growing industrial and residential load. Present output: three million units per annum. Experience on sales side, as well as technical qualifications, essential.—Write, stating age, qualifications, experience and salary required, to SECRETARY, Welwyn Garden City, Limited, Howardsgate, Welwyn Garden City, Herts.

ENGINEER required for talking film work. University training and experience in the theory and practice of telephone engineering, including high quality valve amplifiers and repeaters, is essential. The applicant should also be a qualified musician with professional experience, which should include conducting small orchestras, and orchestration for straight and jazz music. An intelligent knowledge of dramatic technique, especially as applied to sound films, is also a qualification.—Write, giving fullest details of past experience, age and salary expected, to Box A.U.F., THE ELECTRICIAN, Bouverie House, 154, Fleet Street, London, E.C.4.

MAINS SUPERINTENDENT.

THE Barnes Urban District Council invite applications for this post. Candidates must have had a sound technical training, a thorough knowledge of and experience in H.T. Transmission, Rotary Converter Sub-stations and Low Tension D.C. 3-wire distribution.

The selected candidate will be required to undergo medical examination and to contribute to the Council's superannuation scheme.

National Joint Board's conditions, Class "D," Grade 3.

Applications, in own handwriting, stating age and giving full and concise particulars of training and experience, together with copies of recent testimonials, to be sent to the ENGINEER AND MANAGER, Electricity Works, Mortlake, S.W.14.

COUNTY BOROUGH OF BARROW-IN-FURNESS.

ELECTRICITY DEPARTMENT.

APPLICATIONS are invited for the position of Showroom Salesman. Applicants, who must have had experience in an Electrical Showroom, will be required to deal with Cash Sales, Hire-Purchase Schemes, Demonstrations, Window Dressing, etc. Salary, £200 to £250 per annum, according to qualifications and experience.

LADY DEMONSTRATOR.

Applications are also invited for the position of Lady Demonstrator of Electrical Cooking and Domestic Apparatus. Applicants must have had experience in Demonstration work and possess a Cookery Diploma or equivalent qualification. Salary, £150 to £175 per annum, according to qualifications and experience.

Applications for both appointments, stating age, experience and salary required, and enclosing copies of testimonials, to be addressed to H. R. Burnett, Borough Electrical Engineer, Electricity Works, Barrow-in-Furness.

W. A. CHISLETT,
Town Clerk.

Town Hall,
Barrow-in-Furness.
November 13th, 1929.

ASSISTANT Electrical Designer required, with experience of direct current design up to 300 kW; a.c. experience an advantage.—Apply, stating age, training and salary required, with copies of testimonials, to Box A.U.C., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

ASSISTANT required in design office. Applicants must have technical college training and workshop training and some practical experience in a design office.—Apply in writing, stating experience, training and salary required, to Box A.U.D., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4

TRAVELLER required for Manchester district; experience in the sale of C.M.A. wires and cables an advantage.—Write, giving experience, age and salary required, to Box A.U.H., THE ELECTRICIAN, Bouverie House, 154, Fleet Street, London, E.C.4.

ENGINEER'S Draughtsmen wanted for electro-mechanical instruments. Sound modern production methods backed by experience. Knowledge of telegraph-telephone practice desirable. Good prospects for right men.—Write, giving fullest particulars, to Box A.U.G., THE ELECTRICIAN, Bouverie House, 154, Fleet Street, London, E.C.4.

METROPOLITAN-VICKERS ELECTRICAL COMPANY, LTD., Trafford Park, Manchester, requires a Designing Draughtsman for switchgear. Must be neat, quick and accurate, and have had experience in the designing of switchgear for all voltages. State training, experience, and salary required.—Write to Box A.U.E., THE ELECTRICIAN, Bouverie House, 154, Fleet Street, London, E.C.4.

COUNTY BOROUGH OF WEST HARTLEPOOL.

APPOINTMENT OF BOROUGH ELECTRICAL ENGINEER.

APPLICATIONS are invited from qualified Electrical Engineers, who must have sound commercial ability and experience, for the position of Borough Electrical Engineer, upon forms to be obtained from me, which must be delivered duly completed and endorsed "Borough Electrical Engineer," at the Municipal Buildings, West Hartlepool, not later than Saturday, January 11th, 1930.

The salary, which will be in accordance with the National Minimum Scale of Salaries for Chief Electrical Engineers of authorised Electricity Supply Undertakings, amounts to £1,125 for the current year.

The person appointed will in all probability be appointed to the position of Transport Manager, which would carry with it an additional salary of £150 per annum.

Canvassing directly or indirectly will be a disqualification.

HAROLD W. STANTON,
Town Clerk.

Municipal Buildings,
West Hartlepool.
December 20th, 1929.

BOROUGH OF WORKINGTON.

ELECTRICITY DEPARTMENT.

APPLICATIONS are invited for the following:—

(1) PLUMBER CABLE JOINTER, rate in accordance with the D.J.I. Councils Schedule, at present 1s. 5.86d. per hour. Applicant must have had previous experience in Jointing of all classes of L.T. and H.T., Pilosta Cables and service work.

(2) METER TESTER AND REPAIRER (Mechanician)—rate in accordance with D.J.I. Councils Schedule, at present £3 8s. 11d. for a 47-hour week, subject to deductions for Superannuation. Applicants must have had previous experience in the repair and calibration of all types of A.C. meters, including Pre-payment meters.

The successful candidate will be required to pass a medical examination and must not be over 35 years of age.

Applications endorsed "Plumber Cable Jointer" or "Meter Tester" giving age, details of previous experience and enclosing copies of three recent testimonials, should be sent to the undersigned not later than noon on Saturday, December 28th.

WM. A. PARKER,
Engineer and Manager.

TRAVELLER required for Birmingham district; experience in the sale of C.M.A. wires and cables an advantage.—Write, giving age, experience and salary required, to Box A.U.I., THE ELECTRICIAN, Bouverie House, 154, Fleet Street, London, E.C.4.

TRAVELLER required for Liverpool district; experience in the sale of C.M.A. wires and cables an advantage.—Write, giving age, experience and salary required, to Box A.U.J., THE ELECTRICIAN, Bouverie House, 154, Fleet Street, London, E.C.4.

ASSISTANT DIVISIONAL ENGINEER, TELEGRAPHS, FOR THE INDIAN POSTS AND TELEGRAPHS DEPARTMENT.

THE Secretary of State for India in Council will select one candidate for appointment to this service in 1930. The selected candidate will be required to undergo a period of preliminary training in this country before appointment. Every candidate must be an European British subject of non-Asiatic domicile.

Candidates must not be more than 24 years of age on the 1st January, 1930, but preference will be given to candidates who are not more than 23 years of age on that date.

Every candidate must have (1) obtained a degree, diploma or other equivalent distinction in Electrical Engineering from any University or Institution of University standing in the United Kingdom, and (2) spent at least one year on practical electrical engineering work.

Applications must reach the India Office not later than 31st January, 1930. Printed forms together with information regarding the conditions of appointment may be obtained from the Secretary, Services and General Department, India Office, Whitehall, S.W.1.

THE ACID TEST OF TUTORIAL EFFICIENCY—RESULTS.

READ these typical students' results from T.I.G.B. correspondence coaching:—

A.M.I.E.E. Exam.

B. W., Stoke.—"I have passed the A.M.I.E.E. Exam. The happy issue of this attempt was very largely due to your efficient training."

A.M.I.Mech.E. Exam.

H. W. M., Rochdale.—"Have passed. I was surprised to find so many questions similar to those set during the course."

A.M.Inst.C.E. Exam.

T. N., Sutton.—"I beg to say that I sat for the recent A.M.Inst.C.E. Exam., Part C., and have passed."

Convincing evidence that The T.I.G.B. can produce satisfactory results for YOU in the same substantial measure as it has done for other men is to be found in "The Engineer's Guide to Success," containing the widest selection of Engineering courses in the world.

Write TO-DAY for a FREE copy of this 112 page book, stating the exam. or branch that interests you.

The T.I.G.B. Guarantees Training Until Successful.

THE TECHNOLOGICAL INSTITUTE OF GREAT BRITAIN,
(Established 1917.)
164, TEMPLE BAR HOUSE, LONDON, E.C.4.

ENGINEERS—IMPORTANT NOTICE.—Results now to hand show that 86 per cent. of our candidates pass their Exams. at the first attempt, a remarkable record unapproached by any other organisation and showing why we can guarantee "NO PASS—NO FEE." If 86 out of every 100 ordinary men can succeed, why should you remain in the ranks? Now is the time to "get busy" and investigate. Our handbook "ENGINEERING OPPORTUNITIES," explains the most simplest and successful home-study methods of passing A.M.I.Mech.E., A.M.I.C.E., A.M.I.E.E., A.M.I.A.E., A.M.I.Struct.E., C. & G., G.P.O., Matric., etc., Exams. The book outlines Courses in all branches of Civil, Mech., Elec., Motor and Wireless Engineering and includes a brilliant foreword by Prof. A. M. LOW, in which he shows clearly the chances you are missing.—Send for FREE HANDBOOK now (state subject or Exam.) BRITISH INSTITUTE OF ENGINEERING TECHNOLOGY, 43, Shakespeare House, 29–31, Oxford Street, London.

ADVANCEMENT Professionally, also earliest success at A.M.I.E.E., A.M.I.Mech.E., A.M.Inst.C.E., B.Sc.Eng., C. & G., G.P.O. Exams, etc., is what "U.E.C." spare time training offers you! (Many thousands successful. Estd. 1906).—Advice, PROSPECTUS, and full particulars of Individualised Correspondence Courses FREE from ADVISORY BUREAU, UNIVERSITY ENGINEERING COLLEGE, Westgate-on-Sea, Kent.

APPOINTMENTS WANTED.

HONOURS Physics Graduate (24), 2 years electrical engineering seeks business opening.—B.Sc., 48, West End Lane, N.W.6.

BROCHURE Writing, Catalogue Compilation or similar work desired (London area) by advertiser with electrical, wireless and journalistic experience.—ROBERT, 16, Edgar's Court, Welwyn Garden City, Herts.

WORKS MANAGER, disengaged, specialised in electrical gear for shipbuilding, can influence orders for £10,000 per annum.—G. F., 6, Minorca Road, Weybridge.

LAD desires to be Apprenticed to Electrical Engineering with a firm preferably in district East of London, or would accept post where he would have opportunity of learning the trade.—Replies to LA GALLE, 97, Windsor Road, Forest Gate, E.7.

REPRESENTATIVE OR SALES MANAGER.

MANAGER (40), late branch sales manager and general manager for one of the largest electrical manufacturing companies for Yorkshire, is open for offers as Representative or Sales Manager. Last 15 years as sales, branch and general manager specialising in the sale of industrial electrical plant and its application.—Box A.T.Z., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

POWER Station Charge or Works Engineer, last 5 years assistant superintendent at modern station with 35 million units output. Steam plant, coal, gas or oil fired. Switchgear, motors, sub-stations, mains overhead and underground, oil and water pump houses, large units with H.S. and V.S. pumps, and general refinery experience, knowledge of distillation, refining, etc.; speaks Hindustani and Persian; disengaged. Home or abroad. Age 38.—Box A.T.Y., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

EDUCATIONAL NOTICES.

EXAMINATIONS HELD BY THE INSTITUTION OF ELECTRICAL ENGINEERS.

MR. A. J. ANIDO, B.Sc., A.C.G.I. (late R.E.), specialises in the personal preparation of candidates in all subjects of the above examinations. Arrangements are made to suit those engaged in business.

THE Proprietor of British Patent No. 283 221 is prepared to sell the patent or to licence British Manufacturers to work thereunder. It relates to Battery separators made of wood. Address, BOULT, WADE AND TENNANT, 112, Hatton Garden, London, E.C.1.

FOR SALE.

ELECTRIC Motors and Transformers.—A Birmingham manufacturing firm have for disposal a quantity of reliable used a.c. and d.c. motors, as a result of resetting their power equipment. Powers from 5 to 15 b.h.p.; also 150 kVA, 440-volt transforma suitable for Birmingham supply. Inquiries for single motors entertained from users only.—Apply Box A.T.L., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

Digitized by Google

FOR SALE.—Second-hand a.c. MOTOR, single phase, 200 V, 950 revs. Cheap, £10.—UNIVERSAL SUPPLIES, 38, Station Road, London, E.7.

NUMBER Needle Telegraph Instruments, perfect working order. or sale, 15s. each, carriage paid.—DONEGAL RAILWAYS, Stranorlar.

LIGHTING plants for country houses and garages, etc.—Self-contained petrol-paraffin electric, 25 to 220 volts, 300 watts to 50 kW. £18 upwards. Also switchboards and storage batteries.—Box A.U.B., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

SPECIAL Lines of Switches, Lampholders, Ceiling Roses, Cut-outs, Porcelain Cleats and Insulators up to 30 000 volts, with fittings. Conduit and fittings, Bells, Glass Shades and E.I. Reflectors, Strip Light, Wood Blocks, Heaters, Volt and Ammeters, Arc Lamp Carbons, Motors and numerous other lines at low prices.—Box A.U.A., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.34.

FOR SALE.

50-H.P. Petter Crude Oil Engine.
66 h.p. Campbell Semi-Diesel Crude Oil Engine.
12 h.p. Hornsby Crude Oil Engine.
40 kW Crude Oil Generating Set, 440 volts, d.c.
20 kW Robey-E.C.C. ditto, 220 volts, d.c.
60 kW B.T.-H. Dynamo 220 volts, d.c.
12 kW Steam Generating Set by Allen, 110 volts, d.c.
Box A.T.X., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

50-KW Siemens d.c. Generators, direct coupled to 100 h.p. Aster paraffin, gas or petrol engines, new with high-grade switchboard, etc., in stock, voltages 80 to 550.
35 kVA Alternators. Any voltage, direct coupled to 46 h.p. oil engines, new, and complete with exciters, etc. The above are offered at less than half makers' present-day prices. Write for our complete catalogue.—Box A.T.W., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

MOTOR GENERATOR SET FOR SALE.

CRYPTO SET, 2 years old, little used.
Input, 440 Volts D.C.
Output, A.C., 0–300 Volts, 0–20 Amps, 25–60 Cycles, Single Phase.
Output, D.C., 0–300 Volts, 0–20 Amps.
Complete with Static Transformer, Switchboard and Meters.
Cost £145. No reasonable offer refused.
Apply to: SUN-VI-LITE, LTD., 1-8, Whitfield Place, London, W.1.
Phone: Museum 3861.

ELECTRIC MOTORS AND DYNAMOS.

WE hold one of the largest Stocks of New and Second-hand Motors. Second-hand Machines are thoroughly overhauled. Inspection and Tests can be made at our Works.
For Sale or Hire. Send your inquiries to Messrs.
BRITANNIA MANUFACTURING CO., LTD.,
22-26, BRITANNIA STREET,
CITY ROAD, LONDON, N.1.
Telephone: 5512-3 Clerkenwell.

JOB LINE of wall Electric Brackets, very cheap, to be sold at once. Offers wanted.—W. H. WATTS, 44, Briarwood Road, Clapham, London, S.W.4.

BRITISH Material only used in Electrical Installations carried out by us. Absolute guarantee given. Write or phone, T. J. LONG AND SON, Registered Contractors, Hexham-on-Tyne, Northumberland. Tel.: 176 Hx.

FOR anything small in Woodturnery, knobs, handles, plugs, Pegs, Bushes, Cord-grips, Dowels, Buttons, etc., in a great variety of hardwoods.—W. AND J. R. THOMPSON, Woodturneries, Dept. B., Cross Hills, Keighley. 'Phone: Cross Hills 12.

4 K.W. 100 volt Generating Plant, Pelapone engine, Crompton dynamo, switchboard, tank, Hart accumulators 180 amp. hrs. All accessories.—Apply CAMPS, Coopersale House, Epping.

COMPLETE LIGHTING SET for Sale, 7½ kW, 100 V, 12 H.P. Crossley-Crompton Dynamo, 200 Ah. Chloride accumulators, switchboard. Fine order. To be seen in use Morant Hall, Brockenhurst. Cost £700.—Offers to Capt. C. SUTTON, Estate Offices, Brockenhurst, Hants.

20-KVA Transformer, by Hackbridge Electric Construction Co., Ltd., transforming from 200 volt, 2-phase to 500 volt, 3-phase, with tappings at 220 and 440 volts; also additional sub-transformer to give 550 volt, 3-phase. Date of manufacture, 1928.—THE MINING ENGINEERING CO., LTD., Meco Works, Worcester.

CABLE DRUMS, all in new condition, FOR DISPOSAL.

Galvanised iron, with boxwood centres, 11 in. by 6 in.	1s. each
Solidly built, pitch pine, with iron bearings, 16½ in. by 9¾ in.	1s. 6d. each
Solid steel, 16 in. by 9¼ in.	2s. each
Solidly built, pitch pine, with iron bearings, 24½ in. by 12 in.	2s. 6d. each
Also some exceptionally well and solidly made iron bound and protected cable drums, 24½ in. by 12 in.	10s. each

Special quotations for large quantities, f.o.r.
Samples may be had upon application.

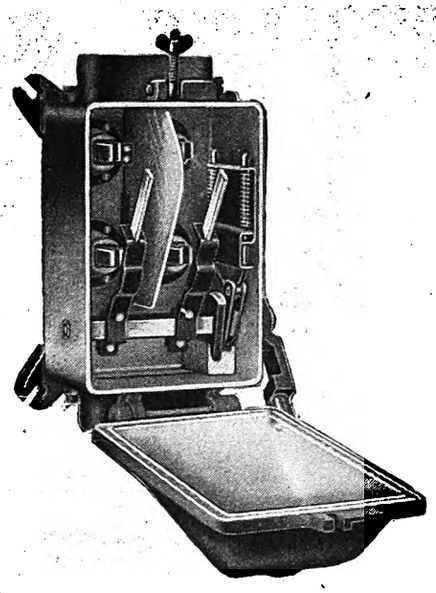
THE "SUPERIOR"



SANDERS SUPERIOR SWITCHGEAR

S

A heavy duty switch of excellent construction, mechanically and electrically faultless, at a price which must command the attention of every Engineer.

The range covers double pole, triple pole, four pole, and three pole and neutral, switches and combined switches and fuses with capacities of 20 to 250 amperes at 500 volts.

Delivery can be effected from stock.

A further rebate to trade users is also given under the new Sanders rebate scheme.

May we send you more particulars ?

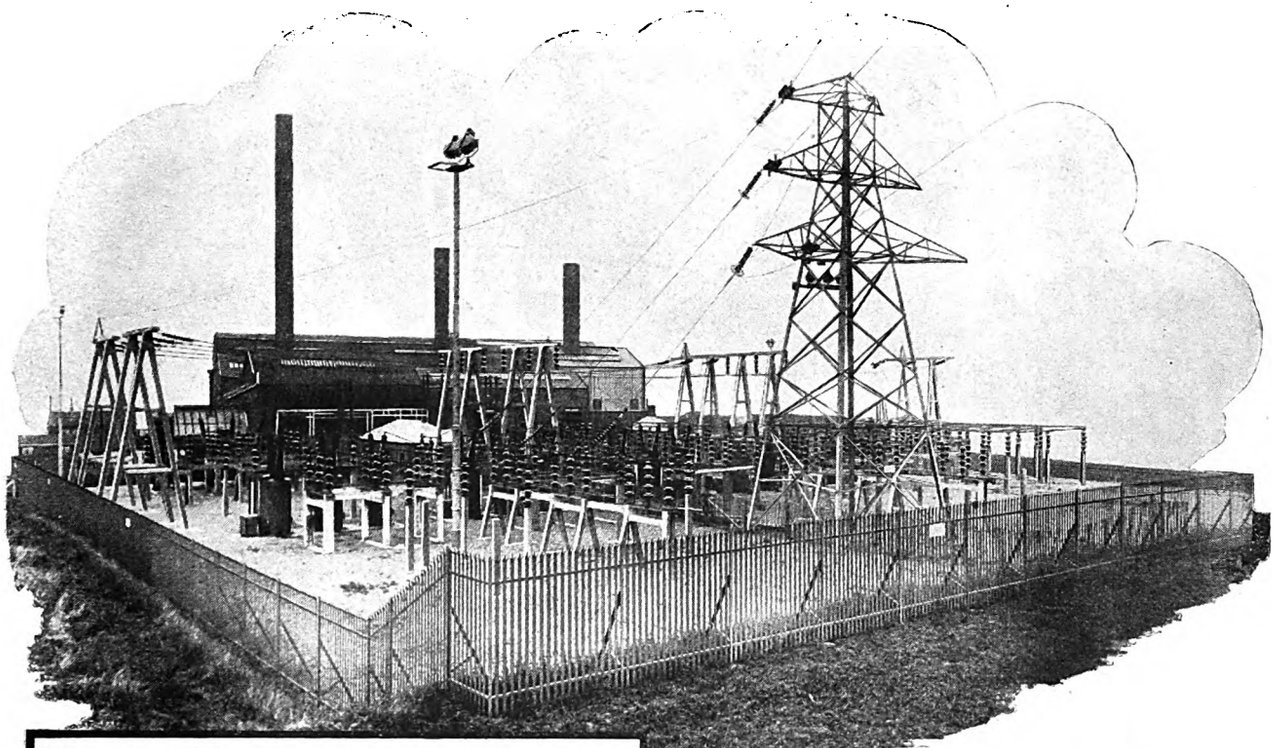
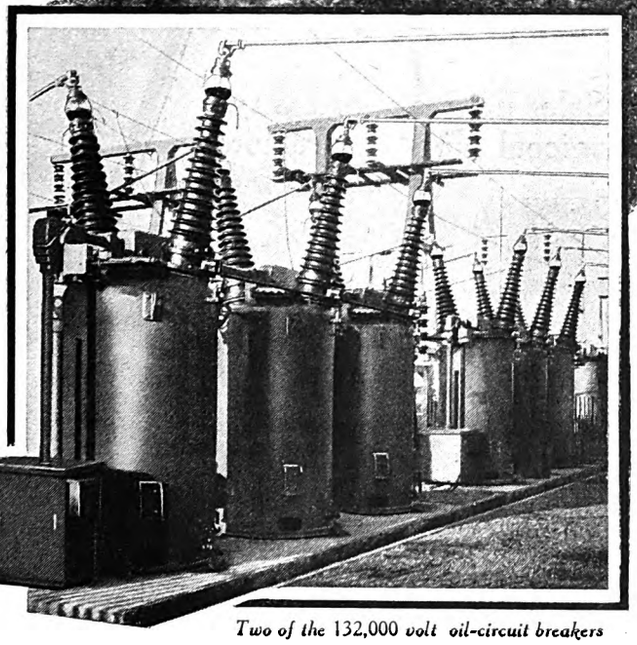
B T-H Switchgear for the Grid Scheme





Two of the 132,000 volt oil-circuit breakers

An Epoch in Power Distribution in Great Britain

was marked by the completion of the Bonnybridge Substation early this year. This, the first substation in operation under the Grid Scheme, was also the first in this country to transmit, commercially, a voltage as high as 132,000 volts. The contract for the complete equipment was carried out by The British Thomson-Houston Co., Ltd.

The upper illustration is a view of the substation and shows the general use of concrete structures in place of steelwork—a system introduced by this company to reduce the cost of maintenance. In the background is the power station for which the generating plant and switchgear were also supplied by this company.

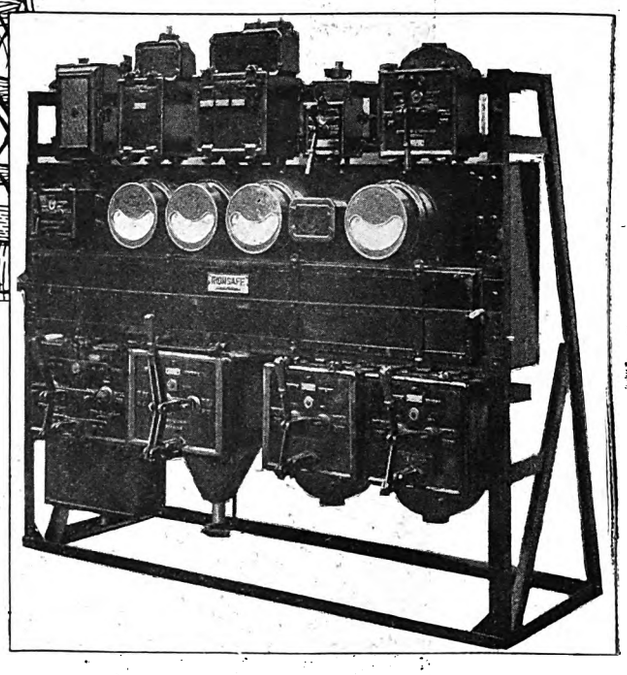
DEPENDABILITY and EFFICIENCY

The "**IRONSAFE**" Switchboard illustrated below is installed for controlling current for POWER—LIGHTING—PUMPING—LIFT, etc., in the Mooring Tower for the world's largest Airship R.101.

A similar switchboard for a like purpose was dispatched to Ismailia.



"IRONSAFE" Switchboards are substantially built to withstand hard usage and to give long service.

Highly skilled workmanship is employed in their construction and the consequent all-round efficiency is responsible for their unrivalled reputation.

"IRONSAFE" Switchboards have been made by us, and installed in a **ROYAL PALACE—UNIVERSITIES—VARIOUS LARGE INDUSTRIAL ESTABLISHMENTS—BANKS—CINEMAS—BREWERIES—MINES—GASWORKS**—and for many other purposes too numerous to mention but sufficient to indicate their suitability for almost any type of installation.

You will never regret specifying or installing a Berry's "IRONSAFE" Switchboard, hundreds are giving efficient service to-day fulfilling their duties faultlessly after many years use.

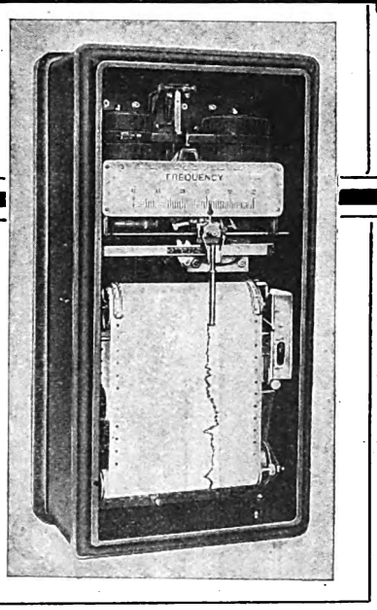
RELAY-GRAPHERS



"C.G.S." Frequencygraph made to any scale interval down to two cycles in six inches. Any range.

THE torque and sensitivity of the C.G.S. Relay-graphers is considerable, and, as all important causes of mechanical friction are overcome by the Motor-relay system, their degree of Accuracy and Reliability is quite remarkable. Large 6-inch scale calibrated to any specified value. Straight co-ordinate graph 120 ft. long. Clean, easily readable and accurate graphs with a large choice of speeds, up to 12 inch per hour. Accuracy independent of friction on paper and weight of ink. The ink is brought to the paper through a sharp steel-blade *drawing pen*, fed from a totally enclosed ink-holder. Ink refilling required about every 3 weeks. Contact system designed so as to allow not only easy inspection (both contacts can be taken out and replaced *exactly at a pre-determinate position* within a few seconds), but to allow also, whenever desired, the suppression of small variations on the chart.

Vol. I: Circuits and apparatus as used in the public service. Post 4to. With many illustrations. Price 25s. net. Vol. II: Auxiliary Services: Private and Branch Exchanges. Post 4to. With 131 illustrations and 9 folding plates. Price 35s. net. Vol. III: Systems for London, New York, and other great cities. Semi-Automatic Systems. Post 4to. With 170 illustrations. Price 55s. net.

ELECTRICAL ENGINEERS' DATA BOOKS

General Editor: E. B. Wedmore, M.I.E.E., F.Inst.P. **3 vols.**

This series comprises 3 volumes under the general editorship of Mr. E. B. Wedmore, Director of the British Electrical and Allied Industries Research Association. Vol. I: Compiled by Mr. D. V. Onslow, A.M.I.E.E., deals with LIGHTING, TRACTION AND POWER DISTRIBUTION. Crown 8vo. of 713 pages, with many illustrations and 200 tables. Price 15s. net. Vol. II: Compiled by Mr. D. V. Onslow, deals with MANUFACTURE, DESIGN AND LABORATORY WORK. Crown 8vo. of 470 pages profusely illustrated and contains 170 tables. Price 15s. net. The third volume, compiled by Mr. J. H. Reyner, B.Sc., A.C.G.I., deals with RADIO ENGINEERING and contains complete sections on Telegraphy and Telephony. Crown 8vo. of 453 pages, with 300 illustrations and 100 tables. Price 15s. net.

SIR JOSEPH WILSON SWAN, F.R.S.

A Memoir by M.E.S. and K.R.S. **7s. 6d. net.**

"Apart from presenting a picture of a delightful personality, this little biography compiled with filial care, has the interest of giving a collected account of a notable scientific inventor, and in particular of the part he played in the development of the incandescent electric lamp."—*The Times* Literary Supplement.

CLIMATE

C. E. P. Brooks, B.Sc. **10s. 6d. net.**

This book, which has been produced as a handbook for business men and travellers, is the first compact account in English of the distribution of climate over the surface of the earth. Dr. Brooks has compiled his statement of the climatic conditions prevailing in the various parts of the world very largely for the benefit of merchants and manufacturers engaged in trade overseas. The author has been at pains to collect the latest official data and also to present the information in an easily intelligible and systematic fashion. As a world guide to a complex subject, this reference book will have a permanent value.

AN ENCYCLOPÆDIA OF THE CERAMIC INDUSTRIES

Alfred B. Searle. **3 vols. Price: £9 9s. 0d. the set.**

This great work, written by an acknowledged expert, embodies, in a compact and convenient form, all that is known of the Ceramic Industries, past and present. Very important sections are devoted to Electrical Porcelains. The first volume is now on sale, the second volume will appear in January next, and the final volume will be published in March, 1930. Orders will only be accepted for the complete set, but each volume may be purchased separately as published, if desired.

FILTRATION AND FILTERS

J. A. Pickard, B.Sc., F.I.C., A.R.C.S. **Just published.** **45s. net.**

This is the first modern book to deal comprehensively with a subject of great importance to engineers in many fields of the industry. The author examines the general principles of filtration, then discusses the various types of filters, and goes on to consider in detail the filtration of water, air, oil, varnishes, paints, etc. Mr. A. J. V. Underwood contributes a section on the mathematical aspects of filtration, and Dr. P. H. Prausnitz a compact account of glass filter apparatus. Nearly 100 well-known firms in Great Britain, France, Germany and America have kindly assisted in making the series of illustrations—450 in number—a virtually complete representation of the best modern practice.

ERNEST BENN, LIMITED, Bouverie

Digitized by Google

ELECTRICAL ENGINEER

INSULATED ELECTRIC CABLES

C. J. Beaver, M.I.E.E. Part I. 36s. net.

deals with Materials and Design. The contents are: Development of electric cables—materials used in the manufacture of cables—conducting materials—insulating materials—protective and preservative materials—Design: Nomenclature and mechanical principles—conductors—di-electrics—factors in voltage rating-sheaths. Part II, on Manufacture and Testing, and Part III, on Installation, will be published shortly at approximately 35s. net each.

ELECTRICAL MEASURING INSTRUMENTS

C. V. Drysdale, D.Sc. and A. C. Jolley, A.M.I.E.E. Two parts. 55s. net each.

unquestionably ranks as the standard work on a subject of vital importance to every electrical engineer. Part I, which includes 365 illustrations, treats of commercial indicating instruments; dynometers; hot wire instruments; electrostatic instruments. Part II, with 437 illustrations, deals with induction instruments, supply meters, and auxiliary apparatus.

Part III, on steady current laboratory instruments, is now in active preparation.

ELECTRICAL HANDLING OF MATERIALS

H. H. Broughton, M.I.E.E. 4 vols.

is an authoritative manual on the design, construction, and application of cranes, conveyors, hoists, and elevators. Volume I deals with electrical equipment, 231 illustrations and 35 tables, 25s. net; volume II with structural work, 388 illustrations and 59 tables, 25s. net; volume III with electric cranes, 300 illustrations and 65 tables, 50s. net; volume IV with machinery and methods, 279 illustrations and 67 tables, 50s. net.

ELECTRIC WINDERS

H. H. Broughton, M.I.E.E. 52s. 6d. net.

is the first comprehensive treatise on a highly important branch of electrical engineering. The book contains 287 illustrations and over 100 tables, and the contents include: mechanics of the simple hoist—electrical equipment—rating of electrical machinery—cylindrical drum winders—inclined shafts—compound shafts—conical drums—bicylindro-conical drums—effect of drum profile on performance—flywheel load equalisers—wire ropes—mechanical equipment—gearing—constants for design—power supply—typical winders.

ELECTRIC SWITCH AND CONTROLLING GEAR

C. C. Garrard, M.I.E.E. 63s. net.

has now been issued in a third edition, entirely rewritten and greatly enlarged to include many new developments. This book by Mr. Garrard is admittedly the standard work on the design, manufacture, and use of switchgear and switchboards in central stations, factories, and mines.

PRACTICAL TELEVISION

E. T. Larner. 10s. net.

The second edition of this well-known work has just been published, containing a Foreword by Mr. John L. Baird. Full particulars are given as to how to construct a Television Broadcast Receiver. This book is absolutely up to date and is indispensable to all who take an active interest in this growing branch of science. "A scientific treatment of the whole subject written in an admirably clear and simple manner, giving the lay reader a bird's eye view of the technical problems involved, and the electrically-minded reader a basis on which to engage in experimental work."—*Electrical Review.*

ELECTRO-FARMING

R. Borlase Matthews, M.I.E.E. 25s. net.

fully and clearly expounds the very great possibilities of electricity in the sphere of agriculture. The author has himself used electrical power, with highly satisfactory results, on his own estate, and he here puts his own experience at the service of both the engineer and the farmer.

Under the Eaves

IF it were not for the efficient, neat and inexpensive Macintosh Overhead Distribution System a Supply of electricity to many districts would have been impossible.

The system is particularly suitable for Housing Schemes and Villages.

All the cables are "Maconite" Insulated, Braided and finished with Indestructible Compound, and the fittings are made from the highest quality materials.

Inconspicuousness is one of the many features of the System.

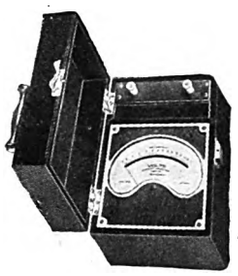
EVERETT EDGCUMBE

testing apparatus



"Precision" Moving-iron Ammeters and Voltmeters

are supplied with sub-standard accuracy on both A.C. and D.C. They are entirely free from errors due to hysteresis, frequency and temperature, and have a smaller power consumption than any other type.

Metrohm Insulation Test Sets

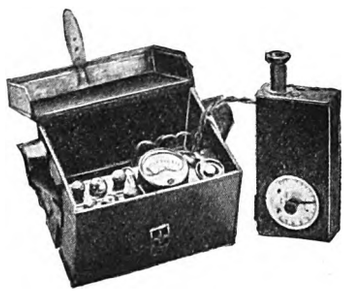
are true ohmmeters and are made in a variety of ranges and testing voltages. The Dwarf pattern illustrated has a scale over 5 inches long although it is only 6 inches square and weighs less than 8 pounds.

Phase Sequence Indicators

An invaluable aid to Meter and Switchboard Engineers when installing watt-hour meters, watt meters, instrument transformers, relays, and all apparatus and machinery where phase relationship is important.

"Omni-range" Current Transformers

A continuous range from 1 to 2,000 amperes is obtained on a single transformer; Ratio and Phase angle variations are negligible, yet there is ample power to operate several instruments at a time.



Luxometer Hand Photometer

The handiest and most accurate of Portable Photometers, invaluable for illumination, surface brightness and candle power measurements both indoors and outdoors.

Time Interval Meter

Accurately measures time intervals down to 1/20th of a second. The timing gear and starting and stopping mechanisms are electrically operated, thus eliminating observation errors.

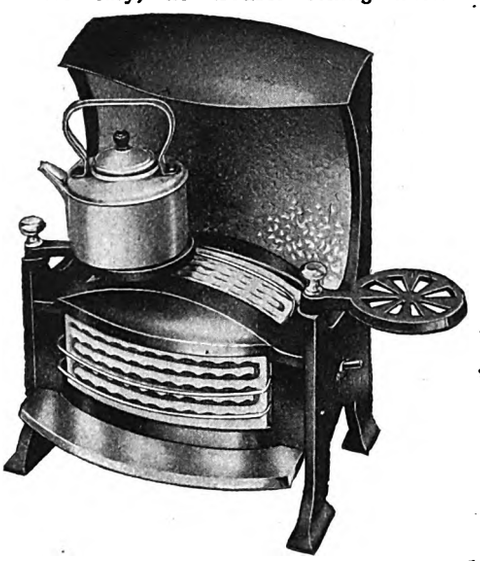
CLACO

THE FIRE WITH THE GREATEST CIRCLE OF HEAT

"CLACO" Electric Fires possess advantages of outstanding merit which make them bigger sellers than any other make of Electric Fire on the market. The "CLACO" Beau Bar has a bolder curve than any other type of Bar in existence. This feature ensures a uniform radiation of heat to all parts of the room. "CLACO" Fires are simple in construction, yet distinctive in design. They are most economical in power consumption, and strictly competitive in price. Let us send you further particulars of these easy, no trouble selling lines.



THE CLACO BEAU BAR RADIATES THE HEAT TO EVERY CORNER OF THE ROOM

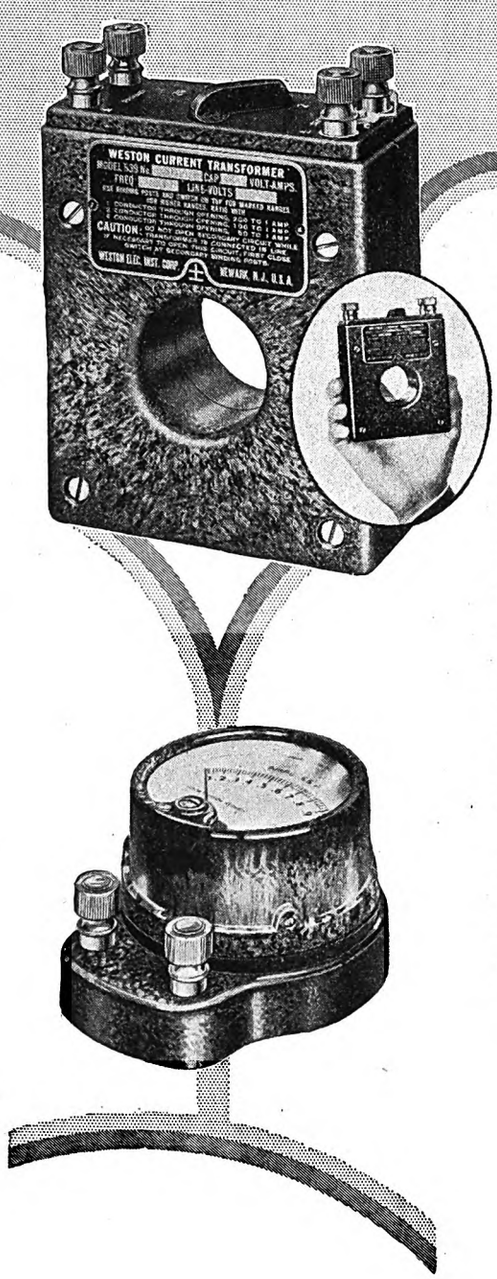
An Ideal Combination for Industrial purposes



Model 539 Miniature Portable Current Transformer as a companion Instrument to Model 528 A.C. Ammeter.

The introduction of the Model 539 Current Transformer makes it possible for the first time to measure A.C. currents ranging from 0·2 of an ampere to 200 amperes with small, high grade, light weight, low cost instruments.

The equipment consists of the Model 539 Transformer weighing only 2⅝ lbs., having self-contained primary ranges of 2/5/10/20 amperes with inserted primary ranges of 50/100/200 amperes, and a miniature A.C. ammeter, Model 528, having a full scale reading of one ampere.

The Model 539 has a one ampere secondary, with a secondary burden of 2 volt-amperes maximum. This Transformer, in combination with the Model 528 one ampere instrument, covers a wide and useful range of current measurements. The Transformer has a guaranteed accuracy of 1 per cent. on frequencies o 25 to 150 cycles.

The self-contained primary ranges are changed by an unique range-changing switch : a noteworthy achievement in design which assures speed and ease of operation.

Moreover, it permits of measuring currents under one ampere which is not possible with Transformers having five ampere secondaries. Yet its testing range is sufficiently high to satisfy the great majority of current measuring requirements.

Model 539 Current Transformer, list price £6:10:0

Model 528 Ammeter, one ampere list price £3:10:0

Model 528 Voltmeter, 150 and 15 volts, list price £3:10:0

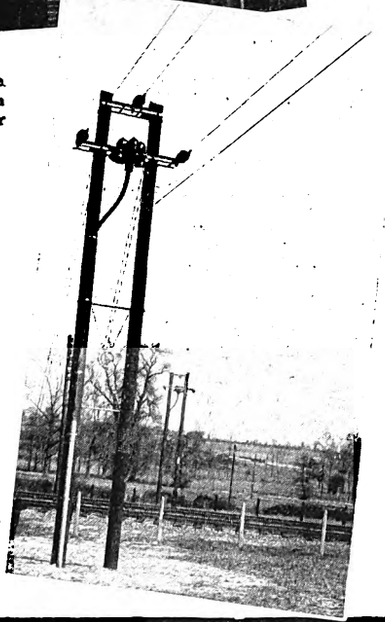
Transformer Pole sub-station with L.T. Cubicle near ground level.



Terminal Poles either side of railway, cable laid under track.

Through nine Villages

East Suffolk, linked up and supplied with light, heat and power. Starting from Melton two Henley 11,000-volt lines run across country to Leiston, Hollesley, Ufford, Orford, Wickham Market, Saxmundham, Eyke and Thorpeness.

At each village the supply is stepped down to 400/230-volt. The top illustration shows a typical example. The transformer pole sub-station can be seen on the centre left, the 11,000-volt air break on the extreme right, whilst the outgoing L.T. distribution terminal pole, taking the supply to the village, can be seen on the extreme left.

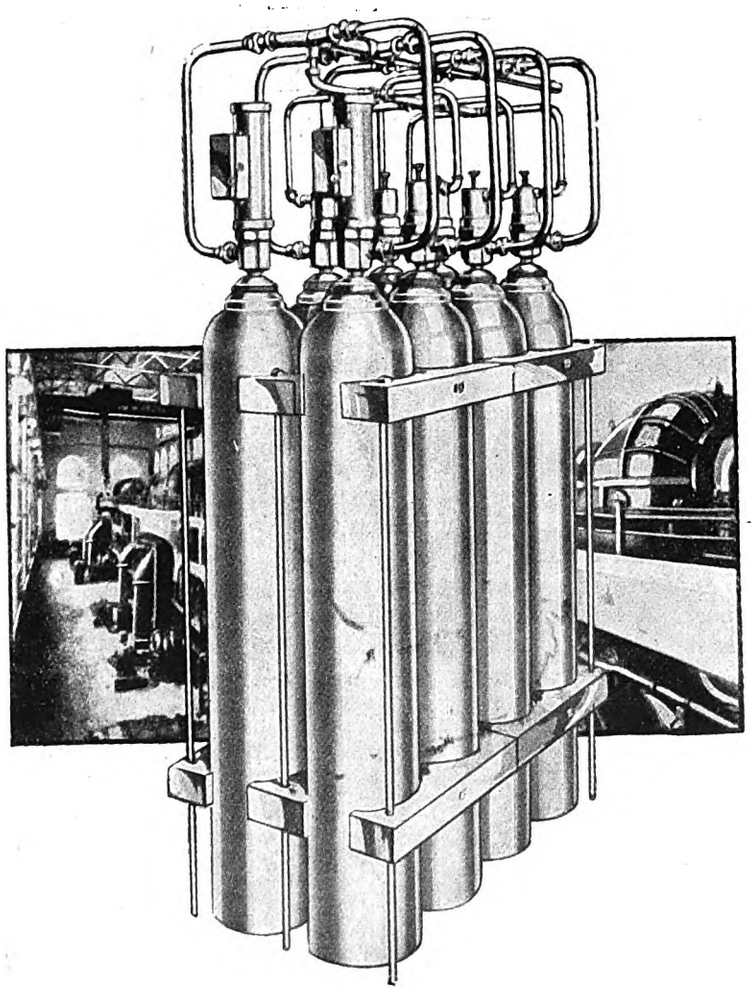
ALFITE—

Kills fire without damaging Equipment or Insulation . . .



The ALFITE *System is simple, yet so rapid in extinguishing action that* all fires are small fires. *Remote control, either automatic, semi-automatic, or manual, floods every recess, crack, and opening with harmless inert* ALFITE *Gas in which fire cannot live.*

HOW long after a fire is extinguished will your equipment be out of use? How much damage to insulation will be caused by the extinguishing agent itself? Putting out fires in either Rotating or Control equipment is only part of the story!

The ALFITE System not only kills fire instantly, by flooding the fire area with harmless, fire-banishing ALFITE Gas—but it *cannot* damage equipment or insulation. It leaves no residue of salts to cause corona. It eliminates the greater part of the fire loss—that part caused by damage done by water or chemicals.

The ALFITE System is the result of years of labour by a group of engineers widely experienced in the use of carbon dioxide as applied to electrical equipment fire protection. It is a simplified system—with fewer working parts, easier to operate, mechanically certain in its release of the gas.

For further particulars as to how the ALFITE System can be applied to your particular risk, apply to—

PROGRESS

AS we see it, Progress consists in **more** people enjoying **better** things, and this belief has directed our efforts for the last fifty years.

Every year, faults in our Social system—that have long been regarded as inevitable and in the natural order of things—are swept away by the pressure of publ c opinion, guided by the results of scientific investigation, and one by one our hopes of **better** things are realised.

There are faults—dangerous and costly faults, many of which it is impossible to detect in the Laboratory—in the material that was for long regarded as inevitable for Switch Panel purposes, but "Sindanyo," the **scientific** product, has rendered the taking of further risks not only unnecessary, but **wrong.**

When can you see one of our Engineers in connection with this question?

Please Enquire for Brochure No. 17

Clear Scales for Accurate Readings

Eversheds Instrument Scales are clear and easy to read: therefore their readings tend to be more accurate.

Eversheds Instrument dials are not printed but are marked one at a time in indelible ink on treated metal dials by special machines designed and built by the company for the purpose. This method not only provides scales of great clarity but there is the additional great advantage that each scale represents the exact calibration of the particular instrument into which it is to be fitted.

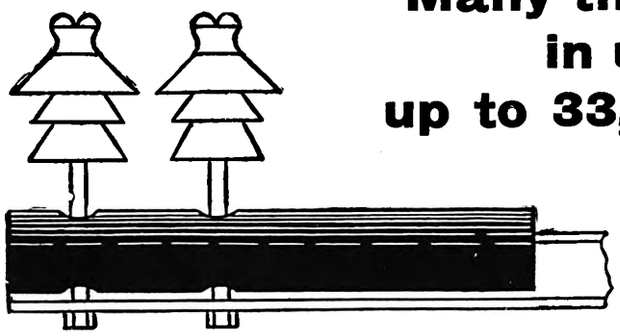
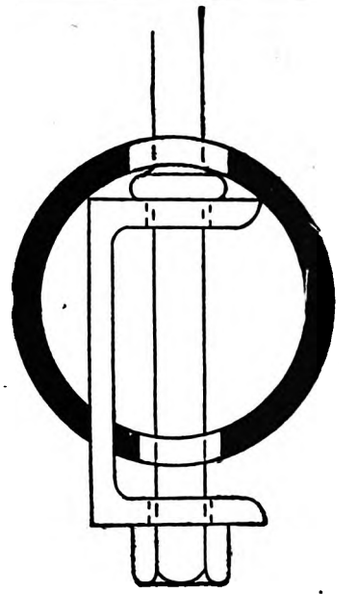
KEY FIBRE BIRD GUARDS



Many thousands in use, up to 33,000 volts



Permanent Protection at a Low Cost

SIMPLICITY OF FIXING.

A slot, ¼ inch wide, is cut on the underside of the Bird Guard along its entire length and this is of sufficient width to enable the Bird Guard to be sprung over the cross arm, which it then grips tightly, no further fixing being required.

Where the insulators are already in position the holes are omitted and the Guards are brought close up to, but not under, the insulators upon which they are not dependent in any way for fixing.

DURABILITY.

For more than 25 years we have always kept from a quarter to half a million feet of our Key Fibre Conduit, from which we cut the Bird Guards, lying out in the open in our yard in Trafford Park exposed to every kind of weather without any ill effects whatever.

PUNCTURE TESTS.

Made on our Key Fibre Conduit from which we cut the Bird Guards.

Six samples, having the following dimensions, were submitted for test: Length 30 inches, inside diameter 3 inches, thickness of tubing ¼ inch, with the following results:—

Sample.	Volts at Puncture.	Average.

Cheap Hot Water "Laid-on" by the 'Sadia' System

WHEN dealing with your next hot water enquiry, have a "Sadia" fitted to work in series with the existing hot water system. It supplies every tap in the house with scalding hot water early morning before the fire has been lit, and at all times throughout the year without any bother. Plumbing work is very inexpensive as most of the existing piping is generally used. Send us your water heating problems and we will guarantee you satisfaction.

The "Sadia" is not a mere copy. There is 20 years actual experience behind its construction, which does tell in the long run.

The heater can of course be fed direct from the ball tank as shown by the dotted pipe A.

Sizes in stock from 1½ to 33 gallons. Our showrooms are yours for demonstration. Write for illustrated list H.S.2

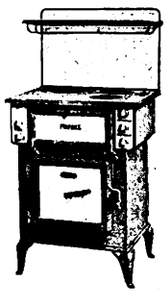
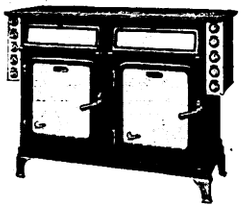
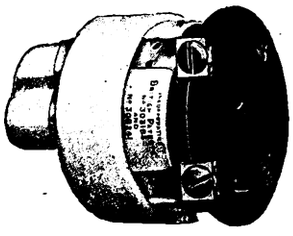
A Happy and Prosperous New Year To Everyone from The Manufacturers of



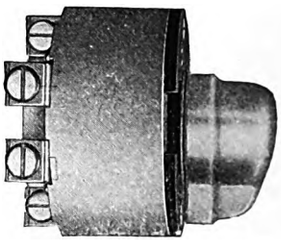
DIAMOND H SWITCHES

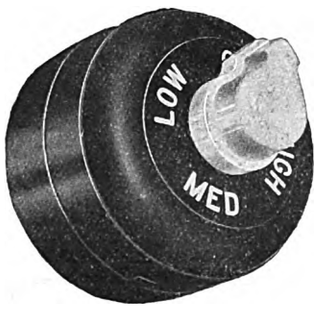


Any woman who has laboured with the coal scuttle, the wood pile, or has experienced the vagaries of gas, will welcome, happily, the clean, *dependable, instantly controllable* electric cooker. What makes a more acceptable Christmas gift than this?



Making electric cookers dependable and *instantly controllable* was the job of DIAMOND-H engineers—they perfected the reciprocating switch that gives three degrees of electric heat at a twist of the wrist; they provided the electric cooker manufacturer with the one thing that makes his product a possible fixture in every wired home in the land—*the switch.*





A good switch makes a good cooker—and more good electric cookers will be sold as Christmas gifts this year than ever before. Most of them will be DIAMOND-H equipped.

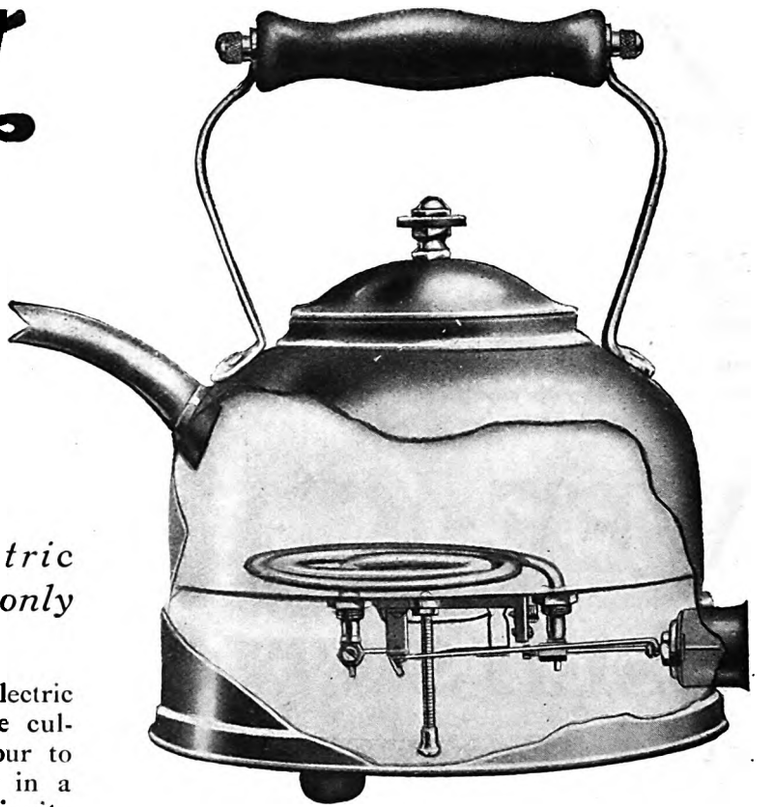
Announcing a New

Hotpoint

SUPER-AUTOMATIC

Electric Kettle

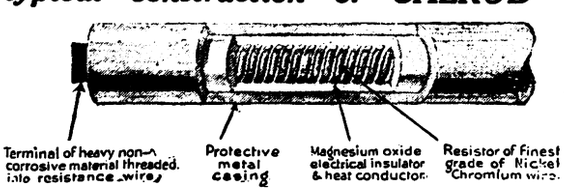
with the CALROD Element



The CALROD Electric Heating Element—Used only in Hotpoint Products

THE patented CALROD Electric Heating Element represents the culmination of a lifetime endeavour to perfect electric heat. Particularly in a domestic electrical convenience continuity of service under all sorts of conditions is of paramount importance. It builds customer appreciation of the convenience and dependability of electric service. Thus, it creates goodwill for the Electrical Contractor and the Central Station.

This sectional view shows the typical construction of CALROD



Hotpoint Super-Automatic Thermal Protector Prevents Overheating

IF the kettle should be forgotten and allowed to boil dry, or if the current should be switched on before water has been added, the Super-Automatic Thermal Protector automatically breaks the circuit before any damage is done. When the kettle cools again the switch automatically closes, but if the kettle is still dry the switch opens again immediately. This cycle of operation will be repeated without damage to the kettle, for an indefinite time, or until such time as water is put in the kettle or the plug is disconnected. This Super-Automatic Thermal Protector is an exclusive Hotpoint feature.

This Kettle is only suitable for use on A.C. Circuits

FANS
for every purpose!

We specialize in air moving apparatus for keeping buildings cool and fresh in summer and healthily warm during winter; for providing local cooling effects to workers engaged in hot spaces; for removing dust given off by materials during manufacture or handling; for maintaining a clear and healthy atmosphere in Smithies, Foundries and Furnace Rooms by removing steam, smoke or fumes; for blowing forge fires, furnaces, cupolas and converters; for ensuring cheaper steam by providing a lequate draught on boiler fires; for preventing the emission of black smoke and grits to the atmosphere; for drying materials quickly and independently of atmospheric conditions; for moving materials pneumatically—and for every other purpose for which such apparatus can be profitably employed.

This is FABLE

As a huge Ox was grazing in a meadow an envious Frog stood gaping at him. Said he—"See if I don't make myself as big as the Ox." So he went swelling on till, in conclusion, he forced himself and burst.

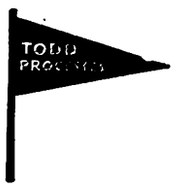
·ÆSOP·

This is FACT

For 35 years Sterling Varnishes have faithfully served the electrical industry in the important matter of efficient, trouble-free insulation. This perfection has only been achieved by years of painstaking research and practical experience on world-wide lines.

Compared with this hard-won pre-eminence of Sterling Varnishes, the rudimentary efforts of firms of a few years' standing give some significance to the old fable of the Ox and the Frog. Wise engineers cannot be deceived by over-inflated statements such as "quality equal to Sterling"—very complimentary, but not true.

Sterling Varnishes are made from the richest quality of materials procurable—made by processes which are a carefully guarded secret. For maximum efficiency, and all this means to you, refuse substitutes.



—Specify—Sterling—spelt with an E—and see the Todd Processes trade mark on all labels and containers.

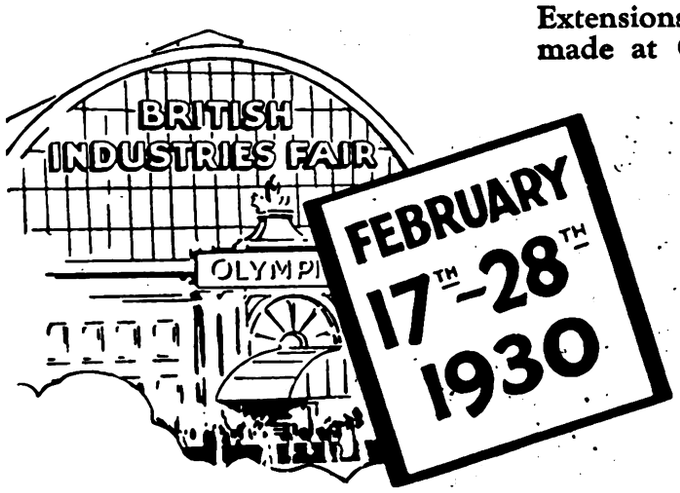
THE BRITISH INDUSTRIES FAIR 1930 will be held at

OLYMPIA & CASTLE BROMWICH
LONDON BIRMINGHAM

OLYMPIA, already the finest exhibition hall in the country, is being specially enlarged to house the vast array of British manufactures shown in the London Section of the Fair, and everything possible will be done for the comfort and convenience of the world's buyers who visit the Fair year by year in increasing numbers. The heating arrangements will enable an equable temperature to be maintained in the most inclement weather. Adequate restaurant accommodation will be provided, ranging from a de luxe service to simple cheap meals.

Every Trade Buyer and Merchant should visit the Fair!

Extensions and improvements have also been made at CASTLE BROMWICH where, as in previous years, the machinery and engineering exhibits and allied trades will be displayed.



Trade buyers should apply now for a free pass which will entitle them to reduced fares on all railways in the United Kingdom.

Full particulars may be obtained from

THE DEPARTMENT OF OVERSEAS TRADE, 35, OLD QUEEN ST., LONDON, S.W.1 *or* THE SECRETARY, CHAMBER OF COMMERCE, BIRMINGHAM.

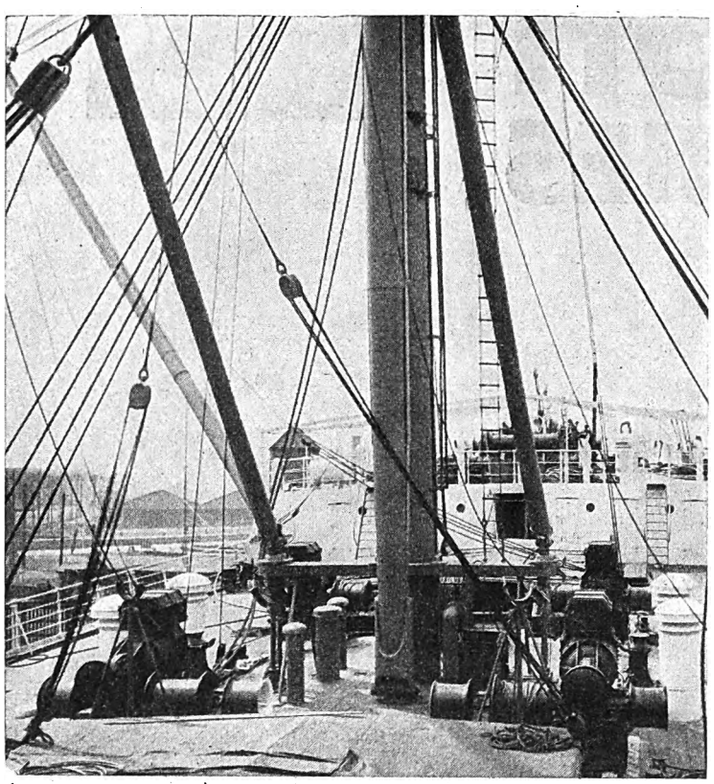
SMOOTH OUT FLUCTUATING LOADS



ON YOUR AUXILIARY DIESELS

THE fluctuating loads in winch operation are smoothed out when a Chloride Battery is floated across the generators. Thus the Diesel operates under a steady load and with greater efficiency. This means greater operating economy. In port, a Chloride Battery can often take the place of the whole auxiliary power plant. It will enable you to eliminate night engine room watches entirely.

CONSERVE NATURE'S ENERGY
Chloride Batteries

The Chloride Electrical Storage Co., Ltd., has been making storage batteries, with acknowledged success, for nearly 40 years. The result of this experience and the advice of the Company's specialist engineers are at the service of any Firm desiring to consider the use of storage batteries for any purpose.

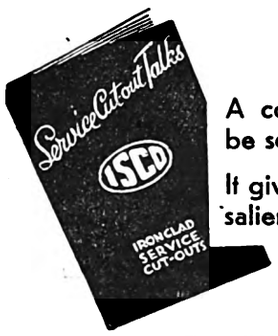
the "Floating Terminals" ensure perfect electrical contact over the full surface area between the Fuse and Circuit Terminals.

In the 60/120 amp. ISCO, for example, the contact area of each terminal (·86 sq. inch) gives a current density of only 70 amps. per. sq. inch.

This conservative rating results in ISCO Cutouts keeping cool under full load conditions, besides ensuring an increased length of service.



A copy of this Booklet will be sent Post Free on request

It gives full details of all the salient features of ISCO Cutouts

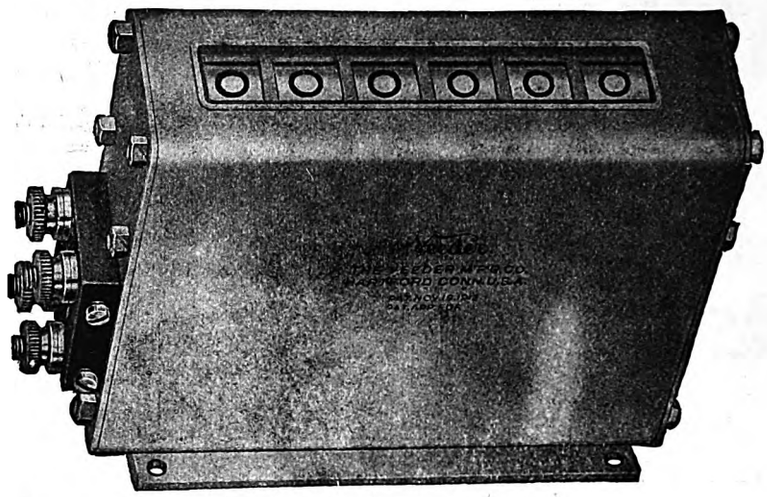
MAGNETIC COUNTERS

FOR A.C. AND D.C. CIRCUITS

HAVE THE SAME HIGH QUALITY AND FINISH ALWAYS ASSOCIATED WITH **VEEDER** PRODUCTS.

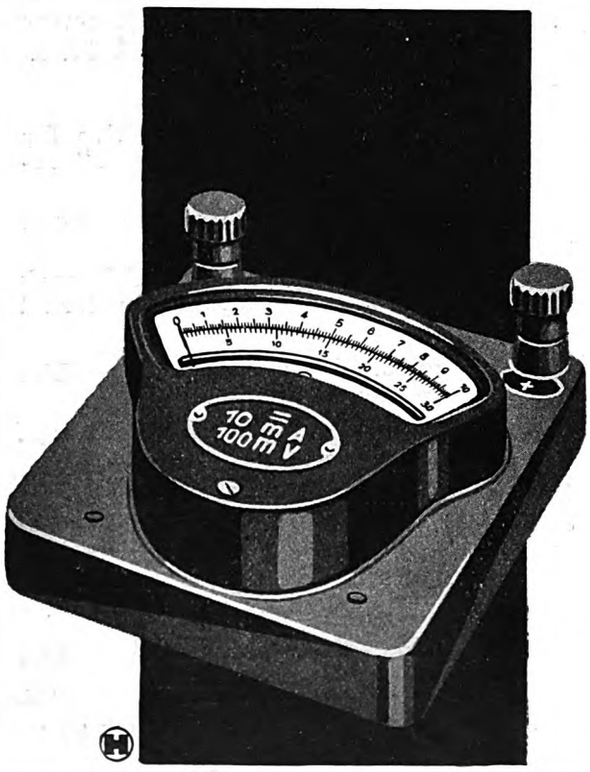
VEEDER Magnetic Counters operate by make and break of an electric circuit—their use and application will readily suggest themselves. The Magnetic Counter is essential under conditions where it is desirable that the counter be placed at some distance from the machine on which the count is to be taken. A number of counters can be grouped together in a central or convenient place. It is also desirable where articles counted are very small or thin or light in weight, making it difficult to count by mechanical means.



F. E. DICKINSON, St. Andrew's House, Holborn Circus, London, E.C.1

'PHONE: CITY 8138. TELE. ADDRESS: VEEDERMETA, SMITH, LONDON.

"Z" TYPE MEASURING INSTRUMENTS



These are equally suitable for the Laboratory, Erection, Inspection Work or general service. They are small, light and handy. Notwithstanding the very low price and small size, the readings are surprisingly accurate.

The "Z" instruments are made as Ammeters, and Voltmeters for A.C. and D.C., as well as Wattmeters for A.C. They are also supplied as a complete set of measuring instruments in strong travelling cases.

FIBREX TREE WIRE

"Decreases Overhead Line Hazards"

Where trees are particularly close together and tree trimming must be avoided to keep the streets attractive, lines of FIBREX Tree Wire can be installed.

FIBREX consists of a rubber-covered conductor, insulated for any commercial voltage, over which is applied a heavy rubber-filled tape; then a heavy thoroughly tarred duck tape, followed by one FIBREX tape which is its distinguishing feature. Over the FIBREX tape is placed a thoroughly weatherproofed cotton braid which gives the tree wire the same appearance as the ordinary line wire into which it is spliced.

Symmetry of trees can be preserved, the good will of residents can be obtained and steady, uniform line service kept up by using FIBREX Tree Wire at places where chafing is likely to occur. Further information will be sent on request.

The illustration on the left shows the FIBREX non-metalic, non-inductive armor. On the right is the weatherproofed braid which constitutes the outer covering of FIBREX Tree Wire.

TELENDURON

INSULATORS

FOR "MAINTENANCE FREE" SERVICE

Efficiency in pole routes for telegraphs, telephones and power lines is reached where Telenduron Insulators are installed. Telenduron has the maximum insulating values.

Telenduron is virtually unbreakable and climatically indestructible. It remains constant in efficiency throughout years of exposure.

Over 5,000,000 Telenduron Insulators are giving satisfaction in all parts of the world and under all conditions. A routine works test of 10,000 megohms at 400 volts after 24 hours' immersion in water and a flash test of 6,600 volts under artificial rain is applied to every insulator produced.

POWER FACTOR IMPROVEMENT

means less cost for current.

Taking current at a low power factor is a costly procedure. By using

DUBILIER CONDENSERS

for POWER FACTOR IMPROVEMENT you are able to take current at a High Power Factor, under which arrangement many Power Supply Companies allow preferential rates. Moreover, it reduces the losses in cables and transformers, thus directly resulting in greater output from plant.

The initial cost of a Dubilier Power Factor Improvement Condenser is the final cost and is recovered in usually little over a year by the amount saved through the installation.

Fit a Dubilier Condenser to every A.C. Motor.

There are Dubilier Condensers suitable for all industrial A.C. circuits. Of the highest efficiency, both electrically and mechanically, they can be supplied in various arrangements, whether for indoor or outdoor installation.

Make an appointment for one or our experts to call and discuss the question with your engineer.

NOW READY

HEAVISIDE'S
OPERATIONAL CALCULUS
as applied to
ENGINEERING AND PHYSICS
by
E. J. BERG
Consulting Engineer, General Electric Co.

214 pages, illustrated
PRICE 15/- NET

A useful guide for engineering students and electrical engineers in practice in solving complex transient phenomena and ordinary alternating current circuit relations. The book explains the use of the "unit function," and shows how to apply Heaviside's operational calculus to problems in electrical engineering and physics.

CONTENTS.—I.—Heaviside's "Unit Function" and the Algebraic Nature of His Operations. II.—The Nature and Practical Value of the Operational Solution. III.—The Expansion Theorem. IV.—The Expansion Theorem Applied to Some Definite Problems. V.—Operations on Unit Function Squared Have No Physical Significance. VI.—Additional Operators Employed When a Network Is Suddenly Connected to a Battery of Constant Voltage. VII.—Procedure When the Expansion Theorem Cannot Be Used Because All Roots Are Not Different Or Some Roots Are Zero. VIII.—Simplification Which Can Be Made When the Roots Are Conjugates. IX.—Problem Involving Mutual Inductance. X.—The Effect of Suddenly Changing the E.M.F. in a System or of Short-Circuiting a Network. XI.—The Effect of Short-Circulting Certain Sections of a Network and of Introducing New Impedances by Closing a Switch. XII.—The Effect of Suddenly Changing the Current Constants by Opening a Switch. XIII.—Heaviside's "Shifting." XIV.—Duhamel's Integral. XV.—General Equations Pertaining to Transmission Lines. XVI.—An Alternator Suddenly Connected to An "Ideal" Cable. XVII.—Transmission Line Having All Four Constants R, L, G, and C. XVIII.—Transmission Line With Impedance at the Sending and Receiving Ends. XIX.—Two or More Transmission Lines of Different Constants Connected Together by an Impedance or Shunted at Their Junction by an Impedance. XX.—A Battery Connected at Some Point of a Cable. XXI.—Effect of Electric Charges Applied at Points of a Transmission Line or Cable—Green's Function. XXII.—Disconnecting and Discharging a Cable. XXIII.—Fractional Differentiation and Integration. XXIV.—Indefinitely Long Transmission Line or Cable. XXV.—Problems Involving Convergent and Asymptotic Series. XXVI.—Difficulties of Interpreting Power-Series Developments. XXVII.—Linear Flow of Heat. XXVIII.—The Numerical Solution of Algebraic and Transcendental Equations. XXIX.—List of Operators and Formulas.

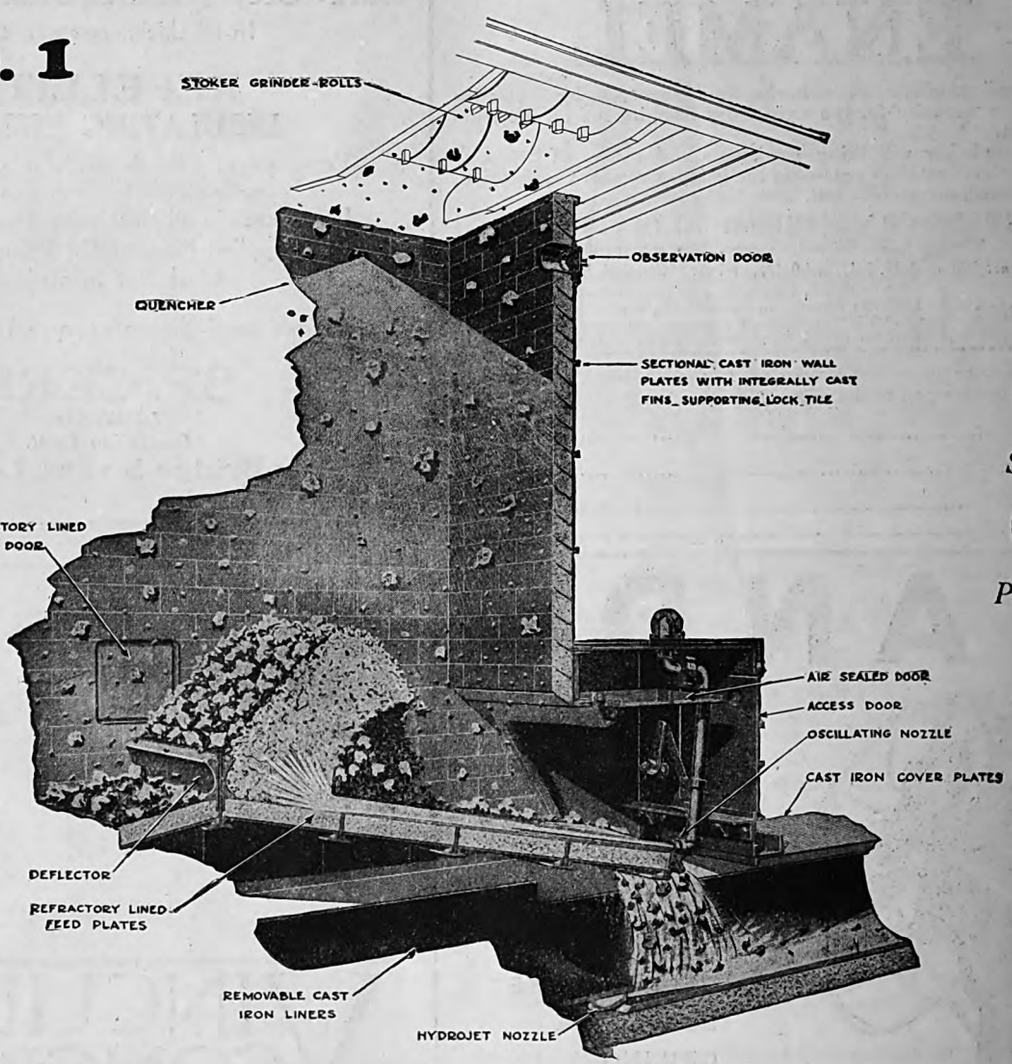
TRADE MARK

Ash Handling Applications

No. 1



Specify ASH *Products*

Specify ASH *Products*

Write for Catalogue

APPLIED TO RETORT TYPE STOKERS FITTED WITH CLINKER GRINDERS OR CHAIN GRATES WITHOUT GRINDING ROLLS

8 to 24 hours Ash accumulation is stored and quenched in specially designed Hoppers. It is then handled to the final point of disposal by one man working for 10 to 15 minutes per Boiler. The system being totally enclosed is absolutely clean and dustless.

GLARELESS LAMPS

Pearl and Opal

Produced by Members of the E.L.M.A. to replace all clear lamps from 15-100 Watts.

The general adoption of these lamps will benefit the user by enabling a higher standard of illumination to be established, and ensure greater profit to the trade

"Glareless Light Preserves the Sight."

ISSUED BY THE ELECTRIC LAMP MANUFACTURERS' ASSOCIATION, 25, Bedford Square, London, W.C.1.
